T O

His Royal Highness.

GREAT SIR,

I Justly esteem it a Peculiar Happiness, that You were pleas'd to accept of the Patronage of this Work; for hereby you exempt me from that Hardship which attends most Dedicators, of inventing the Virtues they Celebrate.

But tho' your Intrinsic Excellence and Real Worth takes away all Possibility of Flattery, yet being convinced that whatever I can say, falls short of your Merit, I Blush as much at my Incapacity of giving You Your just Due, as I should at ascribing more than He deserved to another.

Your Early Years, GREAT SIR, shew'd Your Skill and Conduct in Arms, as well as the Greatness of Your Courage and Love for Glory; and 'twas an uncommon Happiness your Bravery was more than once blest with, by Your own Personal Valour to Save Your Royal Brother, Rout the Enemies Troops, and Change the Fate of the Battle.

After this, when Your Happy Alliance with Your Royal Consort, Our present Gracious and Most Excellent QUEEN, had made You Ours, tho' you were always ready to offer your Self to Command Our Armies or our Fleets, yet when we deny'd our Selves the Happiness of your Conquering for us Abroad, you set your Self to shew us an Illustrious Example of Virtue and Goodness at Home; and prov'd you Self to be as much above Pride and Revenge here, as you would have been without Fear or Surprize there.

The Epistle Dedicatory.

Great within Your Selves Alone, Your Royal Confort and Your Self, like the best of the Old Roman Generals and Consuls, liv'd Retired indeed, but neither unactively nor unusefully: Virtue and Piety You taught, by the best way of Recommending it, Your own Bright, Great, and Glorious Examples; And raised up the Conjugal Happiness to such a Degree of Perfection, as the World never knew before, and which could You have been Unbeloved, would have render'd you almost the Envy of every one.

Then, MIGHTY SIR, did You employ your Noble Mind in Studies of the greatest Use and Benefit to Mankind here, Mathematicks and Mechanicks; and as Your Closet was always the Resort of the usefully Learned and Ingenious, so were you still their Encourager and Patron.

But when the Providence of GOD called Your Illustrious Princess to Empire, and Your Self to Publick Business and Mighty Employments, You soon Both shew'd You could Command with as much Wisdom and Conduct, as you could before Obey with Resignation, and make our Nation Truly Happy by the Gracious and Excellent Administration of your Government.

The Glorious Effects of which that we may long Enjoy, and that Our Gracious QUEEN, and Your ROYAL HIGHNESS, may be Blessed with Issue to Inherit these Great Dominions, that I doubt not but GOD hath raised up HER SACRED MAJESTY to secure in lasting Peace and Happiness to us, is,

GREAT SIR,

The most Sincere and Constant Prayer

of Your ROYAL HIGHNESS'S

Most Obedient and Most Humble Servant

JOHN HARRIS.

THE P R E F A C E.

THE best Account I can give of the following Work, will be to lay before you in a short View what it contains, wherein it differs from other Books which may seem to be of the same Nature, and from whence I have collected the Substance of it. That which I have aimed at, is to make it a Dictionary, not only of bare *Words* but *Things*; and that the Reader may not only find here an Explication of the *Technical Words*, or the Terms of Art made use of in all the *Liberal Sciences*, and such as border nearly upon them, but also those *Arts themselves*; and especially *such*, and *such* Parts of them, as are most Useful and Advantageous to Mankind. In this, which was the chief of my Design, I found much less Help from Dictionaries already published, than one would have expected from their *Titles*: *Chauvin's Lexicon Rationale*, or *Thesaurus Philosophicus*, is a well printed Book, and the Figures are finely Graved; but 'tis too much filled with the School Terms, to be usefully instructive; and is as defective in the Modern Improvements of Mathematical and Physic Learning, as it abounds with a Cant which was once mistaken for *Science*.

The *Grand Dictionnaire Des Arts & Sciences*, par *Mrs. de l'Academie Francoise*, hath no Cuts nor Figures at all, and is only a bare Explication of Terms of Art; and it seems rather to have been design'd to improve and propagate the *French Language*, than to inform and instruct the Humane Mind in general. And, which I have often wonder'd at, 'tis filled every where with *Simple Terms*, so that you are told what a Dog, a Cat, a Horse and a Sheep is; which, tho' it may be useful to some Persons who did not know *that* before, and may shew very well, that such Descriptions can be given in *French*; yet how the bare Names of Animals and Vegetables, of Metals and Mineral, can be reckoned as *Terms of Art*, and consequently make the greatest part of a *Dictionary of Arts and Sciences*, I confess I cannot see: And therefore, tho' this and *Mr. Furetiere's Dictionary* may be Books very well done in their Way, and are certainly very useful for those who would be perfectly acquainted with the *French Tongue*; yet I did not find much Assistance from them, with regard to my Design.

The P R E F A C E.

And much less Help was there to be had from a Book called, *The New World of Words, or an Universal English Dictionary*; for there I found the Compiler had the *Ill Luck* to Collect many *Foreign* Faults, and to understand little or nothing of the *Arts* and *Sciences* himself.

Mr. *Ozanam's Dictionaire Mathematique*, is indeed as good a Book as *Vitalis's* is a bad one; and had *Mathematicks* been a Science I was the least acquainted with of any other, I should have been generally as well supplied from *Ozanam*, as deceived by *Vitalis*; whose last Edition, in two Volumes at *Rome*, after so many Years time to consider upon the Matter, is, I think, not better than the First, because it hath more Matter, and less to the Purpose.

The *Chymical* and *Physical Dictionaries* of *Johnson, Castellus*, and *Blanchard*, have a great many Words and Terms that are not to be met with elsewhere: And the last hath had four Editions in our own Language; but tho' many things are well enough done in him, yet some can hardly be said to be so; so that in many Places I have been obliged to put his Name to what my *Amanuensis* or *Assistent* transcribed from him, lest the Reader shou'd mistake it for my own Words.

I write not this only to disparage the Performances of others, or to build my self a Reputation on their Ruins, but I think my self obliged to acquaint the Reader with the plain Truth of Things, without Favour or Affection, that so he may be informed where to meet with Satisfaction in his Enquiries and Reading, and where not; and perhaps if this were oftner done, both the Time and the Expence of gaining true Knowledge would be much shortned.

There are some other lesser Dictionaries which are of good use, and which have been serviceable to me on Occasion, which I shall mention below; but I must next acquaint the Reader, That *much the greater Part* of what he will find here is collected from *no Dictionaries*, but from the best Original Authors I could procure in all Arts and Sciences, and is the Result of some Years Labour and Consideration.

I have been very Full and Particular in the *Mathematicks*, because it is the only Solid Foundation on which a Useful Enquiry into Nature and all Physical Learning can possibly be built; and because 'tis also of the greatest Use and Advantage to Mankind in all Respects.

In *Geometry*, under the Name of each Figure you have the Essential Properties of it briefly and plainly demonstrated, and the Application to the Practice shewed; so that by the Help of very easy
References

The P R E F A C E.

References from one Place to another, you will find the Demonstration of all such useful and important Propositions in that Noble Science, as are usually given by *Geometrick* Writers,

Under such Words as *Parabola*, *Ellipsis*, *Hyperbola*, &c. in the *Conick Sections* you will find the Properties of each Figure or *Section* demonstrated, with Methods for their Description on a Plane; as also the Properties of the *Cycloid*, *Conchoid*, *Logarithmick-Line*, *Ciffoid*, *Quadratrix* and *Spiral Lines*, &c. Some general Considerations of the Nature of *Asymptotes*, the Nature and Properties of *Catacaustick* and *Diacustick* Figures, of the *Involute* and *Evolute*, of the *Linea Celerrimi Descensus*, &c. And under the Word *Construction*, you have the Construction of *Cubick* and *Biquadratick Equations* by the *Parabola*; together with the Investigation of *Baker's Central Rule*, and its Use and Application.

Under such general Words as *Trigonometry*, *Surveying*, *Spherical Geometry*, *Projection*, &c. you will find Entire Treatises on these Heads; and which, if I mistake not, are as short and plain as any yet extant.

In *Algebra* you will meet, under the proper Heads, every thing that is usually found in Treatises of this Nature, and perhaps something more. And under *Fluxions* you have a succinct Account of the *Nature* and *Algorithm* of them, and some Improvements which are not to be had elsewhere. And in several Places under the proper Words, you have an Account of what we now call the *New Methods*, or *Universal Ways of Investigation*; as particularly, a Method of drawing of *Tangents* to all sorts of *Curves*, a Method *de Maximis & Minimis*, &c. of finding the *Centers of Gravity* and *Oscillation*; of finding the *Uncia*, &c. All the Parts also of *Common Arithmetick* are explained here, and its Application to *Anatocism*, *Compound Interest*, and *Annuities*; together with the Doctrine of *Surds*, the Method of Extraction of *Roots* by *Converging Series*, and the entire Doctrine of *Promotion*; all kinds of *Progression*, *Fractions*, *Logarithms* and *Decimals*: And I have also, from the best Authors I could get, collected an Account of the Ancient *Weights* and *Measures* of all Nations, and adjusted them with our own; and have given you very large and useful *Tables* of the *Values* of all *Modern* or *present Foreign Weights, Measures and Coins*, compared with our own. I have inserted also, from *Dr. Wallis*, a large Account of *Sexagesimal Fractions*. You will find here also the *Descriptions* and *Uses* of both the *Celestial* and *Terrestrial Globe*; the *Doctrine* of the *Sphere*, according to the *New* and *Old Hypothesis*; together with the *Demonstration* and *Practice* of *Spherick Projections in Plano*; and most of

The P R E F A C E.

of the useful things in *Astronomy*, as the *Phænomena*, *Parallaxes*, *Magnitudes*, *Motions* and *Distances* of the *Planets* and their *Satellites*; and in particular, the Incomparable Sir *Isaac Newton's Theory of the Moon*, and a very large Account of *Comets* from the same Author. You will have also the Ground and Practice of *Dialling*; the Nature and Use of *Opticks*; the taking all *Heights* and *Distances*; the *Mensuration* of *Surfaces*; *Gauging*; the *Art* of *Chronology*, *Geography*, *Cosmography*, *Musick*, &c.

In *Gunnery* you have the Method of Shooting in Great Guns and Mortars, with Captain *Halley's* and *Anderson's* Tables; and as to *Fortification*, I have consulted the best Books and Drawings; and I believe the several Parts of a fortified Place are pretty well described, and the Plate belonging to this *Art*, at the End of the Book, comprehensive, and done according to the best of the Modern Ways.

The Figures also of the Five Orders of Pillars in *Civil Architecture*, are, I hope, as instructive as they cou'd be of that Size; and as for the Terms of Art here, I took them from the best Author, as *Vitruvius*, *Vignola*, *Palladio*, and the *Parallel* by Mr. *Evelyn*.

Navigation is also largely treated of, and the whole *Art* taught under the Words *Plain* and *Mercator's Sailing*, and *Traverses*: And as to the *Variation of the Compass*, I have given you a very full and exact Account of it, from the Excellent Mathematician Capt. *Halley*, together with his Ingenious Hypothesis for the Solution of its Variation; and Practical Rules to find the Variation of the Compass at Sea.

And as to a Ship, I have endeavoured to be very full and particular in describing the several Parts of her, both in the *Dock*, when *Building*, and when *Rigg'd*, and *under Sail* at Sea: For I have consulted the best *Draughts*, *Sections* and *Models* I could get a sight of, have got what Helps I could from Captains and Masters of Ships, and have often gone on Board my self, to get the more ready Knowledge of this Affair; and I have compared it all with what we have already Printed of this Nature in Books and Descriptions of Ships; such as *Manwaring's Sea Dictionary*, *Boteler's Sea Dialogues*, *Philips's Section of a First Rate*, &c.

I have given also, from several Eminent Hands, and several Ways, the *Laws of Motion*: As from Dr. *Wallis*, Sir *Isaac Newton*, Monsieur *Varignon*, Mr. *John Keil*, &c.

And the Doctrine of *Mechanicks*, *Nature* and *Properties* of *Statics*, the *Laws of Pendulums*, and of *Projectiles*.

And

The P R E F A C E.

And I have been very large in that most Useful Science *Hydrostatics*, giving an Account of the Principles and Practice of the *Art*, both Mathematically and Experimentally: And under the Word *Specifick Gravity*, I have given you all that the Honourable Mr. *Boyle* hath advanced on that Subject, in his *Medicina Hydrostatica*; to which a large Table of the *Specifick Gravities* of different Bodies is added; and all his *Hydrostatical Paradoxes* are inserted in their proper Place.

I have describ'd also, chiefly from Mr. *Derham*, the way of *Calculation of Automata*, or Clock and Watch-work; and explained the Terms of *Art* used in *Painting* and *Sculpture*.

As to *Physick* and *Natural Philosophy*, and those admirable Helps to the understanding of Nature, which *Geometry*, applied to *Physical Enquiries*, hath of late afforded us, and to which indeed we are chiefly indebted to that Prodigious Mathematician Sir *Isaac Newton*: I have endeavour'd to give you every where the Marrow and Substance of it under proper Heads: And under the Term of *Art*, or Word, expressing any particular *Quality*, I have collected all I could meet with to explain it, and to clear up its Nature and Properties; as you will find at large under such Words as *Electricity*, *Solidity*, *Elasticity*, *Effluvi-ums*, *Magnetism*, *Light* and *Colours*, &c. As to which last, I'm sorry I had not time to take no more from Sir *Is. Newton's* Excellent Book of *Opticks* lately published; what I could, I have insert'd, as I had before done the Substance of what he had published in the *Philosophical Transactions* on that most Noble Subject; and which convinces us that we were all mistaken in our Notions about it before, for want of proceeding in a right Method of Enquiry.

The *Phænomena* of the *Rain-bow*, or *Iris*, are here accounted for from the Learned and Ingenious Capt. *Halley*, now *Savilian Professor* of *Geometry* in *Oxon*.

The Account of *Snow* I give you from Dr. *Grew*: And one of *Ice* from the *French*.

I have collected what I could meet with as to *Sound*; but I wish that *Quality* were a little better considered.

You have here a very full Account of all the *Phænomena* and *Properties* of the *Air* and *Atmosphere*, as its *Gravity*, *Spring* or *Elasticity*, &c. and a full Description of, and the Use of such Instruments as have been invented to enable us to judge of them; as the *Barometer*, *Thermometer*, *Hygrometer*, &c. all which is chiefly from the Honourable Mr. *Boyle* and the *Philosophical Transactions*.

The Account of *Springs* and *Fountains* is from Capt. *Halley* and Dr. *Woodward*: And from the former of these Learned and Ingenious

The P R E F A C E.

nious Gentlemen I have given you a new Theory of *Tides*, or a Solution of the *Phænomena* of the Ebbing and Flowing of the *Sea*, which is very plain, certain and intelligible, and built on Sir *Is. Newton's* Principles.

In *Botany* I have been as large as I could be, without giving Descriptions of Plants, which is contrary to my Design: But you have here, from our Mr. *Ray*, *Morrison*, and Monsieur *Tournefort*, I believe, a pretty exact *Botanick Lexicon*, which was what we really wanted before: Together with an Account of all the several *Kinds*, and *Subalternate Species* of *Plants*, and their *Specifick Differences*; in which I have followed Mr. *Ray's* Method, as appearing to me to be the best and most Natural.

A Table of *Fossils* I have given you from the Accurate Dr. *Woodward*, Professor of Medicine in *Gresham-College*: And a Scheme of *Metals* and *Stones* from Bishop *Wilkins's* Real Character.

I have also given you a large Account of *Vegetation*, which is very curiously and exactly done from the Experiments and Observations of Dr. *Woodward*.

You have here also a good Account of the Nature and Property of the *Wind*, from Capt. *Halley*: And a Description of Mr. *Papin's* *Wind-Gun*, from Mr. *Boyle*.

From which last Excellent Gentleman I have also taken what I say about the Nature and Properties of *Cold*.

And likewise from Capt. *Halley* and Sir *Is. Newton*, is collected all that which you will find under the Word *Heat*.

In *Chymistry*, the Knowledge of which is one great help towards the Understanding of Nature, I have been large and particular; explaining the Chymical Principles, Vessels, and Degrees of Fire; and have omitted no Process nor Operation of Use, that I could either meet with in Books, or get from my Friends; as the Reader will soon see, by consulting the Book it self, under such Words as *Phosphorus*, *Bolonian Stone*, *Sympathetick Inks*, *Transmutation*, &c.

In *Anatomy* I have been very large and full, describing all the Parts of an Humane Body, both Internal and External: And tho' indeed the Figures for this Part are much less than I could have wished them to be, (for the Book hath so much out-run the Expence the Undertakers at first proposed, that they would not be brought to have larger Cuts;) yet I hope the Descriptions, in most Places, will prove tolerably Accurate and Instructive; especially under such general Words, as *Blood*, *Circulation*, *Bones*, *Heart*, *Ear*, *Eye*, *Vision*, *Arteries*, *Veins*, *Bile*, *Lympha*, *Chylification*, &c. in all which I have consulted the Best Authors.

The P R E F A C E.

In *Logick*, *Metaphysicks*, *Ethicks*, *Grammar*, *Rhetorick*, &c. I have been designedly short; giving usually the bare Meaning only of the Words and Terms of Art, with one or two Instances to explain them, and illustrate them.

In *History* and *Chronology*, you have what properly belongs to them as *Arts*; as an Account of the *Civil* Computation of Time; the Original and Reduction, one to another, of the several *Æra's*, *Epocha's*, *Periods*, &c.

In *Heraldry* I have given you the entire Art of *Blazoning* and *Marshalling* a *Coat of Arms*; and explained all the *Ordinaries*, *Charges*, *Bearings*, &c. by Figures: But have said nothing of Families (any further, than that such a Coat belongs to such a Name) my Design being only to explain the *Art* and its *Terms*.

As to the Description of the *Mathematical* and *Philosophical Instruments*; some of them (as the most useful) are largely done, but the others as briefly: For as it would have taken up a large Volume to have described them all; so for many of them, the Reader would not have been much the better. But the *Globes* and *Quadrants* are largely treated of, as are *Telescopes*, *Microscopes*, *Baroscopes*, *Hygrosopes*, and the *Pneumatick-Engines*, or *Air-Pumps*; because these are of vast Use and Benefit to Mankind, and have served to improve and raise up the Knowledge of Nature to that good Height it is now arrived to, and I hope will carry it yet much further.

And as I have usually taken particular Care to give all Authors their just Due, from whom I have taken any considerable Part of my Materials, without Partiality, so I have designedly done Justice to such Ingenious and Industrious Artificers, as do truly deserve the greatest Encouragement for their Skill and Accuracy, in the making of those Instruments: Such are Mr. *John Rowley*, *Mathematical Instrument-maker*, under St. *Dunstan's-Church* in *Fleet-street*: Mr. *Yarwell* late, and Mr. *Marshal* now, *Perspective-Makers* in *Ludgate-street*: Mr. *Hawkesbe*, who makes *Air-Pumps* and all *Pneumatick-Engines*, in *Wine-Office Court* in *Fleet-street*: And Mr. *John Patrick*, the *Toricellian Operator* in the *Old-Baily*, who makes all kinds of *Barometers* and *Thermometers*; as you will find I have done in the proper Places: And I can't here omit mentioning the Ingenious Mr. *Wilson*, which I could not do in the Book, because those Sheets about the *Microscope* were Printed off before I had seen Mr. *Wilson* or his Glasses: But I must now do him that Justice to say, That of all the *Microscopes* I have ever seen for Commodiousness, various Uses, Portability, and Cheapness, I never met with any thing like Mr. *Wilson's* Glasses. They are particularly described in the *Philosophical Transactions*, N.

The P R E F A C E.

As to the *Law Part* of the Dictionary, I did my self actually consult the best Books and Dictionaries I could get recommended to me; and from thence I transcribed, abridgedly, all that seem'd necessary to be inserted here; and since that, I have had it carefully examined and corrected by a Gentleman of known Ability in that Profession.

And thus having given you a short Account of what you may expect to find in this Work, and which may perhaps satisfy the Reader that it is a Book useful to be *read carefully over*, as well as to be consulted like other Dictionaries occasionally: I shall next fairly acquaint you wherein it is defective, and what Improvements may be made of it hereafter, in an additional Volume.

The Catalogue, Right-Ascensions, Declinations, &c. of the *Fixed-Stars*, is very imperfect; the Reason of which is, That Mr. *Flamsteed*, upon whom I thought I might depend, was pleased to refuse me any Communication of that kind; else I would have given those Things under the Name of each Star or Constellation.

There are also, I doubt, here and there some Words which my *Amanuensis*, or *Assistant*, transcribed from other Dictionaries, which are not so well explained as they should be, and which (among so many Thousand Words as I had to range into Order) have escaped a Review; but I have corrected as many of them as I could in each Sheet as the Book was printing off.

I would have had also at the End of the Book, a particular *Alphabet* for each *Art* and *Science* by it self; and some more and larger Copper-Plates in *Anatomy*, and of the *Outside, Rigging*, and the *Section* of a *Ship*: But the Undertakers could not afford it at the Price proposed, the Book having swelled so very much beyond the Expectation: But whatever Alterations, Amendments, Improvements and Additions shall be hereafter, as I question not but many of the latter sort Time will produce, if God please to Bless me with Health and Leisure, these shall all be printed in a Volume by themselves, and so by no Means be prejudicial to the first Impression.

LEXICON

LEXICON TECHNICUM;

OR AN

UNIVERSAL ENGLISH

DICTIONARY

OF

Arts and Sciences.

ABA

ABACOT, the Cap of State, used in old time by our *English Kings*, wrought up in the Figure of two Crowns.

ABACTORS, the same with *Abigei*, such as steal and drive away whole Flocks of Cattle, or the greatest part of any Herd or Flock; in which the Lawyers distinguish them from *Fures*, who only steal a Sheep or two, &c.

ABACUS, sometimes signifies the A, B, C, sometimes a Table of Numbers for casting up Accounts, which was anciently of Brass, and called then, *The Table of Pythagoras*. It signifies also, sometimes the Numeral Figures, which used to be drawn on a Table covered with small Sand or Dust, as *Persius* hints in these Verses.

*Nec qui Abaco numeros et secto in pulvere notas
Scit resisse vafer —.*

ABACUS, in Architecture, is the four square Table that makes the Capital on the Top of a Column, especially those of the *Corinthian Order*: and is a Drip or *Corona* to the Capital. It supports the nether Face of the Architrave and whole Trabeation. In the *Corinthian* and *Composite Orders*, the Corners of it are called; the *Horns*, the middle part the *Sweep*, and the *Curvature* the *Arch*; which commonly has a *Rose* carved in the middle. See Vol. 2.

ABAFI, or *Aft*, a Sea Term, signifying always those Parts which are towards the Stern of the Ship: So they say, Such a Mast hangs *Aft* or *A-baft*, that is, towards the Stern. And because the Master's or Captain's Cabbin is usually in the hinder part of the Ship under the Quarter Deck, 'tis a common Complement to a Person come on Board a Ship, *Sir, will you please to walk Aft*.

ABALIENATION, a Term in the old Roman Law, signifying a simple Sale of the Goods of one Citizen to another: These Goods were called, *Res mancipii*, or *mancipii*; and were Estates either in Slaves or Cattle, and sometimes Land of Inheritance; but they must be in *Italy*.

ABA

ABAPTISTON, or *Ana-baptiston*, an Instrument used by Surgeons, the same with *Modiolus*, which see.

ABATE, *Abatement*, signifies in Law the taking Possession of Land by a Person that hath no right to it, after the Death of the Ancestor, and before the Entry of the right Heir. Also to *Abate a Writ*, signifies to destroy it for a time, thro' want of good Ground, or other Defect. So to *Abate a Nuisance*, is to destroy it, &c.

ABATEMENT of Honour, in Heraldry, is an accidental Mark annexed to a Coat of Arms, whereby its Dignity is abated by reason of some dishonourable Quality or Stain in the Bearer, and 'tis either by adding a *Mark of Diminution*; or by *Reversion* of the whole Escutcheon. The Marks of *Diminution* are, 1. A *Delf Tenn*, which is a Square born in the middle of the Field, thus; and belongs to one that hath revoked his Challenge, or eaten his Words.

2. A *Point Dexter parted Tenn*: due to him that is a *Braggadocio*, or boasts of more than he did, or can do.

3. A *Point in Point Sanguine*, thus; due to him that is Lazy and Sloathful in the Wars.

4. A *Point Champain Tenn*: which is due to him that kills his Prisoner after Quarter demanded and his Commander's Leave to give it; born thus.

5. A *Plain*

5. A Plain Point Sanguine, born thus; due to one that is a Liar, and tells false Stories to his Sovereign.

6. A Goar Sinister Tenn, born thus; and is due to him that is proved a Coward: But a Goar Dexter is not an Abatement.

7. A Gusset Sanguine, born thus; where are two Gussets one on each side. The Gusset is an Abatement proper for an Effeminate Lascivious Man; and is then born on the right side; but if he be given to too much Wine, the Gusset is on the left side; if to both, he should bear two Gussets, as in this Example.

Reversion is two fold, 1. When a Man bears in his own Escutcheon another Reversed, as thus; which is due to a rude and uncivil Treater of Maid or Widow; or as some say, for Deflowering her only; and also, for one that runneth away from his Sovereign's Banner.

2. When a Man's own Escutcheon is entirely Reversed, which is due to a Traitor.

N. B. These Abatements are never charged with any thing; are always born single, and their Colour is never of Metal, but always either Murrey or Tawney.

ABATOR, (in the common Law) is he that abaterh, that is, intrudeth into a House or Land void by the Death of the former Possessor, and not yet entered, or taken up by his Heir.

ABBROCHMENT, is the forestalling of a Market or Fair, by buying up the Wares before they are exposed to Sale in such Market or Fair, and then vending them again by Retail.

ABBUTTALLS, are the Buttings and Boundings of Lands any way, shewing how they lie in respect to other Places.

ABDICATION, a Term of the Roman Law, signifying several things; as the Abandoning of a Son, when he was expell'd his Father's House and refused to be owned as his Child. *Abdicare Magistratum*, or *se Magistratum*, was to abandon or lay down the Office of a Magistrate. We meet there also with *Abdicare se statu suo*; which signifies, a Man's renouncing his Condition to become a Slave, and to be degraded from the Privileges of a Roman Citizen.

ABDICERE, signifies, to debar a Man from his Demands, or not to allow them: Thus *Abdicere vindictas* was in the Roman Law not to allow a Man the Possession of thing in Controversie, as *Addicere vindictas* is the very contrary.

Tho' the Word *Abdication* signifies strictly an actual and voluntary Renouncing, yet in a larger Sense, at common Law, it may be properly used where there is only an *Implicit Renunciation*; as when a Person does such Actions which are inconsistent with the nature of his Trust, he does in consequence renounce it; and this was the late famous Case of a certain Prince, where this known

and ancient Common-Law-Term was revived; tho' indeed 'tis more generally used among the Civilians.

ABDOMEN, the lowermost of the three *Venters* in an Human Body; properly the Lower Belly: It contains in its Region the Stomach, Guts, Liver, Spleen, Bladder, &c. within it is covered with a Membrane called the *Pertitonæum*. The lower part of it is called the *Hypogastrium*. The foremost part is divided into the *Epigastrium*, the Right and Left *Hypochondria's*, and the Navel. 'Tis bounded above by the *Cartilago Encephalis* and the *Diaphragm*, sideways by the short or lower Ribs, and behind by the Vertebres of the Loins, the Bones of the *Coxendix*, *Pubis* and *Os Sacrum*. It hath ten Muscles which both cover it and serve to excrete the *Fæces* and *Urine*, and to expel the *Fœtus* in Women: You will find them under their proper Names.

ABDUCTOR Indicis, is a Muscle of the Fore-Finger, which is not to be seen till the *Abductor Pollicis* is raised; by some it is reckoned amongst the *Interossei*; it arises fleshy from the *Os Metacarpi* that sustains the Fore-finger, and descending over the first Internode of the said Finger becomes Tendinous, joining with the Tendon of one of the Lumbrical Muscles, and is inserted with it together with the Tendon of the former Muscle. Its Name intimates its Use, in drawing the Fore-finger from the rest.

ABDUCTOR Oculi, a Muscle of the Eye, so called from its Action in retracting or drawing off the Eye from the Nose: It is also called *Indignabundus*, because it is made use of in scornful Re-
sentments.

ABDUCTOR minimi digiti, is a Muscle which appears in some Bodies divided into two or three Muscles, having each a differing Series of Fibres; the first of which seems to be a *Flexor primi Internodii minimi digiti*, the second an *Abductor* of the same; the third *Abductor Secundi & Tertii Internodii*; but this Division is not constant. It arises fleshy, first, from the *Ligamentum Transversale* and fourth Bone of the *Carpus*; Secondly, from the third Bone of the *Carpus*; and then, Thirdly, from the superior Parts of the subjacent *Os Metacarpi*: The two first continue fleshy to their Insertions; the former terminating at the superior Part of the first Bone of the Little-Finger forwards; the latter ending at the same part of the said Bone laterally; the Third becoming Tendinous like the *Interossei*, is inserted like them with the Tendon of the *Extensor Minimi Digiti* at the superior part of the third Bone of the Little-Finger. Its Use is to draw the Little-Finger from the others.

ABDUCTOR Pollicis, is a Muscle of the Thumb, which arises broad and fleshy from the internal part of the *Ligamentum Transversale Carpi*, whence descending it lessens it self, and becomes Tendinous, at its Implantation to the superior and external part of the second Bone of the Thumb laterally. This draws the Thumb from the Fingers, from whence it derives its Name.

ABDUCTOR Pollicis Pedis, is a Muscle which arises fleshy from the *Os Calcis* internally and laterally, in half its Progress becoming Tendinous, it joins with another fleshy beginning, springing from the *Os Cuneiforme Majus* that sustains the *Os Metatarsi* of the Great Toe; both which making one Tendon are inserted to the external part of the *Os Sesamoides* of the Great Toe laterally. This pulls the Great Toe from the rest. **ABDU-**

ABDUCTOR *Minimi Digiti Pedis*, is a Muscle which ariseth outwardly Tendinous, but inwardly Fleshly, from the external part of the *Os Calcis*, becoming Tendinous in half its progress on the outside of the Foot; it joyns with the other fleshy part of this Muscle arising fleshy from the outside of the *Os Metatarsi* of the Little Toe, and making one Tendon as its Insertion to the upper part of the first Bone of the Little Toe externally and laterally. Its Use is to draw off the Little Toe from the rest.

ABDUCTORES, in the general are the same with *Abducent Muscles*.

ABDUCENT *Muscles*, are universally those which serve to open or pull back divers parts of the Body, as the Arms, Legs, Eyes, Nostrils, Lips, &c. These are called also *Abductors*. Their Opposites are usually called *Adductors* or *Adducent Muscles*.

ABETTERS, is a common Law Term, and signifies those that without Cause procure others to sue out false Appeals of Murder, or Felony against Men, in order to render them infamous.

ABETTERS, in Murder, are those which advise or procure a Murder to be committed; in the same sense there are *Abettors* in Felony and Treason; in the last of which they are all *principals*, there being no *Accessories* in Treason.

ABELTION, the Licence given to a Criminal Accuser, to desist from further Prosecution.

ABEYANCE, in Law signifies a Thing's being in *Possessio* only and not in *Actu*: Thus suppose a Lease made to *A.* for Term of Life, and the Remainder to the right Heir of *B.* who is living at the time of the Grant; in this case, tho' the Remainder pass presently from the Grantor, yet it vests not presently, or takes hold in the Grantee, that is the Heirs of *B.* but is Indeterminate, in *Potentia*, in *Nubibus*, in *Abeysance*, viz. in Consideration of Law: So when the Parson of a Church dies, and the Church is void, the Fee is in *Abeysance*, because it is not determined who shall succeed him.

ABISHERISING, and in some Copies, *Misbehaving*, is (in Common-Law) being acquitted of *Amercements*, before whomsoever, of Transgression prov'd.

ABJURATION, formerly was an Oath which a Person who had committed Felony, and who, to avoid the Law, had betaken himself to Sanctuary, took to depart the Kingdom for ever: It was a Law enacted by *Edward the Confessor*, but is since changed by the Statutes, 21 H. 8. c. 2. 22. H. 8. c. 14. 32. H. 8. c. 12. But the Sense of the Word *Abjurate*, originally, in the Roman Language, as it is used by *Cicero* and other good Writers of that Age, was, To deny a thing upon Oath; to deny that a Man had promised, committed, detained, or did owe any thing, upon his Oath. Thus with him *Abjurare Creditum* was to forswear a Debt, or to deny on Oath that he ow'd the Debt.

ABLACATION, the weaning of a Child that hath suck'd its full time. Also a kind of Grafting, when the Cyon remaineth on its own Stock, and the Stock you graft it on, together, till such time as they are surely incorporated; then the Cyon is cut from its own, and lives only by the other Stock.

ABLAQUEATION, a laying open or baring the bottom of the Trunk, and Roots of Trees, that so being exposed to the Air, the Sun, and the Rains, they may the better fructify, or bear fruit the ensuing Year.

ABLATIVE Case, is the last of the six Cases of Nouns and Participles in Grammar, and is so call-

ed, because it usually takes away one thing from another. This called also the *Latin Case*, because almost peculiar to the Latin Tongue, and is usually connected with some Prepositions, which serve to determine it.

ABLUTION, the Preparation of a Medicine in any Liquor, to cleanse it from its Impurities.

ABLUDENT *Medicines* are the same with *Absfergent*, which see.

ABNODATION, in Agriculture, signifies the pruning of Trees, and cutting off Knots and Knobs.

ABOLITION, in Metaphysics, is an utter Destruction of any Being.

ABOLITION of a Law, is the perfect repealing it, or the entire taking of it away, so that it shall never have Force again.

ABOMASUS, one of the Stomachs of Ruminant Animals or such as chew the Cud; of which are reckoned four, the *Venter*, *Reticulum*, *Omasus*, and *Abomasus*.

ABORIGINES, are such Nations as the *Italians*, who pretend antiently to be without Original or Derivation from any other Nation or People.

ABORTION, the bringing forth of a Child (or *Fœtus*) before its due time.

ABORTIVE, is spoken of a *Fœtus* brought forth before its time: Hence 'tis also an Epithet given to any Design or Purpose that miscarries.

ABRENUNCIATION, is a renouncing or forsaking of any thing entirely.

ABBREVIATIONS, are Contractions in Writing or otherwise, whereby any thing that is written or spoken, is contained in, or takes up much less Room, than it would do, if written or delivered at large.

ABRIC, with some Chymists the same with *Sulphur*.

ABRIDGMENT of a Plaint, in Common-Law, is, when one Part of the Plaintiff's Demand is left out, and it is pray'd that the Defendant may answer to the other.

ABROGATE, signifies to disannul or repeal; as to *Abrogate* a Law, is, to lay it aside or to repeal it. So that the

ABROGATION of a Law, is the repealing it, or taking it quite away.

ABSCESS, an Ulceration arising in any Part of the Body after a *Crisis*: The same with *Apoistema*.

ABSCISSÆ, in Conick Section, or other Curvilinear Figure, are the Parts of the Axis cut off by the Ordinates, and accounted downwards from the Vertex of the Section. Thus *Vr* or *V R* are the *Abscisse* in this Figure. These are called by some Writers, the *Intercepted Axes* or *Intercepted Diameters*.

ABSIS, the same with *Apfis*, which see.

ABSOLUTE: This Word (which signifies free from the Power of another) is variously used. Sometimes the Terms of a Proposition are said to be taken *Absolutely*, that is, without relation to any thing else. A Prince is said to be *Absolute*, when

he makes his *Will his Law*, and will in no respect be restrained or limited by the Laws of his Country. This is otherwise called Arbitrary Power; and arises from an Imperfection both in the Understanding of the Prince, and in the Spirits of the People. But God Almighty is *Absolute* from the Perfection of his Nature, as containing in himself all possible Power, and lying under no Limitations nor Restraints from any one. *Absolute* is sometimes taken also in Opposition to Terms or Conditions; thus God doth not forgive Men their Sins *Absolutely*, but on Condition of their Repentance and Amendment; and a Priest cannot absolve Men from the Guilt of their Sins *Absolutely*, but only declaratively and Ministerially, on the Condition of the Person's Penitence and Resolutions for Amendment. So (in Law) an *Absolute* Estate is one free from all manner of Conditions.

ABSOLUTE Number, in an Equation in *Algebra*, is that which *Vieta* calls the *Homogeneous Comparisonis*, and which always possesseth one entire part or side of the Equation, and is always a known Quantity; and the Rectangle or Solid, under the unknown Roots, in Quadratics and Cubics. Thus in this Equation $ax - 16a = 36$. The Absolute Number is 36, which is equal to the Product of the two Roots or Values of a , multiplied one into another.

ABSOLUTE Equation, in *Astronomy*, is the Aggregate or Sum of the Eccentric and Optick Equations. See *Equation*.

ABSORBENTS, are Medicines that temper and qualify the Acid Juices in the Body, by imbibing or drinking them up. Thus *Alkali's* are said by some to absorb Acids.

ABSTENSION, in Law, is a with-holding an Heir from taking Possession of his Land.

ABSTERGENT, or *Absterfifile* Medicines, are such as are used to clear the Skin or Superficial Parts of the Body from any Filth, &c. obstructing its Pores.

ABSTERSION, is the Effect produced by *Absterfifile* Medicines, or in general, any cleansing or wiping away.

ABSTRACTION, is a Power peculiar to the Mind of Man, in Contradistinction to the Souls of Beasts, and plainly distinguishes Him from Them; whereby he can make his Ideas, arising from particular Things, become general Representatives of all of the same kind. Thus, if my Eye represents to me Whiteness in a Wall, I can *Abstractedly* consider that Quality of Whiteness, and find it attributable to many other things besides, as to Snow, to Milk, or the like; and this Quality, whatever it be, thus considered apart from the *Concrete*, or the Subject in which it inheres, is said to be taken in the *Abstract*.

ABSTRACT, is frequently used also for a small Draught or Epitome of any greater Work.

ABSTRACT Numbers, are those which are considered as *Pure Numbers*, without being applied to any Subject; and so *Abstracted Mathematics*, is used in Opposition to *Mixt Mathematics*; the former signifying pure *Geometry* or *Algebra*; and the latter Opticks, Dialling, Navigation, &c. where Physical Considerations are connected with the Mathematical.

ABSTRUSE, secret, dark, not easily intelligible.

ABUNDANT Numbers, are those whose Parts added together, make more than the whole Number which they are Parts of; as v. g. Twelve,

whose Parts being 1, 2, 3, 4, and 6. these all added together make Sixteen: Thus also the Parts of 20 make 22, &c.

ABUS, see *Apfis*.

ABYSS, is any vast deep Place, which either hath no Bottom, or else hath none discernable, or at least is supposed to have none.

The Learned Dr. Woodward, in his *Natural History of the Earth*, P. 124. tells us, That there is a mighty Collection of Waters inclosed in the Bowels of the Earth, constituting an huge Orb in the Interior or Central Parts of it; and over the Surface of this Water, he supposes the Terrestrial *Sratta* to be expanded: This is what *Moses* calls the *Great Deep*, and what many Authors call the *Abyss*. And that there is such a vast Collection of Waters lodged in the Bowels of the Earth, is confirmed by abundance of Observations.

The Water of this vast Abyss the Dr. asserts, doth communicate with that of the Ocean by means of certain Holes, *Hiatus's* or *Chasms* passing betwixt it and the Bottom of the Ocean: And this and the Abyss he supposes to have one common Centre, around which the Water of both of them is placed; but so, that the ordinary Surface of the Abyss is not level with that of the Ocean, nor at so great a distance from the Centre as that is, it being for the most part restrained and depressed by the *Sratta* of Earth lying upon it; but wherever those *Sratta's* are broken, or so lax and porous that Water can pervade them, there the Water of the Abyss doth ascend, fills up all the Clefts or *Fissures* whereinto it can get Admittance or Entrance, and saturates all the Interstices and Pores of the Earth, Stone, or other Matter all around the Globe, quite up to the Level of the Ocean.

ACADEMY, is a kind of higher School or University, where young Men are instructed in the Liberal Arts and Sciences. 'Twas so called at first from *Academia*, the Name of a Place near *Arbens*, and built, say some, by *Cadmus* the Phœnician; others, by one *Academos*, whence it had its Name: 'Twas planted with Trees; and here *Plato* taught his Disciples Philosophy, who from hence are called *Academicks*. *Cicero* also call'd one of his Country Seats by this Name, where he had fine Groves, and pleasant Walks for the Entertainment of his Philosophical Friends; and here he wrote his Books, *D. Nat. Deorum* and *De Amicitia*, and his *Offices*, which therefore he called his *Academical Treatises*.

ACADEMICKS, so the Followers of *Plato* were anciently called, because they studied in the *Academia*. Afterward it became the Name of a Sect of Sceptical Philosophers, who maintained, That all things were uncertain, and that Reason and Truth were changeable, so that Men ought to doubt of every thing, and believe nothing.

ACANTABOLUS, the same with *Volsella* (excepting that the *Volsella* is crooked) a Surgeon's Instrument to take out any thing that shall happen to stick in the *Oesophagus* or Gullet; 'tis something like a Pair of Pliers, and may be reckoned as a kind of *Forceps*.

ACANTHA, is with some Anatomists the most backward Protuberance of the Vertebres of the Back; and is otherwise called, *Spina Dorfi*.

ACARNAR, the same with *Acherner*.

ACATALECTICK Verse, is one exactly perfect, where not so much as one Syllable is either redundant or deficient.

ACCEDAS

ACCEDAS *ad Curiam*; a Writ made out of the Chancery, and Returnable in the King's Bench or Common Pleas, and directed to the Sheriff, requiring him to go to the Court of some Lord, or Franchise, (where a Plaint is sued for taking of Cattle as a Distress, or any false Judgment supposed to be made in any Suit in such a Court, which is not a Court of Record) and there make a Record of the said Suit, in presence of the Suitors of the said Court, and also of four other Knights of the same County; and to certify it unto the King's Court, at the Day limited in the Writ.

ACCEDAS *ad Vice Comitum*, is a Writ directed to the Coroner, requiring him to deliver a Writ to the Sheriff, who having a Pone delivered to him, suppresses it.

ACCELERATION of the Descent of heavy Bodies was first discovered by *Galileus*: And if due Attention be given to our excellent *Sir Isaac Newton's* Second Law of Motion, *Axiom*, or Law of Nature, as it may be called, *viz.* That the Mutation of Motion is always proportionable to the Force impressed, and always is according to that same Line of Direction, the Reason of the Acceleration of the Descent of heavy Bodies, will be very clear and intelligible.

For, supposing Gravity (whatever it be) to act uniformly on all Bodies, at equal Distances from the Earth's Centre, and that the Time in which any heavy Body falls to the Earth, be divided into equal Parts infinitely small: Let Gravity encline the Body towards the Earth's Centre, while it moves in the first infinitely small Part of the Time of its Descent: If after this, the Action of Gravity be supposed to cease, the Body would go towards the Earth's Centre equally, with a Velocity equal to the Force of that first Impression, (by *Sir Isaac's* first Axiom.) But now since the Action of Gravity still continues; in the second Moment of Time the Body will receive a new Impulse downward, and then its Velocity will be double of what it was in the first Moment: In the third Moment or Particle of Time, it will be Triple; in the fourth Quadruple, and so on continually. Wherefore since those Particles of Time are supposed infinitely small, and all equal to one another, the Impetus acquired by the Falling Body, will be every where as the Times from the Beginning of the Descent. And since the Quantity of Matter in the Body given, continues the same, the Velocity will be as the Time in which it is acquired (as you will find proved in the *Laws of Motion*.)

And after the same manner may it be proved, That the Motion of Ascending Projectives shall be equally retarded; for since the Force of Gravity acts continually and equally against the Motion first begun, it must diminish or abate the Motion, according to the Time of the Ascent, till at last it wholly ceases.

Let the Right Line ab express the Time of any heavy Body's Descent, and let bc at right Angles to it, denote the Velocity acquired at the end of the Fall. Draw ac , and any where the two Parallels fg , de , so they shall express the Velocities acquired in the Times of De-

scend af and ad . For because of similar Triangles, $ab, ad :: bc, de ::$ and as $ad, af :: de, fg$ wherefore 'tis plain, the Velocities are as the Times of Descent; that is, as the Lines or Elements of the Triangle abc , drawn parallel to the Base bc .

The Consideration of the annexed Figure will teach us, That if an heavy Body be thus uniformly accelerated in its descent; the Space which it describes from the beginning of the Time of its Motion, shall be just the half of that which it would have described, had it gone on for the same Time with a Velocity equal to what it had acquired in the end of its fall.

Let (as before) AC represent the Time of the Descent, DC the Velocity at last acquired; and compleat the Triangle ACD . Let also the Time AC be distinguished into an indefinite Number of small Parts, as ef, fg, gh, hi , &c. and draw the Parallels ek, fl, gm, hn, io , &c. to the Base CD . Then will ek be as the Velocity of the heavy Body, in the infinitely small part of Time ef , and fl will be the Velocity in the small Time fg , &c.

But now 'tis proved in the Laws of Motion, (see that Word) That the Space or Length described by any moving Body, in any given Time, and with a given Celerity; is as the Rectangle under the Time and the Celerity, wherefore the Space described in the Time ef , with the Celerity ek , will be as the Rectangle fke ; and the Space described in the Time fg , with the Celerity gm , will be as the Rectangle gl , &c. wherefore the Space run thro' in the Sum of all these Times, will be as the Sum of all the Triangles; that is, as the Triangle ACD , which contains them all. Again, the Space run thro' by the descending Body in the Time, AC , with the uniform Celerity DC (by the 7th Article of *Mr. Keil's Laws of Motion* above referred to) will be as the Rectangle $ABCD$. Wherefore the Space run over by the descending Body in the given time, and uniformly Accelerated) is to the Space described by the same Body, in the same Time with a uniform Celerity equal to what it at last acquires :: as the Triangle ADC is to the Rectangle $ABCD$. But the Triangle is one half of the Rectangle; wherefore the Space described by the Accelerated descending Body from the beginning to the end of its Motion, in a given Time, is just the half of the Space which would be described by the same Body if it had gone on, for the same Time, with a Velocity equal to what it had acquired in the end of its Fall. *Q. E. D.*

From whence it will follow, 1. That the Space run over with the Velocity CD in half the Time AC , will be equal to the Space described by the falling Accelerated Body, in the whole Time AC .

2. As the Triangle ACD represents the Space passed thro' in the Time AC , so the Triangle Aio , will represent the Space described by the falling Body in the Time Ai ; and the Triangle Aek , will represent that described in the Time Ae , &c. Wherefore

5. 'Tis plain, the Spaces describ'd, or the Distances run thro' in the Fall, will always be as the Squares of the Times: For the similar Triangles *ACD*, *Aio*, *Aek*, &c. are to one another as the Squares of their Homologous Sides *Ac*, *Ai*, *Ae*.

4. Wherefore if a heavy Body descending from its Place of Rest, describe any Length in a given Time, in twice that Time it will describe four times the Length; in thrice the Time, nine times the Length, &c. Or, in other Words, if the Times are considered in Arithmetical Proportionals, 1, 2, 3, 4, 5, &c. the Spaces described will be 1, 4, 9, 16, 25, &c.

5. Since the Space in the first part of Time is 1, in the second four, in the third 9, &c. if you consider the Space run through in the second Part of Time separately, it will be as 3; and if from 9, the Space described in the third part of Time, you take 4, the Space before described in the 2d Moment, there will remain 5, &c. wherefore supposing the Moments or Parts of Time equal, the Spaces described by the Descent of an heavy Body beginning from Rest, in each Moment considered separately, will be as the natural odd Numbers, 1, 3, 5, 7, 9, 11, 13, 15, 17, &c.

6. And since the Velocities acquired in falling, are as the Times; the Spaces run through will be also as the Squares of the Velocities; and both Times and Velocities will be in subduplicate Ratio of the Spaces described by any falling Body.

ACCELERATORES Urinae, are a pair of Muscles belonging to the *Penis*, whose use is to expedite the Urine and the *Genitura*: Our accurate Mr. Cowper saith, Authors have been mistaken in assigning the Origination of these Muscles, either to the *Sphincter Ani*, or to the Tubercles of the *Ossa Ischia*; for they arise Fleshly from the superior Part of the *Urethra*, as it passes under the *Ossa Pubis*, encompassing the external Part of the Bulb of its cavernous Body; both these Muscles meet on the inferior Part, and march on according to the Length of the Skin in the *Perineum*, when parting from each other, they ascend to their Insertions on each side the *Corpora Cavernosa Penis*. He thinks also, that they assist the *Erectores Penis*, by driving the Blood contained in the Bulb of the Cavernous Body of the *Urethra* towards the Glands in a greater Quantity, whereby it becomes distended: The Veins which carry off the Refluent Blood from the *Corpus Cavernosum Urethrae*, being at that time compress'd by the swelling of these Muscles.

ACCENSION, is the enkindling or setting any Body on Fire.

ACCENT in Grammar, is a Mark placed over a Syllable, to shew 'tis pronounced with a stronger or weaker Voice. The Greeks, who were the greatest observer of Accents, distinguish them into the *Acute* one mark'd thus, (´), the *Grave* one thus, (`), and the *Circumflex* thus, (ˆ). But of late one *Hennin*, a Dutchman, hath written a Book to prove the Accents were not ancient among the Greeks, and that that Language ought not to be pronounced according to them: He pretends no Accents are to be found in any MSS. above 800 Years old, and takes them to be an Invention of the *Arabs* about the time of *Mahomet's* Death. He says, the *Masforetes* of *Tiberius* brought them into the Bible about the Sixth Century, and that they were per-

fected by *Rabbi Judah Ben David Ching*, born in *Fer*, about the Eleventh Century.

ACCENTS, in Grammar, shew how to judge of the Measure of Time, in which each Letter, Syllable, Word, or Expression is pronounced; the Elevations and Depressions of the Voice, the Silence or Repose of the Voice at the End of Words or Sentences, &c. These Accents may be very numerous: There are in the Hebrew Grammars more than thirty of them, and *Servius Honoratus* reckons eight in the Latin.

The *Acute Accent* shews when the Voice is to be raised, and is expressed thus (´).

The *Grave Accent* shews when the Voice is to be depressed, and is figured thus, (`).

The *Circumflex Accent* is compos'd of both the *Acute* and the *Grave*, and is expressed thus, (ˆ).

The *Long Accent* shews that the Voice is to stop upon the Vowel that has that Mark, and it is expressed thus, (ˉ).

The *Short Accent* shews that the time of Pronunciation ought to be short, and is marked thus, (˘).

Hyphen, is an Accent in Grammar, that implies two Words are to be joyned, as *male-fans*.

Diastole, is an Accent in Grammar, which shews that those Words or Sentences to which it is adjoyned are to be separated, its Mark is (,).

Apostrophe, is an Accent in Grammar, shewing there is a Vowel to be rejected, and is expressed thus, (') and placed over the Head of the Letter.

ACCENT in Music, is a Modulation of the Voice, to express the Passions either Naturally or Artificially.

ACCEPTANCE, in Law, is an agreeing to some Act already done, which without such Agreement, might have been undone or avoided; as if a Man and his Wife seized of Land in Right of his Wife, do joyn and make a Lease by Deed, reserving Rent, and the Husband dying, the Wife accepts or receives the Rent: By this *Acceptance* in her, the Lease is made good, and shall bar her from bringing a *Cui in vita*.

ACCEPTILATION, in Civil-Law, is the same with *Acquittance* in Common-Law, being a Verbal Discharge from the Creditor to the Debtor.

ACCESS or *Accession*, the Fit or *Paroxysm* of a Disease.

ACCESSIBLE Height, is either that which may be mechanically measured by the Application of a Measure to it, or else an Height whose Base and Foot can be approached to; and from thence a Length measured on the Ground.

ACCESSORIUS Willisii, is a Nerve which arises from the *Medulla Spinalis*, about the beginning of the sixth Pair of the Neck; as it ascends to the Head, it receives on each side a Twig from the first five Pair of Nerves of the Neck; as they rise from the *Medulla Spinalis*; then it enters the Skull, and passes out of it again with the *Par Vagum*, and is wholly spent upon the *Musculus Trapezinus*.

ACCESSORY, in the Common-Law, is a Person advising or procuring before the Fact, or aiding and assisting, receiving or protecting after it, one that hath committed Felony; who therefore shall have Judgment of Life and Member, as well as the Principal which did the Felony, but not till the Principal be first attainted, convict, or outlawed thereupon. A Man also may be Accessory to an Accessory, by aiding, receiving, &c. an Accessory to Felony. In the Statute-Law 'tis such an

as abetts, advifes, aids or receives one that commits Felony, which is made fo by Statute.

ACCIDENT: This Word is ufed by Logicians in three Senfes.

1. In Oppofition to the *Effence* of any Thing, whatever doth not effentially belong to it may (tho' a Subftance it felf) yet be an *Accident* or Adjunct to that Thing, or belong to it only accidentally, as the Cloths a Man hath on; the Money in his Purfe, &c. Thefe indeed are more properly called *Adjuncts*; and by the School-men are diftinguifhed by the Name of *Verbal Accidents*.

2. In Contradiftinction to the *Effential Properties* of any Subject, many Qualities are called *Accidents*; becaufe they are there not *Effentially* but *Accidentally*. This in the Schools is called *Accidens Pradicabilis*, and implies a *Common Quality*, which may or may not be in any Subject, as any particular Colour, &c.

3. In Oppofition to *Subftance*, a Thing is called an Accident, when it is its Effence or Nature to *Inhere* or fubfift in fome Subftance, and cannot be alone: And thus it is with all Qualities whatfoever. This is called *Accidens Pradicamentale*, and the nine laft *Pradicaments* are in this Senfe Accidents.

In reference to its *Caufe* alfo, or at leaft as to our Knowledge of it, a Thing is frequently filed an *Accident*, by which we mean an Effect either caufally produced, or which to us appears to have been fo.

ACCIDENTS (in Heraldry) are the *Points* and *Abatements* in an Efcutcheon; which fee.

ACCIDENTAL Point, in Perfpective is a Point in the *Horizontal Line*, where Lines parallel among themfelves, tho' not perpendicular to the Picture, do meet.

ACCLIVITY, is a Steepnefs reckoned upwards on a Slope Line, as *Declivity* is a steepnefs downwards. Thus *B A* is an *Acclivity*; *A B* a *Declivity*.

ACCOMODATE, fignifies amongst Geometers, to fit in a Line or Figure into a Circle, &c. fo as the Conditions of the Propofition or Problem require. See *Apply*.

ACCOMPT, a Writ in Law fo called, lying againft a Bailiff or Receiver, who will not give up his Accounts, or come to an Account for what he hath received. If the Auditors affigned him, find that he is in Arrears, they have Power by the Statutes of *Wefm.* 2. C. 10. to award him to Prifon till he have made Satisfaction: But if they won't allow him reasonable Charges, or if they charge him with more than he hath received, any Friend of his may fue out a Writ *Ex Parte Talis*, from the Chancery, directed to the Sheriff, to take out four Main-Pernors, to bring his Body before the Barons of the Exchequer on a certain Day, and to warn his Lord or Mafter to appear there at the fame time.

ACCORD, in Law, is an Agreement or Contract from one Man to another, to give him Satisfaction for fome Trefpafs or Damage done, which when executed and Performed, is a good Bar in Law againft an Action of Trefpafs for that Damage or Offence.

ACCRETION; nearly of the fame Senfe with *Augmentation*, and is properly an Addition of Matter to any Body externally: This is ufually faid of the encrease of Bodies without Life, and is fometimes called *Appofition* or *Juxta Pofition*. But fome will have the encrease of Living Bodies to be by *Introfumption* and *Affimilation* of the *Alimentary* or nourifhing Particles.

Dr. *Havers* in his *Ofteologia* gives this Account of *Accretion*, that the Nutritious Particles being feparated by the Glandules placed every where on the fides of the Arteries, are carried into thofe fmall Nervous Pipes, or Interftices of the Fibres where the Spirits move, fo that they fall in the way of the Spirit's Motion: Thefe Spirits he fuppofes to have a twofold Motion; one direct, the other *Rotatory* or turning round their *Axes*. While an Animal is capable of *Accretion*, and the Particles of which the folid Parts confift are not entirely united at their Extremities, but are capable of receding one from another, both end-ways and laterally; the Spirits act upon the Nutritious Particles (which are of a Vifcous Nature) by their *Rotary Motion*, by which they carry them to the fides of the Fibres and Bony Strings, driving fome againft the fides of their Parts, and forcing them out laterally: Others they drive into the Interftices between the Extremities, thereby lengthning every Series of them; where they are placed and fix'd, and thus the Parts of an Animal Body increafe both in Thicknefs and Longitude. But after the Particles are united at their Extremities, and no longer capable of making Room to lode the Nutritious Parts out of the way of the Spirits direct Motion; then the Spirits come to act upon the Nutritious Matter by that Motion, and to drive it fo through the Nervous Channels, that it has not the liberty of ftopping and adhering; and fo the *Accretion* of the Animal ceafes.

ACETABULUM, is that Cavity in the Huckle Bone which is appointed to receive the Head of the Thigh Bone within it: Alfo certain Glandules in the Chorion are call'd *Acetabula*, concerning which (fee *Coryledones*.)

ACERB, is a Tafte between Sowre and Bitter, fuch as moft Fruits have before they are ripe.

ACETUM Radicatum, is the sharpeft part of Vinegar, when the Phlegm is drawn off.

ACETUM Philofophorum; fo fome Chymifts call that four Liquor which is made by difolving a little Butter or Icy Oyl of Antimony in a confiderable Quantity of Water.

ACETUM Alcalifatum, is diftill'd Vinegar faturated with fome Alkalizate Salt.

ACHAMECH, with fome Chymifts fignifies the Drofs of Silver.

ACHERNER, a bright fixed Star of the firft Magnitude, in *Eridanus*, whose Longitude is 10. 31. of ♋, Latitude 59. 18.

ACHOLITE or *Acolite*, an inferior Church Servant, who, next under the Sub-Deacon, followed or waited on the Priests and Deacons, and performing the meaner Offices of lighting the Candles, and carrying the Bread and Wine, and paying other fervile Attendance.

ACHOR, is a fort of a crufted Scab which makes an Itching and Stink on the Surface of the Head, and is occafioned by a Serous, Salt and Sharp Matter: The difference betwixt an *Achor* and *Favus* confifts in this, that in *Achors* the Holes or Cavities are fmall, and fometimes not vifible; but

but in a *Favus* they are more large and conspicuous.

ACHLYS, according to some, is a kind of Darkeness in the Eyes, accounted one of the Species of *Amblyopia*, or Dimness of Sight.

ACHRONICAL, is used in Astronomy for the Rising of a Star when the Sun sets; or the Setting of a Star when the Sun rises; in which Cases the Star is said either to rise or set Achronically; which is one of the three *Poetical Risings or Settings*.

ACIDITY, is the Taſt which Bodies that are *Acid* or Sharp affect the Mouth with: And those Bodies are called

ACIDS, whose Particles are supposed to be longish, flexible, penetrating, and attenuating; and which have their Points sharp and piercing. And these are either *Natural Acids*; which have a proper Acidity of their own, without the help of Art, as Juice of Limons, &c. or else *Artificial Acids*; which are made by Fire in Chymical Operations. So that *Acid Spirits* or *Seygian Liquors*, as the Chymists call them, from their Powers to destroy or dissolve Bodies, seem to be nothing but an *Acid Salt* dissolved, and put into a violent Motion by the Fire: These are called *Acid Menstruums*. You may easily know whether any Liquor contain in it any *Acid Salt* or not, by dropping some of it on a little Syrup of Violets spread on white Paper; or in a Solution of Blue-bottle Flowers, &c. for then the Blue will be immediately turned into a Red or reddish purple Colour; whereas if it turn Green, 'tis a sign the Liquors abounds with Salts of an Urinous or Lixivate Nature; which how to distinguish, see those Words. The Acidity of any Liquor may also be concluded by its being able to destroy the Blueness of a Tincture of *Lignum Nephriticum*: (See Colours, and the ways of producing sudden Changes of them.)

ACIDULE, any Medicinal Waters that are not hot, like those at the Bath, which are called *Therma*.

ACINUS, in Botanicks, doth not signify a Grape-stone, but the Fruit it self of all such Plants which bear it, in a manner resembling Grapes: It is softer and more juicy than a Berry, and therefore distinguishable from it; as it is also because the *Acini* grow in Bunches or Clusters, and Berries often single.

ACINIFORMIS Tunica, is the same with the *Uvea Tunica* of the Eye.

ACMASTICK Fever, with some, is the same as *Synochus*.

ACME, in general, signifies the Height or Top of any thing; the Word is more especially used to denote the Height of a Distemper, many of which have four Periods. 1. The *Arche* or beginning. 2. The *Anabasis*, or Growth and Increase. 3. The *Acme*, when the Morbifick Matter is at the Height. 4. The *Paracme*, or the Declension of the Distemper.

ACOLITE, see *Acholite*.

ACONTIAS, a sort of Comets, shaped like a Dart or Javelin. Its Head is sometimes round, and sometimes oblong or compressed; and its Tail or Train is slender, but extended to a great Length.

ACOPUM, according to some Writers, is a Fomentation of warm and emollient things, to allay the Sense of Weariness, occasioned by too violent Labour or Exercise.

ACOSMY, is an ill state of Health accompanied with the Loss of the natural florid Colour of the Face.

ACOUSTICKS, are Medicines or Instruments which help the Hearing; as to the latter of which, the use of *Orocoastick Trumpets* is now very common; and no question Instruments of this kind are capable of Improvement. Dr. Hook in his Preface to his *Micrography*, saith, 'tis not impossible to hear a Whisper at a Furlong or $\frac{1}{4}$ th part of a Mile's distance: That he knows a way by which 'tis easy to hear any one speak thro' a Wall of a Yard thick: And that by help of a distended Wire, the Sound may be propagated to a very considerable Distance almost in an Instant.

ACQUIETANDIS Plegis, is a *Justicies*, that lies for a Surety against a Creditor, that refuseth to acquit him after the Debt is paid.

ACQUIETANTIA de Shiris & Hundredis, to be free from Suit and Service in Shires and Hundreds.

ACQUITTALE, in Law, signifies the Discharge of a Tenant from any Entries or Molestations, for any manner of Service issuing out of the Land to any Lord; that is, above the Mife. It signifies also, when two are indicted of Felony, the one as Principal, the other as Accessary; the Principal being discharged, the Accessary by consequence is also acquitted.

ACQUITTANCE, signifieth a Release or Discharge in writing of a Sum of Money, or other Dury, which ought to be paid or done.

ACRASY, is the Excess or Predominancy of one Quality above another, in the Constitution of a human Body.

ACRE of Land; its Quantity is four Square Roods; or 160 square Poles; or 4840 square Yards; or 43560 square Feet. By a Statute of 31 of *Eliz.* 'tis ordained, That if any Man erect a new Cottage, he shall add 4 Acres of Land to it.

ACRIMONIOUS Bodies, are those (in the General) whose Particles do eat, fret, destroy and dissolve what comes in their way, or which have a great *Acrimony*.

ACRISY, is such a State or Condition of a Disease, that no right Judgment can be made of the Patient whether he will recover or not.

ACROMION, is the upper Process of the Shoulder-Blade, or the top of the Shoulder, where the Neck-Bones are joined with the Shoulder-Blades.

ACROMPHALUM, is the Middle of the Navel.

ACRONICAL, see *Achronical*.

ACRONYCHAL, is the same with *Achronical*, which see.

ACROS, with some Writers is the Height of a Disease; and with some Anatomists, the Tops, or Prominences of Bones, &c.

ACROSPIRE, the same with *Plume*, which see.

ACROSTICKS; are a certain Number of Verses, whose initial Letters make up some Person's Name, Title, or some particular Motto.

ACROTHERIA or *Avoters*, signify in Architecture those sharp Pinacles and spiry Battlements, which stand in Ranges about flat Buildings, with Rails and Balusters: They signify also a sort of *Pedestal* to support Statues.

ACTINOBOLISM, is the same with the Diffusion or Diradiation of Light or Sound, by which its carried or flows every way from its Centre.

ACTION.

ACTION of a *Writ*, is a Phrase of Speech when one pleads some Matter, by which he shews, that the Plaintiff had no Cause to have the Writ which he brought; and yet it may be that he may have another *Writ* or *Action* for the same Matter.

ACTION upon the *Case*, is a *Writ* brought against one for an Offence done without Force, as for not performing Promise made by the Defendant to the Plaintiff, or for speaking of Words whereby the Plaintiff is defamed, or for other Misdemeanor or Deceit, &c.

ACTION *mix'd*; is when it is part *Real* and part *Personal*; and also is a Suit given by the Law to recover the thing demanded, and Damages for the Wrong done.

ACTION upon the *Statute*, is a *Writ* founded upon any Statute, whereby any Action is given to one in any Case whereby no Action was before.

ACTIONS *Personal*, are Actions whereby a Man claims Debt, or other Goods or Chattels, or Damage for them, or for Wrong done to his Person.

ACTION *Popular*, is an Action upon the Breach of some Penal Statute, which any Man that will may sue for himself and the King, by Information or otherwise.

ACTIONS *Real*, are Actions whereby the Plaintiff claims Title to Lands, Tenements, Rents or Commons, in Fee, or for Term of Life.

ACTIVE PRINCIPLES, according to the Chymists, are the Spirit, Oyl and Salt, because their Parts being briskly in Motion do cause Action in other Bodies.

ACTUARY, the Clerk that Registers the Acts and Constitutions of a Convocation.

ACUTE ANGLES: See *Angles*.

ACUTE ANGLED Triangle: See *Triangle*.

ACUTE DISEASE, is that which is over in a little time, but not without eminent Danger to the Patient.

ACUTE ACCENT, in Grammar, shews when the Voice is to be raised, and is expressed thus, (').

ACUTE *Angular Section of a Cone*, was the Term that the ancient Geometers used for the *Ellipsis*; but *Apollonius Pergæus* first demonstrated, that the Section of any Cone thro' both it Sides, will produce the same Figure; whereas they consider'd it only in that Cone whose Section by the Exis is a Triangle acute angled at the Vertex.

ADARIGE, with some Chymists signifies *Sal Armoniack*.

ADDITAMENTS, Things added a-new to the ordinary Ingredients of any Composition; or to a *Menstruum*, to enable it the better to open, and dissolve any Body.

ADDITION, in general, is the putting of two Things or Quantities together; and that Quantity which arises or results from thence, is call'd the Sum or Aggregate of those Quantities.

ADDITION in *Algebra* or *Species*, is performed in general, by conjoyning the Quantities proposed, preserving their proper Signs. And the proper Mark or Sign of Addition is +, which is always supposed to belong to the Quantity which follows it.

Thus, if to $3a$ the Sum is $3a + 2a$ or $5a$, and you add $2a$ } $A + 2b$ when added to $c + bb$ makes $A + C + 2b + bb$

Addition in *Algebra* may easily be learnt by observing the following particular Rules.

1. When *Simple* and *Like* Integers, having *Like* Signs are to be added, collect the Numbers (or Coefficients) all into one Sum, and to that Sum an-

nex the Letters by which any of the Quantities was express'd; and lastly, prefix the proper Sign;

$$\begin{array}{r} \text{Thus, } -b \\ -2b \text{ and } +bcd \\ \text{make } -13b \quad +2bcd \\ \quad +4bcd \text{ and } -36de \\ \text{make } +7bcd \quad -4de \\ \quad \text{make } -40de. \end{array}$$

2. *Rule*. When two simple and like Quantities have equal Numbers prefix'd, and unlike Signs, the Sum is 0;

$$\begin{array}{r} \text{Thus, } +3a \text{ and } -bb \text{ and } -7dce \\ -3a \quad +bb \quad +7dce \\ \hline 00 \quad 00 \quad 00 \end{array}$$

N. B. The Reason of which is plain, if you consider that all Quantities having Negative Signs, are in Nature directly contrary to such as have Affirmative ones; and therefore will always destroy one another. Thus, if a Man have 10 Pounds in Cash, and run in Debt 13 l. that is, if to his Cash he add 10 l. (which is the proper way to express a Debt) there will remain nothing; for the Debt, or -10 l. will quite destroy the Cash, or +10 l. So also if a Man owe 10 l. and having nothing to pay it, then hath he a -10 l. or is 10 l. worse than nothing: And if any Person give him 10 l. or add a +10 l. to his -10 l. the Sum will be nothing, but however the Man will, tho' worth nothing, be 10 l. better than he was before.

So that 'tis a general Rule in *Algebra*, that to add - is the same as to take away +, and to take away - is the same thing as to add +, and to take away + is all one as to add -.

3. *Rule*. When two simple and like Quantities are given, having unlike Signs, and unequal Numbers prefix'd; subtract the lesser Number from the greater, and to the Remainder annex the Letters due, prefixing the Sign that belongs to the greater Quantity,

$$\begin{array}{r} \text{Thus, } +3a \text{ and } -8b \\ -a \quad +2b \\ \hline +2a \quad -6b \end{array}$$

The Reason of which is clear from what was said in the last Rule.

4. *Rule*. When three or more simple and like Quantities have unlike Signs, collect the Affirmative Quantities into one Sum, the Negative into another, then (by the 3d Rule) add these together, and the last Sum is the Sum sought;

$$\begin{array}{r} \text{Thus, } -7a \quad -10a \\ -3a \\ +5a \quad +14a \\ +9a \\ \hline +4a \text{ Sum.} \end{array}$$

5. *Rule*. When two or more simple and unlike Quantities are proposed, write them down one after another without altering their Signs;

$$\begin{array}{r} \text{Thus, } +3a \\ -3b \\ \hline +3a + 4b \end{array}$$

From the due Apprehension of, and mature Consideration on which Rules, the Addition of Compound Quantities may be easily perform'd;

$$\begin{array}{r} \text{Thus, } +3ee+7bb \\ \quad \quad \quad -ee-2bb \\ \quad \quad \quad +ff+3ff \\ \hline \text{Sum } 3ee+7bb-ee-2bb+ff+3ff \\ \hline \text{Contracted } +2ee+5bb+4ff \end{array}$$

ADDITION of *Indexes* is performed after the same manner with that of Algebraical Quantities.

Thus, to 3 add 3, the Sum is 6, where both are the *Indexes* of Integer Numbers: But to 3 add $\frac{1}{2}$ the Sum will be 1: To $\frac{1}{3}$ add 3, the Sum will be $\frac{1}{3}$, &c.

ADDITION of *Integers*, in Common Arithmetic, is performed by this single Rule:

Set the Numbers orderly one under another, *i.e.* Units under Units, Tens under Tens, Hundreds under Hundreds, &c.

Then collect each Column singly into one Sum, beginning at the Right Hand, at the place of Units; and if the Units in that Row are less than 10, set them down under the Line, but if they are more than 10, set down only the Overplus, and carry the Tens to the next Row, in which set down (under the Line) the odd Tens, and carry the Hundreds to the third Column, &c. as you will see in the following Examples.

16	34	756	5789	93256
72	68	382	3452	13700
		568	7898	78250
88	102		3257	97662
		1706		15628
			20396	
			297496	

But if the Numbers be of different, or of several Denominations, then they must be added by summing up each Denomination by it self, and seeing how many of them will make one of the next Denomination; and bearing so many Units forwards as those will come to.

Thus, suppose the following Pounds, Shillings and Pence were to be collected into one Sum.

l.	s.	d.	
135	17	08	say 9 and 2 are 11, and 8 makes
95	11	02	19, which because it is 7 above
3	05	09	12, or a Shilling, I set down
234	14	07	the odd Seven Pence, and carry

one Shilling to the next Rank. Say 1 that I carry and 5 is 6, and one is 7, and 7 is 14; I set down 4, and I find I have in all 3 Tens, therefore I set down one Ten on the Left Hand of the 4, and carry one Pound to the Column of Pounds; where I proceed, just as in Addition of *Integers*, and find the whole Sum to be 234*l.* 14*s.* 07*d.*

ADDITION of *Logarithms*: See *Logarithms*, N^o 3.

ADDITION of *Vulgar Fractions*: See *Vulgar Fractions*.

ADDITION of *Decimal Fractions*: See *Decimal Fractions*.

ADDITION in *Law*, is that which is given to a Man besides his proper Name and Surname, to shew of what Estate, Degree or Mystery he is, the place of his Birth or Habitation.

ADDUCENT MUSCLES, are those that bring forward, close, or draw together the Parts of the Body whereunto they are annexed.

ADDUCTORES, the same with *Adducent Muscles*.

ADDUCTOR OCULI, is a Muscle of the Eye, so call'd, because it inclines its *Pupil* towards the

Nose; and also *Bibitorius*, it directing the Eye towards the Cup in drinking.

ADDUCTOR POLLICIS, is a Muscle of the Thumb, which arises tendinous in common with the *Adductor Indicis*, and becoming fleshy, ascends obliquely to its broad Termination at the superior part of the first Bone of the Thumb. This brings the Thumb nearer the Fore-Finger.

ADDUCTOR POLLICIS PEDIS, is a Muscle of the Great-Toe, which ariseth partly tendinous and partly fleshy from the Inferior Parts of the *Os Cuneiforme Tertium*, and dilating its self to a fleshy Belly, marcheth obliquely in the bottom of the Foot, and becomes less and tendinous as its Insertion to the Internal Part of the *Offa Sessamoidea* of the Great-Toe, laterally opposite to the Termination of the *Adductor Pollicis Pedis*. This brings the Great-Toe nearer the rest.

ADEN, is the Term for a Glandule in an Animal Body, which is either *Conglobated*, as the Glands of the *Mesentary*, &c. With some also 'tis used for a Tumour in the Groin, the same with *Bubo*.

ADEPS or Pinguedo, *Fat*, is a similiar Part of the Body: But *Adeps* and *Pinguedo* differ in this, that *Adeps* is a thicker, harder, and more earthy Substance than *Pinguedo*; the *Fat* which is particularly meant by *Adeps* flows from the Blood thro' peculiar Vessels into Bags or Bladders appropriate thereunto, as is plain from the Observation of *Malpighius*.

ADEPTISTS, or *Adepts*, are such Alchymists as pretend to have gain'd the Secret of the *Transmutation* of Metals, or to make the *Philosopher's Stone*: Of these Mystical Invisible Gentlemen (they say) there are 12 always in being; which are kept supply'd by new ones when any of the Fraternity pleaseth to die, or to translate himself to some place where he can make use of his Gold, for in this wicked World it will not procure them Shirts.

ADEQUATE; a thing is said to be adequate to, or adequately to agree with another, when 'tis every way equal to it in Extent, Capacity, Power, &c. and all other Properties; and neither exceeds it, nor falls short of it in any respect. And thus when the Notions or Ideas that we have of any thing, take in all the Properties of that thing, and that we omit conceiving nothing which belongs to it, we then say we have *Adequate Ideas* of such things.

ADEQUATE IDEAS, are those Ideas which perfectly represent the Archetypes or Images which the Mind supposes them to be taken from; which it intends them to stand for, and to which it refers them.

ADJACENT or Contiguous Angles, see *Angles*.

ADIAPHORUS, or *Neural*, *i.e.* indifferent; So Mr. Boyle calls a kind of Spirit which he distilled from Tartar and some other Vegetable Bodies; which was neither *Acid*, *Vinous*, nor *Urinous*. 'Tis made thus; First, Shavings of Box, Guajacum, or any other ponderous Wood are distilled *per se* in a Retort; and then the fowrth Liquor is rectified to free it from the Phlegm: After this a Quantity of Powder of Coral, &c. was thrown into the fowr Spirit, which it readily dissolved; and the Acid Parts of the Menstruum did so associate themselves with the Coral, as to leave a part of Liquor that was by no means of an Acid Nature, but which when gently drawn off the Coral, was of a strong Snell, yet without any Acidity, and in many respects of a different Nature from almost any other common Spirit.

AD-

ADJECTIVES (in Grammar) are such Words as describe the manner only of the Being of a thing, and have no natural subsistence of their own, but do subsist by *Noun Substantives*, to which they are joyned.

AD INQUIRENDUM, a Writ in Law commanding an Enquiry to be made (for the better Execution of Justice) about the Merits of a Cause depending in the King's Court.

ADJOINING ANGLES, in Geometry: See *Angles*, or *Contiguous*.

ADJOURNMENT, is the putting off of any Court or Meeting, and appointing it to be kept at another Place or Time.

ADIPOSA MEMBRANA, is the Basis of the *Cellule Adiposæ*, is double, and may be divided into two Parts; the one is External throughout which there are a number of little Cells, full of Fat; the other is Internal, which Anatomists have mistaken for the *Membrana Carnosa*, because it has a greater Number of Blood Vessels.

ADIPOSA VENA, or *Renalis*, a Vein arising from the descending Trunk of the *Cava*; which spreads its self on the Coat, and Fat, that covers the Kidneys.

ADIPOSI DUCTUS, call'd also *Sacculi*, *Vesicule Adiposæ* or *Lobuli*, are Vessels which convey the Adeps or Fat into the Interstices of the Muscles, or to the Parts between the Flesh and the Skin.

ADIT, is the *Shaft*, or Entrance into any Mine.

ADJUDGE, when a determinate Sentence is pass'd in the behalf of another, the Case is said to be Adjudged for him.

ADJUNCT: Whatever comes to any Being from without, is called an *Adjunct* to that Being; as being not naturally and essentially belonging to it, but adjoyned or superadded to it.

AD JURA REGIS, is a Writ that lies for the King's Clerk against him that sought to eject him, to the Prejudice of the King's Title in Right of his Crown.

ADJUTANT, an Officer in the Army, the same with an *Aide-Major*, which see.

ADMEASUREMENT of Dower, is a Writ that lies where a Woman is endowed by an Infant, or by a Guardian, of more than she ought to have.

ADMEASUREMENT of Pasture, is a Writ that lies against such, as having Common of Pasture appendant to their Free-holds, do surcharge it with more Cattle than they ought to do.

ADMINISTRATION, (in Law) is the disposing of a Man's Goods or Estate that died intestate, or without any *Will*, with an Intent to give an Account thereof.

ADMINISTRATOR, he that has the Goods of a Man dying intestate, committed to his Charge by the Ordinary, and is accountable for the same. If the Person be a Woman, she is called an *Administratrix*.

ADMITTENDO CLERICO, is a Writ granted to him that hath recovered his Right of Presentation against the Bishop, in the *Common Bench*.

ADMITTENDO in Socium, is a Writ for the Association of certain Persons to Justices of Assize before appointed.

ADNATA TUNICA, is the common Membrane of the Eye, called *Conjunctive*, it springs from the Skull, grows to the Exterior Part of the *Tunica Cornea*; and that the visible Species may pass there, leaves a round Cavity forward, to

which is annexed another Tunic, without any particular Name, made up of the Tendons of those Muscles which move the Eye; by reason of its Whiteness, 'tis called *Albuginea*.

AD OCTO, among some of the Antient Philosophers, is a Term signifying the Highest or Superlative Degree; because they reckoned no Degree above the Eighth, in their way of distinguishing of Qualities.

ADONICK, a sort of a short Verse, consisting of a *Dactyle* and a *Spondee*; as *Rara juvenis*; 'tis usually placed at the end of each Stanza of Sapphick Verses. So called from *Adonis*, in whose Praise they were first made.

AD QUOD DAMNUM, is a Writ which ought to be sued before the King grant certain Liberties, as a Fair, Market, &c. to the Prejudice of others.

There is also another Writ of *Ad quod Damnum*, if any one will turn a Common High-way, and lay out another as beneficial.

ADAMIRE: See *Arraign*.

AD TERMINUM qui præterit, is a Writ of Entry that lies where a Man having leased Lands or Tenements for Life or Years, and after the Term expired, is held from them by the Tenant, or other Stranger that occupieth the same, and de facto the Lessor: In such Case this Writ lieth for the Lessor and his Heirs.

ADVANCE DITCH, in Fortification, is a Ditch dug all along the *Glacis* beyond the *Counter-scarp*, and usually filled with Water.

ADVANCE GUARD, is the first Line or Division of an Army, ranged or marching in Battarray; or that Part which is next to the Enemy, or which marches first towards them. The whole Body of an Army consists of the *Advance Guard*, the *Arriere Guard*, and the *Main Body*.

Sometime also a Party of 15 or 20 Horse commanded by a Lieutenant beyond, but within sight of the *Main Guard*, is called an *Advance Guard*, and is designed for the greater Security of the Camp.

ADVENT, in the Sacred Calender, is the Time from the *Sunday* that falls either upon St. Andrew's Day, or next to it, till *Christmas*; which Time was wont anciently to be spent in a pious Preparation for the Advent, or coming on of the Feast of our Saviour's Nativity.

ADVENTITIA BONA, were anciently such as came to a Man unexpectedly *Windfalls*, as we call them now: Hence the Word *Adventitious* comes to be used by Philosophick Writers, and to signify such Matter as doth not properly belong to any mix'd Body, but comes to it from some other Place. Thus, 'tis a Question, whether in the Freezing of Water, there do not enter in some *Frigorifick Particles*, which are *Adventitious* to the Water, from the Air, or Freezing Mixture.

AD VENTREM INSPICIENDUM, is a Writ mentioned in the Statute of *Essoignes*: See *Ventre Inspeciendo*.

ADVERB, in Grammar, is a Part of Speech undeclined, and without Conjugation; and is usually joyned with a Verb to express the manner of Action. They are distinguished into Adverbs of Time, Place, &c.

ADULTERATION of any Thing, such as Wine, Medicinal Drugs, Chymical Preparations, &c. is a mixing some baser Matter with it, which hinders it from being truly Good and Genuine in its kind.

ADVOCATES, in the Ecclesiastical Court, were either *Advocate* of the Causes and Interest of the Church, retain'd as a Counsellor and Pleader, to maintain the Properties and Rights: Or, *Advocate* or Patron of the Presentation and Advowson. Both these Offices did formerly belong to the same Founder of a Church or Covent, and his Heirs, who were bound to protect and defend the Church, as well as to nominate or present to it. But when the Patrons grew negligent, or were Men of no Interest or Ability in the Courts of Justice, then the Religious began to retain a *Law Advocate*, to sollicite and prosecute their Controversial Causes. See *Spelman*.

ADVOWSON, in our Common Law, signifies a Right to present a Benefice, and is as much as *Jus Patronatus* in the Canon Law; the Reason why 'tis termed Advowson (*Advocatio*) is, because anciently those who had a Right to present to a Church, were Maintainers of it, or great Benefactors to it: These were sometimes called *Patroni*, and sometimes *Advocati*. Now in the General, an Advowson is where a Bishop, Dean or Chapter, and their Successors, or any Lay Patron, have a Right to present whom they please, to any Spiritual Benefice, when it becomes void. *Advowson* is of two sorts; First, *Advowson in Gros*, that is, sole or principal, not belonging to any Mannor, as a Parcel of its Right: Secondly, *Advowson Appendant*, which depends upon a Mannor, as appurtenant to it; and this may be sold by it self, and then it is in *Gros*: And while it is dependant to the Mannor, 'tis by *Kitchen* called an *Incident*.

ADUST, burnt or parched; the Blood is said to be *Adust*, when by reason of extraordinary Heat, the thinner Parts are steem'd forth, and the thicker remain dreggy and black, as if they were burnt.

ÆGYLOPS, *Angilops* and *Ancylops*, is a Tumour or Swelling in the great Corner of the Eye by the Root of the Nose, either with or without an Inflammation.

ÆGYTIACUM, sc. *Unguentum*, in Pharmacy, is a kind of Deterfive Ointment, described by *Mesue*; and is so called from its black Colour, like the Hue of an Egyptian.

ÆNIGMA: See *Enigma*.

ÆOLIPILE, is a round hollow empty Ball made of Iron, Brass, Copper, &c. and furnished with a Neck, in which there is a very slender Pipe opening to the Ball. Sometimes the Neck is made to screw into the Ball, which is the best way, because then the Cavity may the more readily be filled with Water. But if there be no Screw, you must fill it with Water, thus; Heat the Ball red hot, and then throw it into a Vessel of Water; the Water will run in at the small Hole, and fill about $\frac{2}{3}$ of the Cavity. And if after this the *Æolipile* be laid on or before the Fire, so that the Water and Vessel become very much heated, the Vaporous Air will be forced out with very great Noise and Violence; but it will be by fits, and not with a constant and uniform Blast. Perhaps they may be sometimes of use to blow the Fire, where a very quick and strong Blast is required. And they may serve to scent or perfume a Room, by filling them with perfum'd instead of common Water.

ÆQUATOR: See *Equator*.

ÆQUILATERAL: See *Equilateral*.

ÆQUILIBRIUM, is when either equal Weights at equal Distances, or unequal ones at reciprocally proportionable Distances from the Centre, make the Arms of any Libra or Balance to hang even; so that they do Equiponderate and not out-weigh one another: In such a Case we say the Balance is in *Æquilibrio*.

ÆQUIVOCAL: See *Equivocal*.

ÆRA: *Lucilius* and some others say, that *Æra* did originally signify a Number stamp'd on Money to determine its current Value; and in this Sense it comes from *Æs* Brass, from the Plural of which *Æra*, came this feminine singular *Æra*; and that either because they put the Word *Æra* to each particular of an Account, as we now do *Item*: Or else because the Number of Years was anciently among the Romans mark'd down in Tables with little Brass Nails. In reference to which latter Custom, the Word *Æra* came to signify the same with *Epocha*, viz. a certain Time or Date from whence to begin the new Year; or some particular way of reckoning Time and Years. And in this Signification the Word is thought to rise from these Initial Letters, *A. E. R. A.* which, among the Spaniards, who began their *Æra* from the Reign of *Augustus*, stood for *Annus erat Regni Augusti*. The most eminent *Æra's* among Chronologers, are the *Æra* of the World's Creation, which, according to the Julian Account of Time, began in the Month of *October*, and on the 24th Day. Some place this 3950 Years before Christ's Birth, whom *Gassandus* saith, come nearest to Truth, and that this *Æra* is confirmed by the French Astronomers; others account 3983 Years before the Birth, of our Saviour, and with these *Petavius* joins. *Kepler* make them 3993; and there are some who will have it, that the true Number is 5199.

The Jewish *Æra* or Period, invented by *Hillel* about the Year of Christ 344. This is by no means Historical, but Artificial and Astronomical, and is suted to the Jews false Account of the New Moons, Feasts, Holydays, &c. and is of far later standing than the beginning of the World, tho' they use it as the Date of the Creation; it begins in *Autumn*.

The *Æra* from the Destruction of *Troy*, begins June 16. as *Scaliger* proves out of *Ephorus*: 'tis very common in Profane Authors.

The *Æra* of *Nabonassar*, begins the 26th of February (747 Years before Christ) but it varieth in 1461 Years thro' the whole 365 Days; for so many he accounts, neglecting the odd Hours, which makes a great Intercalation.

The *Æra* of the Olympicks begins from the New Moon in the Summer Solstice 777 Years before Christ, and the *Æra* of *Ipsitus* is only a Collection of the Olympick Years: These two are the *Æra's* chiefly used by Greek Historians.

The Roman *Æra*, from the building of the City, begins April 21. and is 752 Years before Christ.

The Christian *Æra* from the birth of Christ begins December 25.

The Turkish *Æra* or the *Hegira*, begins the 16th Day of July; they account it from *Mahomer's* Flight, A.D. 622.

The *Æra* of the Death of *Alexander the Great* is the 12th of November, 324 Years before Christ: See *Epocha*.

ÆSUSTUM, or calcin'd Copper is made by Stratifying Plates of Copper with Powder of Sulphur

phur in a Crucible, whose Cover or Lid hath a Hole in it to give the Vapours vent, while the Matter is calcining in a strong Fire, till no more Fumes will arise; the Plates must lie separated while hot. In this Stratification the first and last Beds or Layers must be of Sulphur.

ÆSCHYNOMENOUS PLANTS, the same as *Sensitive*, which see.

ÆSTIVAL SOLSTICE, or *Summer Solstice*: See *Solstice*.

ÆTATE PROBANDA, is a Writ of Office, and it lies for the Heir of the Tenant that held of the King in chief, to prove that he is of full Age, directed to the Sheriff to enquire of his Age; and then he shall become Tenant to the King by the same Services that his Ancestors made to the King.

ÆTHER: Dr. Hook *Microgr.* p. 13. calls the *Æther* that Medium or Fluid Body in which all other Bodies do as it were swim and move. But this seems to me to favour the *Cartesian Doctrine* of an Absolute *Plenum*, which, by many infallible Reasons and Experiments, is proved to be impossible. As therefore we call the Medium in which we breath and live, the Air, by which we understand an Elastic Fluid Body, either having its very large Interstices devoid of all Matter, or else filled in part with a Fluid, which is very easily moved out of them by Compression, and which readily returns into them again, when that Compression is taken off: So we agree to call that finer Fluid-Body, if it be a Body, which is extended round our Air and Atmosphere, above it and beyond it, up to the Planets, or to an indefinite Distance; this, I say, we call the *Æther*, tho' what we mean by that Word, we scarce well understand. For that there can be no Fluid whose Parts do resist the Motions of Bodies thro' them (as our Air doth) in the Planetary Regions, we are certain almost to a Demonstration; because the Motion of the Heavenly Bodies is by no means impeded or altered by any such Resistance, but they move as freely as if they were in an absolute Void. But that which is often meant by the Word *Æther* or *Æthereal Matter*, is a very fine thin Diaphanous Fluid, which some will have to surround the Earth up to as far as the Interstellar World, and which easily penetrates and runs thro' all things, and lets all things run as easily thro' it.

ÆTHIOPS MINERAL, is a Medicine usually made by incorporating well together equal Parts of running Mercury and Flower of Sulphur, and then deflagrating the Mixture.

But 'tis much the best way only to mix them well together in a Glass Mortar, and never to enkindle the Matter at all; the Mercury will perfectly disappear, and the Powder in a little time will turn black.

ÆTIOLOGY, signifies an Account of the Causes and Reasons of Diseases, and of their various Symptoms, in order to their Cure: Wherefore it is by some called *Parthology*.

AFFEERORS, a Term in Law, signifies such as are appointed in Court-leets, &c. upon Oath to mulct those who have committed any Fault which is arbitrarily punishable, and for which no express Penalty is prescribed by Statute.

To *Affere* an *Amercement*, is properly to lessen and mitigate the Rigour of it.

AFFIANCE (in Law) is the plighting of Troth between a Man and a Woman, upon an Agreement of Marriage to be had between them.

AFFIDAVIT, in Law, signifies an Oath: As to make *Affidavit*, is to testify a thing upon Oath.

AFFORCIAMENT, a Fortref or strong Hold, or other Fortification.

AFFOREST, (a Term in the *Forest Law*) signifies to lay waste a Piece of Ground, and turn it into *Forest*.

AFFRAY, or *Affraiment*, in the Common-Law, is an Affrightment put upon one or more Persons; and this may be wrought, they say, without a Word spoken or Blow given: As if a Man should shew himself in Armour, or furnished with Weapons not usually worn, it may strike a Fear into others that are unarmed; which therefore is a common Wrong, and is inquirable in a *Courts-leet*, wherein it differs from an *Affault*, which is always a *Particular Injury*.

AFFRETAMENTUM, the Freight of a Ship from the *French Fret*, which signifies the Tuns.

AFTER-SAILS, in a Ship: See *Sails*.

AGE PRIER (a Term in Common-Law) is when an Action is brought in against an Infant for Land which he hath by descent, for then he is to shew the Matter to the Court, and shall pray that the Action may be stay'd till his full Age of 21 Years, and so by Award of the Court, the Suit shall surcease.

AGENT and PATIENT (in Common-Law) is, when a Man is the Doer of a thing, and the Party to whom it is done; as where a Woman endows her self of the fairest Possession of her Husband.

AGGREGATE, is much the same as the *Sum*, arising from the Addition, Connexion or Collection of several things together.

AGGRESSES, or *Ogresses*, the same with *Pellets*. A Term in Heraldry: See *Balls*.

AGGRESSOR, is he that makes the first Assault, Attack, or that first begins any Quarrel, Encounter or Difference.

AGILD, in Law, signifies free from Penalty, not subject to the customary Fine or Imposition.

AGIST (a Term in Law) signifies to take in, and feed the Cattle of Strangers in the King's Forest, and to gather Money due for the same to the King's use. The Officers doing it are called,

AGISTERS; and their Office is called,

AGISTMENT.

AGITATION, in general, signifies Motion or Action; but 'tis mostly used in a Philosophical Sense for the brisk Intestine Motion of the small Corpuscles of any Natural Body. Thus Fire or Heat agitates the small Particles of all Bodies, and puts them into a rapid Motion.

AGNATION, in the Civil Law, is the Term for that Line of Consanguinity which is between Males descended from the same Father; as *Cognation* is the Line of Parentage between Males and Females, both descended from the same Father. The Use of both these Words is derived from the old *Roman Law*.

AGRICULTURE, is the Art of Tilling, Manuring, and Cultivating the Earth, in order to render it fertile, and to make it bear Plants, Trees and Fruits.

AGRYPNIA, is a kind of *Coma Vigil*, a Watching or Dreaming Slumber, proceeding from some Disorder in the Brain.

AGRYPNOCOMA, the same with *Coma Vigil*.

AIDE DE CAMP, in an Army, is an Officer always following one of the Generals, i. e. the General, Lieutenant General, or Major General, to receive and carry their Orders as Occasion requires. When the King is in the Field, he usually appoints young Gentlemen of Note to carry his Orders, and they are called, the *King's Aides de Camp*.

AIDE MAJOR, or *Adjutant*, is an Officer whose Business it is to ease the Major of part of his Duty, and to perform it all in his Absence. Some Majors have several *Aides Majors*; each Troop of Guards hath but one Major, who hath two *Aides Majors* under him, according to the greatness of the Business: Every Regiment of Foot hath as many *Aides Majors* as it contains Battalions. When the Battalion is drawn up, the *Aide Major's* Post is on the Left beyond all the Captains, and behind the Lieutenant Colonel.

AILE, is a Writ which lies where Land descends from the Grandfather to the Son or Daughter of his Son, the Father being dead before the entry by him, and one abates, the Heir shall have this Writ against the Abator.

AMIABLE NUMBERS; Mr. *Ozanam* calls such as are mutually equal to the whole Sum of one another's Aliquot Parts: As are these two Numbers 284 and 220. For 284 is equal to the Sum of all the Aliquot Parts of the second Number 220, which are 1, 2, 4, 5, 10, 11, 20, 22, 44, 55, 110. and the latter Number 220 is equal to all the Aliquot Parts of 284, viz. 1, 2, 4, 71, 142.

AIR. The *Atmospherical Air* in which we breathe is a Diaphanous, Compressible and Dilatable Fluid Body, covering the Earth and Sea to a great Height above the highest Mountains; and differs from the *Æther* (among other things) in this, that it refracts the Rays of the Moon and other remote Luminaries. This Air seems to consist of three differing Kinds of *Corpuscles*, or small Bodies.

1. Such as are carried up into it in the Form of *Exhalations* or *Vapours* from the Earth, Sea, and all Animal, Vegetable and Mineral Bodies, by means of the Sun's, or the Subterranean Heat.

2. There are yet a more subtle sort of Particles in the Air, which we may reckon emitted into it from the Heavenly Bodies; and also the Magnetic Streams of this Globe of Earth and Water.

3. There is also a Third kind of Particles, which perhaps do most properly merit the Name of *Aeræal*, as being the proper and distinguishing Parts of Air taken in the strictest Sense; and these are *Corpuscles* which are constantly *Elastical* or *Springy*. For *Elasticity* is an Essential Property of Air, and 'tis thought no other Fluid hath any thing of it, but only so far as it participates of Air, or hath Air contained in its Pores. So that our Air probably doth either consist of, or abound with Parts of such a Nature, that in case they be bent or compressed by the Weight of the incumbent part of the Atmosphere, or of any other Body, they do endeavour to free themselves from that pressure, by bearing against the Bodies that kept them bent; and as soon as these Bodies are removed to give them way, they unbend themselves, either quite, or so far forth as the Bodies that resist them will permit, and thereby expand the whole parcel of Air, these *Elastical Bodies* compose.

Dr. *Hook*, in his *Micrograph*. p. 13. seems to think the Air to be nothing else but a kind of Tin-

ture or Solution of Terrestrial and Aqueous Particles dissolved in, and agitated by the *Æther*; and these Particles he supposes to be of a saline Nature.

Mr. *Boyle* found, that one and the same Portion of Air, may make up 52000 times the Space it doth at another time. See *Traits about the admirable Rarefaction of the Air*. And in the said Discourse he tells us, That he found by undoubted Experiments, that the same Quantity of Air, by only having the Pressure of the Atmosphere taken off in the Pneumatick Engine, and without any Adventitious Heat to encrease its Spring, would possess above 13000 times its natural Space or Dimensions.

Dr. *Gregory* in his *Astron.* p. 401. shews, that if Air expand it self according to Mr. *Boyle's* observed Law, viz. That the Spaces into which it may be compressed, are always reciprocally proportional to the compressing Weight: Then a Globe of Air of the Diameter of one Inch, if rarefied so, as (according to that Rule) it must be at the Distance of the Earth's Semi-diameter (from the Earth) will fill the Planetary Regions as far as, and much beyond the Sphere of *Saturn*.

And the great Dilatation and Compression of Air may be easily enough conceived, without the Intervention of any subtle Matter, if we imagine each proper elastick Particle of Air to be like a little Spring of a Watch coiled up round, or wound up like a Piece of Ribband: For, if you allow further, that these Particles have also a Circular Motion round their own Axis, the Parts of each Roll, Coil, or *Lamina* will endeavour to recede from the Axis of its Motion, and this more or less, according to the Velocity of their Motion; by which means they will acquire a Springiness outward like a Watch Spring, and will endeavour to fly or unwind themselves out to their full length, but that they are hindered by other such Particles on every side: And therefore these *Elastick Particles* in the lower Parts of the Atmosphere, will always be kept bent or wound up, by the weight of the whole of the Air; but if at any time they can get rid of this Weight and external Pressure, they will readily, by their natural Spring, evolve themselves, and extend their Roll, or Circles to vastly large Dimensions. And this may be the Reason of the Tumescence of a Bladder not apparently blown out, in the exhausted Receiver; of a full-blown one (if dry) breaking there, and of the breaking of square figured Vials, when stop'd well, and the Air thoroughly drawn off from them.

And 'tis equally easy to conceive, that a great Dilatation or Rarefaction of Air may be produced by Heat; for the Rapid Motion of the Calorick Particles must needs so move the Aeræal ones, and by that means may make them more endeavour to recede from the Axis of their Motion, and consequently more unwind or unroll themselves; wherefore they must take up more Space, and must more thrust, by this encreased Spring, all other Bodies from them, and separate themselves from one another.

Mr. *Boyle*, in his Discourse against *Linus*, shews, that the Strength required to compress Air, are in Reciprocal Proportion (nearly) to the Spaces comprehending the same Portion of Air.

AIRS WEIGHT. The Weight of the Air was first discovered by the great *Gallileus*; who finding that Water by pumping could be raised no higher than 34 or 35 Feet, concluded, that the Notion of

Place this under Air Pumps.

M^r Hawksbee's Barometer, rising & falling 60 Inches

an infinite *fuga vacui* would not do in this Case; and therefore happily fell on thinking of the Counter-Balance of the Air's Weight, which *Torricellius* afterwards pursued and improved, with like Sagacity; inventing, as a farther Proof of the Notion of the Gravity of the Air, that which we call the *Torricellian Experiment*.

Mr. Boyle found a Lamb's Bladder containing about $\frac{3}{4}$ of a Pint, and blown up; and well dried to lose about a Grain and $\frac{1}{2}$ when it was prick'd, and the Air let out.

Also, that a Lamb's Bladder being counterpoised in a nice Pair of Scales in the Receiver, on the Air's being drawn out, did manifestly preponderate; but when the External Air was let in again, the Scale's returned to their former Equilibrium.

An *Æolopile* well heated, and then having its little Hole stopp'd, was cooled, and weighed; after which the Hole being opened, the Air was heard plainly to rush in with a whistling Noise, and then the *Æolopile* being weigh'd again, it was manifestly heavier than it was before.

The *Magdeburgick Engine* being weighed when full of Air, and afterwards being again weighed when 'twas well exhausted, was found to weigh an entire Ounce and $\frac{1}{2}$ less than it did before.

And Mr. Boyle found by accurate Experiments, that a small Receiver weigh'd 33 Grains more when full of Air, than after it was exhausted. He found also that

A Glass Bubble as big as a Hen's Egg, having as much Air as could be driven out by Heat, had then its Stem nimble sealed up, and then being left leisurely to cool (for there is great Danger of its breaking) was put into a nice Balance, and then the Scales were equipoized: After, the sealed End being warily broken off, the Air was heard to rush in with a whistling Noise, and then the Scale in which the Bubble was, did manifestly preponderate by near $\frac{1}{2}$ of a Grain. And after this, filling it with Water, it was found to hold 906 Grains of that Liquor; so that allowing for $\frac{1}{2}$ of the Cavity of the Bubble's being filled with Air, which perhaps might weigh about a Grain, the Proportion of Water to Air appears in Weight to be about 905 to one, and roundly it may be supposed as 1000 to one, because 'tis not possible but that some Air must remain in the Bubble more than is now accounted for.

Mr. Boyle found by repeated Experiments, that the weight of Air to Water is as 1000 to 1.

Mr. Halley, in *Philos. Trans.* N^o. 181. says, That the Specific Gravity of Air, near the Earth's Surface to that of Water, at several Trials, was as 1 to 840, as 1 to 852, and as 1 to 860; the Mercury standing at all those times about 29 $\frac{1}{2}$; but because 'twas Summer Weather, and consequently the Air rarefied when all these were try'd, it may, without sensible Error in round Numbers, be said, that the Barometer standing at 30 Inches, and in a mean Estate of Heat and Cold, the Specific Gravity of the Air to Water, is as 1 to 800: Wherefore, since Mercury to Water is as 13 $\frac{1}{2}$ to 1, Mercury will be to Air as 10800 to 1, and a Cylinder of Air of 10800 Inches, or 900 Feet, is equal to an Inch of Mercury; wherefore if the Air were throughout of an equal Density, the Height of the Atmosphere would be no more than 5 Miles, and one Tenth of a Mile, and in the Ascent of every 900 Feet from the Earth's Surface, the Mercury in the Barometer would fall an Inch. But since the

Expansion of Air increases, as the Weight of the incumbent Atmosphere decreases, or as the Mercury sinks in the Barometer; the upper Parts of the Air must be much more rarefied than the lower, and consequently the Height of the Atmosphere much greater than 5 Miles. See Vol. 2.

AIR PUMP, an Instrument to exhaust the Air out of proper Vessels. Mr. Boyle owns he had the first hint of it from *Seboterus*, who had published to the World, (but Mr. Boyle had not seen the Book) that one *Otto Gerick*, Consul of *Magdeburgh*, had found out a way of evacuating Glass Vessels, by sucking out the Air at the Mouth of the Vessel, plunged under Water. But this Engine was defective in two respects: 1. That in order to evacuate the Vessel, there was required the continual Labour of two strong Men for two Hours. 2. The Receiver and Engine being all of one Piece, there was no way to get things in and out of it, in order to try any Experiment upon them. To remedy which, and to supply those Imperfections which Mr. Boyle had heard the *Otto Gerick Engine* laboured under, he directed one Mr. G. and Dr. Hook to contrive a newer and better Air Pump; which Dr. Hook effected in the following Form, which I will describe, because it was the first of the kind made here.

This Air Pump consists of two Parts; a Glass Vessel; and a Pump to draw the Air out of it.

The Glass is expressed by the Fig. 1. *A* having a Hole at the Top with a Cover fitted to it, and also a stop Cock fastened to the Extremity of its Neck below; its Cavity being large enough to contain about 60 lb. of Water. The Diameter (*B C*) of the Hole at the Top of the Vessel (*A*) is about four Inches, the Orifice whereof is encompassed with a Lip of about an Inch in Height, whose use is for the Cover to rest on; which Cover is described in the Second Figure, where (*D E*) denotes a Brazen Ring, which is to cover, and to be closely cemented on the Lip (*B C*) of the first Figure. To the internal tapering Orifice of this Ring, is fitted a Brafs Stopple (*F G*), so exact, as to prevent any considerable access of External Air: In the midst of this Cover there is a Hole (*H I*) of about half an Inch Diameter, encompass'd with a Ring or Socket of Brafs, to which is likewise fitted a Stopple (*K*) of the same Metal, so exquisitely adapted to it, that it may be turned round, without admitting in the least Air, and yet may be put in or taken out at pleasure: Through the lower End of it there is a little Hole (*8*) made for Passage of a String, (*8, 9, 10*) which is likewise to pass through a small Brazen Ring (*L*) fixed to the Bottom of the Stopple (*F G*); the use of which String is to move what is contained in the exhausted Vessel, without unstopping it. That the Stop Cock (*S*) (in the first Figure) might be better fastened to the Neck of the Receiver, and cemented on with Pitch, Rosin and Wood-ashes well incorporated together, and poured hot into the Cavity of the Plate; and to prevent the Cement from running into the Orifice (*Z*) of the Shank (*X*) it was stopp'd with a Cork, having a String fixed to it, that it might be drawn out at the upper Orifice of the Receiver, and then the Glass Neck of the Receiver being well warmed, and thrust into the Cement, it filled the Interstices betwixt the Tin Plate and the Receiver, as also between the internal Superficies of the Receiver, and the Shank of the Cock.

The lower Part is the *Sucking Pump* or *Air Pump*, supported by a Frame of Wood, with three Legs, (III) so contrived, for the free Motion of the Hand, that one side of it may stand perpendicular; across the Midd of the Frame is nailed a Board (222) to which the Pump is fastened.

The Pump is made up of four Parts, viz. An exact and strong Cylinder of Brass of about fourteen Inches in length, with a Cavity of about three Inches Diameter; to which is fixed a Sucker made up of two Parts; the one (44) somewhat less in Diameter than the Cavity of the Cylinder, on which a thick Piece of tann'd Leather is nailed, whereby it closes so exactly to the Cylinder, that the Air cannot insinuate it self between them: The other Part being a thick and narrow Plate of Iron (55) is firmly joined to the Middle of the former Part (44) it is somewhat longer than the Cylinder; one Edge of it being smooth, but the other indented (as in the Figure) with a Row of Teeth; to the Interfices of which are fitted the Teeth of a small Iron Nut (LB) which is fastened by two Staples (22) to the under side of the cross Board (222) on which the Cylinder rests, and is turned to and fro by the *Manubrium* or Handle (7).

The last part of the Pump is the Valve (R) being a Hole at the Top of the Cylinder, a little taper towards the Cavity; to this Hole is fitted a Brass Pegg, to be put in or taken out upon Occasion.

Having thus described the Engine, it will be requisite for the better Exclusion of the outward Air, and the more easy moving of the Sucker, Stop-cock and Key S, as also the Valve, that they should be well oyled with Sallad Oyl; but sometimes Oyl and Water together prove more effectual: Also, that the Ingress of Air betwixt the Brass Cover and the Ring may be likewise prevented, the Edges of both must with the former Cement, be carefully plaistered, and spread on with a hot Iron, that it may run the better, and fill the little Cavities.

Things being thus fitted, and the lower Shank (O) of the Stop-cock being put into the upper Orifice of the Cylinder, then the Handle being turned till the Sucker rises to the Top of it, and shutting the Valve with the Plug, and turning the other way, the Sucker is drawn down to the Bottom; by which means the Air is driven out of the Cylinder, and a Succession from without being prevented, the Cavity of the Cylinder must be emptied of Air; then if the Turn-cock be turned, so as to afford a Passage betwixt the Receiver and Cylinder, part of the Air contained in the Receiver, will descend into the Cylinder, and by turning back the Key, that may be prevented from flying back into the Receiver, and may also, by opening the Valve, and winding up the Sucker, be forced into the open Air; and so by reiterated Exfuctions of the Air out of the Receiver, and Expulsions of it again out of the Cylinder, it may be exhausted, as the Nature of the Experiment requires.

When this Engine is set on work, these *Phenomenas* are observ'd (1) That the Sucker being wound up, and upon stopping the Valve, and turning the Key, drawn down again; the Air in both Vessels will be brought to an equal Measure of Dilatation; and upon returning the Key, and opening the Valve, near a Cylinder full of Air will be expelled; but the Receiver by reiterated

Exfuctions, being more and more exhausted, less proportionably is forced out; so that at least, before you need to open the Valve, the Sucker may be forced up almost to the Top of the Cylinder; and if, when it is so exhausted, you let go the Pump, the Valve being stopped, the Sucker merely by the Protrusion of the External Air, overpowering that more rarified Air within, will be forced up to the Top of the Cylinder; whereby 'tis observ'd, That as the Sucker is press'd higher by the external Air, it shews the Receiver to be more or less exhausted; the Air in the Cylinder being accordingly more or less able to resist the external, as it varies in Quantity. 'Tis also observ'd, That whilst the Receiver retains any considerable Quantity of Air, there is a brisk Noise immediately produced upon the turning of the Key.

2. Also, that when the Receiver is well exhausted, the Brass Key (that is a Stopple to the Brass Cover) cannot be lifted up without some Difficulty, for it feels as if some great Weight were fastened to the Bottom of it: The Cause of this *Phenomenon* seems to be, That the Air in the Receiver being very much dilated, its Spring must be proportionably weakened, and consequently the lower end of the Stopple is accordingly press'd up, whereas the Spring of the external Air is not at all weakened; so that a Strength to lift up the Stopple, must support a Pressure equal to the Disproportion betwixt the Force of the internal expanded Air, and that of the *Atmosphere* incumbent upon the upper part of the Stopple: But if the Air be let into the Receiver by Degrees, the Weight that is supposed to keep the Stopple down, may be felt to decrease more and more, the internal Air by this Recruit approaching more to an *Æquilibrium* with the external, till at last the Receiver being fill'd with Air again, the Stopple may be easily lifted up.

Mr. Boyle, after some Years Experience, found it convenient to alter a little the Form of his first *Air Pump* into that which the annexed Figures represent: And the advantageous Differences between this and the former Engine, are as followeth.

(Vid. Plate I.)

1. The Cylinder is contrived to be placed within a Frame of Wood which is filled with Water, so that the Cylinder is always kept quite covered with it; by which means the Sucker is always kept Turgid and Plump, and the Water also fills up all the little Intervals or Spaces between the Sucker and the Barrel, and by that means the Air is much more exactly excluded than in the former Engine. But here great Care must be taken in turning the Stop-cock, or else the Water will get into the Receiver, and spoil the Experiment.

2. Because in this Engine the Sucker is to be always under Water. There is a Perforation *PQ* (See Plate II.) which passes perpendicularly thro' it, and together with the Stick *RS*, serves for a Valve, and is to be stop'd at the Bottom of the Cylinder *NO*, when it is full of Water; wherefore the Stick *RS* must be of a considerable Length, as of 2 or 3 Foot.

3. The chief thing in this reformed Engine is, that the Pipe *AB* (Plate II.) whose End *B* turns upwards, is made to lie in a Groove or Gutter hollowed purposely for it in the Board *CDEF*, on which the Receivers are to rest. This Board was covered

covered with good Cement, and then on it was applied a strong Plate of Iron of the bigness of the Board, having only a Hole in the Middle for the Mouth of the Pipe *B* to pass through; and this Plate he added, because he found that the Weight of the Atmosphere would sometimes force the Air to penetrate thro' a thick Board, tho' its Pores were also designedly filled with Oyl. The Edges of this Plate should be a little turned upward, to hold a little Water, which now and then will be apt to get into the Receiver.

The Stop-cock, *GHIK*, tho' it may be soldered into the Cylinder at *I*, yet had better go on with a Screw; for then it may be more easily mended if it should not prove right or stanch, and also will not be so apt to break off. 'Tis convenient also to have a little Cover of Tin, &c. to put over the Nose of the Pipe *B*, to hinder things from falling into it, or injuring it, and to keep the Cement out of it, when very small Receivers are used.

There is this considerable Advantage in this flat Board on which the Receiver is placed; that the Receiver needs no Stop-cock of its own, but is usually one entire piece of Glass in the form of a Bell, or Cucurbit, &c. which will much better keep out the Air than if it were perforated, tho' the Stop-cock should be never so good.

Care must be taken to get a good Cement to fasten the Receivers to the Plate: That which the Honourable Mr. Boyle used was a well wrought mixture of equal parts of Bees-wax and Turpentine; tho' in the Winter he found it best to use a little more of the Turpentine, and in the Summer a greater portion of Bees-wax.

The Description of Mr. Papin's Engine for exhausting the Air from Mr. Boyle's continuation of the *Physico Mechanical Experiments*, Part 2. *Iconismus primus*, Figure 1, 2.

AA, are two Pumps made of Brafs.

BB, are two Pluggs hollow within and open below:

CC, are two Holes in the upper part of the Pluggs, with Valves opening inwardly, that they may afford passage to the Air to go out, and hinder it from coming in.

DDDD, are Iron Rods serving to move the Pluggs, and annexed to them, by means of the Gnomons *FF*.

EE, are two flat Iron Stirrups at the top of the Rods *DD*, on which the Operator must stand to set a-work the Engine.

GGG, is a Cord joyned to the two Stirrups, and compassing the Pulley *H*.

LL, are two Valves at the Bottom of the Pumps, opening inwardly, for the admission of the Air out of the Tube *MM*.

MM, is a Tube reaching from both Pumps to the Plate *OO*, by means of the Curvature *PP QQ*; which Curvature ought to be so long, that the Tube *PP QQ* may not hinder the Exerciser of the Pumps, but that he may conveniently stand on the Stirrups *EE*.

OO, is a Plate bored in the middle, on which the Receivers to be evacuated, are to be put; as *R* for Example.

This Engine is to be put into a Frame of Wood to support it before it can be used, such as is shewed in the second Scheme. And as much Water is to be pour'd into the Pumps thro' the Hole *Q* in the Plate *OO*, as is sufficient to fill the Cavities of the Pluggs, and a little more; and then some Body must stand on the two Iron Stirrups *EE*, and must alternately depress and elevate them: For by this means the Pluggs following the Motion of the Stirrups, in their ascent will leave the Space in the Bottom of the Pump empty; and seeing all other Passage is intercluded from the Air, that Air alone which is contained in the Receiver *R*, is conveyed into the afore said Pumps by the Tube *QQ PPM*, and opens the Valve *L*, which being shut again, hinders the same Air from making a Regress; wherefore the Plugg afterwards descending, compresseth that Air, whence, of necessity, the Valve *C* must be open'd, and all the Air must pass out of it,

D

because

because the Water in the Bottom of the Pumps doth exactly fill all the Spaces, and doth also regurgitate through the Valve G.

Here 'tis observable, That this *double Engine* is upon many Occasions to be preferr'd before a *single one* (that's mov'd with the Foot) for it doth not only produce a double Effect, but performs it much more easily; for in these Engines, which are furnished but with one Tube, whilst the Plugg is drawn out to evacuate the Pump, the whole Pillar of the Air, incumbent on the Plugg, is to be elevated by Force; and again, when the Plugg returns back, it is also by Force to be restrained, lest it should be too swiftly impell'd by the Air, and so break the Bottom of the Engine; but in these *double Engines*, the Plyer of them is in a manner wholly free from that Toil. For the Pluggs are easily lifted up, in the first Suction; because the Air, immediately derived from the Receiver R into the Pumps, presses the Pluggs downwards, almost as strongly as the external Air incumbent on the opposite Parts; and when the Quantity of the internal Air is diminish'd, it comes to pass, that the Plugg to be deprest'd, tends downward with so much the greater Force, and so by means of the Cord GGG compassing the Pulley, draws the other Plugg upwards, and at the same time hinders it from too much Velocity of Descent; so that by this means both Pluggs at one and the same time will be helpful to him that exerciseth the Pumps.

This Engine is of great use in order to those Experiments which cannot be very well made but

with Velocity and Speed, seeing the Pluggs make but a small Resistance, a Man may easily judge, that the two Pumps of this Engine may be plyed with greater Ease and more Speed, than one Pump in a single Engine can.

The Ingenious Mr. *Hawkesbee* now makes *Air Pumps* of a much simpler and easier Form than these Engines, above described, and in which are many Conveniences which they had not: The Form of which is as follows.

1. There is a square Board, as *ABCD*, which, by the Help of two Screws, is fastened readily in any Window, or on any Table; in the middle of this Board is a Hollow, which contains a Brass Plate, on which the Recipient R is placed, and fastened to it without any Cement, by means of a thin Piece of wet Leather: In this Brass Plate are two Holes, into one of which is an Elbow fitted, which hath the End of the *Air Pump* screw'd on it, and on that Screw is a Valve made by a piece of Bladder, and answers alternately to another in the Sucker, opening when that shuts, and closing when that opens reciprocally: The other Hole hath fastened into it a small Brass Pipe, on which is screw'd the upper Part of the Mercurial Gage, whose use is by the rising of the Mercury from the Cistern below in the *Torrillian* Tube, to shew to what Degree the Recipient is exhausted. This Gage is represented by the Letter G. S expresses the Body of the Syphon or *Air Pump*, which is work'd Horizontally by means of the Handle of the Piston b: By which means the Recipient is very easily exhausted, the Valves much better supplying the Use of the Stock-cock in other Engines of this Nature.

And when the Experiment is over, and you would let the external Air return again into the Receiver, in order to take it off the Engine, you need only unscrew a little the Elbow above-mentioned, by turning the *Air Pump* about from the Left Hand towards the Right, as far as Liberty allows, and then the Air will easily insinuate it self between the Joints of the Screw: Or you may let the Air in also, by unscrewing the Cap at P.

R. 2. is another Receiver, through whose Cap P (which contains a Box, in which are several Collars of Cork and Leather) passes a Brass Wire as W, moveable up and down in the Cap, without letting in any Air into the Receiver, and on whose Hook K, may any thing be suspended or fastened in an Experiment.

F is a small *Air Pump* applicable to a Cupping-Glass, by which 'tis easily affixed to any part of the Body, without Fire.

Y is a Syphon or Syringe for Injection in Anatomical Experiments; having several small Pipes, as C, of differing Bores, to screw on upon it; and receiving a constant Supply of the Liquor by means of the crooked Pipe a.

In the *Memoires de Mathematique & de Physique* for December 1693, you have this general Theorem (from Mr. *Varignon*) about the Proportion of the remaining Air in the (partly) exhausted Receiver, to that which was in the Receiver before you began to pump, viz.

The Quantity of the Natural Air contained in the Receiver before you begin to pump any out, is always to the Quantity of what remains, after any Number of Pumps: As the Capacity of the Receiver, and the Cavity of the Pump together (which Cavity is made by the drawing up of the Sucker) raised to a Power which shall have the Number of the Stroaks of

of the Pump for its Index; is to a like Power of the Capacity of the Receiver alone.

Demonstration.

Let a be the Natural Air, v that which remains after any number of Stroaks of the Pump, r the Capacity of the Receiver, s the Capacity of the Receiver, and the Cavity of the Pump together, n the number of the Stroaks of the Pump (here supposed all equal in force and effect to one another). Then says Mr. Varignon.

which is the Theorem above delivered, in species. To shew the Truth of which, 'tis enough (saith he) to consider, That each time the Piston or Sucker of the Pump is drawn back, the Air in the Receiver must expand it self so as in some measure to fill up the Cavity of the Pump left vacant by the Piston, as well as the Receiver it self. (N.B. He seems to build on the Cartesian Notion of a Plenum, but it matters not, the Calculation is just) wherefore, as now, so after each Stroak of the Pump, the remaining Air in the Receiver and Pump, will be to what was in the Receiver just before, as the Capacity of the Receiver alone, is to that of the Receiver and Pump taken together; that is, as r to s .

Let us make then a, b, c, d, e, f , &c. and at last t and v to denote the different Quantities of Air found successively in the Receiver after each Stroak of the Pump: That is, let a be the Air in its Natural State when you begin first to Pump; b the Quantity of Air there after the first Stroak; c the Quantity of Air after the second Stroak, and so on till you come to the last Stroak, where v represents the Quantity of Air remaining in the Receiver and Cavity of the Pump after any Number of Stroaks; and that Number will be n .

Then will it ever be

$$a. b :: s. r.$$

$$b. c :: s. r.$$

$$c. d :: s. r.$$

$$d. e :: s. r.$$

$$e. f :: s. r.$$

and in one Word,

$$r. v :: s. r.$$

wherefore $a. v :: s^n. r^n$. Q. E. D.

From whence, by way of Corollary, he gives us this Rule.

Let h, k, l, m . represent the Logarithms of the Quantities before-mentioned, a, v, s and r ; then will $b. k :: l n. m n$. that is, those four Terms will be Arithmetically Proportional: Wherefore $b + m n = k + l n$: or $b - k = l n - m n$. Which is the Rule to be used, as follows in the Problems.

Problem 1. The Capacity of the Receiver, and of the Cavity of the Pump being given, or the Ratio between them; together with the Number of the Stroaks of the Pump in the Evacuation of the Receiver; To find the Ratio between the Natural Air, and that now in the Receiver.

The Rule is, keeping to the last mentioned Notation, $b - k = l n - m n$.

Where $l n - m n$ is the Logarithm of the Ratio sought; that is, in Words, The Logarithm of the Ratio of the Natural Air to that in the (nearly suppos'd) exhausted Receiver is always equal to the Product of the Number of the Stroaks of the Pump, multiply'd by the Logarithm of the Ratio between the Capacity of the Pump and Receiver together, and the Receiver alone.

So that these things being given, as in the Supposition of the Problem, the Ratio of the Natural Air, to that which now remains in the nearly exhausted Receiver, is found. Q. E. D.

Let this Ratio be as p to q ; then will $a. v :: p. q$. and consequently $a q = p v$ and dividing all by q ,

the Natural Air will be thus exprest, $\frac{p v}{q}$,

if you have the remaining Air in the Receiver;

and that remaining Air will be exprest thus, $\frac{a q}{p}$

if you have the Natural Air. And supposing both Natural and Remaining Air to be each = 1, they

will be thus exprest: The Natural Air = $\frac{p}{q}$ and

the remaining rarify'd Air = $\frac{q}{p}$

As for Example, Suppose the Cavity of the Receiver to be 10 times as great as that of the Cavity of the Pump left by drawing up the Piston; and that the Number of the Stroaks of the Pump be 30: I demand what Proportion the Air in the (partly) exhausted Receiver bears to the common Air. The Answer is, That there is about the 18th part of the Air which was in the Receiver when you began to Pump.

For in this Case the Logarithm $l - m =$ to the Ratio between the Capacity of Receiver and Pump together, to Receiver alone, will be 413927; which, multiply'd by 30 = n , gives 12417810 for the Logarithm of $l n - m n$, the Ratio of the Natural Air to the remaining Air. Let the Natural Air in the Receiver, before the Pump was set on work, be = 1; then will = 12417810 be the Logarithm of that small Quantity of Air which shall at last remain after the 30 Pumps, which will be the Logarithm of $\frac{1}{18}$ fere; that is, it may be

exprest thus, $\frac{a}{18}$. And therefore, to find the

Weight of all the Natural Air (= a) in the Receiver, we may say, that the re-entred Air at last

let in is = $a - \frac{a}{18}$; and then taking a for its

proper Weight, (as supposing the Weights of Bodies to be proportionable to their Bulks) let p be the Difference between the Weights of the Receiver when full and when exhausted; we shall find

that $a - \frac{a}{18} = p$, which Equation will produce

$a - p = \frac{a}{17}$, for the Weight of all the Natural

Air in the Receiver. In general, if g be put for the Number of which $l n - m n$ is the Logarithm, the remaining Air at last will always be precisely

= $\frac{a}{g}$, its Weight = $\frac{p}{g - 1}$: And the Weight

of the Natural Air = $\frac{g p}{g - 1}$.

Problem 2. The Ratio between the Natural Remaining Air being given with the Number of Stroaks of the Pump, to find the Ratio of the Receiver, to the Cavity of the Pump.

The Rule will be $b - k = l n - m n$, and consequently $\frac{b - k}{g} = l - m$; then will $\frac{b - k}{n}$

be the Logarithm of the Ratio of the Capacity of the

the Receiver alone; which Ratio being also known, viz. as p to q , then will $s, r :: p, q$, and $s - r :: p - q$; that is, the Logarithm of the Ratio of the natural Air to the remaining Air, being divided by the Number of the Strokes of the Pump, will always give for the Quotient the Logarithm of a Ratio, whose Antecedent less the Consequent, will be to the Consequent, as the Pump is to the Receiver; and therefore this Quotient being known, the Ratio between the Pump and the Receiver will also be known. Q. E. I.

From hence, if the Capacity of the Receiver be known, the Capacity of the Pump will be found to be $\frac{r p - r q}{q}$; and if the Capacity of the Pump be known, viz. $s - r = e$, then that of the Receiver will be $\frac{e q}{p - q}$.

Problem 3. The Ratio between the Pump and Receiver being given, together with that of the natural Air to the remaining Air; To find what Number of Strokes of the Pump, are necessary to bring the natural and remaining Air to the given Ratio: Or, in other Words, To rarefy the Air in a given Ratio, with an Engine whose Receiver and Pump are given in Capacity.

The Rule being $b - k = l n - n m$, and consequently $\frac{b - k}{l - m} = n$, it will be, as the Logarithm of the Ratio of Receiver and Pump together, to Receiver alone, is to the Logarithm of the Ratio between the natural and remaining Air: So is Unity to the Number of Strokes of the Pump required: Or, in other Words, the Quotient of the Second of these Logarithms divided by the First, is always equal to the Number of Strokes sought.

AIRY METEORS: See *Meteors*.

AISTETERIUM, the common Sensory, which Cartes would have placed in the *Glandula Pinealis*, but is now generally supposed to be about the beginning of the *Medulla Oblongata* in the *Corpus Striatum*.

AJUTAGE, is the Spout for a *Fets d'eau* in any Fountain: Mr. *Marriot* asserts, That an even polished round Hole in the End of the Pipe, will give an higher Jet than either a Cylindrical or a Conick *Adjutage*; but of those the latter is the best.

ALA, in Botany, signifies the Angle (which generally is acute, and never greater than a Right one on the Foot Stalks of Plants, and is always tending upwards) that either the Leaves or the Foot Stalks of Leaves make with the Stalk, or with any Branch of the Plant. Sometimes also 'tis taken for a little Branch, making an Angle after that manner with the Stalk.

ALABASTRA, in a Plant, are those little green Leaves which compass in the Bottom of the Flower.

ALBA FIRMA, in Land, is an Annual Rent in Money, payable to the Chief or Lord of any Hundred; and *Spelman* saith, 'Tis called *Alba* because it is not paid according to the Custom of old Times in Corn (which was call'd *Blackmail*) but in Silver, or as they say now in some Parts of England, in White Money. There are Tenures of this Nature in *Westmorland*, 2 Part Institut. Fol. 10.

ALBAPITUITA, the same with *Leuco-Phleg-*

ALBUGINEA OCULI, is a very thin white Coat or Tunic of the Eye, adhering to the Cornea, extending it self beyond the Sclerotic, even to the Circle of the Iris, but leaves a Hole forward for the opening of the Apple of the Eye. See *Tunica Adnata*: 'Tis by some Writers call'd *Tunica Conjunctiva*.

ALBUGINEA TESTIS, is the White Membrane immediately involving the Testes or Testicles.

ALBUGO, the Pin and Web, is a white Speck in the Honey Tunicle of the Eye, which hinders the Sight, and usually follows an Inflammation, Wound or Ulcer of that Part. Sometimes it's taken for the *Album Oculi*, or White of the Eye; being that part where the *Tunica Adnata* or *Albuginea* adheres to the Sclerotic.

ALBUM OCULI, sometimes is taken for the same with *Albugo*: But by *Galen* and *Hippocrates* is used for that Tunic of the Eye which is usually call'd, the *Tunica Adnata*; and by some Writers *Albuginea Oculi*: Which see under those Words.

ALCHAICKS, are a sort of Verses consisting of two *Dactyls* and two *Trochees*, as some will have it; but *Fabricius* saith, they consist of 5 Feet, of which the first is a *Spondee* or *Iambick*, the second an *Iambick*, the third a long Syllable, the fourth a *Dactyle*, the fifth a *Dactyle* or *Amphimacer*; as these of *Horace*.

*Vides ut alta stat nive candidum
Soratæ, nec jam sustineant onus.*

ALCHYMIST, is one that studies *Alchymy*; that is, that Sublimer Part of *Chymistry* which teaches the Transmutation of Metals and the Philosopher's Stone; according to the Cant of the *Adeptists*, who amuse the Ignorant and Unthinking with hard Words and Non-sense: For were it not for the *Arabick* Particle *Al*, which they will needs have to be of wonderful vertue here, the Word would signifie no more than *Chymistry*. Whose Derivation see under that Word. This Study of *Alchymy* hath been rightly defined to be, *Arts fine Arte, ejus principium est mentire, medium laborare, & finis mendicare*: That is, an Art without an Art, which begins with Lying, is continued with Toil and Labour, and at last end in Beggery. And so poor *Penotus* found it, who after he had spent his whole Life and Fortune in this vain Study, died at last in an Alms-House at *Yverdon* in *Switzerland*; and used to say, he would recommend the Study of *Alchymy* to a mortal Enemy, whom he did not dare openly to attack.

ALCOHOL, a Term used by the *Chymists* both for a very fine or impalpable Powder; and also for a very pure Spirit well rectify'd or dephlegmated. Thus the highest rectify'd Spirit of Wine is called *Alcohol Vini*. Hence to *Alcoholize* any thing, with them signifies to subtilize; as when any thing is beaten to a very fine Powder, &c.

How to make a tolerable true Alcohol or pure Spirit of Wine, see in *Alcalizate Spirit of Wine*.

ALCOVE, in Architecture is a part of a Chamber separated by an *Estrade* or Partition made by Columns and other corresponding Ornaments, in which is placed a Bed of State, or sometimes Seats to entertain Company.

ALDEBARAN, an Arabian Name for a fix'd Star of the first Magnitude, situate in the Head of the Constellation called the Bull, and therefore is usually named the Bull's-Eye.

ALE-TASTER, is an Officer appointed and sworn in every Court-Leet, to look that there be a due Size and Goodness of Bread, Ale and Beer sold within the Jurisdiction of the Leet.

ALEMBICK, is a Chymical Instrument used in Distilling; it has the shape of an Helment Concave within, and Convex without; and towards the Bottom is placed a Beek or Nose about a Foot and a half long, by which the Vapours descend; sometimes they are made without a Nose, but then they are rather Circulatory Vessels, and the Head is called a *Blind-Head*: They are made usually of Copper tinn'd within-side; and often of Glafs.

ALEOPHANGINÆ (*Pillule*) are purging Pills composed of Aloes and several Spices.

ALERSANS JOUR, (a Law Term) signifying to be finally dismiss'd the Court, because there is no further Day assign'd for Appearance.

ALEXIPHARMICK MEDICINES, are such as are used as Antidotes against Poison, or any Infectious Disease; or to raise or strengthen the decayed or drooping Spirits in malignant Distempers.

ALEXITERICAL, } the same with *Alexiphar-*
ALEXITERICK, } *mick*.

ALGAROT, In Chymistry, signifies a strong Emetick and Cathartick Powder, the same as *Mercurius Vite*, being made of Butter of *Antimony* precipitated into a white Powder, by being washed or diluted in a large Quantity of warm Water.

ALGEBRA, the wonderful Analytick Art, or the Art of Equation. In *Arabic* is called *Al-giabr W'al-mokabala*, from the former of which Words we call it *Algebra*; and it may be render'd, either the Art of Restitution and Comparison, or the Art of Resolution and Equation. *Lucas de Burgo*, the most Ancient European Writer of *Algebra* we have, defines it *Restauratiois et Oppositionis Regula*.

The *Italians* gave it the Name of *Regula Rei et Censui*; that is, the Rule of the Root and the Square, because they call the Root *Res*, and the Square *Census*; and from *Cosa* in the Italian Language, for *Res* or the Root, comes the Word *Cosick*: For some Writers call the Powers of Numbers, as the Root, the Square, Cube, &c. *Cosick Numbers*.

Cardan calls it, and that very justly, *Ars magna*, The great Art; following therein *Lucas de Burgo*, who styles it in Italian, *L'Arte Maggiore*.

It was certainly of Old in use amongst the *Greeks*, but purposely concealed as a very great Secret. We have some Examples of it in *Euclide*, or at least in *Theon* upon *Euclide*, who tells us, it was first communicated by *Plato*: There are also Instances of this Art in *Pappus*; and we find the Effects of it plainly in *Archimedes*, *Apollonius*, and some others, tho' studiously covered and disguised. The first Books among the *Greeks*, and, I believe, the only one that treats professedly of *Algebra*, is that of *Diophantus*: Published at first in Latin by *Xylander*, afterwards in Greek and Latin by *Bachet*, with some things added of his own; and since him by *Mr. Fermat*, with some Additions of his likewise. But it certainly was in use among the *Arabs* more anciently than among the *Greeks*; and they are supposed to have had it from the *Persians*, and the *Persians* from the *Indians*. Thence, that is, from the *Arabs*, the *Moors* and *Saracens* brought it into *Spain*, from whence it came into *England*; and that before we knew any thing of *Diophantus*. The Use of the Numeral Figures, Mathematick

Learning and all our old Astronomy, came to us likewise the same way from the same Original, and about the same time.

The first European Writer of *Algebra* (as was hinted above) is *Lucas Pacciolus* or *Lucas de Burgo* a Minorite Frier: His Book is in Italian, printed at Venice 1494. He makes mention of one *Leonardus Pisannus*, and several others, from whom he learn'd it, but we have none of their Writings. He says, this Art came Originally to us from the *Arabs*, and makes no mention of *Diophantus*, who therefore 'tis probable was not yet known here. His *Algebra* goes no farther than Quadratick Equations.

Next came out *Stiphelius*, a good Author, but he also went on beyond Quadratics.

But *Scipio Ferreus*, *Cardan*, *Tartalea*, and some others, proceeded to give a Solution of some Cubick Equations.

After this *Bombelli* went a little farther, and shew'd how to resolve a Biquadratic Equation into two Quadratick ones, by the means of a Cubick.

Then, in the last Century, appear'd *Nonnius* (*Nunnez* in Spanish) *Ramus*, *Schonerus*, *Saliquacus*, *Clavius*, &c. who wrote on this Subject in various ways, but generally went no farther than Quadratick Equations.

About this time out came *Diophantus*, whose Method differs much from that of the *Arabs*, which others had hitherto followed.

All this while, the known Quantities in any Equation, were design'd only by the Numerical Letters, and there were no Symbols nor Marks but for those that were unknown or sought.

But then came *Vieta*, A. D. 1590, and introduced what he called his *Specious Arithmetick*; which is a way of giving Marks or Symbols to all the Quantities, both known and unknown; whereby a very short and conspicuous way of Notation was gained, the whole Operation expos'd always to the Eye in a short Synopsis, and many Discoveries were made in *Algebra*, not before taken notice of.

Vieta also introduced the *Numeral Exegesis* of affected Equations, shewing how to extract their Roots in Numbers. And in the Denomination of the Powers of Numbers, he follows *Diophantus*, and not the *Arabian* manner used by others.

The Incomparable *Mr. Oughtred* followed, and mightily improved the *Specious Algebra* of *Vieta*, in his *Clavis Mathematica*, first published 1631: He also affecting Brevity, (which indeed he was a perfect Master of, being short, but not obscure) invented many Compendious Characters or Ligatures to note the Sums, Differences, Rectangles, Squares, Cubes, and their Sum, Difference, &c. by which means his little Book contains more excellent and useful Geometry, than many other large Volumes. *Oughtred* in his *Clavis* usually contents himself with the Solution of Quadratics, rarely proceeding to those of higher Powers, because he design'd it as an Introduction to *Algebra* only.

The Famous *Mr. Harriott* was Contemporary with *Oughtred*, but died before him; he left many good things behind him, of which nothing is yet published but his *Analytice or Algebra*, which *Mr. Warner* printed A. D. 1631. From this great Man did *Des Cartes* borrow, not to say steal, all the famous things in his *Geometry*, which are purely Algebraical, as any one may see, that will compare their Methods together: For 'tis impossible but one must be Copied after the other: But the *Geometry* of *Des Cartes* was not published in French till the

the Year 1637, and not in *Latin* till the Year 1649: Therefore he must have seen and copied Harriott's Book.

Mr. Harriott did wonderfully improve (in this Treatise) that which is purely *Algebra*, in the following Respects, and many others which I might mention.

1. He brought in small Letters instead of the Capitals used by *Vieta* and *Oughtred*.

2. He waved the uncouth Terms of *Quadrato-Cube*, *Sursolid*, &c. explaining the Power plainly to the Eye, by only repeating the Root as often as the Index of the Power.

3. He shewed the true Original and Constitution of all Equations, by putting all the Equation over to one side; and thereby making the whole equal to nothing; whereby also he determined the Number of Roots, which he shews are in Number, such as the Index of the highest Powers in the Equation.

4. He discovers the true Construction of the absolute Number (the *Homogeneous Comparationis*) in a Quadratick or Superior Equation; shewing it to be the Product of the continual Multiplication of all the Roots.

5. The same he doth also by the Co-efficients.

6. He shews the way to multiply the unknown Roots of an Equation according to any Proportion assigned, thereby freeing the Co-efficients from Fractions and Surds.

7. He shews how to reduce the adjected Quadraticks, to simple Equations, and all adjected Cubicks to a Form easily solvable, by the means of destroying the second Term in such Equations.

8. He shews the Method (and a very good one 'tis) of solving all adjected Quadraticks by completing the Square.

9. He mightily also improves the *Exceffus Numerola*, invented by *Vieta*.

All these vast Improvements, and many more (which, to avoid Prolixity, I omit) did *Des Cartes* take from Harriott, without ever so much as naming him, and publish them as his own. 'Tis true, in his *Geometry* there are abundance of excellent Things about the Accomodation of *Algebra* to Geometrical Propositions, and many very fine Geometrical Effusions and Constructions; but this was not Harriott's Business, who kept himself up pure *Algebra* only. As to which *Des Cartes* hath added but one single Rule (and even that is plainly deducible from Harriott's Principles) over and above what is in Harriott; and that is, the Method of dissolving a Biquadratick Equation, whose second Term is wanting, into two Quadraticks, by means of a Cubick Equation of a plain Root; and this, after all, both *Bombell* and *Vieta* had done before him. And thus leaving the French Plagiary, I come next to another of Our Country Algebraists, Dr. Pell, who revised and altered a Piece of *Algebra* first published in *High Dutch*, A. D. 1659, at Zurich; and after translated into *English* by Mr. Thomas Brancher, and printed, A. D. 1688, and called, *An Introduction to Algebra*: In which Dr. Pell gives us a peculiar Method of his own for applying *Algebra* to Problems of divers Sorts; and introduces a way of keeping a Register of the whole Process in the Margin. He shews also there how to judge whether a Problem be fully determined or not; which is by this Rule (as Dr. Wallis interprets him). If the Number of the Data, or Things given in any Question, be (independent of each other) fewer than the

things sought, the Question is not fully determined, but is capable of innumerable Answers or Solutions.

But if the Number of both Data and Quæsitæ be the same, the Question is then determined to either to some one, or to some certain Number of Solutions.

And when the Data are more in Number than the Quæsitæ, so many as exceed are always superfluous, and sometimes, it may be, are contrary to, or inconsistent with others, and consequently render the thing impossible.

Dr. Pell also, besides the former Characters, introduced this Mark \ominus for *Involution*, and this \cup for *Evolution*, as he calls it, i. e. for *Squaring*, *Cubing*, &c. of any Quantity, and for *Extracting the Square*, *Cube*, &c. Roots out of any Quantity. He makes also the Mark : to stand for *Division*, and Registers the several Steps of the whole Process by Numeral Figures in their Order in the little Column in the middle; keeping an Account also in Symbols of the several Operations in the Column towards the Left Hand, that so you may see how any Quantity or Equation in the large Column towards the Right Hand is produced. In which very good Method he is follow'd by Mr. Ward, in his small Treatise of *Algebra*.

Algebra is well enough divided into

1. *Numeral or Vulgar*; which was that of the Ancients, and served only to find the Solution of Arithmetical Problems, without any Demonstration; such as those given us by *Diophantus*, &c.

2. *Specious or New*, called sometimes *Logistica Speciosa*, and often *Species* alone; which since *Vieta* hath been perform'd by Letters of the Alphabet. And this way of Notation is very pleasing to the Mind, assisting to the Imagination, and easy to the Memory. This also is no ways limited, like the former *Algebra* to any one certain kind of Problems, but serves equally for the Investigation and Demonstration of all Theorems; especially if to those two you add the new Methods of

3. *Fluxions*; a large Account of which you will have under that Word.

And the several Operations of *Algebra*, such as *Addition*, *Subtraction*, *Multiplication*, *Division*, *Extraction* of Roots, *Fractions*, *Equations*, &c. you will find Directions how to perform under those several Words.

ALGENEB, a fix'd Star of the second Magnitude in the right side of *Perseus*, whose Longitude is 57 Deg. 17 Min. Latitude 30. 5. Right Ascension 44 Deg. 15. Min.

ALGOL, or *Medusa's Head*, a fix'd Star of the third Magnitude, in the Constellation *Perseus*, whose Longitude is 51. 27. Latitude 22. 22. and Declination 39. 39.

ALGORITHM, sometimes call'd *Logistica Numeralis*, is the Sum of the principal Rules of Numerical Computation; of which they commonly reckon Five, *Numeration*, *Addition*, *Subtraction*, *Multiplication* and *Division*; to which may be added *Extraction* of Roots.

ALGORISM, is the Practical Operation in the several Parts of *Specious Arithmetick*, or *Algebra*; and sometimes the Word is used for the Practice of Common Arithmetick by the ten Numeral Figures.

ALIDADA, the Label or Ruler which is moveable on the Centre of an Astrolabe, Quadrant, &c. which carries the Sight. It is so called by the Arabian Writers of Mathematicks, from whom we took and retain several Arabic Terms, as *Azimuth*, *Zenith*, *Nadir*, *Almacanter*, &c.

ALIEN,

ALIEN, a Subject born in a Foreign Country, who (by our Common Law) is not capable to inherit Lands in England, till Naturaliz'd by Act of Parliament.

ALIENATION, is (in Law) making a thing another Man's, or to alter or put the Possession of Lands, or other things, from one Man to another; and in some Cases a Man hath Power in himself to do so, without the Assent or Licence of any other, and in some not.

ALIFORMES MUSCULI, *Alares, Pterygoide*, are Muscles arising from the Pterygoide Bones (the Process of the *Os Cuneiforme*, partly with a Nervous Beginning, and partly Fleshy; and ending in the Neck of the lower Jaw, and towards the internal Seat of the Head.

ALIFORMES PROCESSUS, are the Prominences of the *Os Cuneiforme*, from the fore Part; the same with the *Pterygoide*.

ALIMENT, is whatever serves to nourish, supply the Decays of, and to recruit an Animal or Vegetable Body.

ALIMONY, formerly signified Nourishment or Maintenance; but in a Modern Legal Sense, it is that Portion or Allowance which a married Woman sues for upon any Occasional Separation from her Husband, wherein she is not charged with *Elopement* or *Adultery*. This was recoverable in the Spiritual Court, but now only in Chancery.

ALIQOT PART of a Number, is such an one as will exactly measure it without any Remainder. But an

ALIQANT PART, is that which cannot measure any Number exactly, but that some Remainder will be left. Thus 3 is an Aliquot Part of 12, because being taken 4 times it will just measure it; but 5 is an Aliquant Part of 12, for being taken twice it falls short, and when taken 3 times it exceeds 12.

ALKAHEST; one of the canting Terms of the *Alchymists*, by which they intend an Universal *Menstruum* that will dissolve all manner of Bodies; and by which they pretend to extract the Sulphur of Metals. Some Chymists have given this mighty Name to the *Tincture*, or *Liquor of Flints*, which is a Solution of them made (after Calcination) by the means of Salt of Tartar; and others to the *Liquor of Fixt Nitre*, which is Nitre calcined and fixed, by burning powder'd Coals with it, and at last run into a *Deliquium*, by being set in a cool Cellar, as Oyl of Tartar per *Deliquium* is made. *Van Helmont* calls this Liquor sometimes *Ignis Gebenne*: He pretends to be Master of it himself, and Mr. Boyle is inclined to believe him. *Helmont* saith, it would dissolve all Bodies, without leaving any *Caput Mortuum*, and was as fit for a new Operation after it had dissolved one kind of Body as at first; it would dissolve Metals, Marchasites, Stones, and even Glass it self when finely powdered.

'Tis found, that the common *Menstruums*, such as *Aqua Fortis*, Spirit of Nitre, &c. when they have once dissolved any Metal, are render'd incapable by it of any further Service, having the Points or Edges of their *Acids* so broken, that they can hardly dissolve any more of the same, or any other Metal. Therefore this immortal *Alkaest* had, in this respect, a wonderful Preheminence, if what they relate of it be true. And to shew that something of this Nature is possible, Mr. Boyle says, That he distill'd a Spirit from Verdigrise, which would serve more than once as a *Menstruum* to dissolve Bo-

dies. or to draw Tinctures, and being drawn off, was ready for the same Operation anew.

ALKALISATE SPIRIT OF WINE; So Mr. Boyle calls a Spirit of that Liquor distill'd from Salt of Tartar, or Tartar calcined to Whiteness: And by so drawing off Spirit of Wine from that Salt, you may get easily a pure and rich dephlegmated Spirit (viz. one that shall burn all away, and fire Gunpowder) after this manner;

Put about an Inch thick of Tartar calcined white, into a Glass as long and slender as you can procure, and then put upon it Spirit of Wine that hath been once rectified, to a Finger's Height above the Tartar; and sitting on a Head, draw the Spirit off in a very gentle Heat; or at least, so much of it as you conclude, or find will come pure, and it will answer your Expectation at the first Distillation. The Tartar being dried and new calcined will serve again for a new Operation. If you cannot procure Tartar, Quick-lime, or the Salt of Pot-Ashes will do tolerably well. *Essay of Unsuccessfulness of Experiments.*

ALKALI, a Chymical Word signifying the fixt Salt of any Plant; and is so call'd, because the Herb called *Kali* which is a kind of a *Sea-blite*, *Glass-wort*, or *Salt-wort*, yields such a Salt in a great Quantity. This fix'd Salt of Plants (which is made by burning the Plant, making a *Lixivium* or Lee of its Ashes; and after filtrating the Lee, evaporating the Moisture over a gentle Heat, that the fix'd Salt may remain at the Bottom of the Vessel) being render'd very Porous by the Fire's passing so often thro' it in its Calcination, and it may be fixing there some of its Essential Salt: And because very many of the fiery Particles do also stick in those Pores, it makes a very great Ebullition or Effervescence when any *Acid Liquor* is mingled with it, and from thence, all Bodies that do, or are supposed to ferment with *Acids*, are now always call'd *Alkalies*, or *Alkalisate Bodies*; not because they must always contain any Hidden Alkali in them; which some Chymists assert as necessary to the Cause of Fermentation; but because they are of the Nature of *Alkalies* themselves, and have their Pores naturally so form'd, in such a Proportion, as that they are fitted to be penetrated and put into a violent Motion by the Points of the *Acid* poured upon them. These fix'd Salts of Plants are called *Fix'd Alkalies*: but the Volatile Salts of Vegetables, because they will ferment with *Acids*, are called *Volatile Alkalies*.

ALKERMES, in Pharmacy, is a Confection described in the *Dispensatory*, and sold in the Shops, and so called from the Arabic Particle *Al* and *Kermes*, which are Red or Scarlet Grains, the chief Ingredient in the Confection.

ALLANTOIS or **ALLANTOIDES**, is the Urinary Tunic placed betwixt the *Amnion* and the *Chorion*, which by the Navel and *Urachus* (or Passage by which the Urine is convey'd from the Infant in the Womb) receives the Urine that comes out of the Bladder: It's called likewise *Farciminales*, because that in many Brutes it's of the Shape of a Gut-pudding, but in Man, and some other few Animals it is round, and like the thin soft Skin which wrapperh the Child in the Womb.

The Ingenious and Accurate Dr. Richard Hale, of *Trin. Coll. in Oxford*, in *Phil. Transact.* N. 271 hath obliged the World with a more perfect Discovery of the Human *Allantoin*; and assign'd the Reasons why those who believed its Existence had not before

fore fully found it out; giving also an Answer to the Objections of those, who even still, deny its Reality.

ALLEGATION, is the Citation or Quotation of any Authority, Book, &c. to make good any Point or Assertion.

ALLEGORY, is a Figure in Rhetorick, consisting of one continued Metaphor, carried on thro' the whole Discourse.

ALLEGIANCIA, is the natural and sworn Allegiance or Legal Obedience which every Subject bears to his Prince.

ALLEGIARE, is to justify and clear himself by course of Law, of the Crime objected to him.

ALLEMANDE, is a kind of grave solemn Musick, where the Measure is full and the Movement slow.

ALLIANCE, properly is a Connection of two Persons or two Families together by Marriage; but it is often extended in a larger Sense, signifie the Leagues, Unions and Treaties made between Princes, &c.

ALLIGATION, is a Rule in Arithmetick (so called from the Numbers being bound or connected together by Circular Lines) relating to the mixture of Merchandizes; as Corn, Wine, Metals, Medicines, &c. one with another; and to the Proportion of the Ingredients in any Quantity of, and the Price of such a Mixture. 'Tis distinguished into two kinds, viz. *Alligation, Medial* and *Alternate*.

Alligation Medial teaches how to find a Mean in the Price, Quantity or Quality between the Extreams; and all Cases in it may be solved by these Propositions and Rules.

1. Having the Quantity of the Ingredients, and the particular Prices, to find the Price or Value of some part of the Mixture.

Rule; Multiply the Ingredients severally by their own Prices, and Divide the Sum of those Products by the Sum of the Ingredients, and the Quotient answers the Question.

2. Having the particular Prices of the Ingredients, and the Sum paid or received for a Mixture bought or sold; to find what Quantity of each was bought or sold.

Rule; Divide the Sum paid or received for the Mixture bought or sold, by the Sum of the particular Prices, the Quotient gives what was required.

3. Knowing the Ingredients of a Mixture, to augment or diminish the Mixture proportionally.

Rule; Sum up the Ingredients; then say, As that Sum is to the Augmentation or Diminution, so is the Quantity of each Parcel of the Mixture to the Quantity of the Mixture desired.

4. Knowing the Nature, Quality, or Fineness of the several Ingredients of a Mixture, to find the resulting Temperament or Fineness of the whole.

Rule; Place the several Quantities of the Mixture in Rows, against which place orderly their several Qualities of Fineness, and multiply each Quantity by its own Quality or Degree of Fineness, then as the Sum of all the Quantities is to the Products of all the Quantities, so is Unity to the Quality or Fineness of Mixture.

Example; There are melted and mixed together two kinds of Silver, one worth 5s. and the other worth 4s. an Ounce, and there were 4 Ounces of the former, and 8 of the latter; what is the value of an Ounce of the Mixture?

s. d.

Oun. s.

Silver $\begin{cases} 4 + 5 = 20 \\ 8 + 4 = 32 \end{cases}$ $12 : 52 :: 1 : \frac{52}{12} (= 4 \frac{4}{3})$

$12 \quad 52$

5. Knowing the Quantities of a Mixture, to find the particular Quantities of any Ingredient in any part of the Mixture.

If the Mixture be compounded of but two things, then say, As the Total of the Ingredients in the Composition, is to the part of the Mixture proposed: So is the Quantity of the Ingredient proposed in the whole Composition, to the Quantity of the Ingredient in the Part desired.

But if the Mixture be decompounded, then you must repeat your Work upon every Mixture.

6. Knowing the Total of a Mixture, with the Total Value, and the Values of the several Ingredients mixed, to find the several Quantities mixed, tho' unequally.

Rule. Multiply the Total of the Mixture by the least Value; subtract the Product from the Total Value, and the Remainder is the first Dividend: Then take the said least Value from the greatest valued Ingredient, and the Remainder is the first Divisor. The Quotient of this Division shews the Quantity of the highest Pric'd Ingredient, the other is the Complement to the Whole: And when more Ingredients than two are in the Composition, the Divisors are the several Remains of the least Value taken from the other. The Dividends are the Remains left upon the Divisions, till o remain there; which will be one fort of the Number of Ingredients, and this defective Ingredient is to be supplied as a Complement; and in Division no more must be taken in every Quotient, than that there may remain enough for the other Divisors, and the last to leave nothing remaining.

II. *Alligation Alternate*, shews the due proportion of every Ingredient entering the Mixture, and counter-changes the Places of such Excesses or Differences as fall out between the Mean Price and the Extreams, ascribing it to the greater Extream which proceeds from the Lesser, and the contrary.

Rule 1. Let every greater Extream be linked with one Lesser.

2. When either of the Extreams be single, and the other Extreams be plural, the single Extream must be linked to all the rest.

3. If both greater and lesser Extreams are not single, then they may be linked so diversly, that sundry Differences may be taken, and Diversities of Answers to the Question, yet all true: But if one of the Extreams be single, there can be but one Answer.

4. The Numbers being linked, take the Difference of each Number from the Mean or common Price, and place this Difference against the Number it is linked to alternately.

5. Every Number linked with more than one, must have all the Differences of the Numbers it is linked to set against it.

6. Those Differences resolve the Question, when the Price of every of the Ingredients is given without their Quantities, and the Demand be to mix them so as to sell a certain Quantity at a mean rate.

7. But when the Quantity of one, with the Price of all the Ingredients is given, and the Demand

mand is to know the Quantities of the other Ingredients, then the *Rule of Three* is to be used.

8. And when the Price of every Ingredient is given, without any of their Quantities, and the Demand be to make up a certain Quantity to be sold at a mean Rate, then all the Differences added together, shall be the first Number in the *Rule of Three*; the whole Quantity to be mixed shall be the second Number; and each Difference apart the several third Numbers: And so many forts mix'd, so many Operations of the *Rule of Three*.

9. A Question may be so propounded, as both Sorts of *Alligation* is needful to the Resolution.

Example.

Suppose a Mixture of Wine of 119 Quarts be required, that must be made up of these several Prices, 7 d, 8 d, 14 d and 15 d, so as the whole may be afforded at 12 d. per Quart.

Having link'd 8 to 14, and 7 to 15, and counterchanged their Difference from the common Price 12 d, I find the Sum of their Differences to be 14, by which dividing 119, the Quotient is $8\frac{1}{2}$ or $8\frac{1}{2}$, or for convenience in Operation $8\frac{1}{2}$.

Quarts.

8	2	$\frac{1}{2}$	2	$\frac{1}{2}$	= 17
14	3	$\frac{1}{2}$	4	$\frac{1}{2}$	= 34
7	4	$\frac{1}{2}$	3	$\frac{1}{2}$	= 25 $\frac{1}{2}$
15	5	$\frac{1}{2}$	5	$\frac{1}{2}$	= 42 $\frac{1}{2}$

14

119

ALLIOTH, the Name of a Star in the Tail of the great Bear, whose Observation is much used at Sea. The Elevation of the Pole or the Latitude may thus be easily found by this Star.

Observe when *Allioth* comes to the Meridian under the Pole, then take the Height of the Pole-Star with a Quadrant, and out of that subtract $2^{\circ} 25'$ the Distance of the Pole-Star from the Pole, the Remainder is the Pole's Height, or the Latitude.

ALLITERATION, (a Figure in Rhetorick) is a repeating and playing on the same Letter.

ALLOCATIONE FACIENDA, is a Writ directed to the Lord Treasurer and Barons of the Exchequer, upon complaint of some Accountant, commanding them to allow him such Sums as he hath by virtue of his Office lawfully and reasonably expended.

ALLOCATION, in Law, is an Allowance made upon an Account.

ALLODIAL Lands are those, for which no Rents, Fines, nor Services are due. Such as *Free-Land*.

ALLODIUM, a Law-term, signifying, every Man's own Land, &c. which he possesseth merely in his own Right, without acknowledgment of any Services, or payment of any Rent to another, which is a property in the highest degree.

ALLOETICKS, are Medicines consisting chiefly of *Aloes*.

ALLOGOTROPHY, with some Writers, is a Disproportionate Nutrition of the Body; when one part (as in the Rickets) is nourished more than the other.

ALLOY, is the Proportion of a Baser Metal mingled with a Finer or Purer; as the Quantity of Copper that is mingled with Gold to make it of a due hardness to be Coined into Money, is called its *Alloy*: And Gold that hath more of this than it ought to have, is said to be of a Courser or Greater *Alloy*. The Proportion of *Alloy* for Gold used in our Mints is about a 12th part.

ALMACANTERS, an *Arabick* Word signify-

ing the same with *Parallels of Altitude on the Globe*: Which see. Some write it *Almicanters*, and others *Almacanters*.

ALMACANTERS STAFF, is an Instrument usually made of *Pear-Tree* or *Box*, with an Arch only of 15 degrees, to take Observations of the Sun, about the times of its Rising and Setting, in order to find the *Amplitude*, and consequently the Variation of the Compass.

ALMONDS of the Throat or the Tonsille; a Glandulous Substance representing two Kernels placed on each side of the Uvula, at the Root of the Tongue. They are covered with the common Tunick of the Mouth, and have Veins and Arteries from the Carotides and Jugulars: They are of a lax and spongy Substance, having several Sinus's within them, in which they contain the Liquor of the Saliva, which they receive from the Bruin, and by dispering it to the Larynx, Jaws, Tongue, and Oesophagus, do moisten and lubricate those Parts. When these are swelled and inflamed by a Cold, &c. they very much straiten the Passage of the Throat, and render Swallowing painful and difficult, and help to make what we call a sore Throat, and as the Country People say, the coming down of the Almonds of the Ears.

ALMUCANTERS, the same with *Almacanters*: Which see.

ALOPECY, is a shedding of the Hair, occasioned by the Pox, or otherwise: So called from a Fox *ἀλώπηξ*, whose Urine is said to make places bald, and barren for a Year, as the Scholiast on *Callimachus* observes; or from a Disease peculiar to a Fox. It is called likewise *ὀψίσις*, from the Figure, because that the parts smooth and destitute of Hair, look winding like a Serpent, in Greek *ὀψίς*. It's common to both these Distempers that the Hair fall of *Areatim*, i. e. by shedding, whence in general this Disease is called *Area*. Blanchard.

ALPHETA, the Name of a Star. See *Lucina Corona*.

ALPHUS, is a Cutaneous Distemper, in which the Skin is rough, and looks here and there as if there were Drops of a white Colour upon it: Some call it *Morpheu*; it differs from the *Leuce*, in that it penetrates not so deep as the *Leuce* doth.

ALRAMECH, a Star's *Arabick* Name, which is the same with *Arcturus*.

ALTERAGE, or **ALTARAGIUM**, is a Word which includes not only the Offerings made upon the Altar, but also the Profit that arises to the Priest by reason of the Altar.

ALTERATION, is, in a Physical Sense, that Motion by which a Body is varied or changed in some Circumstances from what it really was before, tho' as to Sense, its Nature and Bulk appear to continue still the same; so that it consists in the Body's acquiring or losing such Qualities, as whether present or absent, do not essentially change the Subject: And herein it differs from *Generation* and *Corruption*, which Terms express the Acquisition or Loss of the Essential Qualities of any Body. Or otherwise.

ALTERATION, is an *Accidental* and *Partial* Change made in any Body, without proceeding so far as to make the Subject be quite unknown, or to take a new Name or Denomination upon it: Or it may be called the *Acquisition* or *Loss* of such Qualities as are not Essential to the Form of any Body.

ALTERING REMEDIES; such Medicines as serve to purifie and restore the due Mixture of Blood, and other circulating Humours.

ALTERNATE PROPORTION: See the Word *Proportion*, N^o. 8.

ALTERNATE ALLIGATION: See *Alligation Alternata*.

ALTERNATE ANGLES: See *Angles*.

ALTERN BASE, a Term in *Trigonometry*, distinguished from the *True Base*, thus; In Oblique Triangles the *True Base* is always either the Sum of the Sides, (and then the Difference of the Sides is called the *Altern Base*) or the *True Base* is the Difference, and then the Sum of the Sides is called the *Altern Base*.

ALTERNATION, is a Word used by Dr. Wallis, and others for the different Changes or Alterations of Order in any Number of things proposed. Of this that learned Mathematician hath a peculiar Discourse at the end of his *Algebra*. This Alternation is easily found, by only continual Multiplication of all the Numbers beginning at Unity. Thus, if it were required to know how many Changes can be rung on six Bells, you need only write down 1, 2, 3, 4, 5, 6, and then multiply all those Numbers continually one into another, and the last Product gives the Number of Changes, which is 720 Changes.

ALTIMETRY, the Art of taking and measuring of Heights, whether Accessible or Inaccessible: See *Altitudes or Heights*.

ALTITUDE of the Pole: See *Elevation of the Pole*.

ALTITUDE of MOTION, is a Term used by Dr. Wallis in his *Mechanicks*, for the Measure of any Motion, estimated according to the Line of Direction of the moving Force.

ALTITUDES, or Heights of Places perpendicularly above the *Horizon*, are thus found, whether Accessible or Inaccessible, i. e. whether they are such whose Foot or Bottom you can have access to, or such as you cannot come near.

1. To take an Accessible Altitude at one Station.

Let T be a Tower standing upon a level Ground, whose Height is required, your Station being at S, 90 Foot distant from the Basis of the Tower.

First, with a *Quadrant*, *Theodolite*, or some other graduated Instrument for that purpose, from your Station S, take the Angle of Altitude ASC, 25 Deg. 1 Min. Now, you see that the Perpendicular Height of the Tower AC, the Base CS, and the Visual Line SA, do constitute a Right Angled Triangle, wherein there is given the Base B 90 Foot, the Angle at C a Right one, and the Angle of Altitude taken by Observation 25°. 51'. and therefore the Angle SAC, its Complement to 90 Deg. = 64°. 60'. and the Altitude P is required.

Wherefore, by *Cafe* 1. of *Right Angled Plain Triangles*, the Proportion is,

As the Radius, is to the Base; so is the Tangent of the Angle of Altitude, to the Height of the Tower. That is, R : B :: T, S : P.

And the Operation is performed thus:

To the Logarithm of B, 90 F.	1,954242
Add the Tang. of the Angle S, 25°. 51'.	9,685290
The Sum will be	11,639532
From which Subtract the Radius,	10,000000
The Remainder is the Log. of 43 Feet,	1,639532
Which is the Perpendicular Height of the Tower.	

N. B. Here, and in all such Cafes of this kind, Allowance must be made for the Height of the Eye, or Instrument above the Ground.

You may also, having the former Requisites, viz. the Base and Angles, easily find the Hypotenuse H, or how far it is from the Top of the Tower to the Station, by the second *Cafe* of *Right Angled Triangles*; and this will be useful in many Cafes.

On the *Common Quadrant* you have a Line called the *Quadrat*, which hath two Sides, divided each into 100 equal Parts, and that on the Left-hand is called *Right Shadow*, and that on the Right-hand *Contrary Shadow*.

By which means 'tis very easie to take any Accessible Altitude at one Station by the *Quadrat*; for, if the Angle S be just 45, the Distance to the Foot of the Tower from the Station is always equal to the Altitude: But if the Angle be less than that, the String will fall on *Right Shadow* in the *Quadrat*. Then say, as 100 : Is to the Number of Parts of the *Right Shadow*, cut by the String :: So is the Distance : To the Altitude. So that if the String cut 25, 75, or 50, &c. the Height is accordingly $\frac{1}{2}$, $\frac{3}{4}$, or half the Distance.

But when the String falls towards the Right-hand, and the Angle S be above 45°. then say, As the Parts cut by the Thread in the *Quadrat* : Are to 100 :: So is the Distance : To the Height. Wherefore, if the Thread cut 50 here, the Height is double to the Distance; if it cut 25, 'tis 4 times as great as the Distance, &c.

N. B. By applying what is here said of Distances to the Shadow of any Objects; the taking their Height by the Length of their Shadows, will be easily understood.

2. How to take an Inaccessible Altitude at two Stations.

Let AB (see the following Figure) be a Church, Steeple, &c. whose Height is required; your Station being at D, between which and the Basis of the Steeple, there is a River, so that it is inaccessible, that is, you cannot come to the Foot at B.

First, from D with your *Quadrant* (or the like Instrument) take the Angle of Altitude ADB, which suppose 52 Deg. 30 Min.

2. Remove your Instrument to another Station, as to C; where take also the Angle of Altitude ACB, 27 Deg. 30 Min.

3. Measure the Distance between the two Stations D, C, which let be 92,7 Foot.

Now, the two visual Lines DA, CA, together with the Distance DC, do make the *Oblique Angled*

gled Triangled ADC , wherein there is given the Angle ACB , $27^{\circ}.30'$; and by the Angle ADB , $52^{\circ}.30'$ Min. you have the Angle ADC , $127^{\circ}.30'$ Min. its Complement to 180 ; and consequently you have the Angle CAD 25° Degrees, also the Side DC $92,7$ Feet.

So that having the three Angles and one Side given, the Side AD may be found, by Case 3d of Oblique Angled Triangles; for the Analogy is,

$$\text{As } \begin{cases} S. DAC : DC :: S. ACD : AD \\ S. 25,00 : 92,7 :: S. 27, 30 : 101,3 \end{cases}$$

By which means you gain AD , they Hypotenuse of the right angled Triangle ADB ; then in the Right angled Triangle ADB , there being given AD , the Hypotenuse, $101,3$, and the Angle ADB $52^{\circ}.30'$, 'tis easy to find the Perpendicular AB .

By Case 6. of Right angled plain Triangles, for the Proportion or Canon is,

$$\text{As } \begin{cases} \text{Rad.} : AD :: S. ADB : AB \\ S. 90, : 101,3 :: S. 52^{\circ}.30' : 80,3 \text{ Feet.} \end{cases}$$

3, To take the Altitude of a Tower Steeple, &c. or the like, which standeth upon a Hill.

Let HK (see the following Figure) be a Tower standing upon a Hill, and you standing at L , desire to know the Height thereof above the Hill.

First, take the Angle HLM 40° Degrees; as also, the Angle KLM 22° Degrees, 3 Minutes.

Secondly, remove your Instrument to O , and take the Angle HOM 60° Degrees; as also the Angle KOM 39° Deg. 54 Min.

Thirdly, measure the Distance $OL = 132$ Feet.

Now, in the Triangle HOL , you have given the Angle HLO 40° Deg. the Angle HOL 120° Deg. and the Distance LO 132 Foot. Then, by Case 3. of Oblique angled Triangles,

$$\text{As } \begin{cases} S. LHO : OL :: S. HLO : HO \\ S. 20^{\circ} : 132 :: S. 40^{\circ} : 218. \end{cases}$$

Then, by Case 1. of Right angled Triangles, HM is found to be 214 Foot.

Now, in the Triangle HMO , you have given the Angle HOM 60° Degrees, and HO 248 , or the Perpendicular HM 214 Foot, required, the Base MO ; 'twill be, As Rad : $HO :: S. HOM : MO$ 124 Foot.

Also in the Triangle KMO , there is given MO 124 , and the Angle KOM 39° Deg. 54 Min. required KM , which, by Axiom 2. Plain Triangles, is found to be $108,7$ Foot, which being subducted from HM 214 , leaves $105,3$ Foot for the Height of the Tower.

ALTITUDE, in Astronomy, is of the Sun, Stars, or any Planet or Point of the Heavens, an Arch of an Azimuth Circle, contained between the Horizon and any Parallel of Altitude, or between the Star, Planet, or assigned Point in the Heavens and the Horizon.

To find the Sun's Altitude at any time by the Globe, rectify your Globe, and fit the Quadrant of the Altitude; then turn the Globe about till the Hour Index shew the Time of the Day, and stay it there; after which bring the Quadrant to cut the Sun's Place in the Ecliptic, and then that Place shall shew the Altitude on the Quadrant.

To find the Sun's Altitude and Hour of the Day, when he is due, East or West, and above our Horizon, by the Globe.

Having rectified the Globe, and fitted the Quadrant, bring it to cut the true East Point, and then turn the Globe till the Sun's Place in the Ecliptic cut the graduated Edge of the Quadrant, for then that Place will shew the Altitude, and the Index the Hour.

To find the Sun's Altitude on any Azimuth by the Globe.

Set the Quadrant to the Azimuth given, and then turn the Globe till his Place in the Ecliptic touch the Graduated Edge of the Quadrant, so shall that Place give the Altitude on the Quadrant.

By Trigonometrical Calculation.

1. To find the Sun's Altitude when it is due East or West.

Having the Latitude of the Place, and the Sun's Declination given,

Say, *As the Sine of the Latitude : Is to the Radius :: So is the Sine of the Sun's Declination : To the Sine of the Sun's Altitude required.*

Example, Suppose the Latitude be $51^{\circ} 30'$.
And the Sun's Declination $11^{\circ} 31'$
Then to the Ar.co. of the Sine of $51^{\circ} 30'$, 106455
Add the Sine of $11^{\circ} 31'$ 9,300275
Sum the Sine of $14, 49, 9,406730$
Which is the Sun's Altitude that Day when due East or West.

2. To find the Sun's Altitude on any Hour in the Equinoctial.

Say, *As the Radius is the Co-sine of the Latitude, so is the Co-Sine of the Sun's Distance from the Meridian (or Hour from Noon) to the Sine of the Altitude required.*

3. To find the Sun's Altitude at Six.
Say, *As the Radius is to the Sine of the Latitude, so is the Sine of the Declination to the Sine of the Altitude at Six.*

4. To find the Sun's Altitude on any Azimuth.
Say, *As the Radius is the Co-Sine of the Azimuth, so is the Co-Tangent of the Latitude to the Tangent of the Altitude.*

To find the Sun's Altitude at any time, having the Latitude and Declination given ;

Say, *As the Radius is to the Sine of the Sun's Distance from Six, so is the Co-Tangent of the Latitude to the Tangent of the fourth Ark.*

Which 4th Ark, for Hours between 6 and 6 must be subtracted from, or for Hours, before or after Six, must be added to the Sun's Distance from the Pole, and the Sum or Difference shall be a Fifth Ark.

Then as the Co-Sine of the 4th Ark, is to the Sine of the Latitude, so is the Co-Sine of the 5th Ark to the Sine of the Sun's Altitude.

Sir Jonas Moore gives an easier Method for these Problems ; of which this is his Example for the Hour of the Day.

There is given the Complement of the Sun's Height, his Complement of the Declination, and the Complement of the Latitude of the Place : Required the Angle of the Sun's Distance from the Meridian, or the Hour from Noon.

Write all these down thus ;
Complement of the Latitude $38^{\circ} 30'$. $\left. \begin{array}{l} \text{Sine Comp.} \\ \text{Arith.} \end{array} \right\} 0.205850$
Complement of Declination $76. 53.$ $\left. \begin{array}{l} \text{Sine Comp.} \\ \text{Arith.} \end{array} \right\} 0.011481$
Their Difference is $38. 23$
To which add $60. 00$
Comp. of the Alt. $98. 23$
And their Difference is $21. 37$

Then take the Sum which is $49. 11$ Sine = 9.878984
And the half difference, which is $10. 48$ Sine = 9.272726
Then add the two Arith. Compl. and these two Sines all into one 19.369041
Sum, and it will make 9.684520

The Half of which will be 4.842260
Which last Quantity is the Sine of $28^{\circ} 56'$. Double those Degrees and they make $57^{\circ} 12'$. which Sum converted into Time make 3 Hours 51 Minutes ; which is the Time that the Sun wants of being at the Meridian,

or it is the Hour of 8 a Clock 9 Minutes before Noon ; or 3 a Clock and 51 Minutes after Noon.

ALTO & BASSO, (or in *Alto*, & in *Basso*) in Law signifies the absolute Submission of all Differences, small and great, high and low, to a Judge or Arbitrator.

ALUDELS, are Pots used by the Chymists in Sublimations : They are without Bottoms and are fitted into one another as many as there is occasion : At the Bottom (in the Furnace) there is a Pot holding the Matter to be sublimed ; and at the Top there is a Head to receive the Flowers that sublime up thither.

This is the Figure of them.

ALVEARIUM, is the Cavity of the inward Ear, near the Passage which conveys the Sound, where that yellow and bitter excrementitious Stuff is bred, call'd *Eav-Wax*.

AMAIN ; a Word used at Sea when a Man of War giveth Defiance to another Ship, or biddeth her strike her Topmasts or yield ; for to bid a Ship Strike *Amain*, is to order her to let fall her Topmasts.

AMALGAMATE, a Chymical Term signifying the mixing Quicksilver with some melted Metal : The Design of which is either to render the Metal fit to be extended on some Works, as in Gilding, &c. or else to reduce the Metal into a very subtle Powder.

The *Amalgama* of Gold is thus made ; Take a Dram of the Regule of Gold, beat it into very thin little Plates, which heat in a Crucible Red hot in a strong Fire, then pour on it an Ounce of pure Quicksilver ; stir the Matter with an Iron Rod, and when you find it beginning to raise a Fume, which will soon happen, cast it into an Earthen Pan filled with Water ; it will co-agulate and become tractable. Wash it often to take away its Blackness, and pressing from it with your Fingers and in a Linen Cloth, that *Mercury* that remains united with the Gold. The Gold will retain a third thrice its weight of the *Mercury*. If you would reduce the Gold into Powder, put this *Amalgam* into a Crucible over a gentle Fire, and the *Mercury*

ry will evaporate into the Air, and leave the Gold at the bottom in an insensible Powder, which you may melt into its Form again; and if it should retain any Blackness from the Mercury, Oil of Tartar per Deliquium will fetch it off.

For Experiment sake, you may make a *Luminous Amalgama* after this manner.

Put into a long Vial 10 Grains of the *Phosphorus* made from Urine, and pour on it two Drachms of Oil of *Aspike*: The Glass must be large enough for two Thirds at least to remain empty. Heat it a little with a Candle, and the *Phosphorus* will dissolve with an Ebullition: Whilst this Dissolution is making, pour into it half a Drachm of pure Quicksilver, shaking the Glass that the Matter may be stir'd and mix'd. You will have an *Amalgama* which will appear all of a Fire in the Dark; but it must, like the *Phosphorus*, be kept close stop'd from Air, else it will soon be spoiled.

If the *Amalgam* of Gold be design'd to be so hard, 'as to be fit to be powder'd, you must use 3 parts of the Metal, and 2 of Mercury; but if you would have it so soft as to spread, you must use 3 parts of Mercury to one of the other Metal.

AMANSES, a barbarous factitious Word which some of the canting Chymists use for counterfeit Gems, and precious Stones.

AMAUIROSIS, is a dimness of Sight, whether the Object be placed near or at distance; but so that no external Fault appear in the Eye, if you inspect it never so narrowly; the Defect consists in the Obstruction of the Optic Nerve: It is called also *Gutta Serena*. Blanchard.

AMBAGES, an idle Circumlocution, or vain connecting together of far fetch'd Words or Sayings, remote from the true purpose of the Speaker.

AMBE, is a superficial jutting out of the Bones: Also a Chyrurgeon's Instrument, with which disjointed Bones are set again.

AMBIDEXTER (in Law) signifies that Juror or Embracor that takes Moneys of both Parties for giving of his Verdict, for which he forfeits ten times as much as he taketh.

And ordinarily, *Ambidexter* denotes that Man that can equally use both his Hands.

AMBIENT, encompassing round about: Thus the Bodies which happen to be placed round any other Body are called the *Ambient*, and often the *Circum-Ambient* Bodies; and the whole Body of the Air, because it encompasses all things on the Face of the Earth, is often by Physical Writers called, by way of Eminence, *The Ambient*.

AMBIT, of any Figure in Geometry, is the Perimeter, Circumference or Sum of all the Bounding or Encompassing Lines that include it.

AMBLIGONIAL, in Geometry, signifies Obtusangular, or that the Sides of any Plane Figure make an Obtuse Angle one with another. Thus an *Ambigonal Triangle* is that which hath one Obtuse Angle.

AMBLIOPIA, is a dulness or dimness of Sight when the Object is not clearly discern'd at what distance soever placed, and proceeds from an imperfect Obstruction of the Optic Nerves, a light Suffusion, want of Spirits, or grossness of the same, &c. Some reckon 4 kinds of *Ambliopia*, viz. *Myopia*, *Presbytia*, *Nyctalopia*, and *Amaurosis*: Which see under those Words. Blanchard.

AMBLOTICK Medicines, are such as Cause Abortion.

AMBUSCADE, a Place where Soldiers hide themselves to surprize the Enemy.

AMENDMENT (a Common-Law Term) signifying the Correction of an Error committed in a Process, and espied before Judgment, but may be amended by the Justices after Judgment; and if there be Error in giving Judgment, they may not amend it, but the Party is to put in his Writ of Error.

AMERCEMENT, (a Term in Law) is a Penalty ass's'd by the Peers, or Equals of the Party amerced, for an Offence done.

AMERCEMENT ROYAL, is when a Sheriff, Coroner, or other such Officer of the King is amerced by the Justices for Abuse in his Office.

Blunt makes this Difference between *Amercements* and *Fines*; that the latter, as taken for Punishments, are Punishments certain, which grow expressly from some Statute; and *Amercements* are arbitrarily, imposed by *Affessors*.

AMETHIST, in Heraldry, is the Term for the Purple Colour in the Coat of a Nobleman; which in all Gentlemen's Escutcheons below that Degree is called *Purple*, and in those of Sovereign Princes *Mercury*.

AMITERE LEGEM TERRÆ, a Law Term, signifying to lose the Liberty of swearing in any Court, to become Infamous; the Punishment of a Champion overcome or yielding in a Fight, or in Battel, and the Jurors found Guilty in a Writ of *Attaint*, and of a Person outlawed.

AMNESTY, is an Act of Oblivion; such as was granted at King Charles's Restauration.

AMNION or AMNIOS, is the innermost Membrane with which the *Fetus* in the Womb is most immediately covered, and with which the rest of the *Secundines*, the *Chorion*, and *Allantois* is ejected after the Birth; it is whiter and thinner than the *Chorion*. It contains not only the *Fetus*, but the Nutritious Humour, whence the *Fetus* by the Mouth and Throat sucks its Nourishment. It is outwardly clothed with the Urinary Membrane and the *Chorion*, which sometimes stick so close to one another, that they can scarce be separated: Tho' it is not knit to the *Chorion* in any Place, save where the Umbilical Vessels pass thro' them both into the *Placenta*. It hath Vessels from the same Origin as the *Chorion*.

Before the *Ovum* is impregnated, this Membrane contains a Limpid Liquor, out of which, after Impregnation, the Embryo is formed. In it (says *Gibson*) resides the Plastick Power, and the Matters also out of which the first Lineaments of the Embryo are drawn; but because its Liquor is so very little, there Transfuses thro' this Membrane the *Amnion*, a part of the Nutritious Albugineous Humour which is contained in the *Chorion*, which it had imbibed out of the *Uterus*, and by the *Juxta-Position* or Addition of its Humour to undiscernible Rudiments of the Embryo, it receives its Encrease. But tho' the *Amnion* have its additional Nutritious Liquor at first only by Transudation, yet when the Umbilical Vessels and the *Placenta* are formed, it receives it after another manner; for then its Liquor at first being separated from the Mother's Arteries by the *Placenta*, and imbibed by the Umbilical Vein of the *Fetus*, it passes directly to its Heart, from whence, being driven out by the *Aorta*, it is sent forth again, in good part, by the Umbilical Arteries, out of whose Cavities, being plentifully dispersed thro' the *Amnion*, it issues

lies into its Cavity: just as the Juices, which are far more gross and viscid than this, do sometimes critically, and often on taking a Purge, ouze into the Intestines out of the small Mouths of the Arteries: Indeed, here the Intervention of the Glands assist this Matter; but 'tis hoped, some curious Person one time or other will discover, that there are such also in the *Aminion*.

AMORTISE (a Term in Law) is to alien Land or Tenements to any Corporation, Guild or Fraternity, and their Successors, which cannot be done without Licence of the King, and the Lord of the Mannor.

AMOUSES, counterfeit Gems, or Precious Stones.

AMPELITE (in Agriculture) is a kind of Black or Bituminous Earth, used about Vines, to make them thrive the better.

AMPHIBOLOGY, a Grammatical Figure, when our Expressions seem to look one way, and are intended another.

AMPHIBLESTROIDES, or the *Tunica Retina* or *Retiformis* of the Eye, is a soft, white and slimy Substance; which is so named, because that being thrown in the Water it resembles a Net; it shoots from the very Centre of the Optick Nerve, and consists of the Medullar Substance of it, and expanding it self over the *Vitreous Humour*, is extended as far as the *Ligamentum Ciliare*, or the Ligaments of the Eye-lids: This Tunic, in that it is whitish and of a marrowy Substance, seems to proceed from the very marrowy and fibrous Substance of the Optick Nerve; so that it is, as it were, an Expansion of Nervous Fibres, which are there gathered into one Bundle, into a Contexture made like a Net; and indeed if the whole Eye were taken for a Flower, growing, as it were, to the Brain by the Stalk of the Optick Nerve, the *Tunica Retina* would be the very Flower it self, and the two other Tunics, the *Sclerotica* and *Choroides*, be only in the Nature of a Stem. This Tunic seems to be the principal Organ of Sight, and receives the visible Species within the Bed of the Eye much after the same manner as a white Wall, or a piece of a white Paper in a darkned Chamber, receives and represents the visible Species which are intrmitted thro' a little Hole: See *Camera Obscura*.

AMPHIBRACHYS, is the Foot of a Latin Verse consisting of three Syllables, where the two Extrems are short, and the Middle long, as *Amare*.

AMPHIBRANCHIA, are Places about the *Glandules* in the Jaws, which moisten the *Asepera Arteria* and *Stomach*.

AMPHIBIOUS, is used for an Animal that lives both on Land and in the Water, as an Otter, Beaver, &c.

AMPHIMACER, is the Foot of a Latin Verse, consisting of three Syllables; the two Extrems long, and the Middle short; as *Castus*.

AMPHIDÆUM, with some Writers is the Summit or Top of the Mouth of the Womb. *Blanchard*.

AMPHIPROSTYLE, a Term in Architecture for a kind of Temple of the Ancients, which had four Columns in the Front, and as many in the Face behind.

AMPHISCII, so the Inhabitants of the *Torid Zone* are called in respect of their Shadows; because their Shadows fall both ways, viz. to the South (as ours always do to the Northward) when the Sun is beyond them in Northern Signs, and to

the North when the Sun is to the Southward of them in Southern Signs.

AMPHISMELA, is an Anatomical Instrument used in the Dissection of Bones.

AMPHITHEATRE, is a Place built for Acting and seeing of Publick Spectacles and Stage-Plays: The common Theatre was but semicircular, but this was built entirely round, or in a Form of a perfect Circle.

AMPLIATION (in Law) signifies a deferring of Judgment till the Cause be further examined.

AMPLITUDE of the *Sun* and *Stars*, is an Ark of the *Horizon* intercepted between the true *East* and *West* Point of it, and the Center of the *Sun* or *Stars* at their Rising or Setting; and so is either *North* and *South*, or *Orrise* and *Occasus*.

To find the *Sun's Amplitude*, either Rising or Setting by the Globe, bring the *Sun's* Place to the *Horizon* either on the *East* or *West* side, and the Degrees from the *East* Point either *North* or *South*, are the *Amplitude* required.

To find the *Sun's Amplitude* Trigonometrically: having the *Latitude* and *Sun's Declination* given.

Say, As the Co-sine of the *Latitude* is to the *Radi- us*, so is the *Sine* of the present *Declination* to the *Sine* of the *Amplitude*.

Example, Suppose the *Latitude* to be 51 deg. 30 min. and the *Declination* of the same 11 deg. 50 min.

Then, to the Ar.co. of } 50°. 30'. 0, 2058503
the Co-sine of }

Add the *Sine* of - - - - 9, 3118926

Sum is the *Sine* of - - - - 9, 5177429

Which is the *Amplitude* required.

AMPLITUDE MAGNETICAL: See *Magnetical Amplitude*.

AMPLIFICATION (in Rhetorick) is a Figurative Speech aggravating a Crime, enlarging in Praise of another, insisting upon a Relation, &c.

AMPUTATION, is the Surgeon's Term for the cutting off any Member of the Body.

AMULET; any thing that is hung about the Neck or any Part of the Body, supposed to be good against Witchcraft or Diseases. These were called anciently *Prebia*, *Aporopæa*, *Phylacteria*, *Amynteria*, *Alexiteria*, and *Alexipharmaea*.

AMUNITION, in the general, is all Sorts of Warlike Stores and Provisions; especially Powder and Ball.

AMMUNITION-BREAD, in an Army, is that which is provided for and distributed to the Soldiers.

AMY (is a Law Term) signifying the next to be trusted for an Orphan or Infant.

AMYGDALATE, in Pharmacy, is an Artificial Milk, or Emulsion made of blanch'd Almonds, &c.

AMYGDALÆ: See *Tonfille*.

ANA, a kind of barbarous Word used amongst the Writers of Pharmacy, and signifies that an equal Quantity of those Ingredients with which it is connected, is taken for the Composition of any Medicine.

ANABIBAZON, the *Dragon's Head*, or the Northern Node of the *Moon*, where she passes the *Ecliptick* from *South* to *North Latitude*, is sometimes so called.

ANABROCHISMUS, is a way of drawing out the inverted pricking Hairs of the Eye-lids, by means of a Thred of a fine Silk in the Eye of a Needle

Needle, which when you have doubled; you put the Hair thro', and so draw it out.

ANABROSIS, is a consuming or wasting of any Part of the Body by sharp Humours.

ANACAMPTICK, signifies Reflecting; 'tis frequently used in reference to Echoes, which are Sounds produced *Anacamptically*, or by Reflection: And therefore *Anacampticks* is by some taken for *Catoptricks*.

ANACATHARSIS, is a Medicine that discharges Nature by some of the upper Parts; as a thing that provokes to Vomit, to Sneezing, to Salivation, &c. in which last Sense *Hippocrates* used the Word, as *Galen* saith.

ANACATHARTICK MEDICINES, are such as cause Vomiting.

ANACEPHALEOSIS, is a brief Summary or Recapitulation of the Heads of any Matter spoken or delivered in Writing.

ANACHRONISM, an Error in *Chronology*, an undue Connexion of Time, or a false Chroni-
cling.

ANACLATICKS, a part of *Opticks* which treats of all sorts of *Refractions*, and is the same with *Dioptricks*.

ANACOLLEMA, is a kind of Linement or dry Medicine, to be apply'd to the Forehead or Nose, in Diseases of the Eyes, or to stop Bleeding; also a Medicine which will breed Flesh and conglutinate the Parts.

ANACREONTICK VERSE, is a kind of Verse consisting of seven Syllables, without being tied to any certain Law of Quantity; so call'd from its Author *Anacreon*, a *Lyrick* Poet.

ANADIPOLOSIS (a Figure in *Rhetorick*) when one Verse begins with the same Word the last ended with. 'Tis also sometimes used in Medicine, for the Redublication of the Paroxysms or Fits of Feavers; and in this Sense 'tis call'd by some Writers *Epanadiplotis*.

ANADOSIS, is sometimes used for whatever tends upwards in the Body, as a Vomit, &c. but most usually for the Distribution of the *Clyle* thro' the proper Vessels.

ANAGLYPHICK ART, is the Art of Carving, Engraving, or Embossing.

ANAGOGICAL, the same with *Mysterious*, or which hath an elevated, raised, uncommon Signification, or which raises the Mind up to Divine Contemplations.

ANAGRAM, is the Transposition of the Letters of any one's Name, Title, &c. in order to make out from thence something to the Honour of the Person. Thus *Galen* by Transposition is *Angel*, &c.

ANA LEMMA, is a Projection of the Sphere on the Plane of the *Meridian*, Orthographically made by straight Lines and *Ellipses*, the Eye being supposed to be at an infinite Distance, and in the *East* or *West* Points of the *Horizon*.

To describe the Annalemma.

With 60 Degrees of — the Line of Chords, describe the *Meridian* *ZHNb*, which is the *Primitive* Circle.

Then draw the Diameters *ZN* and *Hb* at Right Angles one to another: Then will *Hb* be the *Horizon*;

P the North Pole, elevated above the *Horizon* 51°. 30'.

p The South Pole.

Pp The *Axis* of the World.

Æ æ The *Equinoctial* at Right Angles with *Pp*.

Z The Zenith.

N The Nadir.

ZN The *Axis* of the *Horizon*, the *Prime Vertical* Circle, or *East* and *West* *Azimuth*.

The Annalemma for the Lat. 50°. 30'. North.

At the Distance of 23 Deg. 30 Min. (on the Limb) each way from *Æ* and *æ* draw,

Æb The *Tropic* of *Cancer*.

vs o The *Tropic* of *Capricorn*; draw also

Ævs The *Ecliptic*, and at Right Angles to it

AK The *Axis* of the *Ecliptic*.

Let *Dd* drawn any where parallel to the *Æ* Equator, and representing a Parallel of the *Sun's* Declination, or the *Sun's* Diurnal *Ark* for that Day.

M } the Point of Rising or Setting.
D } the *Sun's* Culminating, or being on the Meridian.

Then will *VM* represent the *Sun's* Amplitude, and the parts of the Parallel.

DM } the *Sun's* Semi-Diurnal } *Ark*,
dM } Nocturnal }

n *⊙* The like Sine of the *Sun's* Right Ascension.

Mn The like *Ark* of his Ascensional Difference.

HD The *Sun's* Meridian Altitude.

LA A Parallel of Altitude or *Almacantar*.

VL or *q*, the Sine of the *Sun's* Meridian Altitude when he is at *L* and at *D*.

To find the Arches of Lesser Circles, which Mr. Oughtred calls *Like Arks*; Say,

As the Semi-Diameter of any Parallel is to the like Distance in that Parallel, so is the Radius of the Primitive Circle to the Sine of the true Distance from the Center.

So that if by this Method, you will find *nM*, the like Sine of the Ascensional Difference.

To the end of the Parallel *Dd*, draw the Radius *VD*, and from the Point *M*, draw *EQ* parallel to *Pp*; that Parallel will cut the Legs of the Triangle *VDn* proportionably; so that

n d :: *n M* :: *VD* :: *VF* (= *VF*) the Sine of the Ascensional Difference.

If the Sum be in the 17th deg. of *Leo*; then he must be 47 deg. distant from the first degree of *Cancer*.

Wherefore

Wherefore set 47 deg. on the Limb, from \odot to \mathcal{Q} 17, and from thence take the nearest Distance to k γ , the Axis of the Ecliptick, and set it from γ to \odot on the Ecliptick, so shall it be the Sine of the Ark \mathcal{Q} 17 k , 43 Deg. or the Sine of the Sun's Distance from the next Equinoctial Point.

To describe the *Azimuths*, Meridians or Hour Circles, which in the *Analemma* are *Ellipses*.

As suppose, to draw an *Azimuth* through the Points Z M N .

Draw as many Parallels as you will to the Horizon, 'twill always be, as

γ b : γ M :: $\mathcal{Q}\mathcal{A}$: $\mathcal{Q}G$:: Pq : q r , &c.

By this means you may find as many Points as you please, as r , G , to describe the *Ellipses*.

To bring which to practice, set the Sector to the Radius of the Parallel, and then from it take the Sine of the *Azimuth's* Meridian or Hour Circle's Distance from the Prime Verticle Z N , and set it from \mathcal{Q} to G , or from q to r , &c. which will find you as many Points as you please, through which the *Ellipses* must pass.

ANALEPTICKS, are Medicines which cherish and renew the Strength; it signifies also a part of *Hygieina*, or the Art of preserving Health, whereby weak Persons are recovered.

ANALOGY, in Mathematicks, is the Comparison of several *Ratio's* together, much the same with *Proportion*, which see. And 'tis frequently used in common Discourse for the Word *Proportion*.

ANALOGISM (in Logick) a forcible Argument from the Cause to the Effect, implying an unanswerable Necessity.

ANALYSIS, a Resolution of any thing into its component Principles: Thus a Chymist is said to *Analyze* Bodies, when he dissolves them by the Fire, and endeavours to find out their Constituent Parts: And *Algebra* is sometimes called the *Analytick Art*, because it teaches us to solve Questions, and to demonstrate Theorems, by enquiring into the Bottom, into the Fundamental Constitution and Nature of the Thing, which is, as it were, resolved into its Parts taken all to Pieces, and then put together again, that so we may see into the Reason and Nature of it. And in this Sense *Analytical* Demonstrations are opposed to *Synthetical* ones, which see. The Ancients had some Knowledge of this Art, but kept it concealed; whose Invention *Theo* ascribes to *Plato*, and he defined it (according as *Vieta* renders it) *Assumpti Quæstii tanquam concessi, per consequentia ad verum concessum*; a taking of that as granted, or confessed which is enquired after, and thence going back by Consequences to what is confessedly true.

ANALYTICK, in Logick, is a part of that Science teaching to decline and construe Reason, as Grammar doth Words. Our famous *Butler* makes his Impertinent Heroe and Scholar *Hudibras*, to be profoundly skill'd in Analytick.

ANAPÆST, is a Latin Verse, whose Feet consist of three Syllables, the last long and the two first short. Such Verses are called.

ANAPÆSTICK VERSES; they are commonly used in *Tragedies*, where are three Feet which are used in all Parts of the Verse indifferently; as,

*Castos sequitur mala paupertas,
Tutiusque potens regnat Adulter.*

ANAPHORA, (a Figure in Rhetorick) is the Repetition of the same found in the beginning of several Sentences or Verses.

ANAPLEROTICK MEDICINES, are such as help to fill Ulcers with Flesh.

ANARCHY, want of all Government in a Nation where there is no Supreme Authority lodged in either Prince or Rulers; but the People live without any Rule or Government at all, and all things are in the utmost Confusion.

ANASARCHA, is a white, soft, yielding Tumour of the whole outward Body, or of some of its Parts, which dents in by compressing the Flesh; it is caused by the Blood upon a double account; first, when it doth not rightly sanguify or assimilate the Chyle; and again, when it is not rightly accended in the Lungs; the Blood thus perverted, pours forth the *Serum* at the Extremities of the Arteries in greater Quantities than it can receive and reduce by the Veins and Lympheducts, or expelled by the Veins and Pores, and other Passages that send it forth. If the Humours be too viscous, it is called *Leucophlegmatia*. *Blanchard*.

ANASTOMATIQUE, (*Medicines*) are such as open and dilate the Orifices of the Vessels, and by that means help to make the Blood circulate freely, and pass easily out of the Arteries into the Veins.

ANASTOMOSIS, is an Effluxion of the Blood, the Lymph or Chyle, at the meeting of Vessels that close not narrowly: It is also taken for the mutual opening of Veins and Arteries into one another.

ANATOCISM, is the annual Increase or Interest of Money, whether *Simple* or *Compound*. And under it, they also comprehend the Valuation of Annuities. See *Interest*.

ANATOMY, is an artificial Dissection of an Animal, especially Man, whereby the Parts are severally discovered and explained, for the use of Physick and Natural Philosophy; and he that is skilful in this Art, is called an *Anatomist*.

ANCHILE, is the back part of the Knee; also the Contraction of a Joint, especially of the *Ham*.

ANCHOR of a Ship, is a thing as well known as the Ship it self, and also its use; but the Terms of Art used at Sea about its several Parts, Kinds and Uses, are as followeth.

The Parts of an Anchor are, (1.) The Ring, into which the Cable is fastened. (2.) The Beam or Shank, which is the longest Part of the Anchor. (3.) The Arm, which is that which runs down into the Ground; at the End of which is, (4.) The Fluke or Fluke, by some called the Palm, being that broad and pecked Part, with its Barbs like an Arrow-head, which fastens into the Ground. (5.) The Stock, a Piece of Wood fastened unto the Beam near the Ring, serving to guide the Fluke, so that it may fall right, and fix in the Ground. There are three kinds of Anchors, the Kedger, the Grapnel, and the Stream Anchor, (which see under those Words). The Anchors aboard a Man of War, are, the First, Second and Third Anchors; and two of which being always carried at the Bow of the Ship, are therefore called the First and Second Bowyer: The other, which is the largest of all, is called the Sheet Anchor, and is their utmost Refuge when in a great Streets of Weather they are forced to ride on a Lee Shore.

When

Fig. 4

A Description of the Anatomical Plate.

FIGURE I.

Representing the Muscles of the Fore-part of an Humane Adult Body.

- a* The *Musculus Frontalis*.
- b* The *Temporalis*.
- c* The *Musculus* called *Masseter*.
- d* The *Deltoides*.
- f* The *Biceps*.
- g* The *Extensor Carpi*.
- h* The *Flexor Carpi*.
- i* The *Extensor tertii Internodii Pollicis*.
- k* The *Flexor Pollicis*.
- ll* The *Musculi Pectorales*.
- mm* The *Musculi Recti* of the *Abdomen*.
- nn* The *Linea Alba*.
- uu* The *Musculi obliqui descendentes* of the *Abdomen*.
- oo* The *Musculus Sartorius*, or *Fascialis*.
- pp* The *Musculi Recti Femoris*.
- qq* The *Triceps*.
- r* Part of the *Musculus Membranosus*.
- ss* The *Vastus internus*.
- t* The *Vastus externus*.

FIGURE II.

Representing the Muscles of the Hinder-part of the Body.

- aa* The *Trapezius Musculus*.
- b* The *Deltoides*.
- c* The *Supra Spinatus*.
- d* The *Infra Spinatus*.
- e* The *Teres Major*.
- f* The *Extensor Brachii*.
- g* The *Musculus Brachialis*.
- h* The outward *Extensor Carpi*.
- i* The other *Extensor Carpi*.
- k* The *Musculus Radii longus*.
- ll* The *Latissimus Dorsi*.
- mm* The *Musculi obliqui descendentes Abdominis*.
- n* The *Musculus Quadratus*.
- oo* The *Gluteus Maximus*.
- p* The *Vastus Externus*.
- q* Part of the *Membranosus*.
- rr* The *Seminervosus*.
- ss* The *Seminembranosus*.
- t* The *Gracilis*.
- u* The *Triceps*.
- x* The *Biceps*.
- y* The *Subpopliteus*.
- zz* The *Gastrocnemii*.
- w* The *Peronæus*.

FIGURE III.

FIGURE III.

Representing the Skeleton of an Adult Humane Body on the Fore-side.

- a* The *Os Frontis*.
- b* The *Os Temporis*,
- c c* The *Osse Nasi*.
- d d* The *Osse Jugalia*.
- e e* The Bones of the Upper-Jaw.
- g* The Teeth.
- f f* The Bones of the Lower-Jaw.
- h h h* The *Vertebra* of the Neck, *Thorax*, and *Os Sacrum*.
- i i* The *Clavicula*.
- k k* The *Scapula*.
- l* The Articulation of the *Scapula*, with the *Os Humeri*.
- m m* The Second Process of the *Scapula*, call'd *Acromium*.
- n n n* The Bones of the *Sternum*.
- o o o* The *Os Humeri*.
- p p* The Upper and Outer Head of the *Os Humeri*, which serves to implant the Ligaments upon.
- q q* The Upper and Inner Head of it, which Articulates with the *Scapula*.
- r r* The Innermost Head of its Lower Appendix, which receives the *Ulna*.
- s s* The Outer Head of the same Appendix, which receives the *Radius*.
- x* The *Ulna*.
- y* The *Radius*.
- z z* The Eight Bones of the *Carpus*.
- A A* The Four Bones of the *Metacarpus*.
- B B* The Four Fingers and Thumb, each consisting of three Bones.
- C C* The *Os Ilium*.
- D* The *Coxendix*.
- E* The *Os Sacrum*.
- F* The *Os Pubis*.
- G G* The *Os Femoris*.
- H H* The Upper Head of it, which is received into the *Acetabulum* of the *Coxendix*.
- K K* The Outer *Trochanters*.
- L L* The two Lower Heads of the Thigh-Bone.
- N N* The *Patella*.
- P P* The *Tibia*.
- Q Q* The *Fibula*.
- R R* The *Talus*.
- S S* The *Os Naviculare*.
- V V* The Five Bones of the *Tarsus*.
- T T* The Fourteen Bones of the Toes.
- 2 2* The *Foramena* of the *Os Ischium* and *Pubis*.

FIGURE IV.

Representing the Back-side of an Humane Adult Skeleton.

- a* The *Os Scincipitis*.
- b* The *Os Occipitis*.
- c* The *Os Squammosum*.
- d* The Lower Jaw.
- e* The *Vertebra* of the Neck.
- f* The *Scapula*.
- g* The *Spina Scapula*.
- h* The Outward Head of the *Os Humeri*.
- i* The *Os Humeri*.
- k k* The *Radius*.
- l l* The *Ulna*.
- m* The Back of the *Os Ilium*.
- n* The Spine of the *Ilium*.
- o* The Protuberance of the *Os Ischium*, whence the Muscles arise which bend the Leg.
- p* The *Os Sacrum*,
- q* The *Os Coccygis*.
- r r* The *Os Femoris*.
- s* The *Trochanter Major*.
- t* The *Trochanter Minor*.
- u u* } The two Inferior Protuberances of
- w w* } the Lower Appendix of the *Os Femoris*.
- x* The *Tibia*.
- y* The *Fibula*.
- 2* The *Os Calcis*.
- 3* The *Os Astragali*.
- 4* The *Os Cuboides*.
- 5* The three *Osse Cuneiformia*.
- 6* The *Osse Metatarsi*.

When the Cable is perpendicular between the *Hawse* and the *Anchor*, the *Anchor* is then said to be *a-peek*. When the *Anchor* hangs right up and down by the Ship's Side, it's said to be a *Cock-Bell* upon the Ship's coming to an *Anchor*. To put an *Anchor* down into the Sea, in order to make the Ship *ride*, is called *letting fall* or *dropping* the *Anchor*. They say an *Anchor* is *foul*, when by the turning about of the Ship, the Cable is hitched about the *Fluke*. An *Anchor* is said to *come home*, when it cannot hold the Ship, but that she drives away by the Violence of the Wind or Tide. To *Shoe an Anchor*, is, to put Boards fitted and formed for that purpose on upon the *Flukes*, that the *Anchor* may the better hold in soft Ground.

The Shank of an *Anchor* is to be 3 times the Length of one of its *Flukes*; and a Ship of 500 Tun hath her Sheet *Anchor* of 2000 Weight; and so proportionably for others smaller or greater.

ANCHORING, or *Anchorage*, is Ground fitting to hold a Ship's *Anchor*, that so she may ride it out safely: The best *Anchoring* Ground is stiff Clay or hard Sand; and the best riding at an *Anchor*, is when a Ship is *Landlocked*, and out of the Tide.

ANCHORAGE, (in Law) is a Duty taken of Ships for the *Pool* of the *Haven* where they cast *Anchor*; for no Man can let any *Anchor* fall on the King's Ground in any Port, without paying for it to the King's Officer appointed by Patent.

ANCHYLOPS, the same with *Aegylops*: Which see.

ANCIENT, is the Flag or Streamer in the Stern of a Ship.

ANCON, is the Top or Point of the Elbow, and is taken also sometimes for the backward and larger shooting forth of the *Ulna*.

ANCONÆUS, a Muscle of the *Cubiti*, called so by *Riolanus* from its Situation. It ariseth fleshy from the inferior and back Part of the *Os Humeri*, growing larger as it marcheth between the superior Ends of the *Ulna* and *Radius*, and is inserted fleshy to the lateral Part of the *Brachii externus*, a Thumb's length below the *Olecranon*: It helps to extend the *Cubiti*.

ANCYLOBLEPHARUM, is the growing of the Eye-lids to the *Tunica Cornea*, or to the *Albuginea*, so that sometimes both the Eye-lids grow together.

ANCYLOGLOSSUM, is when the little String under the Tongue is too straitly tied, so that there is a Difficulty of uttering the Words.

ANCYROIDES, the shooting forth of the Shoulder-Bones in the form of a Beak; which is called *Coracoides*, *Anchoralis* and *Cornicularis*.

ANDRATOMY, is a Dissection of Human Bodies, as *Zootomy* is of those of Beasts.

ANDROMEDA, a Northern Constellation consisting of 27 Stars.

ANDROGYNE, an *Hermophradite*, which is of both Sexes, or both Male and Female: The same with.

ANDROGYNUS, an *Hermophradite*, or one who is *Castrate* and *Effeminate*.

ANGLICISM, is the *English* Idiom, or form of Expression, or manner of Speech which is peculiar to *England*.

ANEMOSCOPE, a Machine invented to foresee the Change of the Air or Wind: I have observed, that *Hygroscopes* made of Cat's-gut (according to the Directions which you will find un-

der that Word) are very nice *Anemoscopes*; and never fail hardly by their turning the Index about to foretel the shifting Wind. But, as *Vitruvius* describes an *Anemoscope*, it shews, that the Ancients rather designed it to shew which way the Wind blew, than to foretel to what Quarter it would shift or change.

AN-JOUR and WAST, is a Forfeiture when a Man has committed petit Treason or Felony, and has Lands held of some common Person, which shall be seized for the King, and remain in his Hands a Year and a Day next after the Attaindure; and then the Trees shall be pulled up, the Houses razed and pulled down, and the Pastorage and Meadows plowed up; unless he to whom the Lands should come by Escheat or Forfeiture, redeem it of the King.

ANEURISM, is a Disease which is a kind of Dilatation or bursting of the Arteries, always beating, and swelling sometimes to the bigness of an Egg, which yields if you compress it, but recoils presently.

The most Accurate and Learned Dr. *Tyson* found in his *Anatomy of the Tazacu or Aperi Mexicanus*, several *Aneurismata* in the *Aorta* or great Artery, which it seems were natural, and which he never saw before in the Arteries of any other Animal: Tho' *Malpighius*, as he observes, took notice of such in the *Aorta* of Silk-worms.

ANGARIA, a Term in Law, signifying any troublesome or vexatious Duty or Service paid by the Tenant to the Lord.

ANGLID, the bare single Valuation or Compensation of a Man or Thing, according to the legal Estimate, from the Saxon, *An* one, and *gild* Payment, Mulet, or Fine; so *Twigild* was the double Fine, *Trigild* the treble Fine, according to the rated Ability of the Person.

ANGIGLOSSUS, one that stuttureth, or hath a Difficulty in his Speech of pronouncing *L*, *R*, or *K*.

ANGINA, a *Quinsey* or *Squinancy*, is an Inflammation of the *Jaws* or *Throat*, attended with a continual Fever and Difficulty of Respiration and Swallowing; and it is two-fold, either *Spuria* or *Exquista*, a bastard or a true *Squinsey*: The latter is again four-fold, *Synanche*, *Parasynanche*, *Clynnache* and *Paraclynnache*, of all which in their proper Places. *Blanchard*.

ANGLE, in Geometry, is either *Plane* or *Solid*.

A *Plane Angle* is the Inclination, Aperture or Distance between two Lines meeting in a Point,

and which, when the Lines forming it (which are called

called its *Legs*) are *Right* or *Strait* ones, is called a *Right Lined* or *Rectilineal Angle*, as *B*; but when the *Legs* are crooked Lines, 'tis called a *Curvilineal Angle*, as *A*; and when one *Leg* is *strait* and the other crooked, 'tis called a *Mixed Angle*, as *C*.

An *Angle* is usually marked with 3 Letters (especially if there be more *Angles* than one at the same Point) wherefore the middle Letter, which is always placed at the Angular Point where the Lines meet, denotes the *Angle*.

The *Quantity*, i.e. the *Greatness* or *Smallness* of an *Angle*, is by no means measured by the Length of its *Legs*, but by their *Distance* from, or *Inclination* to each other. Thus the *Angle B* is less than *A*, tho' the *Legs* of *B* are much longer than those of *A*, but then those of *B* are more inclined to each other, than the *Legs* of the *Angle A*. Which, to conceive the better, imagine

the *Angle A* to be laid upon *B*, as the prick'd Lines about *B* do represent; then 'tis plain, the *Angle B* will easily be contained within *A*; and therefore is less than *A*, because its *Legs* come nearer, or are more inclined towards each other, than those of *A*; and consequently *A* will be a greater *Angle* than *B*, because its *Legs* are farther distant from each other than the *Legs* of *B*. If you imagine the *Legs* to open and shut like those of a Joint Rule, or a Pair of Compasses, the thing will be very plain.

The *Quantity* of any *Angle* is measured by the Number of *Degrees* of the *Ark* of a Circle intercepted between the *Legs* of the *Angle*, whose

Center is the Angular Point. Thus the *Ark* *ab* is the Measure of the *Angle a c b*; and if that *Ark* contain 30 *Degrees*, the *Angle* is said to be an *Angle* of 30 *Degrees*.

A *RECTILINEAL ANGLE* is of 3 sorts.

1. *Right*, when one *Leg* of the *Angle* stands exactly upright, or perpendicularly on the other, as *p c* doth on *cb*; and inclines no more one way than it doth another. And such a *Right Angle* is said to be an *Angle* of 90 *Degrees*, because 'tis measured by an *Ark* that is the 4th part of a

Circle (as you see in the last Figure) and every Circle being supposed to have its whole Circumference divided into 360 Parts (which are called *Degrees*) the 4th Part of that is 90 *Degr.* and therefore a *Right Angle* contains 90 *Degr.*

2. An *Obtuse Angle*, as *a c o*, which exceeds or is bigger than a *Right* one, and is called *Obtuse*, because its Angular Point is blunt.

3. An *Acute Angle*, as *a c b*, which is less than a *Right* one, and is called *Acute*, because its Angular Point is sharp. No *Angle* can contain fully 180 *Degrees*, for then one *Leg* falls into the same *Right Line* with the other, and they make the *Diameter* of the Circle *o b*.

Angles also receive several other Denominations according to their several Positions, their Relation to the several Figures they are in, and the Lines that form them. Some are called

1. *Contiguous*, or *Adjacent Angles*, as *a* and *c*, *c* and *b*, *a* and *d*, &c. which have one *Leg* common to both *Angles*, and are both taken together, always equal to two *Right* ones; for if they are equal, the *Obtuse* one will be as much bigger than a *Right* one, as the *Acute* one is less; and therefore in the whole must make just two *Right*. 13 *e* 1 *Euclid*.

Cor. And from hence 'tis plain, that all the *Angles* that can be made about any Point, are equal but to four *Right* ones.

2. *Opposite* or *vertical Angles*, as, 1. Those that are made by two *Right Lines* crossing each other, and which touch only in their Angular Point. Thus the *Angles a* and *b*, or *c* and *d*, are called *Opposite* or *vertical Angles*, because they are opposed *ad Verticem*, or at the Head; and therefore in some Books are called *Head Angles*. These are always equal one to another, because each, with the *Contiguous* one, makes two *Right Angles*.

An *Angle* also in any *Triangle* is said to be *Opposite* to the Side that subtends it; as the *Angle a* is to the Side *B*. (Fig. *preced.*)

4. In any *Triangle*, as *a e f* (see the same Figure) the *Angle e* and *a* are called *Internal* and *Opposite*, in respect of the *External Angle f*, which is equal to them both.

5. If a *Line* cut two others that are Parallel, the *Angles c* and *d* are called *Internal* and *Opposite* also in reference to the *External* one *a* and *b*, to which they are severally equal.

6. The Angles a and b , as also c and d in every Rectangle or Parallelogram, are called the Opposite Angles; and are always equal to one another,

for the Angle a is equal to the Alternate one e , and e is equal to the Internal and Opposite one on the same Side b , wherefore a is equal to b ; and after the same manner may d and c be proved equal to each other.

ANGLE of Right Ascension, is the Angle which the Circle of the Star's Right Ascension maketh with the Meridian at the Pole of the World.

ANGLE at the Centre of a Circle, is an Angle made there by two Radius's which meet in the Centre.

Proposition.

If standing or insitting on the same Chord, or being in the same Segment, two Angles are formed, as ocd , opd , one at the Center, and the other at the Circumference: The Angle at the Center is always double of that at the Circumference. Of this there are three Varieties.

1. When one Leg of the Angle is the Diameter of the Circle, then 'tis plain the Angle at the Center ocd being external to the Triangle ocp , will be equal to $o + p$ (by 16 e 1. Eucl.) but $o = p$, because the Triangle is an *Isoceles* (5 e. 1.) wherefore $c = 2p$. Q. E. D.

Case 2.

2. When the Diameter divides the two Angles, then 'tis plain, the whole Angle at the Center oco must be double to the whole Angle opo at the Circumference, because its Parts are severally double of the Parts of P (by the 1st Case.)

Case 3. When the Angles fall both on the same Side of the Diameter, then 'tis plain the whole External Angle bcd is $= 2cpd$, and the Part $bco = 2cpo$; wherefore the remaining part ocd , the Angle at the Center, must be double to opd , the Angle at the Circumference. Q. E. D.

And hence are deducible the following Corollaries.

1. All Angles of d and opd standing on the same Ark, or being in the same Segment, are e-

qual, because they are just the Halves of the Angle ocd at the Center.

2. Hence any Angle at the Center c standing on half the Ark ob must be equal to one at the Circumference a , which shall stand on od the whole Ark, or on the double of the former Ark.

3. And from hence 'tis plain, that every Angle in a Semi-circle, as a , must be a Right one, because 'tis equal to c at the Center, which stands on a Quadrant, and is a Right Angle.

4. Wherefore an Angle, as a , made in a Segment less than a Semi-circle, must be *Obtuse*, because 'tis equal to ocb , which is bigger than a Right one.

F 2

5. And

5: And consequently the Angle b made in the Segment $o b d$, which is greater than a Semi-circle, is *Acute*; for the Angle a of the Quadrilateral Figure $o a d b$ inscribed in a Circle, being *Obtuse*, b must needs be an *Acute* one, since the Sum of both is but 2Ls , (by $22\text{e}3$ Euclid.)

Hence may be drawn this Problem for the Bifsection of any Angle or Ark of a Circle; as suppose the Angle CDE , or the Ark CE .

Taking $EA = DE$, on the Center E , make the Ark $FA = CE$, and the Angle $FEA = CDE$, then draw DF , and that shall bisect the Ark CE , or the Angle CDE : For the Angle $FEA (= CDE)$ is double (because an Angle at the Center) to FDA an Angle at the Circumference.

ANGLE of or at the Center, in Fortification, is that which is made by the Concourse of two Lines drawn from the Angles of the Figure.

ANGLE at the Circumference of a Circle, is an Angle made by any two Chords which meet there in a Point.

ANGLE of the Circumference, in Fortification, is the mix'd Angle made by the Arch which is drawn from one Gorge to another.

ANGLE of the Counterscarp, is made by the two Sides of the Counterscarp meeting before the Middle of the Curtain.

ANGLE of the Curtain, or Angle of the Flank, is that which is made by or contained between the Curtain and the Flank in any Piece of Fortification.

ANGLE of the Complement of the Line of Defence, is the Angle proceeding from the Intersection of the two Complements one with another.

ANGLE DIMINISHED, in Fortification, is that which is made by the meeting of the outermost Sides of the Polygon, and the Face of the Bastion.

ANGLE of the Ecliptick with the Vertical Circle, or, as some call it, *Parallactick Angle*, is thus found; As the Tangent of \odot 's distance from *Aries*: Is to Rad :: So is the Tangent of his Declination: To the Co-sine of the *Parallactick Angle*.

ANGLE of Elevation: See Elevation.

ANGLE of the Exterior Figure, or The Angle of the Polygon, is that which is formed at the Point of the Bastion, by the meeting of the two outermost Sides or Bases of the Polygon.

ANGLE of the Interior Figure, in Fortification, is that which is made in the Center of the Bastion by the meeting of the innermost Sides of the Figure.

ANGLE FLANKING, is that which is made by the meeting of the two *Rasant* Lines of Defence, viz. the two Faces of the Bastion prolonged.

ANGLE flanking inward, is the Angle made by the Flanking-Line and the Curtain.

ANGLE FLANK'D, by some called the Angle

of the Bastion, in Fortification, is that which is made by the two Faces, being the utmost part of the Bastion most exposed to the Enemy's Batteries, and therefore by some is called the Point of the Bastion.

ANGLE forming the Flank, is that which consists of one Flank and one Demi-Gorge.

ANGLE forming the Face, in Fortification, is that which is composed by one Flank and one Face.

ANGLE of Incidence: See Incidence.

ANGLE of Inclination in Opticks: See Inclination.

ANGLE of Inclination of the Axis of the Earth to the Axis of the Ecliptick is $23^{\circ} 30'$, and remains inviolably the same in all Points of the Earth's Annual Orbit.

Mr. Keil in his Examination of Burnet's Theory of the Earth, hath shewn the great Wisdom of God in thus placing the Axis of the Earth Obliquely to the Plane of the Ecliptick; for by that means all those who live beyond 45° of Latitude, have more of the Sun's Heat, take all the Year round; and those who live within 45° have less than if the Earth moved always in the Equinoctial, P. 69, &c. And besides, 'tis the Oblique Position that causes all our Diversities of Seasons, and different Degrees of Heat and Cold.

ANGLE of Longitude, is the Angle which the Circle of a Star's Longitude maketh with the Meridian at the Pole of the Ecliptick.

ANGLE of the Meridian and Ecliptick, is found thus; As Rad: T , of the Sun's greatest Declination :: So is the Co-sine of his Longitude or Distance from *Aries*: To the Co-Tangent of the Angle sought.

ANGLE of the Meridian with the Horizon, is thus found; As the Co-sine of \odot 's Declination is to Rad :: So is the Co-sine of the Elevation of the Equinoctial: To the Sine of the Angle required.

ANGLE of the Moat, in Fortification, is that which is made before the Curtain, where it is intersected.

ANGLE of the Parallax: See Parallax.

ANGLE of the Interval of two Places, is the Angle made by the Lines directed from the Eye to those Places.

ANGLE of the Sun's Position, is the Angle made by the Intersection of the Ark of the Meridian Line, with an Ark of an Azimuth, or any other great Circle cutting thro' the Body of the Sun.

ANGLE of Reflection: See Reflection.

ANGLE of Refraction: See also Incidence.

ANGLE of Refraction: See Refraction.

ANGLE Refracted, in Opticks, is the Angle between the Refracted Ray and the Perpendicular.

ANGLE RE-ENTRING, or Re-entrant Angle, in Fortification, is that which retires inward toward the Place.

A N G

ANGLE of a Segment, is an Angle made by the Circumference, and a Right Line cutting it:

Thus here the two mix'd Angles, *a* and *e*, made by the Chord, and the Ark, are called Angles of a Segment.

ANGLE in a Segment, is an Angle made by two Right Lines rising from the Angles of the Segment, and meeting in the Circumference: Thus

the Angle *abc* inscribing or standing on the Chord *ae*, and having its Vertex in the Circumference of the Circle, is called an Angle in the Segment *abc*.

Proposition.

All Angles in the same Segment, or standing on the same or equal Arches or Chords, are equal, because they are just the Halves of the Angles at the Center standing on the same Ark. See Angles of the Center.

ANGLE SAILANT, is that which advances its Point towards the Field. This is called *Soriant* or *Viff*.

ANGLE of the Sun's apparent Semi-Diameter in his nearest Distance to the Earth; Bullialdus found it by two Observations to be 16 min. 45 sec. And the Semi-diameter of the Moon he found to be 16 min. 54 sec. And the Semi-diameter of the Earth's Shadow he found in an Eclipse of the Moon to be 44 min. 9 sec.

ANGLE SPHERICAL, is made on the Surface of the Globe or Sphere by the Interfection of two Arks of great Circles.

ANGLE of the Shoulder, in Fortification, is that which is constituted by the Lines of the Face and Flank.

ANGLE SOLID: See Solid Angle.

A N G

ANGLE made by a Tangent to a Circle and any Chord drawn from the same Point of Contact, is equal to any Angle that can be made in the opposite Segment, 32. e. 3. Euclid.

I say, $\angle rfn = \angle a$.

Draw the Diameter *bf*, and also the Line *br*.

Demonstration.

Because *fb* is a Diameter, the Angle *brf* is a Right Angle; wherefore the Angles *b* and *bfr* together must be equal to a Right Angle.

Also, *bfr* and *rfn* = \angle , because *fn* is a Tangent; therefore take away *bfr* which is common to both, and $\angle b = rfn$.

But the $\angle b = \angle a$, because in the same Segment, wherefore $\angle a = \angle rfn$. Q. E. D.

Also, I say, $\angle ofr = \angle d$.

Demonstration.

The $\angle ofr + rfn = 2 \angle$

And $\angle d + \angle rfd + \angle frd = 2 \angle$

But $\angle rfn = rfd + frd$.

Therefore taking away *rfn* from both, the $\angle d$, will remain equal to the $\angle ofr$. Q. E. D.

Corollary.

Hence 'tis plain, That the opposite Angles (*d* and *a*) of any Quadrilateral Figure inscribed in a Circle, are equal to two Right Angles.

For $d + a = ofr + rfn = 2 \angle$ s.

ANGLE of the Tenaille, or the outward Flanking Angle, called also Angle Mort or the Dead Angle, Angle Reentrant or Angle Inwards; is made by the two Lines Eschant, in the Faces of the two Bastions extended till they meet in an Angle towards the Curtain; and is that which always carries its Point in towards the Work.

ANGLE of the Triangle, in Fortification, is half of the Angle of a Polygon.

ANGLES ALTERNATE, are *o* and *c*, as also *e* and *d* in Figure, N. 5. and are always equal to one another. See 3 Pages back.

ANGLES of a Battalion, are made by the last Men at the ends of the Ranks and Files: And two last Men of the Front and Rear Ranks, are called { Front and } Angles.
Rear

ANGLES EXTERNAL, are the Angles of any Right Lined Figure without it, when all the Sides are severally produced; and they are all taken together, equal to 4 Right Angles: And, in particular, of a Triangle the External Angle *e* is equal

equal to both the Internal and Opposite ones *a* and *b*. See the Demonstration of which under Triangle.

And as to the former part, that the Sum of the External Angles of any Plane Figure is \equiv to 4 \angle s, is plain from hence; that the Sum of all the Angles of any Right-lined Figure both Internal and External, must be \equiv to twice as many \angle s as the Figure hath Sides, (by 13. e. 1. Euclid.) But the Internal ones are \equiv to twice as many \angle s as the Figure hath Sides, except 4. (by Theor. 1. Prop. 32. e. 1. Barrow's Euclid.) wherefore the External Angles all together must be equal to those 4 Right ones.

ANGLES INTERNAL, in general, are all Angles made by the Sides of any Right-lined Figure within. Also the two Angles between the Parallel Lines on each Side the crossing Line, as *o* and *d*, *e* and *c* (in Fig. 5.) are called the two Internal Angles; and are always equal to two Right ones. The Angles *c* and *d* (see Fig. 5.) are also called Internal and Opposite Angles in respect of *a* and *b*, as hath been lately said.

The Sum of all the Internal Angles of any Right-lined Figure, is equal to twice as many Right Angles as the Figure hath Sides, except 4. For since every such Figure from a Point taken within it, can be divided into as many Triangles as it hath Sides, and since the Sum of the Angles of each Triangle is equal to 2 \angle s (32. e. 1. Euclid.) That will make twice as many \angle s as the Figure hath Sides; from which

Sum you must take away all those Angles which are about the Point *c*, which (by 13. e. 1. Euclid.) are equal to 4 \angle s; wherefore the remaining Sum of all the Internal Angles is equal to twice as many Right Angles as the Figure hath Sides, except 4. Q. E. D.

ANGLES OBLIQUE, are such as are either Obtuse or Acute, in opposition to Right Angles.

ANGULAR, is that which relates to or hath Angles.

ANHELATION, a Difficulty in fetching one's Breath.

ANHELOTE, a Term in Law, signifying that every one should pay according to the Custom of the Country, his respective Part and Share.

ANIENTE, a Law Term, signifies frustrated or made void.

ANIMADVERSION, sometimes signifies Correction, sometimes Remarks or Observations made on a Book, &c. and sometimes serious Consideration and Reflection on any Point.

ANIMATION, is informing an Animal Body with a Soul; thus the *Fœtus* in the Womb is said to come to its Animation, when it begins to act like a true Animal, or after the Female that bears it is Quick, as the common way of Expression is.

ANIMA HEPATIS, is *Vitriolum* or *Sal Martis*, Vitriol or Salt of Steel, according to some Chymists.

ANIMA SATURNI, signifies (with some Chymists) the Extract of Lead.

ANIMALS, are such Beings, which, besides the Power of growing, encreasing and producing their Like, as Plants and Vegetables have, are endowed also with Sensation and Spontaneous Motion.

For the more easie and clear Comprehension and Distinction of the several kinds of Animals, Mr. Ray gives two Schemes or Tables of them: The first a general one of all Animals; the second a particular one of Quadrupeds.

Animals are either

- Sanguineous, that is, such as have Blood, which breath either by
 - Lungs, having either
 - Two Ventricles in their Heart, and those either
 - Viviparous.
 - Aquatick, as the Whale-kind.
 - Terrestrial, as Quadrupeds.
 - Oviparous, as Birds.
 - But one Ventricle in the Heart, as Frogs, Tortoises and Serpents.
 - Gills, as all Sanguineous Fishes except the Whale-kind.
 - Exanguineous, or without Blood, which may be divided into
 - Greater, and those either,
 - Naked
 - Terrestrial, as naked Snails,
 - Aquatick, as the Poulp, Cuttle-Fish, &c.
 - Covered with a Tegument, either,
 - Crustaceous, as Lobsters and Crab-fish.
 - Testaceous, either,
 - Univalve, as Limpets.
 - Bivalve, as Oysters, Muscles, Cockles.
 - Turbinate, as Periwinkles, Snails, &c.
 - Lesser, as Insects of all sorts.
- Viviparous Hairy Animals or Quadrupeds, are either
 - Hoof'd, which are either,
 - Whole-footed or Hoof'd, as the Horse and As.
 - Cloven-footed, having the Hoof divided into
 - Two principal Parts, called Bifcula, either
 - Such as chew not the Cud, as Swine.
 - Ruminant, or such as chew the Cud, divided into
 - Such as have perpetual and hollow Horns,
 - Beef-kind,
 - Sheep-kind,
 - Goat-kind,
 - Such as have solid, branched, and deciduous Horns, as the Deer-kind.
 - Four parts, or Quadrisfulca, as the Rhinoceros and Hippopotamus.
 - Claw'd or Digitate, having the Foot divided into

Two Parts or Toes, having two Nails, as the Camel-kind.

Many Toes or Claws; either

Undivided, as the Elephant.

Divided, which have either

Broad Nails, and an Human Shape, as Apes.

Narrower, and more pointed Nails, which in respect of their Teeth, are divided into such as have

many Fore-teeth or Cutters in each Jaw;

The Greater, which have

A shorter Snout and rounder Head, as the Cut-kind;

A longer Snout and Head, as the Dog-kind.

The Lesser, the Vermin or Weasle-kind.

Only two large and remarkable Fore-teeth, all which are Phytivorous, and are called the Hare-kind.

ANIMALCULA, are very small Animals, such as by the Microscope have been discovered in most Fluids, of which there are prodigious Numbers in Black-Pepper Water, and as I have often seen also in Water wherein Barley, Oats, and especially Wheat, hath been steeped for about 4 or 5 Days.

ANIMATED MERCURY; so Mr. Boyle calls a Mercury, which by being impregnated with some Subtile, Agile and Spirituous Particles, is rendered capable of growing hot when mingled with Gold; and such also he calls *Incalescent Mercuries*.

ANIMATED NEEDLE, is one touch'd with a Load-stone.

ANI SCALPTORIS MUSCULIPAR, is the Muscle called also *Latissimus Dorsi*, from its largeness; its Use is to draw the Arm backward and downward, and therefore is called *Ani Scalptor*, because it helps to scratch the Breech.

ANKRED, so the Heralds call one of their Crosses in a Coat of Arms, whose Figure is this.

ANNALS, are a Chronological Account of the Remarkable Events of a State, yearly, as the Annals of Tacitus: they differ from History, because this descants upon those Events, and on the Causes that produced them. The Writer of such an History is called an *Annalist*.

ANNATES, (a Law Term) signifying the same with *First-Fruits*: The Reason of the Name is, because the Rate of *First-Fruits* paid to Spiritual Livings, is after the Value of one Year's Profit.

ANNIENTED, a Term in Law, signifying as much as frustrated or brought to nought.

ANNIHILATION, is the destroying utterly, or turning of any created Being into nothing.

ANNUA PENSIONE, is a Writ whereby the King having due unto him an Annual Pension from an Abbot or Prior, for any of his Chaplains (whom he should think fit to nominate, being as yet unprovided of sufficient Liberty) did demand the same of the Abbot or Prior; and also willed him, for his Chaplain's better Assurance, to give him his Letters Patent for the same.

ANNUAL EQUATION, or mean Motion of the Luminaries: See *Equation*.

ANNUALIA, formerly a Yearly Stipend assign'd to a Priest, for keeping the Anniversary, or

otherwise for saying continued *Masses* one Year, for the Soul of the deceased Person.

ANNUATES MUSCULI, a pair of Muscles at the Root of the Transverse Vertebra of the Back, described by Mr. Couper, and called by him *Recti Interni Minores*, because they lie under the *Recti Majores*; and he thinks they may very properly have this Name of *Annuates*, because they serve to nod the Head directly forward.

ANNUITY, is a Yearly Rent to be paid for Term of Life, or Years, or in Fee: In Common-Law, the Difference between a Rent and an Annuity is this, That Rent is payable out of Land, Annuity charges only the Person of the Grantor. For the Valuation of *Annuities*: See *Interest*.

An Annuity cannot be taken for *Affees*, because 'tis no Freehold in Law; nor can it be put in Execution on a Statute Merchant, Statute Staple, or Elegit, as a Rent may.

ANNULAR CARTILAGE, the second Gristle of the Larynx, which is encompassed by it, as it were with a Ring.

ANNULARIS PROCESSUS, is a Protuberance made by the meeting of the Processes of the *Medulla Oblongata*, under the Side thereof.

ANNULET, a little Ring, which in Heraldry is the Mark of Distinction which the Fifth Brother of any Family ought to bear in his Coat of Arms. *Anulets* are also part of the Coat-Armour of several good Families.

ANNULETS, in Architecture, are small square Parts turned about in the Corinthian Capital, under the *Echinus* or Quarter-round.

ANNULAR PROTUBERANCE, is with the Anatomists a certain part of an Human Brain lying between the *Cerebellum* and the two backward Prominences. The same with the *Annularis Processus*.

ANODYNES, (in Medicine) are such Remedies as alleviate or quite take away Pain. They are sometimes also called *Paragoricks*, from the Comfort and Quiet that they procure to the Patient: If they are of such a Nature as to produce Sleep, they are called *Hypnoticks*; if they stupify and take away the Sense of Pain, they are called *Narcoticks*.

ANOMALY, is an Inequality or Irregularity in the Motion of the Planets. In *Phil. Trans.* N. 57. you have a way to find it Geometrically

by Mr. *Cassini*. The Word *Anomaly* is sometimes used to signify the *Argument* of the Irregularity, and the *Equation* which should adjust it. This Irregularity is most considerable in the *Moon's* Motion, and it must be adjusted before the exact time of her Conjunction with the Sun can be found, and consequently an Eclipse truly calculated.

The Angle ACQ , or its equal ATM , is the *Argument* or the *Mean Anomaly* of the *Moon*; and the Angle ATQ is the *True* or *Co-adequated Anomaly*: See *Mercator's Astronomy*, P. 69.

ANOMALY of the Orbit, is the Arch or Distance of a Planet from its *Aphelion*. The *Mean*

ANOMALY of the Center, in the *Ptolemaick Theory* of the Planets, is an Ark of the *Zodiack* of the *Primum Mobile* terminated by the *Linea Apfidiom*, and by the Line of the *Mean Motion* of the Center. The *True*

ANOMALY of the Center, is the same Ark of the *Zodiack* terminated by the Lines of the *Apses*, and by the Line of the *True Motion* of the Center.

ANOMALY (true or equal) of a Planet, is an Ark of the Eccentric comprehended between the true Place and the *Apogee*.

ANOMALY, *Mean* or *Equable* of a Planet in the *New* or *Elliptical Astronomy*, is the Area contained under the Line SL drawn from the Sun to the Planet, under SA and LA , computed from SA , in *Consequentia*, or according to the Natural Order of the Signs. They call it the *Equable*, *Mean* or *Middle Anomaly*, because this Area increases equally, or in Proportion to the Time of the Planets Revolution round the Sun in the Focus S .

The Angle ASL under the Line of the *Apses* AP , and the Line LS , which is that of the Planets Motion, is called the *Anomaly Co-equated*, or *True*, in this *Astronomy*.

ANOMALY, (*Mean*) of the Sun or other Planet, in the old *Astronomy*, is an Ark of the *Ecliptick* between its mean Place and *Apogee*. This is call'd the *Argument*.

ANOMALY, is also used by the Grammarians, and is apply'd to such Words as do not in their Formation or Variation, agree with a common Rule; as *do*, *dedi*, *datum*, where the *Imperfect Tense* and the *Participle* are both *Anomalous*, that is, *Irregular*.

They reckon 4 kinds of *Anomalous Nouns*, *Heterogeneous*, *Heteroclitcs*, *Deficients*, and *Redundants* or *Abundants*, which see.

ANOMALOUS, is the same with *Irregular*, and is spoken of a Motion in the Planets that is Unequal or Irregular.

ANONYMOUS, *Nameless*, to which no Name is affixed. Mr. Boyle finding by Experiment, that a Spirit was separable from *Tartar*, and several Woods, which in many Qualities differed both from the *Vinous*, *Acids*, and *Urinous ones*, and having not fully discovered its Nature, he called it by this Name *Anonymous*, and sometimes the *Neutral* or *Adiaphorous Spirit* of *Tartar*, *Wood*, &c.

ANOPSY, is want of Sight, or Blindness.

ANOREXY, is a loathing of Meat, arising from an ill Disposition of the Stomach.

ANOYANCE, the same with *Nuisance*.

ANSES or **ANSE**, the same with the Ring of Saturn; so called, because they sometimes appear like Handles to the Body of the Planet. See *Ring*. Anno 1668, August 17th, 11 h. 13m. P. M. Mr. *Hugens* and Mr. *Picart*, by the Help of a 21 Foot Telescope, found the Inclination of the great Diameter of the Ring of Saturn, with the *Equator*, to be about 9 Degrees; whence they inferred, the Angle of the Plane of the Ring, with that of the *Ecliptick*, must be about 21 Deg. See *Saturn*.

ANTAGONIST, he that in Disputation, or Arguing opposes another.

ANTAGONISTA, is a Muscle placed oppositely to another; as may be seen betwixt the *Adductor* and *Abductor*, that which contracts, and that which expands the Arm.

ANTANACLASIS, a Figure in Rhetorick, where the same Word in appearance is repeated in a various Signification.

ANTAPHRODITICK MEDICINES, are such as are used for the *French Pox*.

ANTARES, the *Scorpion's Heart*, a fix'd Star of the first Magnitude in the Constellation *Scorpio*; its Longitude is 245. 13'. Latitude 4°. 27'.

ANTARTICK POLE, is the Southern Pole, or End of the Earth's *Axis*; 'tis so called because opposite to the *Arctic* or North Pole.

ANTARTICK CIRCLES: See *Polar Circles*.

ANTARTHRITICK MEDICINES, are such as are used against the Gout.

ANTASTHMATICK MEDICINES, are such as are used against the *Asthma*.

ANTECEDENCE IN, or in *Antecedentia*: The Astronomers say, a Planet is in *Antecedence*, when it appears to move contrary to the usual Course or Order of the Signs of the *Zodiack*, as when it moves from *Taurus* towards *Aries*, &c. but if it go from *Aries* to *Taurus*, and thence to *Gemini*, &c. they say, it goes in *Consequentia*, or in *Consequence*.

ANTECEDENT, (in Logic) is the first of the two Propositions in an *Enthymema*, as the latter is called the *Consequent*.

ANTECEDENT, in Mathematics, is the former of two Terms in Proportion, or that which is compared with the other; thus, if the Proportion were of A to B , A is said to be the *Antecedent*.

ANTEMETICKS, are Medicines given against Vomiting.

ANTES, in Architecture, are square Pilasters which the Ancients used to place at the Corners of the Walls of their Temples.

ANTESTATURE, is a small Retrenchment made of *Palisadoes*, or Sacks of Earth set up in haste to dispute with the Enemy the remainder of a

Piece

piece of Ground, part whereof hath been already gained.

ANTHELIX, is the Protuberance of the Ear, or the inward Brink of the outward Ear, being a Semicircle within the *Helix*, and almost parallel to it.

ANTHELMINTICKS, are such Medicines as destroy Worms.

ANTHERÆ, are those little Tops or Knobs which grow on the Tops of the *Stamina* of Flowers, and are often called *Apices*: which see. Mr. Ray Englishes them *Chives*.

ANTHOLOGY, is a Discourse or a Treatise of Flowers, or the Art of a true Florist.

ANTHRACOSIS OCULI, is a corrosive scaly Ulcer in the Eye, attended with a general Tumour, especially of the Parts about the Eye.

ANTHRAX, *Carbo*, *Pruna*, or *Carbunculus*, is defined to be a Tumour that arises in several places surrounded with hot, fiery, and most sharp Pimples, accompanied with acute Pains, but without ever being separated; and when it spreads it self farther, it burns the Flesh, throws off Lobes when it is rotten, and leaves an Ulcer behind it, as if it had been burnt in with an Iron. *Blanchard*.

ANTIAS, in the plural *Antiaes*, are the Glands called the *Tonfills* or the Almonds of the Ears.

ANTIAPHRODITICKS, are Medicines that lay Lust.

ANTIARTHRITICKS, are Medicines against the Gout.

ANTIASMATICKS, Remedies against shortness of Breath.

ANTIBACHIUS, is a Latin Verse whose Feet consists of three Syllables, the two first long, and the last short.

ANTICARDIUM, the same with *Scrobiculus Cordis*.

ANTICTHONES, the same with *Antipodes*.

ANTICKS, in Architecture, are certain carved Works representing divers odd Shapes of Men, Beasts, Birds, Fishes, Flowers, *etc.* which being rudely determin'd and form'd one out of another, serve as an Ornament to the whole Fabrick, and afford a grateful Variety to the Eye of the Beholder.

ANTIDILUVIAN, is whatever was before Noah's Flood: Thus those Generations from *Adam* which were before the Flood, are called the *Antidiluvians*, as those since descended from Noah are called the *Post Diluvians*. The Earth that then was before it was destroyed by the Flood, and which the ingenious and learned Dr. *Tho. Burnet* conceives to have been very different from ours in Form, Constitution, Figure and Situation, is called the *Antidiluvian Earth*.

But Dr. *Woodward* in his *Natural History of the Earth*, undertakes to prove from a Series of Observations carefully made,

1. That the Face of the Earth before the Deluge was not as the Theorist imagines, *Smooth, Even, and Uniform*, but as it is now, *Unequal, distinguished into Mountains, Valleys and Plains*, as also having a Sea, Lakes and Rivers.

2. That this Sea was Salt as ours is, agitated by Tides replenished with Fishes of all kinds, and that the Ocean then was nearly of the same Extent, and possess'd an equal share of the Globe with the present one.

3. That the *Antidiluvian Earth* was stock'd with Vegetables and Animals on all sides and in all Parts of it quite round the Globe; had both Metals and Minerals in it; had the same Position in respect of the *Sun* which ours now hath, its *Axis* being not parallel, but inclin'd as at present, to the Plane of the *Ecliptick*; and consequently there were then the same Succession of Heat and Cold, Wet and Dry, and the same Vicissitudes of Seasons, *Spring, Summer, Autumn and Winter*, as there are now.

ANTIDOTE, a Medicine against deadly Poison.

ANTIEPILEPTICKS, are Remedies against the Falling sickness.

ANTIEMETICKS, Remedies that stop Vomiting.

ANTI-HECTICUM POTERII, or *Jupiter's Diaphoretick*, is a Chymical Medicine made by the Mixture of *Tin*, the Martial Regulus of *Antimony*, and fixed by *Salt-Petre*. See the Operation in *Lemmer's Chymistry*, last Edit. p. 117.

ANTHYPNOTICKS, Medicines that drive away Sleep.

ANTI-HYPOCHONDRIACKS, are Medicines used against the *Hypochondriack Melancholly*.

ANTI-LOGARITHM, the Complement of the Logarithm of any *Sine, Tangent, or Secant* to 90. *De*.

ANTI-LOGY, is a Contradiction between any Words or Passages in any Author.

ANTI-METRICAL, is whatever is contrary to the Nature and Order of Metre or Verse.

ANTIMONIUM DIAPHORETICUM, is made of one part of *Antimony* and 3 of *Salt-Petre*, powdered and mixed together, and thrown Spoonful by Spoonful into a red hot Crucible, a Detonation will follow each Spoonful; when all is put in, continue a great Fire about the Crucible for about two Hours; then throw the white Matter into an Earthen Vessel of fair Water, and leave it steeping warm for about two Hours, that all the *Salt-Petre* may be dissolved; then pour off the Liquor gently, and wash several time the white Powder at the Bottom; which is the *Calx of Antimony*, or *Antimonium Diaphoreticum*. Some use it as a *Diaphoretick*; but *Lemmer* saith, he could never find it would raise a Sweat.

ANTIMONIUM MEDICAMENTOSUM, is a Preparation consisting of 5 Ounces of *Antimony*, 1 Ounce of *Salt of Tartar*, and 4 Ounces of *Salt-Petre* fluxed together into a *Regulus*, which is afterwards powdered and wash'd.

ANTIMONIUM RESUSCITATUM, is made of equal parts of *Antimony* and *Salt Armoniac* sublimed together three times; then the Sublimate is wash'd with distill'd *Vinegar* warm to get out the Salts.

ANTINEPHRITICK, is a Medicine good against the Stone.

ANTINOMASY, is a Figure in Grammar, or rather Rhetorick, whereby an Appellative is used instead of a proper Name; as the *Philosopher* instead of *Aristotle*, &c. and whatever is thus delivered or spoken, is said to be so delivered or spoken *Antonomastically*.

ANTINOMY, is a Contradiction between two Laws.

ANTIÆCI, are such Inhabitants of the Earth as dwell one against another in the same Semicircle of the same Meridian, and in the same De-

gree of Latitude, but one North, the other South. These have Noon and Midnight at the same time, but the Seasons of the Year are contrary; as when the Northern *Antiaci* have their Summer, the Southern have Winter, &c. In one Word, they live under the same Meridian, but opposite Parallels.

ANTIPAGMENTS, (in *Architecture*) are the Garnishing of Posts or Pillars.

ANTIPASIS, the same with the *Revulsion* of a Disease, when the Humours flowing into some one Part, are turned back again, and forced to take some other Course.

ANTIPERISTASIS, according to the *Peripatetics*, is a certain Invigoration of the Internal Heat of any Body, by its being invironed all round with Cold. They instance in Lime growing hot on the Effusion of cold Water, &c.

ANTIPERISTALTICK, is a Motion by which the Excrements of the Guts are carried upwards instead of downwards, which is the usual and natural *Peristaltick Motion*. See that Word.

ANTIPHARMACUM, the same with *Antidote*, is a Medicine that expels Poison.

ANTIPHHRASIS, a figurative Speech, having a contrary Meaning to what it carries in Appearance.

ANTIPILEPTICKS, are Medicines against the Falling-Sickness.

ANTIPODES, are such Inhabitants of the Earth as live diametrically opposite to one another, that is, in Parallels of Latitude equally distant from the Equator, but one North, the other South; and under the same Meridian, though 180°. or just half of that Meridian distant from one another.

ANTIPRÆDICAMENTS, in Logick, are such Notions as are previously necessary to understand the Doctrine of the Prædicaments; such as the Definitions of Univocal, Equivocal, and Denominative Terms, &c.

ANTIPTOSIS, a Figure in Grammar, wherein in one Case is put for another.

ANTISCH, is a Term in Geography, signifying such Inhabitants of the Earth as live in two Places opposite to one another, one on the North, the other on the South Side of the *Æquator*; so that their Shadows at Noon fall different ways, one directly opposite to the other.

ANTISCORBUTICK, are Medicines against the Scurvy.

ANTISTROPHE, is a Figure in Grammar, whereby two Terms of Things which are mutually independant one upon another, or reciprocally converted; as if one should say, the Master of the Servant, and the Servant of the Master.

ANTISPASMODICKS, are Remedies against Convulsions.

ANTITHENAR, one of the Muscles that extends the Thumb.

ANTITHESIS, in Rhetorick, is a setting two things by way of Opposition one against another, that is the Excellence of one, and the Evil and the Folly of the other may the better appear.

ANTITRAGUS, a little Prominence at the lower end of the *Antihelix*, seated opposite to the *Tragus*, whence it has its Name.

ANTÆCI, the same with *Antiaci*, which see.

ANTONOMASIA, (a Trope in Rhetorick) is when the proper Name of one thing is applied

to several others; or on the contrary, the Name of several things to one.

By this Trope we call any voluptuous Person a *Sardanapalus*, and any cruel Person a *Nero*, for the one was a voluptuous King, and the other a cruel Emperor; Or when we say, the Philosopher has prov'd it in his *Metaphysics*; The Orator gives this Precept in his *Rhetorick*; we mean *Aristotle* and *Cicero*.

ANUS, is the Extremity of the *Intestinum Rectum*; it consists of three Muscles, two called the *Levatores*, which distend and open the *Anus* in order to discharge the Excrements; and one called the *Sphincter*, which shuts it and keeps it so. There is also a Cavity in the Brain called *Anus*, which arises from the four Trunks of the *Spinal Marrow*; and by some the Skin which goes over the Navel, in aged Persons becoming wrinkled, is called *Anus*.

AORTA, or great Artery, so called because it is the greatest Artery in the whole Body, from which all others (except the *Pulmonary*) are deriv'd: It rises immediately out of the left Ventricle of the Heart, and at its rise hath three Valves, which have the same Use and Figure as the *Semilunares* in the *Arteria Pulmonaria*. As soon as the *Aorta* comes out of the Heart, it ascends a little upwards, and then turns downwards to form the descending Trunk, because the Blood might offend the Brain, if it ran with that impetuosity with which it's thrown out of the Heart; and from the upper side of this turning, the *Cervical* and *Auxillary* Vessels do arise: By this Artifice, as the Blood collides against the sides of the *Aorta*, its force is broken, part of it is taken in by the Mouth of the ascending Branches, but its greatest part is directed downwards. At the rise of the *Coronaria* out of the *Aorta*, there is a Valve placed that permits the Blood to flow out of the great Artery into them, but hinders its reflux. When it has pierced the *Pericardium* and bended a little Arch-ways backwards, it is divided into two Trunks, whereof the one is called *Truncus Ascendens*, the other *Descendens*.

The *Aorta* hath four Tunicks, a Nervous, a Glandulous, a Muscular, and a Membranous one, which is the Internal. See *Arteries*.

APAGOGICAL DEMONSTRATIONS, are such as do not prove the thing directly; but shew the impossibility and absurdity which arises from denying it, and therefore 'tis usually called *Reductio ad impossibile, vel ad Absurdum*.

APATHY, is an utter want of Passion.

APEPSIE, bad Digestion or rawness of Stomach, when there is no good Concoction of the Aliments.

APERIENS PALPEBRAM RECTUS, is a Muscle so called from its freight Progress and Use. It arises sharp and fleshy from the profoundest Part of the *Orbis*, near the Place where the Optick Nerve is transmitted, passing directly over the *Musculus Atrolens*, it becomes Tendinous as it marches over the Bulb of the Eye, whence growing still broader and thinner, till it is inserted to the whole superior part of the upper Eyelid.

APERITIVE MEDICINES, or such as open the obstructed Passages in the small Vessels, Glands or Pores, and by that means promote a due Circulation of the contained Juices.

APERTURA FEUDI, a Term in the Civil Law, signifying the loss of a Feudal Tenure by Default

Default of Issue of him to whom the *Feud* was first granted or given.

APERTURE, in some Writers of Geometry is the Inclination of one Right Line to another, which meet in a Point and form an Angle. And 'tis so called, because the Angle is the *opening* of the Legs of the Angle, like those of a Joint Rule.

APERTURE, in Opticks, is the Hole next to the Object Glass of a Telescope or Microscope, thro' which the Light and Image of the Object comes into the Tube, and thence is carried to the Eye. Mr. *Auzout* saith, he found that the *Apertures* of Telescopes, ought to be nearly in a Subduplicate Proportion of their Lengths.

The visible *Area* of an Object, is not encreased or diminished by the greater or lesser *Aperture* of the Object Glass; all that is effected thereby, is the admittance of more or less Rays, and consequently the more bright or obscure appearance of the Object. When you look at *Venus* thro' a Telescope, you must use a much less *Aperture* than for the *Moon*, *Jupiter* or *Saturn*, because her Light is so vivid and glaring.

APETALOUS Flowers or Plants, are by the Botanists accounted such as want the fine coloured Leaves of Flowers which they call *Petala*: These Flowers are otherwise called *Stamineous*, and are justly reckoned *Imperfect*.

APEX, is the top, point, uppermost or sharpest part of any thing.

APHÆRESIS, in Grammar, is that Figure which takes away a Letter or a Syllable from the beginning of a Word.

In Surgery, is that part which teaches to take away Superfluities.

APHELIUM, or *Apelton*, or *Auge* in the *Copernican Hypothesis*, is that point of the Earth's or any other Planet's Orbit, in which it is the farthest distant from the *Sun* that it can ever be; and when 'tis at its nearest distance, it is said to be in its *Perihelion*.

Sir *Isaac Newton* proves the *Apheia* of the Planets as well as the Nodes to be at rest, *Prop. 14. Book 3.*

In *Philos. Trans. N. 128.* is a strict Geometrical Method for finding the *Apheia* of the Planets by Mr. *Halley*.

APHORISM, is in a general Rule, or eminent but short Observation, experienced for a Truth in any Art, or relating to Practice.

APHTHÆ, are Wheals, Ulcers or Pimples about the Internal Parts of the Mouth; as also about the Ventricle and Guts, which when they come to be ripe, fall off by piece-meal, and are often accompanied with a Fever in those of riper Years. Infants are often subject to the *Aphthæ*, they begin in the Gums, and by degrees spread over the whole Palate and Mouth; if they seize the Epiglottis and the upper parts of the Throat, the Child seldom recovers. These are called *Aphthæ* of *Celsus*.

APICES, of a Flower, are those little Knobs that grow on the Tops of the *Stamina*, in the middle of the Flower: They are commonly of a dark purplish Colour. By the Microscope they have been discovered to be, as it were, a sort of *Capsule Seminales* or *Seed Vessels*; containing in them small Globular, and often Oval Particles, of various Colours, and exquisitely formed, as I have often with Admiration observed my self: In the Plant called *Germanium Robertianum* or *Herb Robert*, these *Apices* are of a deep purple Colour,

and the Pulvicular Matter within of a glorious Yellow; they are exquisitely Spherical, and afford a very pleasant Prospect in the Glass.

What the Use of these so finely elaborated Particles is, is not yet, that I know of, discovered: Some have guessed it to be a kind of *Male-Sperm*, which falling down into the Flower, they will have to help, fecundate and ripen the Seed; but this I take to be a meer Fancy.

APNOEA, a Depravation and Diminution, or an entire Suppression of Breathing, at least to Sense, as it happens in Swoonings, Fits of the Mother, and Strong Apoplexies.

APOCHYLISMA, is any Juice boiled and thickened with Honey or Sugar into a kind of hard Consistence. This is called also *Rob. Rubab*, and *Succago*.

APOCOPE, a Figure in Grammar, wherein the last Letter of a Word or Syllable is cut off.

APOCROUSTICKS, are (according to some Physicians) such Medicines as hinder the Influx of the Humours to any particular part of the Body, and reject those which are beginning to flow thither.

APODICTICAL Argument or *Syllogism*, signifies a plain Proof or Demonstration of a thing.

APODICTICK, the same with *Apodictical*.

APODIOXIS, a Figure in Rhetorick, wherein any Argument or Objection is with Indignation rejected as absurd.

APOGEE or **APOGÆUM**, in Astronomy, is the farthest distance that any Planet can be at from the Earth in its whole Revolution; as *Perigeum* is its nearest distance.

How to find both *Apogæum* and *Perigeum*, see the Geometrical Method of *Cassini*, with some Considerations upon it by Mr. *Mercator*, in *Philos. Trans. N. 57.*

APOGEE of the *Equant*, is the farthest distance of it from the Earth, or that Point where the Circumference of the *Equant* is intersected by the *Linea Apfidum* in the remotest part of the Diameter; as the *Perigee* of the *Equant* is the opposite Point of the nearest part of the Diameter. The *Mean*.

APOGEE of the *Epicicle*, is a Point where the *Epicicle* is cut above by a Right Line drawn from its Center to the Center of the *Equant*, or the Point of the *Epicicle* most remote from the Earth.

APOLOGETICAL, is what is said or written by way of Excuse or Apology for any Action.

APOLOGUE, is an instructive Fable, like those of *Æsop*.

APOMETRIMETRIE, is an Art teaching the Practiser how to measure things at a Distance, viz. how far they are off from him.

APONEUROSIS, is (with Anatomists) the spreading or extension of a Nerve or a Tendon out in Breadth, in the manner of a Membrane: Also the cutting off a Nerve or Tendon is so called.

APORE, in Mathematicks, is a Problem which tho' it be not impossible, yet it is very difficult to be resolved; and hath not yet actually been so: Thus the *Quadrature* of the Circle may be called an *Apo*, because there is yet no Way or Path discovered to lead us into it.

APORIME: See *Porime*.

APOPHLEGMATICAL Medicines, are such as are endowed with the Faculty of drawing cold puituous

pituitous Humours from the Head, and discharging them by the Nose or Mouth.

APOPHYGE, in Architecture, signifies that part of a Column where it seems to fly out of its Base, like the Process of a Bone in a Man's Leg, and begins to shoot upward. But this *Apo-phyge* is really no more than the Rings or Ferrils heretofore fastened at the Extremities of wooden Pillars to keep them from splitting, and afterward imitated in Stone Work.

APOPHYSIS, is a Protuberance made by the Fibres of a Bone, produced above its Superficies, and is ordinarily upon the Extremity of the Bones.

APOPLEXY, *Atonitus Stupor*, *Syderatio*, and *Morbus atonitus*, is a profound Sleep, wherein the Patient being either vehemently shaken, tossed or pricked, yet perceives nothing, nor affords any Sign of Action, accompanied with a Difficulty of Respiration for the most part, and sometimes with none at all. *Blanchard*.

APORRHEÆ, are Vapours and Sulphureous Effluviæ which exhale through the Pores of the Body.

APORRHEAS, a Word used by Mr. Boyle for Effluviæ; of the same Sense with the former.

APOSIOPEISIS, (a Figure in Rhetorick) is, when on a sudden, a Person changes his Passion, cutting off his Discourse, so that the Hearer cannot easily imagine what it is he intends: As it is very common upon Occasion of threatening, to say, *If I — &c. But, &c.*

APOSTARE LEGES, and *Apostatare Leges*, signifies, wilfully to break or transgress the Laws.

APOSTATA CAPIENDO, is a Writ directed to the Sheriff, for to take the Body of one, who having enter'd into, and professed some Order of Religion, leaves it and departs from his House, and wanders about the Country.

APOSTEM, the same with *Aposthume*.

APOSTROPHE, is a Figure in Rhetorick, when the Speaker is in an extraordinary Commotion, turns himself on all Sides, and addresses himself to all Beings, whether sensible or insensible; whom he, for the present, supposes to be equally capable of hearing his Complaint, and of returning an Answer to his Demands.

APOSTROPHE, also is an Accent in Grammar, shewing there is a Vowel to be rejected, and is expressed thus (') and placed over the Head of the Letter. *Vossius* writes it *Apostrophus*.

APOTHEGM, is a short pithy instructive Sentence spoken by some grave and considerable Man; or else made in Imitation of such. As the *Apothegms* of *Plutarch*, or those of the Ancients collected by *Lycosthenes*.

APOTOME, in Mathematicks, is an Irrational Remainder, or Residual Root; when from a Rational Line, as suppose *a*, you cut off a part as *b*, which is only commensurable in Power to the whole Line. Then 'tis express'd thus $a - \sqrt{b}$, and is called *Aporome*, because it signifies a Remainder left by cutting off *b*.

APOTOME, in Musick, is the Difference between the greater and the lesser Semitone.

APOZÈME, is a Decoction of Roots, Woods, Barks Herbs, Flowers, Fruits, Seeds, &c. which is boyled down commonly to Twelve, Fifteen or Twenty Ounces. It is either Purging, Loosening, Altering or Drying, *Cephalick*, *Stomachick*, *Dis-*

terick, *Splenetic* or *Hepatic*, according as the Indications of the Disease direct.

APPARENT CONJUNCTION: See *Conjunction Apparent*.

APPARENT HORIZON: See *Horizon*.

APPARENT Place of a Star, is a Point determined by a Line drawn from the Eye through the Center of the Star; whereas the *True* or *Real Place* is determined by a Line drawn from the Center of the Earth to the Star or Planet.

APPARENT PLACE of any Object in Opticks, is that (different from the real one) in which it appears when seen through one or more Glasses. For when by Refraction through Glasses, that parcel of Rays which fall on the Pupil of the Eye from each Point of any near Object, is made to flow as close together as that which comes from a distant one; or when by the same way, the Rays coming from distant Objects are made to Diverge as much as if they flowed from nigh ones, then the Eye must necessarily see the Place of the Object changed; which Change is its *apparent Place*.

If an Object be placed nearer to a Convex Glass than is the Distance of its Focus, its Apparent Place may be determined; as Mr. *Mohyneux* in *Dioptr.* p. 116. shews.

But if the Object be in the Focus of the Glass, the *Locus Apparens* of the Object cannot be determined; only, as Dr. *Barrow* saith, it will appear vastly remote.

Nor can the *Locus Apparens* be determined, if the Object be beyond the Focus of a Convex Glass. But if an Object be more distant from a Convex Glass, then its Focus and the Eye lie beyond the distinct Base, the *apparent Place* of the Object will be in the distinct Base.

APPEAL of *Mayhem*, (in Law) is an accusing of one that hath maimed another: But that being no Felony, the Appeal is but a kind of Action of *Trespas*, because there is nothing recover'd but Damages.

APPEAL, (in Law) is a removing of a Cause from an Inferior Judge to a Superior: Also a private Accusation of a Murderer, by one who had Interest in the murdered Party; or of any Felon, by one of his Complices in the Fact.

APPEAL of wrong Imprisonment, a Term in Law, is by some used for an Action of wrong Imprisonment.

APPELLANT, is he that brings an Appeal.

APPELLATIVE, a Term in Grammar, signifying a Name in Opposition to Proper, and which belongs to a whole Species or Kind, as *Man*, *Crymist*, &c.

APPELLOR or *Appellant*, the same with *Approver*.

APPENDANT and *Apurtenant* (in Law) are things that by time of Prescription have belonged, appertained, and are joyn'd to another principal thing, by which they pass and go as accessory to the same special thing, as Lands, Commons, &c. to a Mannor; Courts, Ways, &c. to a House, Office, or such others.

APPENDICULA VERMIFORMIS, so some Anatomists call the *Intestinum Cæcum*, or Blind Gut, from its Figure and manner of Situation, which in some Animals hangs pendulous like a Worm, and is not filled with Excrement, as it is in others.

APPENDIX, the same with *Epiphys*.

APPENSA, the same with *Periaptra*, such things as are hung about the Necks of diseased Persons, to free them from some Distempers which they labour under; such as a dried Toad to stop Bleeding, Peony Roots for Convulsions, &c.

APPERTINANCES, signify, in the Common-Law, Things both Corporeal, belonging to another thing, as the more principal; as Hamlets to a chief Mannor, Common of Pasture, Turpary, Piscary, and such like; and Incorporeal, as Liberties and Services of Tenants.

APPLICATE, in Geometry, is a Right Line, otherwise called the *Ordinate* or *Semi-ordinate* in a Conick Section: See the Word *Ordinate*, or any Treatise of Conick Sections.

APPLICATION, is sometimes the Geometrical Term for Division, the Reason of which see in *Geometrical Division*. But Application also signifies the fitting or applying one Quantity to another, whose Area's, but not Figures, are the same. Thus, Euclid, Book 6. Prop. 28. teaches how to a Right Line given, to apply a Parallelogram equal to a Rectilineal Figure given.

APPLICATE ORDINATE, (a Term in Geometry) see *Ordinate*. It signifies a Right-line applied at Right-angles to the Axis of any Conick Section, and terminated by the Curve.

APPLY, a Term used by Geometricians in three Senses.

1. It signifies to transfer a Line given into a Circle (most usually) or into any other Figure, so that it shall be there fitted or Accomodated, (which is also another Word they use for the same thing) according to its proper length.

2. 'Tis also used to express Division in Geometry, especially by the Latin Writers, who, as they say, *Duc 8 in 9*, when they would have 9 multiply'd by 8; so they say, *Applica 4 ad 12*, when they would have 12 divided by 4: See *Division Geometrical*, or in Lines, where the Reason of this way of speaking is explained.

3. It signifies also to fit Quantities whose Area's are equal, but Figures different, so that they shall conform to one another; as when Euclid in his sixth Book, teaches how, on a Line given, to apply a Parallelogram equal to a Rectilineal Figure given.

APPORTIONMENT, is a dividing into Parts a Rent which is dividable, and not entire or whole; and forasmuch as the thing out of which it was to be paid is separated and divided, the Rent also shall be divided, having Respect to the Parts.

APPORTUM, in Law, signifies Revenu, Gain or Profit, which a thing brings to its Owner.

APPOSAL of Sheriffs, is the charging them with Money received upon their Account in the *Exchequer*.

APPOSITION, in Grammar, is the putting of two or more Substantives together in the same Case.

APPRENDRE, in Law, signifies a Fee or Profit to be taken or received.

APPREHENSION, is the simple Contemplation of things that present themselves to the Mind, as when we consider the Sun, the Earth, a Tree, Roundity, a Square, Cogitation, Entity, pronouncing nothing expressly concerning them; and the Forms under which they are considered are called *Ideas*.

APPROACHES, in Fortification, are Works

cast up on both sides; so called because the Besiegers by that Means may draw near a Fortrefs without fear of being discovered by the Enemy. Or *Approaches* are all sorts of Advantages by the Help of which an Advancement may be made toward a place besieged.

APPROPRIARE COMMUNAM, to discommon, that is, to separate and enclose any parcel of Land that was before open Common.

APPROPRIATION, is when the Advowson of a Parsonage is given, or belongs to any Bishoprick, Religious House, College, &c. And to their Successors, so that the House or Body is both Patron or Parson, and some one of the Members officiates as Vicar. 'Tis called *Appropriation*, because the Profits of the Living are appropriate to the use of the Patrons.

APPROPRIATE ad HONOREM, a Term in Law, signifying to bring a Man not within the Extent or Liberty of such an Honour.

APPROVEMENT, is where a Man hath Common within the Lord's waste Ground, and the Lord encloses part of the Waste for himself, having nevertheless sufficient Common, with Egress and Regress for the Commoners. This Inclosing is called *Approvement*.

APPROVER, (in Law) is he who hath committed some Felony, which he confesses; and to save himself, impeaches his Accomplice or Accomplices; and he is so called, because he must Prove that which he hath alledged in his Appeal.

APPROVERS of the King, are those that have the letting of the King's Demains in small Mannors for the King's greater Advantage.

APPROXIMATION, in *Arithmetick*, or *Algebra*, is a continually coming still nearer and nearer to the Root or Quantity sought, without expecting to have it exactly. Of these Methods of Approximations, Dr. Wallis gives several Specimens in his History of Algebra, P. 317. and some have been invented since: They are all nothing but a Series infinitely converging or approaching still nearer to the Quantity required, according to the nature of the Series.

In *Philosoph. Trans.* N. 215. That excellent Mathematician hath a Discourse about the Methods of Approximation in the Extraction of *Surd Roots*, in which he designedly shews the Grounds and Reasons of the whole Business, and which therefore is very well worth the Reader's perusal: The Substance of what the Doctor delivers, is as followeth.

To begin with the *Square Root*.

From any non-quadrato Number or Quantity proposed (suppose n) subtract (in the usual manner) the greatest Square in Integers therein contained (suppose $a a$) the Remainder (suppose $b = 2a + e e$) is to be the Numerator of a Fraction, for designing the near Value of e the remaining part of the Root sought ($a + e = \sqrt{n}$) whose Denominator or Divisor is to be $2a$ (the double Root of the subtracted Square) or $2a + 1$ (that double Root increased by one) the true Value falling between these two; sometime the one, sometime the other, being nearest to the true Value. But (for avoiding negative Numbers) the latter is commonly directed.

The true Ground of the Rule is this; $a a$ being (by Construction) the greatest Integer Square contained in n , 'tis evident that e must be less than 1, (otherwise not $a a$, but the Square of $a + 1$, or

or some greater than it, would be the greatest Integer Square contained in n . Now if the remainder $b = 2a + ee$ be divided by $2a$, the result will be too great for e , (the Divisor being too little, for it should be $2a + e$ to make the Quotient e). But if (to rectify this) we diminish the Quotient by increasing the Divisor, adding 1 to it, it becomes too little, because the Divisor is now too big. For (e being less than 1) $2a + 1$ is more than $2a + e$, and therefore too big.

As for Instance; if the Non-quadrat proposed be $n = 5$, the greatest Integer Square therein contained is $a^2 = 4$ (the Square of $a = 2$) which being subtracted, leaves $n - a^2 = 5 - 4 = 1 = b = 2ae + ee$; which being divided by $2a = 4$, gives $\frac{1}{4}$; but divided by $2a + 1 = 4 + 1 = 5$, gives $\frac{1}{5}$: That too great, and this too little for e . And therefore the true Root ($a + e = \sqrt{n}$) is less than $2\frac{1}{5} = 2,25$, but greater than $2\frac{1}{4} = 2,25$: And this was anciently thought an *Approach* near enough.

If this *Approach* be not now thought near enough, the same Process may be again repeated; and that as oft as is thought necessary.

Take now for $a, 2\frac{1}{5} = 2,25$, whose Square is $4,84 = a^2$ (now considered as an Integer in the second place of Decimal Parts) this subtracted from 5,00 (or, which is the same 0,84, the excess of this Square above the former, from 1, which was then the remainder) leaves a new remainder $b = 0,16$; which, divided by $2a = 4,4$, gives $\frac{16}{44} = \frac{4}{11} = 0,3636$ +, too much: But divided by $2a + 1 = 4,5$, it gives $\frac{16}{45} = \frac{32}{90} = 0,3555$ +, too little. The true value (between these two) being $2,236$ *proxime*, whose Square is 4,999696.

If this be not thought near enough, subtract this Square from 5,000000: The remainder $b = 0,000304$, divided by $2a = 4,472$, or by $2a + 1 = 4,473$, gives (either way) 0,000068 -; which added to $a = 2,236$, makes $2,236068$ -, somewhat too big; but $2,236067$ +, would be much more too little.

Which gives us the Square Root of 5, adjusted to the sixth Place of Decimal Parts, at three steps. And by the same method, if it be thought needful, we may proceed further.

It were easy to compound the Process of two or more Steps into one, and give (for the Rule) the Result of such Composition, which would make it seem more intricate and mysterious, to amuse the Reader.

In the *Cubick Root* (consonant to the Quadratick) the Rule is this:

From the *Non-Cubick* proposed (suppose n) subtract the greatest Cube in Integers therein contained (suppose aaa) the Remainder (suppose $b = 3aae + 3aee + eee$) is to be the Numerator of a Fraction for designating the value of e , (the remaining part of the Root sought, $a + e = \sqrt[n]{n}$). To this Numerator, if (for the Denominator or Divisor) we subjoin $3aa$, the Result will certainly be too great for e , because the Divisor is too little: (For it should be $3a + 3ae + ee$, to give the true value of e). If for the Divisor we take $3a + 3a + 1$, it will certainly be too little, because the Divisor is too great. (For e by construction is less than 1.) It must therefore (between these Limits) be more than this latter; and therefore this latter Result being added to a , will give a Root whose Cube may be subtracted from

the Non-Cubick proposed in order to another step.

But if for the Divisor, we take $3a + 3a$ (or even less than so) the Result may be too great; or (in case b be small) it may be too little, and oft is so.)

Which comes to pass from hence, because e (by Construction) is less than 1; and therefore $3ae$ less than $3a$; and perhaps so much, as that the Addition of ee will not redress it. And when it so happens $3a + 3a$ is a better Divisor than $3a + 3a + 1$, (or even somewhat less than either). But because it doth not always so happen (tho' for the most part it doth) the Rule doth rather direct the other; as which doth certainly give a Root less than the true value, whose Cube may always be subtracted from the Non-Cubick proposed. The Design being to have such a Cube, as (being subtracted) may leave another b to be ordered in like manner for a new Approach. But for the most part $3aa$ may be safely taken for the Divisor: For tho' the Result will then be somewhat too big, yet the excess may be so small as to be neglected; or at least we may thence easily judge what Number (somewhat less than it) may be safely taken; and if we chance to take it somewhat too big, the Inconvenience will be but this, that b for the next step will be a Negative; of which Case we shall speak anon.

Thus for Instance; if the *Non Cube* proposed be $9 = n$, the greatest Integer Cube therein contained is $8 = aaa$ (whose Cubick Root is $a = 2$) which Cube subtracted, leaves $9 - 8 = 1 = b = 3aae + 3aee + eee$. This divided by $3aa = 12$, gives $\frac{1}{12} = 0,08333$ +, too big for e ; but the same divided by $3a + 3a + 1 = 12 + 6 + 1 = 19$, gives $\frac{1}{19} = 0,05263$ +, too little; or if but by $3a + 3a = 2 + 6 = 8$, it gives $\frac{1}{8} = \frac{1}{8} = 0,125$ +, too much. For the Cube of $a + 0,06 = 2,06$, is but $8,742$ -, which is short of 9: And so much short of it, that we may safely take $2,07$ as not too big; or perhaps $2,08$ (which, if it chance to be too big) it will not be much too big (as shall be farther shewn:) And upon trial it will be found not too big; for the Cube of $2,08$, is $8,998912$.

If this Step be not near enough, this Cube subtracted from 9,000000 leaves anew $b = 0,001085$, which divided by $3aa = 12,9796$, gives $0,000084$ -, which will be somewhat too big, but not too much (for e is now so small) as that $3ae$ may be safely neglected (and ee much more) so that if to $2,08$ we add $0,000084$ -, the Result $2,080084$ will be too big, but $2,080083$ will be more too little; (as will appear if we take the Cube of each) so that either of them at the second Step, gives the true Root within an Unite in the sixth place of Decimal Parts.

He says, (taking the Cube of each; which he does) that the thing may be more clearly apprehended, but it is not necessary that we trouble our selves with the whole Cube: For aaa being already subtracted, for finding $b = 3aae + 3aee + eee$, we have no more to try, but whether $3aae + 3aee + eee$ be greater or less than b , according as we take $0,000084$, or $0,000083$, for e .

Which may be conveniently done in this manner: Take $3a + e$ and multiply this by e (or e by it) so have we $3ae + ee$; to this add $3aa$, and multiply the whole by e (so have we $3aae + 3aee$

$3aae + eee$) to see whether this be greater or less than b .

That is, in the present Case, if we take $e = 0,000084$, and add to this $3a = 6,24$, then is $6,240084 = 3a + e$: This multiply'd by $e = 0,000084$, is $3ae + eee = 0,000524 +$; to which, if we add $3a = 12,9792$, it is $3a + 3ae + eee = 12,979724$, which multiply'd again by $e = 0,000084$, is $0,0010902 +$, $= 3aae + 3aee + eee$, which is more than $b = 0,001088$.

But if we take $e = 0,000083$, and proceed as before, we shall have $3ae + 3aee + eee = 0,001077 +$, which is less than b , and therefore (if we subtract that from this) the Remainder $0,000011$, will be another b for the next Step, if please to proceed further.

Hitherto we have pursued the Method most affected by the Ancients, in seeking a Square or Cube (and the like of other Powers) always less than the just Value, that it might be subtracted from the Number proposed, leaving b a positive Remainder, thereby avoiding Negative Numbers.

But since the Arithmetick of Negatives is so well understood, it may in this (and other Operations of like nature) be advisable to take the next greater (in case that be nearer to the true value) rather than the next lesser.

According to this Notion for the Square Root of 5, I would say, it is $(2 +)$ somewhat more than 2, and enquire, how much more? But for the Square Root of 8, I would say, it is $(3 -)$ somewhat less than 3, and enquire, how much less? Taking in both Cases that which is nearest to the just Value.

Thus, in the Cubick Root before us, I take for e (in the last Enquiry) $0,000084$ (where, for the near Step, we have $b = -0,000002$) rather than $0,000083 +$ (where, for the next Step, we should have $b = +0,000011$). In this latter Case we are to divide $b = +0,000011$, by $3a = 12,980236 -$, to find (by the Quotient) how much is to be added to $0,000083$. In the other Case, we are to divide $b = +0,000002$, by $3a = 12,980248$, to find (by the Quotient) what is to be abated of $0,000084$, so have we $\frac{0,000011}{12,980236} = 0,00000085 +$, to be added to $6,240083$: Or $\frac{0,000002}{12,980248} = 0,00000015 +$ to be abated of $6,240084$: (Or it may suffice in either, to divide by $12,98 +$, or even by $13 -$, without being incumbered with a long Divisor) either of which gives us, for the Root sought, $2,08008385$ *proxime*. True (at the third Step) to the eighth place of Decimal Parts. And if this be not near enough, the Cube of this compared with the Number proposed, will give us another b , for the next Step, and so onwards as far as we please.

Now, what is said of the Cube, is easily applicable to the higher Powers.

That of the Biquadrate may be omitted, because here perhaps it may be thought most advisable to extract the Square Root of the Number proposed; and then the Square Root of that Root.

But if we would do it at once, we are from n (the Number proposed, being not a Biquadrate) to subtract a^4 (the greatest Biquadrate contained in it) to find the Remainder $b = 4a^3e + 6a^2e^2 + 4ae^3 + e^4$, which Remainder, if we

divide by $4a^3$, the Quotient will certainly be too big for e (tho' perhaps not much).

If by $4a^3 + 6a^2 + 4a + 1$, it will certainly be too little (for Reasons before mentioned.) And we are to use our Discretion in taking some intermediate Number. And if we thence chance not to hit on the nearest, the Inconvenience will be but this, that our leap will not be so great as otherwise it might be, which will be rectify'd by another b at the next Step.

For the *Surfolid* (of the five Dimensions) we are from n (the Number proposed, being not a perfect *Surfolid*) to subtract a^5 (the greatest *Surfolid* therein contained) to find the Remainder.

$$b = 5a^4e + 10a^3e^2 + 10a^2e^3 + 5ae^4 + e^5.$$

which (as before) if we divide by $5a^4$, the Result will be somewhat too big (because the Divisor is too little).

If by $5a^4 + 10a^3 + 10a^2 + 5a + 1$, the Result will certainly be less than the true e . The just Value of e being somewhat between these two, where we are to use our Discretion, what intermediate Number to take; which according as it proves too great or too little, is to be rectify'd at the next Step.

If to direct us in the choice of such intermediate Numbers, we should multiply Rules of Precepts for such choice, the trouble of observing them would be more than the advantage to be gained by it. And for the most part it would be safe enough (and least trouble) to divide by $5a^4$, which gives a Quotient somewhat too big; which we may either rectify at Discretion (by taking a Number somewhat less) or proceed to another b (affirmative or negative as the Case shall require) and so onward to what exactness we please (which is, for substance, in a manner coincident with Mr. Raphson's Method, even for affected Equations).

Thus, in the present Case; if the Number proposed be $n = 33$, then is $a^5 = 32$, and $b = 33 - 32 = 1 = 5a^4e + 10a^3e^2 + 10a^2e^3 + 5ae^4 + e^5$, which if we divide by $5a^4 = 5 \times 16 = 80$, the Result $\frac{1}{80} = 0,0125$ is somewhat too big for e , but not much. And if we examine it, by taking the *Surfolid* of $2,0125$, or of $2\frac{1}{8}$, we shall find a Negative b (for the next Step) but not very considerable. Or if we think it considerable, we may proceed further to another Step, or more than so.

The like Method may be apply'd (with more advantage) in the higher Powers, according as the Composition of each Power requires. And the same Method may be of use (with good Advantage) in long Numbers (if ducly applied) even before we come to the place of Units, for the same will equally hold there also.

APPURTENANCES, in the Common Law, are the same with *Appendante*: Which see.

APSID, in Astronomy is used as well for the *biggest part* of an Orbit, to which when a Planet comes, it is at the greatest distance from the Earth, and is called the *Apogaeum*; as the *lowest part* of that Orbit, when the Planet is in his nearest distance to the Earth, which is called the *Perigaeum* of that Planet.

APTITUDE, is the natural Disposition that any thing hath to be fitting for such or such a Pur-

Purpose. Thus Oil hath an Aptitude to burn; and Water to extinguish Fire.

APTOTE, (in Grammar) is a Noun Indeclinable, or which is without the variation of *Cafe*.

APYREXY, is an Intermiffion, cooling, or abating of a Fever; the Cause of it is, that all the Morbifick Matter is spent in one Fit, and so it intermits till new come, and begins to swell and ferments as the other. *Blanchard*.

AQUÆDUCTUS, (in Anatomy) is the Bony Passage of the Tympanum of the Ear, reaching into the Palate of the Mouth.

AQUA FORTIS, is made by distilling in a close Reverberatory Furnace a Mixture of equal Parts of Purified Nitre, *Vitriol calcined white*, and Potter's Earth or Clay dried and powdered. A small Fire is used at first to warm the Retort, and to draw off the Phlegm; but as soon as the Spirits begin to appear in the Receiver in Red Clouds, the Fire is raised to the most intense Degree, and kept so till White Fumes begin to come forth; then unlute the Vessels, and you have the *Aqua Fortis* in the Receiver. 'Tis used to dissolve Metals.

AQUALICULUS, the lowest part of the Belly, being the same with *Hypogastrium*.

AQUARIUS, a Constellation in the Heavens, being the Eleventh Sign in the Zodiac; it is commonly marked with this Character ☾, and consists of 33 Stars.

AQUATICK or AQUATILE, is that which belongs to, or lives mostly in the Water: Thus those Animals or Plants that live or grow usually in Water, are called *Aquatick Animals* and *Plants*.

AQUEDUCT, is the Term in Architecture for a Conduit or Work to convey Water (without Force of Engines) to any Place.

AQUEOUS HUMOUR, or the watry Humour of the Eye, is the utmost being transparent, and of no Colour; it fills up the Space which lie between the Cornea Tunicle and the ChrySTALLINE Humour.

AQUILA ALBA, or the white Eagle, the same with *Mercurius Dulcis*, which see.

AQUILA, or Vultur Volans, a Constellation in the Northern Hemisphere, consisting of 32 Stars.

ARA, the Altar, a Southern Constellation, containing 8 Stars.

ARACNOIDES, is the ChrySTALLINE Tunic of the Eye; by some called also

ARANEA TUNICA, or ChrySTALLINA; and is that which furrounds and contains the ChrySTALLINE Humour; by reason of its light thin Contexture, like that of the Web of a Spider, it has the Name of *Aranæa*. This Coat, by means of the Ciliary Processes, helps to move the ChrySTALLINE Humour of the Eye nearer to, or farther from the Retina, and perhaps also to render its Figure more or less Convex.

ARÆOSTYLE, in Architecture, is a sort of Edifice where the Pillars are set at a great Distance one from another.

ARBITRATOR, is an extraordinary Judge in one or more Causes between Party and Party, chosen by their mutual Consents. The Civilians distinguish between *Arbiter*, who is to proceed and judge according to Law and Equity mingled, and *Arbitrator*, who is permitted wholly to use his own Discretion, without Solemnity of Process, or

Course of Judgment, to hear and determine the Controversy committed unto him.

ARBITREMENT, is a Power given by two or more contending Parties, to some Person or Persons to determine the Matter in Dispute between them; and to pronounce the same, to which they bind themselves under a Penalty to stand: And the Determination thus made is called an *Award*; or the Result of an *Arbitration*.

ABOR DIANÆ: See *Diana's Tree*.

ARBOR MARIS, a Name by some Chymists given unto Coral, because it grows like a Tree or Plant under the Water of the Sea.

ARBOREOUS, is by the Botanists used for such Fungi or Musci which grow upon Trees, whereas others grow on the Ground. Thus *Agaric* is a *Fungus Arboreus*, because it always grows on the Larix. But the *Fungus Pulverulentus* is Terrestrial, always growing on the Ground.

ARBORIST, is one that hath good Skill in the several Kinds and Natures of Trees; and knows how to propagate and preserve them well for their several Uses.

ARCANUM CORALINUM, is the Red Precipitate of Mercury, on which hath been burnt six times, well rectify'd Spirit of Wine, in order to burn off some of the Acids, and to sweeten the Precipitate so as that it may be fit to be taken inwardly.

ARCANUM DUPLUM, is a kind of a Salt gain'd by washing the Caput Mortuum remaining after the Distillation of double *Aqua Fortis* with warm Water; which Water is afterwards filtrated and evaporated, and the Salt remains at the Bottom of the Glass.

ARCANUM JOVIS, is an Amalgama made of equal Parts of Tin and Mercury, powder'd and digested with good Spirit of Nitre; and from it the Spirit being drawn in a Retort, the dry Mass is powdered again, and then digested with Spirit of Wine till the Powder be insipid.

ARCH or ARC, in Geometry is any part of the Circumference of a Circle.

ARCHAISMS, are obsolete Expressions now out of use, and to be found only in ancient Authors.

ARCHES, (or the Court of the Arches) is the chief and most ancient Consistory belonging to the Archbishop of Canterbury, and it is so called from the Arches of the Church where the Court is kept namely, Bow-Church in London.

ARCHÆUS, with the Paracelsians, is the Principle of Life, Health and Vigour in any Animal Body.

ARCHIPELAGUS, in Geography, is a part of the Sea containing many small Islands one near another, and consequently several little Seas denominated from those Islands; as the Grecian Archipelago or *Ægean Sea*.

ARCHITECTONICK, is that which builds a Thing up regularly according to the Nature and Properties of it. Thus that plastick Nature, Power, Spirit, or whatever it be called, which hatches the Ova of Females into living Creatures of the same Species, is by some called the *Architectonick Spirit*.

ARCHITECTURE, is the Art or Science of Building, and is usually divided into *Civil* and *Military*; *Civil Architecture* teaches how to make any kinds of Buildings, Palaces, Churches or private Houses. *Military Architecture* instructs us in the

TUSCAN

DORICK

IONICK

CORINTHIAN

COMPOSITE

The Explanation of the Plate for the Five Orders of Architecture.

In the Tuscan Column.

- a* The *Ovolo* or *Egg*: In the *Ionick* and *Corinthian* Orders, and every where by some 'tis called the *Echinus*. The *French* call it the *Quart de rond*.
- b* The *Astragal* or *Baguette*, as the *French* call it: The *Italians* the *Tondino* or *Round*; below which is a small *List*, *Reglet* or *Fillet*.
- c* Is the *Crown*, the *French* call it the *Larmier*.
- e* The *List* or *Fillet* under that.
- f* The *Gula* or *Talon* in *French*.
- g* The *List* of the *Gula*.
- H* The *Frieze*.
- i* The *List* of the *Architrave*.
- k* The *Architrave*,
- l* The *List* of the *Abacus*.
- m* The *Abacus* *Cymatium* or *Saillon*, as the *French* call it.
- n* The *Ovolo* or *Echinus*.
- o* The *List*, *Ring* or *Fillet* under that.
- p* The *Frieze* of the *Capital*: The *French* call it the *Gorgerin* or *Collarin*.
- q* The *Astragal* of
- r* The *Conge* or *Ceinture*, as the *French* call it; or of the *Neck* of the *Column*.
- s* The *Body* of the *Column*; in *French* the *Fust* or *Vif*.
- t* The *Listel* of the *Base*, or the *Nether-band* or *Swath*.
- u* The *Tore*, or the *Gros Baton*, in *French*.
- w* The *Plinth*.
- x* The *Riglet*, *List* or *Fillet*.
- y* The *Gula* reversed, or the *Talon*.
- z* The *Ring*, *List* or *Fillet*.
- B* The *Die* of the *Base*.
- 2* The *Reglet* or *Fillet*.
- 3* The *Base* of the *Pedestal*; in *French* the *Zocle*.

In the Dorick Column.

- a* The *Gula*, sometimes the *Grove* or hollowing of the upper *List*.
- b* The *Dentils* or *Teeth*.
- c* The *Capital* of the *Trygliph*.
- d* The *Trygliph*, of which those *Parts* that are framed inwards or hollowed, are called *Flutes*: And the *Square* of the *Frieze* between the *Trygliph* is called the *Metops*, as *r*; and sometimes

the outermost towards the *Right-hand* is called a *Demi-Metops*.

- e* The *Cymatium* or *Bandelette*.
- f* The *Gutta* or *Drops*.
- g* The *Platteband* or *Face*.
- h* The *Reglet*.
- i* The *Talon* or *Gula*.
- k* The *Ovolo* or *Echinus*.
- l* Three *Annulets* or *Fillets*.
- m* The *Frieze*, *Gorgerin* or *Collarin*.
- S* The *Fust*, *Shaft* or *Body* of the *Pillar*.
- o* The *Listel*.
- p* The *Tore*.
- q* The *Plinth*.
- r* The *Fillets* and *Gula*.
- B* The *Die* of the *Base*.
- t* The *Fillets* or *Reglets* of
- u* The *Base* of the *Pedestal*.

In the Ionick Column, the Things in which it differs from the former, are these.

1. The *First Scotia*.
2. The *Second Scotia*.
3. The *Bands* or *Canal* of the *Volute*.
4. The *Volute*.
5. The *First* or *Little Face*.
6. The *Second* or *Middle Face*.
7. The *Third* or the *Great Face*.
9. The *Figure* of *Eggs* carved there.

In the Corinthian Column, the Things peculiar are.

1. A *Tore*, *Reglet* and *Gula* finely wrought.
2. A *Reglet* and *Astragal*, with
3. *Frieze* about it.
- 4, 5, 6. The *Ranks* or *Rows* of *Leaves*, some say of the *Acanthus* or *Great Dock*, others of *Olive*, and others of *Palm*.
8. The *Abacus* of the *Capital*.
9. The *Flower*.

In the Composite Order.

The *Pedestal* of this *Column*, is the same with that of the *Corinthian*, except in the *Members* of the *Cymatium* and *Base*. And the *Composite Capital* differs from the *Corinthian* only in this, That it hath *Volute* or *Scrolls* like the *Ionick*, when the *Corinthian* hath curled *Stalks*; and therefore 'tis called *Composite*, because composed of the *Ionick* and *Corinthian* together.

The Explanation for the Plate of Fortification.

- A** *A Single Bastion.*
- B** *A Double Bastion or Cavalier*, to overlook the Enemy's Bastions, and to scour their Trenches.
- C** *A Platt Bastion*; which is made when the Line of Defence is too long; *i. e.* exceeds 150 Fathom, which is the Distance a Musket will be sure to do Execution. Wherefore this *Platt-Bastion* is placed in the middle of the Curtain.
- D** *A Half-Bastion* placed on the Side of a River.
- E** *A Bastion Tenailled*; when the Angle of the Bastion is less than 70 Degrees
- F** *A Ravelin* which covers the Gates, Bridges and Curtains. Sometimes these Ravelins have Flanks made to them, as G.
- G** *A Ravelin with Flanks.*
- H** *An Half-Moon*, made to cover the Flanked-Angle of the Bastion. The Gorges of *Half-Moons* are circular.
- I** *Counter-Guard*, which are raised instead of *Half-Moons*.
- K** *A Single Tenaile.*
- L** *A Queue D'Yronde, or Swallow's-Tail*: So called, because its Sides instead of being parallel, open or spreads towards the Head, and grow narrow at the Gorge.
- M** *A Bonnet, a Pestre, or Priest's-Cap*: Some call them *Double Tenailles*. But they differ from a *Tenaile*, because its Sides are not parallel, but spread or open out towards the Campaign like a *Swallow's Tail*. This Work hath two Angles *Saillant*, and two Inwards.
- N** *A Horn-work*, whose Heads is fortified with two *Demi-Bastions*, or *Epaulements*, joy'n'd by a Curtain, and closed by parallel Sides ending at the Gorge of the Work. These *Horn-works* are used to cover the Gates, &c. instead of *Tenailles*.
- N 2**, *A Horn work*, whose Sides are not parallel.
- O** *A Crown-work*, whose Design is to cover some large Spot of Ground to defend a Rising-Ground, or to defend the Head of a Camp that is intrenched: 'Tis the largest of all Outworks, having a large Gorge, and two Sides, ending towards the Campaign in two *Demi-Bastions*; each of which joyns by a Curtain, to an entire Bastion that is at the Head of the Work.
- P** *Tenailles* to defend the Ditch.
- Q** *An Half-Moon* covered with two *Counter-Guards* R R, to make it the stronger.
- SS** *Places of Arms* on the *Counterscarp*, being open Spots of Ground for the Garrison to Rendezvous on an Alarm, &c.
- T** *The Ditch.*
- T T, &c.** *The Counterscarp, or Covered-way.*
- g g, &c.** *The Glacis.*
- V** *A Retrenchment* within or behind a Breach; as X.
- W** *A Place for a Magazine.*
- l l l** *Pallisades.*
- a a** *Redoubts.*
- b b b** *Batteries.*
- c** *Lines of Communication.*
- d d** *Trenches*, by which the Approaches are carried on.
- e** *Mine* under the *Glacis* and *Covered-way* of the *Horn-work*.
- f** *A Lodgment* at the Foot of the *Glacis*.

Scale of Feet for the Profile

the best way to fortify Cities, Camps, Sea-Ports, or any other Places of Strength.

The Ancients at several Times, and on several Occasions, establish'd 5 Orders of *Architecture*, that is, 5 sorts of Pillars, viz. the *Tuscan*, the *Doric*, the *Ionick*, the *Corinthian*, and the *Composite* or *Roman Order*, (which see under those Words.) The Difference between which Orders consists in the *Column*, with its *Base* and *Capital*, and the *Entablature*, that is, the *Architrave*, *Frieze* and *Cornice*; for these are the Parts which constitute the *Order*, and each one hath its proper and peculiar Measures.

Besides these five Ancient Orders, some Authors mention two more, as that of the *Caryatides* and the *Perseick*, (which see.)

The Rules of *Architecture* require, That in a well-built Fabrick there should be *Solidity*, *Convenience* and *Beauty*; to which some Writers add, *Order*, *Disposition*, *Proportion*, *Decorum* and *Oeconomy*: And these Eight, they say, make the necessary Parts of *Architecture*. *Solidity*, implies the Choice of a good Foundation, and good sound Materials to work with. *Convenience* consists in so ordering and disposing the Parts of an Edifice, that they may not hinder or embarrass one another. *Beauty* is that agreeable Form and pleasing Appearance which it exhibits to the Eye of the Spectator. *Order* (they say) gives each Part of the Building a convenient Bigness, whether we consider them apart, or with Relation to the Whole. And *Disposition* they make the due Ranging and agreeable Union of all the Parts.

Proportion, is the Relation that all the Work hath to its Parts, and which every one separately hath to the *Idea* of the Whole: For among Works that are perfect, from any particular Part we may make a certain Judgment of the Greatness of the whole Work: u. gr. the *Diameter* of a Pillar, or the Length of a *Triglyph*, gives us a right *Idea* of the Whole to which they belong: And to express the Relation that many things have to one another, as to their Greatness, and the different number of their Parts, *Vitruvius* indifferently uses those three Words; *Proportion*, *Eurithmy* and *Symmetry*; the two last of which are of much the same Sense with the first.

Decorum or *Decency* comes next to be considered, which consists in making the whole Aspect of the Fabrick so correct, that nothing shall appear but what is founded upon, and approved by some Authority: And they say, *Decorum* teaches you to have a Regard to these three things, *Design*, *Custom* and *Nature*. The Regard to *Design* makes us choose (for Instance) other Dispositions and Proportions for a Palace than a Church. The Respect we pay to *Custom*, makes us adorn the Porches and Entries into such Houses as are within Rich and Magnificent. And the Regard we have to the *Nature* of the Places, makes us pitch upon different Prospects for different Parts of a Building: As for Example, we expose Bed-Chambers and Libraries to the Morning Sun: Winter Apartments to the West, and Closets of Pictures, &c. to the North, because they require an equal Light.

Oeconomy teaches the Architect (they say) to have regard to the Expenses that are to be made, and the Quality of the Materials, near the Places where he builds, and to take his Measures rightly for the Order and Disposition, viz. to give the Fabrick a convenient Form and Magnitude.

ARCHITRAVE, is the chief Beam in any Building, and the first Member of that which is called the *Entablature*, viz. that part of a Stone Pillar which is above the *Capital*, and below the *Frieze*. And 'tis called the *Reason-Piece* or *Master-Beam* in Timber Buildings; but in Chimneys it is called the *Mantle-Piece*, and over the Jambes of Doors or Lintels of Windows *Hyperthyron*. The Greeks called it the *Epistyle*.

ARCTICK CIRCLE, is a Lesser Circle of the Sphere drawn on the Globe, parallel to the Equator, and at 23°. 30'. distant from the North Pole of the World, from whence it takes its Name. This, and its opposite the *Antarctick*, are called the two *Polar Circles*. They may be conceived to be describ'd by the Motion of the Poles of the Ecliptick round the Poles of the Equator, or of the World.

ARCTOPHYLAX, see *Bootes*.

ARCTOSMINOR, the same with *Ursa Minor*.

ARCTURUS, a fixed Star of the first Magnitude placed in the Skirt of *Arctophylax*: Its Longitude is 199°. 39'. Latitude 31°. 2'. Right Ascension 210°. 13'. and Declination 20°. 58'.

ARDENT SPIRITS, in Chymistry, are such Spirits as being distilled from fermented Vegetable, will take fire and burn, as Spirit of Wine, Brandy, Aqua Vitæ, &c. They are usually distilled in an Alembick, or in a Copper Body with its Moor's Head and Refrigeratory.

ARDOR VENTRICULI, is the Disease commonly called the *Heart-burning*.

ARDOR URINÆ, is the same with *Dysuria*.

AREA, of any Figure in Geometry, is its Internal Capacity or Superficial Content reckoned in the Square Parts of any Measure; as if a Field be in the Form of a Square, and its Side be 40 Yards in length, its *Area* or Superficial Content will be 1600 Square Yards: Or will contain 1600 little Squares, each of which is a Yard every way.

Problems. To find the Area of all sorts of Plane Figures.

1. For a *Square* or *Rectangle*, multiply one Side found in any known Measure by another: The Product is the true *Area*. The Reason of which you have under *Multiplication in Geometry*: which see.

2. For all *Parallelograms*, multiply the Perpendicular let fall from any side, by the side it falls upon; and the Product is the *Area*. Because all such Figures are equal to Rectangles of the same or equal Base and Altitude.

3. For all *Plane Triangles*, multiply half the Perpendicular let fall from an Angle, by the opposite side, or half that side by the Perpendicular, and the Product is the true *Area*; because Triangles are the Halves of Parallelograms of the same or equal Bases and Altitudes.

4. For a Trapezium, where two Sides are Parallel, multiply the Sum of the Parallel Sides (b and d) by half (p) the Perpendicular.

5. For any other Trapezium, or any Multangular Plane Figure, resolve it Diagonally into Triangles; and add the Area's of those Triangles (found by the 3d Problem) into one Sum; which will be the true Area of the whole. Thus, suppose a Trapezium whose Sides are not parallel, divide it into two Triangles by a Diagonal, and let fall a Perpendicular from the other Angles thereto; then multiply the whole Base by half the Sum (or half the Base by the whole Sum) of the Perpendiculars, the Product is the Area.

Base 14, its half 7
Sum of the Perpend. 11, its half 5.5.

$\begin{array}{r} 14 \\ 5.5 \\ \hline 70 \\ 70 \\ \hline 77 \end{array}$	$\begin{array}{r} 11 \\ 7 \\ \hline 77 \end{array}$	Area 77.
--	---	----------

6. For all Regular Figures or Polygons, multiply the half Sum of all the Sides by the length of a Line drawn from the Center to the Middle of any one Side, the Product gives the Area.

Because that Line will be equal to the height of each Triangle in the Polygon, and their Bases will be also equal, because they are Sides of a Regular Polygon.

Thus in a Hexagon, whose Side is 8 Yards,

and the Distance from the Center to the Middle of any of the Sides 10 Yards.

The Sum of the Sides is $6 \times 8 = 48$, whose half is 24, which multiplied by 10, produces 240 Yards, the Area of the Hexagon.

7. For all Circles, multiply half the Circumference by the Radius, because every Circle is equal to a Rectangle Δ , one of whose Legs is the Periphery, and the other the Radius, as Archimedes hath demonstrated. For Practice, measure the Semi-diameter, then say, As 1000 : 3141 :: So is the Semi-diameter : To the Circumference : which found, multiply by half the Diameter (or Radius) the Product is the Area.

8. For a Sector of a Circle, multiply the Radius, or one of its Legs by half the Arch (or half the Radius by the whole Arch) the Product gives the Content.

9. For all Segments of Circles, find the Area of the Sector inscribing on the Ark, and also the Area of the Triangle, and subtract that of the Triangle from that of the Sector, the Remainder is the Area of the Segment.

10. For an Ellipsis, multiply the longest Diameter by the shortest, and extract the Square Root of the Product, it gives the Diameter of a Circle, whose Area is equal to the Area of the Ellipsis; because the Diameter of such a Circle is a mean Proportional between the Diameters of the Ellipsis.

11. For a Parabola, multiply the entire Ordinate by the Abscissa or intercepted Ax; then double that Product, and divide the whole by 3; the Quotient is the Area.

AREOLA PAPILARIS, a darkish coloured Circle about the Nipple.

AREOMETER, is an Instrument to measure the Gravity of Liquor. 'Tis usually made of a thin fine Glass of this Figure, and sealed at the Top, there being first as much running Mercury put into it, as will serve to keep it swimming in an erect Position. The Stem is divided into Degrees, and by the Depth of its Descent into any Liquor, its Lightness is concluded; for that Fluid or Liquor in which it sinks least, must be heaviest, and that in which it sink lowest, will be lightest.

AREOSTYLE, in Architecture, is a Building where the Columns stand a little too thick, as some say; or as the *French Dictionary of Arts and Sciences* expresses it, *Loin a loin*, that is, at a convenient Distance.

AREOTECTONICKS, is that part of Fortification and Military Architecture which teaches how to attack safely, and to fight an Enemy advantageously.

AREOTICK MEDICINES, are such as open the Pores of the Skin, and render them large enough for the Morbifick Matter to be carried off by Sweat, or insensible Transpiration. *Blanchard*.

ARGEMA, a little Ulcer of the Eye in the Circle of the *Iris*, having its Seat in a part of the White, and also some part of the Black of the Eye. *Blanchard*.

ARGENT, the Name in Heraldry of the white Colours which is used for Gentlemen, Knights and Barons: But Bafons, and all Nobles, have the white Colour called *Pearl*, as all Sovereign Princes have it called *Luna*; Without either this or *Or*, the Herald's say, there can be no good Armory. This is expressed in Engraving, by the Parts being left plain without any Strokes from the Graver.

ARCO NAVIS, a Southern Constellation consisting of 42 Stars.

ARGUMENT, in Astronomy, is an Ark by which we seek another Ark unknown, and proportional to the first; as the

ARGUMENT of INCLINATION, is an Ark of the Orbit intercepted between the Node ascending, and the Place of the Planet from the Sun, being numbred according to the Succession of the Signs.

ARGUMENT of the Moon's Latitude, is her Distance from the *Dragon's Head and Tail*, viz. where the Orbit of the Moon in two Points diametrically opposite, is intersected by the Ecliptick, whereby we find out the Quantity of the real Obscuration in *Eclipses*, or how many Digits are darkened.

ARGYROCOMUS, according to some Writers, is a Silver-coloured Comet differing very little from the *Solar Comet*, except that it is of a brighter Silver Colour, and shines with so great a Lustre that it dazzles the Eyes of the Beholders.

ARIES, a Constellation of Stars drawn on the Globes in the Figure of a Ram: 'Tis the first of the 12 Signs of the *Zodiack*, and is mark'd thus ♈, and consists of 19 Stars.

ARISTA, in Botany, signifies that long slender Needle-like *Beard* which grows out from the Husk of Corn or Grass: By some 'tis called the *Awn*.

ARITHMETICK, is the Art of numbring truly; or, as some define it, the Science of discrete Quantity: 'Tis divided into two general Branches; *Common Arithmetick*, and *Algebra*.

ARITHMETICAL COMPLEMENT, of a Logarithm, is what that Logarithm wants of 10.0000000. That the Arithmet. Complement of 7.1079054 is 2.8920946, where each Figure but the last is taken from 9, and that from 10.

ARITHMETICAL PROGRESSION, or *Proportion*, see the Word *Progression*.

ARK, the same with *Arch*, which see.

ARK of DIRECTION or Progression, in *Astronomy*; is that Ark of the *Zodiack* which a Planet appears to describe when its Motion is forward according to the Order of the Signs.

It is also in the *Ptolemaick System*, the *Ark of the Epicycle*, which a Planet describes when it is *Progressive* according to the Order of the Signs.

ARK of RETROGRADATION, is that which a Planet describes when it is *Retrograde*, or moves contrary to the Order of the Signs.

ARK of the First and Second Station, is the *Ark* which a Planet describes in the former or the latter Semi-circumference of his *Epicycle* when it appears *Stationary*.

ARMARIUM UNGUENTUM, the same with the *Hyplo*, *Chryisma*, *Magnes Microcosmicus*; or a Weapon Salve; whereby Wounds, as they pretend, may be cured at any distance, by dressing the Weapon only. They prescribe it to be made of the Flesh of a Man hanged, or which died some such violent Death, at the Increase of the Moon; and in a good Sign, &c. according to the foolish and wicked Superstition of Astrologers. See a good Refutation of this Imposture, and of the Arguments brought for it, by the Author of *Philosophie Mosaicque*, in *Athani. Kircher de magnete, Lib. 3. pars vii.*

ARMED, is said at Sea of a Man of War fitted out and provided in all respects. Also a *Cross-Barr-Shot* is said to be *Armed*, when some Rope-Yarn, or the like, is rowled round about one end of the Iron-Barr which runneth thro' the Shot, both that the Shot may be the better rammed down into the Gun; and also chiefly, lest the sharp end of the Bar should catch into any *Honey Combs* within the Cylinder of the Piece.

A Load-stone is also said to be *Armed*, when it is capped or cased, or set in Iron; in order to make it up the greater Weight, and also to distinguish readily its Poles. *Kircher*, in his Book de *Magnete*, tells us, That the best way to arm a Loadstone, is to drill a Hole thro' the Stone from Pole to Pole, and in that to place a Steel Rod of a moderate length; which Steel Rod will, he saith, at the end, take up more Weight, than the same Stone armed the common way can do; as he saw tried at *Rome*.

ARMED, is the proper Term in Heraldry for Blazoning the Beaks and Feet of Cocks, and all Birds of Prey; and these are always painted of a different Colour from the Bird it self, and therefore they say he beareth a Cock, or a Falcon *Armed Or, Gules*, &c.

ARMILLARY SPHERE, is when the greater and lesser Circles of the Sphere being made of

Brass, Wood, Past-board, &c. are put together in their natural Order, and placed in a Frame, so as to represent the true Position and Motion of those Circles.

See the Figure following.

ARMONIACK. SALT, see *Sal Almoniack*.

ARMONIACK Volatile Spirit, see *Volatile Spirit of Sal Armonick*.

ARMORY, the same with *Heraldry*, being the Art of truly *Blazoning* and *Marshalling* all Coats of Arms, and appropriating them to their proper Bearers.

AROMATICK, the same with *Oloriferous*, or *Sweet Scented*.

AROMATICK Volatile Salt, the same with *Sal Volatile Oleosum*, which see.

AROMATIZATION, or *Aromatizing* of Medicines, is mingling them with a due Proportion of *Aromatick Spices, &c.* in order to make them more grateful and useful.

ARQUEBUSE, or *Harquebuss*, is a large Hand-Gun something bigger than our *Musquet*; by some 'tis called a *Caliver*.

ARRAIGN, is to put a thing in order, or in his Place.

ARRAIGNE the *Affize*, is to cause the Tenant to be called, to make the *Plaint*, and to set the Cause in such order as the Tenant may be enforced to answer thereto.

Also a Prisoner is said to be *arraign'd*, when he is indicted and put to his *Trial*.

ARRAY, (in Law) is the ranking or ordering a Jury or Inquest of Men that are *Impannelled* upon any Cause.

ARRENTATION, signifies the licensing an Owner of Lands in the Forest to enclose them (with a Hedge and a little Ditch) under a yearly Rent.

Saving of the Arrentation, is the saving Power to give such Licences for a yearly Rent.

ARRERAGES, are Duties behind unpaid after the Days and Times in which they are due, and ought to have been paid, whether they be Rents of a Mannor, or any other thing reserv'd.

ARREST, is when one is legally taken and restrain'd from his Liberty.

ARRESTANDIS bonis ne dissipantur, is a Writ which lies for him whose Cattel or Goods are taken by another, who, during the Controversy, doth, or is like to waste or consume them, and will hardly be able to make Satisfaction for them afterwards.

ARRESTANDO ipsum qui pecuniam recepit ad proficiendum in obsequium Regis, &c. is a Writ that

lieth for the Apprehension of him that hath taken *Prest-money* towards the King's Wars, and hides himself when he should go.

ARRESTO factio super bonis mercatorum alienigenorum, is a Writ that lies for a *Denizon* against the Goods of Strangers of another Country, found within the Kingdom, in Recompence of Goods taken from him in that foreign Country, after denial of Restitution. This, among the *Civilians*, is called *Clarigatio*, but now barbarously *Reprisatio*.

ARRETTED, (in Law) is he that is convicted before any Judge, and charged with a Crime.

ARRIERE-GARDE, see *Rear-Guard*.

ARSENAL, is a Royal or Publick Magazine, or Place appointed for the making and keeping of all Arms necessary either for Defence or Assault.

ARSIS & THESIS, are certain Terms in Musical Composition; as where a Point being inverted, is said to move *per Arsin & Thesis*, that is to say, where a Point riseth in one part, and falls in another; or on the contrary, where it falls in one part, and riseth in another; whence is produced a very agreeable Variety.

ARTERY: There are three kinds of Ducts in an Animal Body which bear the Name of *Artery*, the *Asperia Arteria* or *Trachea*, the *Arteria Pulmonaris* or *Vena Arteriosa*; both which see: And most properly, the *Aorta* or great *Artery*, which carries the Spirituous Blood from the left Ventricle of the Heart by its Branches, to all Parts of the Body; This, and its Ramifications, are the only true *Arteries*. The Word *Artery*, some say, is derived from *ἀρό τῆ ἀρτην*, because 'tis continually rising or moving with a Pulse like Motion; and may be defined to be an Organical and Similar Part, oblong and round, appointed to convey Spirituous Blood to all Parts of the Body.

The greatest *Aorta* in the whole Body is the *Aorta*, for that Reason often called the *Arteria magna*; and from it all the *Arteries* in the whole Body are derived, except the *Arteria Pulmonaris*. A brief Account of which, and how they spring from the *Aorta*, I shall here subjoin.

Before it comes out of the *Pericardium*, it sends out sometimes one, but oftner two small *Arteries*; on each side one, which compass the *Basis* of the Heart like a Garland in their Circuit, sending down divers Twigs lengthways on the Heart; and these are called the *Arterie Coronarie*. When these two small *Arteries* have encompassed the *Basis* and meet, they inosculate one with another, but not with the *Veins*: At their rise out of the *Aorta*, there is a Valve to hinder the Reflux of the Blood into the *Aorta*. These Coronary *Arteries* Dr. *Ruych* observes, send Branches to the *Auricles*, and to the very Substance of the Heart it self, and to the Root of the Trunk of the *Aorta*.

The ascending Trunk then running up under the *Vena Cava*, lies upon the Wind-pipe, and presently sendeth forth two large Branches, whereof one passeth to the Right, the other to the Left Arm: They are called *Rami subclavii*, because they march under the *Clavicule*; and as soon as they are gone out of the Breast, are called *Axillares*. The Right is the larger, and rising higher, goes a more direct way towards the Right Arm; the Left is less, and rising lower, ascends more obliquely towards the Left Arm. They send
out

out several Branches both from their lower and upper side.

From the Lower proceeds the *Superiour Intercostal*, which runs along the Interstices or Intervals of the four uppermost Ribs, and sends Slips to the neighbouring Muscles and spinal Marrow. These sometimes are propagated from the Cervical Arteries coming out thro' the Holes of the *Vertebrae*.

From the upper side of each *Subclavian* springs first the *Mammari*, which descends towards the Breast thro' the Muscles that fill up the Interstices of the Cartilages of the true Ribs; and a considerable Branch of each descending out of the *Thorax* by the Sides of the *Cartilago enfformis*, run down the *Abdomen* under the *Musculi Recti*, spreading there into many Twigs, which are said to inoculate with the Extremities of the like Twigs of the *Epigastrick Artery* ascending. But that Opinion is so opposite to the Circulation of the Blood, that it is impossible to be true; for no Blood can ascend by the *Mammariæ*, nor descend by these ascending Twigs of the *Epigastricæ*.

The next is *Cervicalis* (otherwise called *Vestibralis*) which sendeth Slips to the *Vertebrae* and Muscles of the Neck, at whose seventh *Vertebra* it enters in by the Holes of the transverse Processes, and pierceth the Membrane that invests the Spinal Marrow, bestowing Twigs both on the Membrane and Marrow, and runs up therewith in at the great Hole of the *Occiput*, and being enter'd the Skull, both Branches (the Right and Left) join under the *Medulla Oblongata*, and then are divided into innumerable most small Twigs, which make wonderful Net-like Plexus in the *Pia Mater* about the *Cerebellum*, and run into the Substance of the *Cerebellum* it self; and some of them being united with those of the *Carotides*, make part of the very *Rete mirabile*.

The third *Artery* that riseth out of the upper side of the *Subclavian* is *Muscula*, which is spent on the Muscles of the Neck, and sometimes also on some of the Arm.

After the *Subclavians* have had all these Pairs of Arteries going out of them, they pass out of the *Thorax*, and begin to be called *Axillars*.

At the same Place, or very near, where the ascending Trunk of the *Aorta* sends out the *Subclavians* sideways, the remainder of it is divided into two, called *Carotides*, which ascend directly upwards (tho' the Right sometimes arise from the right *Subclavian*.) These, at their rise, are sustained by the *Thymus*; and having bestowed Twigs on the *Larynx*, *Tongue*, the Muscles of the *Os Hyoides*, and the neighbouring Gland, pass up on each Side by the sides of the Wind-pipe to the Jaws, with the Internal Jugular Vein, and there are each subdivided into the *External* and *Internal* Branches.

The *External* is smaller, and is dispersed into all the Muscles of the Cheeks, Fore-head, Temples, Lips, and, in general, thro' all the outer Parts of the Head and Face.

The *Internal*, which is larger, sends forth some more Twigs to the *Larynx*, *Tongue*, &c. as also to the Glands behind the Ears, and the spongy Parts of the Palate and Nose. Then it entereth the upper Jaw, and bestows a small Slip on the Root of each Tooth (as the *External* did on the

Roots of the Teeth of the lower Jaw) whereby sharp Humours flowing in upon them, sometimes cause a very painful Tooth-ach. The remainder of it climbs upon the Skull, being about the *Basis* divided into two Branches: The *less* and hinder whereof having sent one Slip to the inner Muscles of the Neck, and another thro' the Hole of the uppermost *Vertebra* into the Membrane that invests the Spinal Marrow, ascending farther, enters the Skull, at the Hole by which the sixth Pair of Nerves (commonly so called) comes out, and creeping along the *Dura Mater*, ends near its *Sinus* (which yet some say it enters.) The larger Branch, tending upwards, is carried thro' the bony Channel in the Wedge-like Bone, with a winding Duct to the *Sella equina*; at whose *Basis*, after it has sent out a Twig on each Side into the *Dura Mater*, it opens it self into many small Slips, which being interwoven with those of the Cervical Artery (above-mentioned) make the *Rete mirabile*, which is more observable in Beasts than in Men. Yet it is not all spent on the said Slips, but perforating the *Dura Mater*, it enters the *Pia Mater* with two notable Branches, which being divided into very small Twigs, are mingled with those of the Cervical Artery, with which they pass out of the Skull, and accompany the Spinal Marrow even to the Loins: Afterwards it sends a small Branch thro' the second Hole of the Wedge-like Bone with the Optick Nerve, out of the Skull to the Eye; and yet still supplying more Twigs to the Substance of the Brain and *Pia Mater*, and being united with some other Twigs of Cervical Artery, it makes the *Plexus Chorooides*.

The descending Trunk of the *Aorta*, which is larger than the ascending, goes down by the Gullet to which it cleaveth. And hence is a Man that is hot, so much cooled with a draught of cool Drink; for the Gullet being cooled thereby, the Blood in the *Aorta* contiguous to it, must needs be cooled likewise.

Before it arrive at the *Diaphragm* it sends out of its hinder side the *Inferiour Intercostals*, which run along the Interstices of Eight or Nine of the lower Ribs, namely, those which the *Superiour Intercostals* did not supply. They likewise send Sprigs by the Holes of the *Vertebrae*, made for the Nerves, to the Marrow of the Back, and to the Muscles which rest upon the *Vertebrae*, and also to those of the *Thorax*. Sometimes above this, and sometimes below it, there ariseth also out of the hinder part of the *Aorta* and Artery called *Bronchialis*, first found out and so named by *Frederick Ruysch*, which accompanies all the *Bronchia* of the Wind-pipe.

When it comes to the Midriff, there springs out of it the *Phrenicæ*, one on each side; these running all thro' the *Diaphragm*, pass up into the *Mediastinum*, and sometimes into the *Pericardium*.

Then having penetrated the Midriff it descends in one Trunk to the fifth *Vertebra* of the Loins; in which Passage it first sendeth forth the *Celiacæ*, which ariseth single, and is so called, because it sendeth Twigs to the Stomach. This springeth from the fore-part of the Trunk at the first *Vertebra* of the Loins, and descending under the hollow of the Liver, upon the Trunk of the *Vena Porta*, it is divided into two Branches, the *Right* and *Left*.

The *Right* which is the smaller, ascending, produces in its upper part the *Gastrica dextra*, that comes

comes to the *Pylorus*, whence *Spigelius* calls it *Pylorica*: And besides, the *Cystica gemella*, which are very small, and are dispersed thro' the Gall-Bladder. And out of its lower side there spring;

1. *Epiplois dextra*, which runs thro' the right side of the inner or hinder Leaf of the Caul and the Colon that it is annexed to.

2. *Intestinalis*, bestow'd on the *Duodenum* and beginning of *Jejunum*.

3. *Gastro-epiplois dextra*, on the right side (to the middle) of the bottom of the Stomach, and also on the Caul that it is knit to its bottom.

4. *Hepatica*, which are two small ones: These are spent on the investing Membrane of the Liver (for its *Parenchyma* is nourished by the *Porta*) the *Capsula Communis*, the Gall-Bladder and *Porus Biliaris*.

The Remainder of this Right Branch enters the Mesentery with many Twigs.

The Left Branch of the *Celiaca*, which is call'd *Splenicus* (sometimes springing immediately from the *Aorta*) is larger than the Right; and as it goes towards the Spleen, it sendeth forth of its upper side *Gastrica major*, which after it hath bestow'd a Slip upon the upper and middle part of the Stomach, is divided into two others; the first whereof is called *Coronaria Stomachica*, which encompasses the upper Orifice of the Stomach like a Garland, and sends many Twigs to the Body of the Ventricle it self; the other *Gastrica sinistra* which (according to *Diemerbroeck*) is carried towards the Right Hand into the upper part of the Stomach, and to the *Pylorus*. Out of its lower side spring, first *Epiplois postica*, which runs to the hinder Leaf of the Omentum, and the Colon annex'd to it; secondly, *Epiplois sinistra*, which is bestow'd on the lower and left side of the Omentum.

Just as the *Splenicus* Branch is entering into the Spleen, there arises out of its upper part *Vas breve arteriosum*, which goeth straight to the Left part of the bottom of the Stomach; and the *Gastro-epiplois sinistra*, which being sustain'd by the upper or fore-leaf of the Omentum, sends some Twigs thereto, and also to the Left part of the bottom of the Stomach, and to both its fore and hinder sides, then it enters into the Spleen.

All these Arteries spring from the *Celiaca*, and accompany the Veins of the *Porta* of the like denomination.

The next that ariseth out of the Trunk of the *Aorta* is the upper Mesenterick, which springs from the fore-part of it as the *Celiac* did. It accompanies the *Vena Mesariaca* of the *Porta*, and runs thro' all the upper part of the Mesentery, and bestows many Branches on the Guts, *Jejunum Ileum*, and that part of Colon that lieth in the right Hypochonder.

Immediately below this, about the second *Vertebra* of the Loins, there go out of each side of the descending Trunk of the *Aorta* an Emulgent Artery, each of which being after its rise divided into two, and sometimes into three Branches, enters the Kidney on its own side. The Right springs out of it a little lower than the Left: both are subdivided into innumerable Twigs in the *Parenchyma* of the Kidneys, (all of which are invested with the Veins in one common *Capsula* borrow'd from the Pelvis) and their Capillaries end in the Glands, wherein the Serum that these Arteries bring with the Blood is separated there-from, and carried from them by the Urinary Siphons into the Pelvis.

Next to these arise the *Spermatice* (called *Arteriae preparantes*). These go out of the fore-part of the Trunk very near together (very seldom either of them out of the Emulgents, as the Left *Spermatick Vein* does) and the Right passes over the Trunk of the *Vena Cava*: About 2 Fingers breadth from their rise they are each joyn'd with the *Vena preparans* of their own side, and descend with them, in Men, thro' the Process of the *Peritoneum* to the Stones, being divided into two Branches a little before they arrive at them, one of which runs towards the *Epididymis*, and the other to the *Testes*. In Women, when they come near the *Testes* (or *Ovaria*) they are divided also into two Branches, one whereof goes to the *Testes*, and the other to the bottom of the Womb. Next below the *Spermatick* springs the lower Mesenterick out of the Trunk a little before it is divided into the *Rami Iliaci*. This entrench the lower Region of the Mesentery, and distributes many Branches to the Left part of the Colon, and to the freight Gut; and lastly, descending to the *Anus*, makes the internal Hemorrhoidal Artery.

Very near to this, out of the Trunk still arise the *Lumbares*, reckon'd four in number: These go out of the back-side of the *Aorta*, and are distributed, not only to the neighbouring Muscles of the Loins, and to the *Peritoneum*, but enters in at Holes of the *Vertebra* of the Loins, and run along the Membrane that involves the Spinal Marrow, and penetrates into the Marrow it self.

Besides these some reckon other two, on each side one, call'd *Musculæ Superiores* (which run to the Muscles of the Abdomen) unless these be two of the four call'd *Lumbares*.

When the Trunk is descended as low as the fifth or last *Vertebra* of the Loins, and the top of *Os Sacrum*, it begins to climb upon the *Vena Cava*, under, or behind which it passed thus far: But as it begins to get upon it, it is divided into two equal Branches call'd *Rami Iliaci*, and at its very division there springs out of it *Arteria Sacra*, whose small Twigs entering in at the Holes of the *Os Sacrum* penetrate into the Marrow contained in it.

The Trunk of the descending *Aorta* being divided into the *Rami Iliaci*, these are sub-divided presently into the *interiour* and *exteriour* Branches. From the *interiour*, which is less, proceed three others.

First, The *inferiour Muscula* (called otherwise *Glutea*) which is bestow'd on the Muscles, named *Glutei* that makes the Buttocks, and also on the lower end of the Iliack Muscle and the *Pseas*.

Secondly, The *Hypogastrick*, which is large, and at the lower end of the *Os Sacrum* runs to the Bladder and its Neck, and the Muscles that cover the *Ossa Pubis*. In Men it goes also along the two Nervous Bodies of the *Penis* as far as the *Glans*; and in Women it is distributed in numerous Branches into the bottom of the Womb and its Neck, out of which, for the greatest part, issue the *Menses* in their Monthly Purgation. It goes also to the *Podex*, where it makes the external Hemorrhoidal Artery.

Thirdly, The *Umbilical Artery*, which ascending by the sides of the Bladder, and being inserted into the *Peritoneum*, proceeds betwixt the two Membranes thereof to the Navel, out of which it passes in a *Fetus* in the Womb, and runs into the *Placenta Uterina*: But after the Infant is born, when there is no more use of it, it closes up, and turns into

into the nature of a Ligament, in some measure sustaining the sides of the Bladder, and hindring it from pressing on its Neck.

From the *Exterior Branch* of the *Ramus Iliacus* two Arteries arise.

First, The *Epigastrick*, which turning upwards on the outside of the *Peritonæum* runs betwixt it and the *Musculi Recti* of the *Abdomen* as high as the Navel, where the Mammary Artery meets it, and according to Tradition (tho' false) inosculates there with it.

Secondly, *Pudenda*, which sends forth a notable Artery on each side into the Nervous Body of the *Penis* in Men, and into the *Clitoris* in Women. Hence it is carried inwards by the joyn'ting of the *Ossa Pubis* to the *Pudenda* and Groins, and their Glands, and is spent on the Skin of those Parts, and of the Yard, in Men. When all these pairs of Arteries have arisen out of the *Rami Iliaci*, they run down out of the *Abdomen* to the Thighs, where they begin to be called *Cruvales*.

ARTERIA VENOSA: See *Pulminaria Arteria*.

ARTERIOTOMY, is the artificial opening of an Artery for the letting of Blood in an inveterate Head-ach, Madnefs, Falling-sicknefs, Pain and Inflammation in the Eyes and Ears, and the Section is made in the Fore-head, Temples, or behind the Ears: The manner of it is thus; after the Ligature is made in the Arms or Neck, the Artery is cut just as a Vein is, and when the Blood is emitted, you apply a very Astringent Plaister with a Leadn Plate to the Orifice, and then swathe it well. *Blanchard*.

ARTHRITIS, *Morbus Articularis*, the Gout, is a Pain in the Joints of the Limbs, sometimes accompanied with a miserable Contraction of the Nerves, Tendons, Ligaments, and thin Membranes about the Bones, with Swelling and Rednefs, and now and then with hard chalky Concretions. They account it four-fold: *Cyragra* the Hand Gout; *Ishias*, the Gout in or about the Bone connected to the *Os Ilium*, which therefore some call the Hip-Gout; *Gonagra*, in the Knees; and *Podagra*, in the Feet.

ARTHRITIS PLANETICA, } the wandering
ARTHRITIS VAGA, } Gout, which
flies or moves from one Limb to another.

ARTHRITICK, or *Arthritical*, Gouty, Dis-eased in the Joints, &c.

ARTHRODIA, is the Articulation of one Bone into the shallow *Sinus* of another, as the *Radius* receives the *Humerus*.

ARTHROSIS, the same with *Articulation*.

ARTICK POLE, is the North Pole of the World.

ARTICK CIRCLE: See *Polar Circle*.

ARTICLE, in Arithmetick, is *Ten*, with all other whole Numbers that may be justly divided into ten Parts, as 20, 30, 40, &c. they are sometimes called *Decads*, and sometimes Round Numbers.

ARTICLE, in Grammar, is a small Word or Particle used to Decline or Vary the Cases, and to distinguish the Genders of Nouns and Pronouns, as *Hic*, *Hec*, *Hoc* in the Latin Tongue.

ARTICULATION, is that part of Grammar which treateth, first of Sounds and Letters (which are called the Elements of Speech) and then of the manner of their Combination for the composing of Syllables and Words; so that he which

pronounces his Words clearly and distinctly, is said to pronounce them *articulately*. And such Sounds as can be expressed by Letters, and which form Words, are called *Articulate Sounds*.

ARTICULATION, in Anatomy, is a Conjunction of the Limbs of an Animal Body, for the due performance of Motion: Some make this twofold, *viz.* *Diarthrofsis*, which is a more loose, and *Synarthrofsis*, which is a more close Conjunction.

The Term is also used by the *Botanists* for the Joints or Knots that are in some *Siliques*, as those of the *Ornithopolium*, and in the Roots of the *Polygonatum*, and the Distance or Space between Knot and Knot, or Joint and Joint they call the *Internodium*.

ARTIFICIAL DAY: See *Day*.

ARTIFICIAL NUMBERS, *Secants*, *Sines* and *Tangents*: See *Logarithmetical Numbers*, *Secants*, *Sines* and *Tangents*.

ARTIFICIAL LINES, on any Sector or Scale are Lines so contrived as to represent the Logarithmetick *Sines* and *Tangents*, which, by the help of the Line of Numbers, will solve all Questions in Trigonometry, Navigation, &c. tolerably exact.

ARTILLARY, is all sorts of great Fire-Arms with their Appurtenances; as Cannons of all sorts, Mortars, Muskets, Carbines, &c.

ARTYÆNOIDES, or *Cuturales*, are two Cartilages which with others make up the top of the *Larynx*; and these are so called, because when their Processes are joined together, they represent the Month of an Ewer (*Gutturium*) or the indented Lip of a Cup or Vessel.

ARTYÆNOIDEUS, is the smallest Muscle belonging to the *Larynx*; it's in the Opinion of some, double; but has always (says Mr. Cowper) appeared to us single. It arises from the external part of one of the *Artenoidal Cartilages*, and running transversly, is inserted to the other. This pulls the *Artyenoidal Cartilages* nearer each other, and shuts the *Rimula* adequately, by forcing down the *Epiglottis*, which quite closes the *Glottis* so that no Air can enter.

ASAPHY, is a lownefs of the Voice, proceeding from an ill Constitution, or Contemperation of the Organs of Speech.

ASBESTINE Paper or Cloth, is such as will burn in the Fire, be purified by it, and yet not consume. 'Tis made of the *Asbesto* or *Lapis Amianthus*, and is by some called *Linum Vroom*.

ASCARIS, or *Ascarides*, are little Worms which breed in the *Intestinum Rectum*, and tickle and trouble it.

ASCENDANT, is that part of the Heavens which ascends, or is coming up above the Horizon in the East.

ASCENSION, is the rising of the Sun or Star, or of any part of the *Equinoctial* with it, above the *Horizon*. *Descension* is the setting of the same. These *Ascensions* and *Descensions* are either *Right* or *Oblique*; which see.

ASCENSIONAL Difference, in Astronomy, is the Difference between the *Right* and *Oblique Ascension* or *Descension*; or, it's the space of Time, the Sun riseth or setteth before, or after six of the Clock.

To find the *Ascensional Difference* Trigonometrically, having the Latitude of the Place, and the Sun's Declination given.

Say, As the Co-Tangent of the Latitude : Is to the Tangent of the Sun's Declination :: So is the Radius : To the Sine of the *Ascension Difference*.

Example. Suppose the Latitude be $51^{\circ}.30'$. and the Sun's Declination be $9^{\circ}.00'$.

Then to the Ar. co. of the }
Co-Tangent of $51^{\circ}.30'.$ -- $0,099395$
add the Tangent of $9^{\circ}.00'.$ -- $9,199712$
Sum is the Sine of $11^{\circ}.29'.$ -- $9,299107$

Which is the *Ascensional Difference* required ; and being reduced into Time, by allowing 4 Minutes of an Hour for every Degree, 'twill be $44^m.29^s$.

ASCII, are the Inhabitants of the *Torrid Zone*, which twice a Year have the Sun (at Noon) in their *Zenith*, and consequently, then their Bodies cast no Shadow ; whence comes the Name of *Ascii*, ἀσχοι.

ASCITES, is a Dropfic or swelling of the *Abdomen*, and consequently, of the *Scrotum*, Thighs and Feet, proceeding from a Serous, and sometimes Lymphatick or Chylous Matter, like the washing of Flesh, collected in the Cavity of those Parts.

ASCITICK, is he that is affected with the *Ascites*.

ASCLEPIAD, a Greek or Latin Verse of four Feet, containing a Spondee, a Coriambus, and two Dactyles ; as,

Sublimi feriam sidera vertice.

ASPARAGUS, in Botanicks, signifies the first *Germen*, Sprout or Shoot of a Plant ; which is either edible by it self, or boiled in Broth : It comes out before the Leaves are unfolded. And hence (*i. e.* ἀσπράγος) the famous Plant of this Name receives its Denomination.

ASPECT, a Term in Astronomy, signifying the Situation of the Stars and Planets, in respect of one another. Of these they usually reckon five.

1. The *Sexile*, when two Stars or Planets are 60 *degr.* from one another.
2. *Quartile*, when they are 90 *degr.* distant.
3. The *Trine*, when they are distant 120 *Degr.*
4. *Opposition*, when they are 180 distant.
5. *Conjunction*, when they are both in the same Degree.

Kepler added 8 new *Aspects* more ; as the *Demi-sexile* of 30° . the *Decile* of 36° . the *Octile* of 45° . the *Quintile* of 72° . the *Tredecile* of 108° . the *Sextantile* of 135° . the *Biquintile* of 144° . and the *Quinticinx* of 150° .

How the Distance is reckoned, and on what Circle, see the Word *Secondary Circles*.

ASPERSA Arteria, or Trachea, is an oblong Pipe consisting of various Cartilages and Membranes, which begins at the Throat, or lower part of the Jaws, lies upon the Gullet, descends into the Lungs, and is dispersed by manifold Ramifications or Branches thro' their whole Substance : The upper Part is called *Larynx*, and the Lower *Bronchus*, to which *Malpighius* adds a third, or lowest, called by him *Vesicular* : It is subservient to Speech and Respiration.

That part of the *Aspera Arteria* which is called the *Bronchus*, contains all of it, but the *Larynx* ; being the Body of the Pipe as well before as after its Insertion into the Lungs, all the Cartilages of this *Bronchus* are like the lowest of the *Larynx*, to which the uppermost of the *Bronchus* adheres.

These Cartilages are seated one below another at equal Distances, and keep in their Places by both the Membranes of the *Trachea*, which fill up their Interstices, and tie them one to another like Ligaments. Yet these Rings have not their Circle entire, but on the backside of the *Bronchus* next the Gullet, that they might give way to the Meat in swallowing, they pass into a Membrane, so that they are in Figure like the Letter C. But this Interstice in their Circle, which most Anatomists affirm to be Membranous, *Casp. Bartholin* (after his Father) says, is rather a Carnous Fibres that run from one Side or End of the Cartilage across to the other, which, in Expiration (especially violent) contracting themselves, draw the Ends of the Cartilage towards one another on each Side, and thereby straiten the Pipe of the *Trachea*.

And tho' the Cartilages, so far as they are contiguous to the Gullet (being about twenty in number) are thus femilinear as it were ; yet those of the Branches of the *Bronchus* within the Lungs, have no Interstice in their Circumference, being all Cartilaginous, tho' not all of a Circular Figure, but some Four-square, other Triangular, &c. as *Diemerbroeck* observes, the inner Membrane is plentifully beset with military Glands, out of which a good part of that mucous Matter that bedaubes its Inside issues, for the lubricating of it. The outer Membrane helps to connect the Cartilages the more firmly one to another, and the whole *Trachea* to the neighbouring Parts, that it may more safely and firmly descend into the *Thorax*. This is much thinner than the other ; for the Inner (according to *Dr. Wallis*) has two Rows of Muscular Fibres, the Outer straight, the Inner Oblique, the First by their Contraction shorten the *Trachea*, the Latter straiten it ; so that he thinks they assist Expiration, especially when it is violent, as Coughing, Hawking, or the like. Yet he says, this inner Membrane has two others growing upon it, as it were, one Glandulous, and another Vascular. Thro' this latter do the Blood-Vessels and Nerves every where run ; and the Glands placed in the former, receive and keep all the superfluous Moisture or *Lympha* deposited by the Arteries, which the Veins do not imbibe, till they can remand it by the Lympheducts (which spring from them) or if it be over plentiful, so that the Lympheducts cannot receive it at all, then it issues both out of these Glands, and out of the Arteries into the Cavity of the Wind-pipe, and causes a Catarrh. But the Inside of this Membrane is naturally moist, being besmeared with a fattish and mucous Humour, to hinder its drying, and to make the Voice smoother ; so that when this Humour is fretted off in Catarrhs, or the Inside of this Membrane becomes rough from any Cause, the Voice becomes hoarse ; and when it is dried by too much Heat, as in Fevers, it becomes squeaking.

The *Aspera Arteria* has Veins from the external Jugulars. Arteries from the *Carotides*, and from the *Arteria Bronchialis* (first found out by *Frederick Ruysch*) which springs from the backside of the descending Trunk of the *Aorta*, a little above the lower Intercostals. Nerves it receives from the recurring Branches of the *par Vagus*, which run mostly along its inner Membrane, whence it becomes so exquisitely sensible.

When it is descended as low as the fourth *Vertebra* of the *Thorax*, it is divided into two Trunks, whereof one goes into the right Lobe of the Lungs, the

the other into the left, and each is presently again divided into two, and those into others, till at last they end in very small Branches, which are dispersed among the like Branches of the Pulmonary Artery and Vein, and end in and are continued with the little Bladders that make up the greatest part of the Bulk of the *Lungs*.

ASPERIFOLIÆ (*Plantæ*) is one of the Divisions or kinds of Plants : See (*Plants*, N. II.)

In this kind of Plants, the Leaves stand alternately, or without any certain order on the Stalks : The Flowers are *monopetalous*, but having the Margin cut into 5 Divisions, sometimes deep, sometimes shallow ; and the upper Spike or top of the Plant is often curved back something like a Scorpion's Tail. They are called *Asperifoliæ* because they are usually *rough leaved*, but they are not always so. After each Flower of this kind of Plants, there usually succeed four Seeds : There being only the *Cerintæ* reckoned by Mr. Ray to belong to this Genus, which hath less than four Seeds at the Root of each Flower, but that hath but two.

The Herbs *Asperifoliæ* are, the *Pulmonaria Maculosa*, *Gynoglossa*, *Borago*, *Buglossa*, *Anchusa*, *Echium*, *Linum Umbilicatum*, *Heliotropium majus*, *Aparine major*, *Consolida major*, *Lithospermum*, *Echium Scorpoides* and *Cerintæ*.

ASPERITY, is the inequality or roughness of the Surface of any Body, whereby some parts of it do so stick out above the rest, as to hinder one's Hand, &c. from passing over it easily and freely.

ASPHYXIA, or a Cessation of the Pulse of the whole Body, is the highest degree of Swooning, and next to Death.

ASPIRATION, or the pronouncing of any Syllable or Word strongly, with a good deal of Breath and some Vehemency ; as we do those Words which have the Letter *H* before them, as *have*, *bear*, *hear*, &c. whereas they are sounded much softer and easier without the *H* ; as *ear*, *eat*, &c.

ASPHYXIA, a sensible decayed Pulse, the same with *Asphyxia*.

ASSART, a Term in Law, signifying an Offence committed in the Forest, by plucking up the Woods by the Roots : Also to make Glades in a Wood, to grub up or clear a Ground of Bushes and Shrubs, &c. or to lop off the Boughs of a Tree.

ASSATION, is a Term in Pharmacy, used for a peculiar kind of Decoction or Boiling of Plants, &c. in their own Juice.

ASSAULT (in Law) signifies a violent kind of Injury offered to a Man's Person, of a more large extent than Battery ; for it may be committed only by offering to give a Blow.

ASSAULT (in the Art of War) is taken also for a general Attack made upon the Fortrels to get it by main Force, without defending themselves in the Attack by any Works : The Words are, to give an *Assault* to such a Place ; to be commanded to the *Assault* ; to stand an *Assault*, to second an *Assault* ; to repulse an *Assault* ; to carry by *Assault*, &c. While an Assault lasts, and both Parties are mixt, there is no fear of Cannon on either Side, for they are afraid of destroying their own Men thereby.

ASSETS (in Law) signifie Goods enough to discharge that Burden which lies upon the Executor or Heir, in satisfying the Testators or Ancestors Debts or Legacies.

ASSEWIARE, signifies to draw or drain out Water from a Marshy Ground.

ASSIGN, (a Law Term) is he that is appointed or deputed by another to do any Act, or perform any Business, or enjoy any Commodity : And it is either in *Deed* or in *Law*.

ASSIGN in *Deed*, is he that is appointed by the Person himself.

ASSIGN in *Law*, is he whom the Law so makes, without any appointment of the Person.

ASSIMILATION, is a Term in Anatomy, by which they express the Change that is made either of Chyle into Blood, or of the Nutritious Juice into the Substance of an Animal Body. Thus the Modern Anatomists say, Sanguification is not performed by the Liver only, as the Ancients supposed, but by a gradual changing of the Chyle into Blood by frequent Circulations, and the manner of this Change they call *Assimilation*.

ASSISA *Cadere*, in Law, signifies to be Non-suited.

ASSISA *Nocumenti*, an Affize of Nuisance.

ASSISA *Continuanda*, is a Writ directed to the Justices assigned, to take an Affize for the continuance of a Cause, where certain Records alledged cannot in time be procured by the Party that would use it.

ASSISA *Proroganda*, is a Writ directed to the Justices of Affize for the stay of Proceedings, by reason of the King's Business, wherein the Party is employed.

ASSISE, *de mort d'ancestors* : See *Cofinage*.

ASSISE *de utrum*, lieth for a Parson against a Lay-Man, or a Lay-Man against a Parson, for Land or Tenement doubtful whether it be Lay-fee, or Free-Alms.

ASSIZE, in Law, properly signifies a Writ that lies where any Man is put out of his Lands, Tenements, or of any Profit to be taken in a certain Place, and so disseised of his Free-hold. In an *Affize* it is needful always that there be one Disseisor, and one Tenant, or otherwise the Writ shall abate.

There is also another *Affize*, called *Affize of fresh Force*, and lies where a Man is disseised of Tenements which are devisable ; as in *London* or other Boroughs that are Franchises : For there the Tenant shall come into the Court of the Town or Borough, and enter his Plaintiff, and accordingly shall have a Writ directed to the Mayor or Bayliffs, &c. and thereupon shall pass a Jury in manner of *Affize of Novel Disseisin* ; and in case the Officer delay Execution, the Plaintiff shall have another Writ of Execution, then a *fiat alias*, and after that a *Pluries*, &c. And from things of this Nature being done by the Judges in their Circuits ; when at any Place they sit to do Justice by Commission, that Court or Meeting is called the *Affizes*.

But besides this, the Judges of the *Affizes* have several other Commissions ; as, 1. A Commission of Oyer and Terminer, directed to them, and to many others of the best Account in their Circuits ; but here the Judges are of the *Quorum*, so as without them there can be no proceeding : By this Commission they enquire into and punish Murders, Treasons, Felonies, &c. 2. They have a Commission of Goal Delivery ; this is directed only to themselves, and the Clerk of the Affize Associate ; and by this Commission they deal with all Prisoners in Goal, for whatever Offences there committed. 3. They have also a Commission of Nisi

Prius, directed to the Judges themselves and the Clerk of the *Affize*, by which they are commissioned to take *Nisi Prius*, &c. 4. They have also a Commission of the Peace, in which all the Justices of the Peace of the several Circuits are obliged to assist them; for Default of which they are fineable at the Discretion of the Judges.

ASSIZE *de darraïn Presentment* : See *Quare impedit*.

ASSIZE of *Novel Disseisin*, lies where a Tenant in Fee-simple, Fee-tail, or for term of Life, is lately disseised of his Lands or Tenements, or else of a Rent-service, Rent-feeke, or Rent-charge of Common, of Pasture, of an Office, &c.

ASSIZE of the *Forest*, is a Statute or Condition, touching Orders to be observed in the King's Forest.

ASSIZE of *Bread and Beer*, is the Power a Magistrate has of affizing or adjusting their Weights and Measures.

ASSOCIATION, is a Patent sent by the King, either of his own Motion, or at the Suit of the Party Plaintiff to the Justices of *Affize*, to have other Persons associated to them to take the *Affize* : And upon this Patent of the Association, the King will send his Writ to the Justices of *Affize*, by it commanding them to admit them that are so sent.

ASSODES *Febris*, is a kind of burning Fever, in which the sick Person incessantly tumbles and tosses, being exceeding restless, and subject to Sicknefs at the Stomach, and Vomiting, by reason that the Distemper usually arises from the Vexation of the Stomach, by sharp and cholerick Humours, biting the Orifice or Coat thereof. *Blanch*.

ASSOYLE, (a Law Term) signifies to deliver or discharge a Man of an Excommunication,

ASSUMPSIT (in Law) or *Nude Contract*, is a voluntary Promise made by Word, by which a Man assumes and takes upon him to perform, or pay any thing to another : Or a Promise may arise in Law, as upon the sale of Goods, &c.

ASSUMPTION, in Logick, is the *Minor* or *Second Proposition* in a *Categorical Syllogism*.

ASTERICK, is a small Star set over any Word or Sentence, to make it the more conspicuous or taken notice of by the Reader.

ASTERISM, the same with *Constellation*; or a Collection of many Stars into one Class or System, which is usually on the Globe represented by some one particular Image or Figure, to distinguish the Stars that compose this Constellation from those of others.

ASTHMA, or *Phthisick*, is a difficulty of breathing, proceeding from the ill affection of the Substance of the Lungs, and the intercostal Muscles serving to Respiration.

ASTRAGAL, in Architecture, is by the French called the *Talon*, by the Italians *Tondino*, and is a kind of half *Tore*, sometimes wrought (in the Richer Orders) like a kind of overcast Hem or Edge to the larger *Tore*; which frequently is placed between, as in the *Ionick Base*, with two *Scotia's* or *Trochiles*; and sometimes, but rarely, just about the Plinth of the Base. Sometimes it is taken for the Collar or Cinchure next the *Hypotrachelium* and Diminution of a Pillar lifted on both Edges; and it runs also round under the *Echinus* of the *Ionick*. We find it also sometimes dividing the *Fascia* of the Corinthian Architrave, where it is wrought in Chaplets, and Beads or Berries; and sometimes 'tis used both above and below the *Lists*, and joining immediately to the Square or

Die of a Pedestal, where the *Stylobata* is introduced. Freart's *Parallol of Architecture*.

ASTRAGAL, in Gunnery, is the Cornice Ring of a Piece of Ordinance.

ASTROLABE, is a Mathematical Instrument serving to take the Height of the Sun or Stars. It consists of an entire Circle, whose Limb (or what Part of it is necessary) is divided into Degrees and Decimal Parts of a Degree, with a moveable Ruler or Label which turns upon the Centre, and carries two Sights. At the Zenith is a Ring to hang it by in time of Observation, and then you need only turn it so to the Sun, that the Rays may pass freely through both the Sights, and the Edge of the Label cuts the Altitude in the Limb. This *Astrolabe*, though now not much in use at Sea, yet if well made, graduated and poised, and of a great Thickness and Weight, that it may hang the steadier, it may be a very serviceable Instrument, especially between the Tropicks, where the Sun comes near the Zenith; and in calm Weather. There are also some Projections of the Sphere which are called by this Name, as that of *Gemma Erizius* and *Stoffler*.

The Common Sea Astrolabe.

ASTROLOGY, is an Art which pretends to foretel future things from the Motion of the Heavenly Bodies, and their Aspects to one another; and also from some Imaginary Qualities, which the foolish Admirers of this Cheat will have to be in the Stars, as the Causes of great Sublunary Effects; though they have no tolerable Grounds to prove that there are any such things. And therefore as I wish that such a ridiculous Piece of Foolery as this may be quite forgotten, so I have every where omitted explaining any of its Terms, unless they fall in with *Astronomy*.

ASTRONOMICAL Calendar, is an Instrument engraved on Copper Plates, printed on Paper, and pasted on Board, with a Brass Slider, which carries a Hair, and shews, by Inspection, the Sun's Meridian, Altitude, Right Ascension, Amplitude, Declination, Time of its Rising and Setting, &c. to greater nicety than the largest Globes now made.

ASTRONOMICAL Numbers : See *Sexagesimal Fractions*.

ASTRONOMICAL Place of a Star or Planer, is its Longitude or Place in the *Ecliptick*, reckoned

ed from the beginning of *Aries*, in *Consequencia*, or according to the natural order of the Signs.

ASTRONOMICAL Quadrant, is an Instrument curiously framed, and the Degrees exactly and minutely divided by the help of a Screw on the Edge of the Limb, fitted with Telescopes, and either apply'd to a Wall in the Meridian; or on a strong Axis or Pedestal, with two Semi-circles placed at Right Angles on two endless Screws, which readily direct or guide the Instrument to take Observations of the Sun, Moon or Stars.

ASTRONOMY, is a Mathematical Science, teaching the Knowledge of the Stars or Heavenly Bodies, and their Magnitudes, Distances, Eclipses; Order, and Motions: By some 'tis taken in so large a Sense, as to contain in it also, the Doctrine of the Mundane System, the Laws of the Planetary Motions, &c. which others reckon as a part of Physicks or Natural Philosophy.

ASYMMETRY, the same with *Incommensurability*, which see.

ASYMMETRICAL, the same with *Incommensurable*.

ASYMPTOTES, are Lines which continually approach nearer to each other, but tho' continued Infinitely, can never meet. Of these there are many kinds, as the Curve of the *Concoid*, &c. but it may be enough here to mention the Famous.

ASYMPTOTES in *Conick Sections*, which are the Lines *OS* and *OR*; and are thus drawn; Imagine, in the *Hyperbola*, the *Second* or *Conjugate Axis PQ* to descend still keeping parallel to the *Ordinates*, till it touch the *Vertex* of the Section *E*, for then, if thro' the Centre *O*, you draw Lines thro' the Ends of this Tangent Line *p q*. These are the Famous *Asymptotes* mentioned by *Apollonius*, Lib. 2. Prop. 1.

and of which he demonstrates, that tho' infinitely produced, and tho' the Curve come continually nearer and nearer to them, yet can they never be Co-incident with the Sides of the *Hyperbola*, nor ever meet it, or touch it; whence comes their Name of *Asymptotes*: And by some Latin Writers they are called *Intactæ*, for the same reason. This Non-Co-incidence appears very plainly; where the Section of the *Hyperbola* is made parallel to the Triangular Section of a Cone by the Ax; As,

Suppose along the Line *ef* parallel to *EF*. For if you imagine the *Hyperbola g e b* to be moved forward parallel to it self, as far as the length of the equal and parallel Lines,

g G, f F, E e, H h, till it come to be in the position *GEH*, or to be co-incident with the Triangular Section by the Ax, then it will be manifest, that the Hyperbolic Line *GEH* is distant each way from the Asymptotes *BC, BA*, by the length of the versed Sines of the equal Arks

b C and *g A* in the Circumference of the Circular Base of the Cone; and that at the same time it comes, if produced, still nearer and nearer to them. And consequently, I say,

1. *RG* and *HS*, or *AG* and *HC* being always equal to one another; as are also the Ordinates *GF* and *FH*, &c. The Rectangles *RG S* and *SHR*, *AG C* and *CHG*, will always be respectively equal to one another.

2. The Curve and the *Asymptote* can never meet, because the Circles generated by *EQ*, and the Rings generated by *RS*, and *HC*, &c. (which will arise from the Imaginary Revolution of the whole Figure round the Axis *FE*) will always be equal to one another, and to the Circle made by the Revolution of the Radius *E q*, as is plain by comparing this last Figure with the former in N°. 1, 2.

For the Spaces generated by the Lines *E q, FC*, &c. will be as the Squares of their Diameters, or of the Generating Lines. But 'tis certain, that the Square of *Fb* or of *FC*, exceeds the Square of *Fh*, by the Square of *bH* or *f F*; that is, by the Square of *EQ*, by the Supposition above; wherefore the Circle generated by the Motion of *FC*, will exceed that generated by *FH*, by that Circle generated by *EQ*. But the Space generated by *FC*, exceeds that generated by *FH*, by the Ring generated by *HC*; wherefore that Ring made by *HC*, must be equal to the Circle made by *EQ*, *QED*. And this will always be so; and therefore the Line *HC*, can never grow of no length, and consequently the Curve and the *Asymptote* can never meet.

There are other *Asymptotes* to other Curves; and tho' the *Parabola* hath no *Asymptote*, yet two *Parabolas* may be drawn *Asymptotically* to each other.

The following general Observations about *Asymptotes* and *Asymptotick Curves*, I had communicated from Mr. Humphrey Ditton, now Master of the New Mathematical School in *Christ's Hospital*, a Person peculiarly skilful in these Matters, and are as follows.

Some General Observations about Asymptotes, and Asymptotical Curves.

I. Tho' it be certain that all such Curves as have *Asymptotes*, be of the Number of those which (running on in *Infinitum*) do not include a Space; yet is not true, on the other hand, that wherever we have a Curve of that Nature and Property, we find an *Asymptote* also. For this infinite Continuation of the Curve, is visible in all those of the *Parabolic* Family, and yet none of all these can have an *Asymptote*; that is, not any Right Line placed in any Position to the Curve; which can infinitely approach to it, and yet not cut it, as is not hard to be demonstrated.

II. Of those Curves that have an *Asymptote*, some there are that have two, others that have only one. Instances of the former kind are all the sorts of *Hyperbolic* Curves, which from the Principle of their Genesis (as being formed from *Reciprocal Series*) are easily proved to have two *Asymptotes*. And of the latter sort we have the *Concoid*, the *Cissoid*, and the *Logarithmic Curve*.

the Nature of which considered, as clearly shews that they have one and no more.

III. As a Right Line and a Curve may be *Asymptotical* to one another, so also may Curves and Curves: And here are two or three Varieties to be considered.

1. Any of these Curves that have from their own Nature and Construction an *Asymptote*, are capable of being *Asymptotical* to one another. Thus in Conick Sections 'tis demonstrated, that Hyperbola's that have the same common *Asymptote*, are also themselves *Asymptotes* to each other; and this shall afterwards be shewn universally of all such Curves.

2. Not only those Curves which are endowed with an *Asymptote*, but even such as in their own Nature admit of no such thing, may also have this Affection. The Parabola (for instance) we know has no *Rectilineal Asymptote* belonging to it; and yet two Parabola's, with their Axes placed in the same Right Line, will be *Asymptotical* to each other; as *De la Hire* has demonstrated, *Señ. Conic. Lib. 6.*

3. But no Curve that has any *Asymptote* belonging to it, can ever be *Asymptotical* to another whose Nature refuses a *Rectilineal Asymptote*; for if it were supposed to be so, then this latter Curve would have the *Asymptote* of the former Curve for its own *Asymptote* too, which is contrary to the Hypothesis of its having none at all. Thus, for Instance, a Parabola and an Hyperbola can never be *Asymptotical* to one another; for were it so, the *Asymptote* of the Hyperbola would be also an *Asymptote* to the Parabola; which is impossible, since that Curve can have no *Asymptote*.

IV. No Right Line can ever possibly be an *Asymptote* to a Curve that is every where concave towards that Right Line: This is very clear from the bare Consideration of the Curvature, and the Tendency of it; and may be thus brought into Demonstration.

Let the Curve *ADG* (whose Ax is *AE*) be concave in all its Parts towards the Right Line *FE*; this Line then *FE*, shall never be an *Asymptote* to the Curve *ADG*. Let *AB* touch the Curve in the Vertex *A*, and be imagined parallel to *FE*; then any other Tangent as *CD*, suppose shall, if it be produced, meet with *FE* in some Point or other; but because *CD* is a Tangent, therefore the Curve Line it self falls between the Tangent and the Line *FE*; but it is by the Hypothesis also concave to all its Parts; therefore if the Tangent *CD* produced, intersects *FE*, *a fortiori*, the Curve *CDG* shall meet with it also; and therefore *FE* is not an *Asymptote*.

V. But a Right Line may be an *Asymptote* to a mixt Curve that is partly Concave and partly Convex towards the same Line. An Instance of this we have in the *Conchoid of Nicomedes*, which is Concave (for some Parts of it) to its Normal, and then after the *Punctum Flexus*, in which 'tis neither Concave nor Convex, it is for ever Convex towards the same. Concerning which *Punctum Flexus*, see *Schoten. Comment upon Cart. Geometry, Lib. 2.*

VI. All Curves that have one and the same Common *Asymptote*, are also *Asymptotical* to one another.

Let the Curves *EGH*, *OFK*, have the common *Asymptote ADP*; then they shall be *Asymptotical* to each other. First of all it is evident, that they continually approach to one another; for instance, drawing the Line *FD* a Tangent to the Curve *OK* in *F*, to meet with the *Asymptote* in *D*, and producing *BF* to *G* in the Curve *EH*, draw *GH* a Subtense in that Curve parallel to *FD*; and then from *H*, the Line *HKC* parallel to *GB*, 'tis clear, that *FG=HI*, and *HI ⊥ HK*, because *FD* touches in *F*; therefore *FG ⊥ HK*, that is, the Curves are nearer to one another in the Points *H, K*, than in *F, G*; and the same may be shewn of any other Points taken from the Parts of *B, C*, towards *P*. But then again, these Curves can never possibly meet with, or cut one another. For imagine they could, and did intersect each other, at the Point *Q* suppose; and let *QY, RT* be parallel to *BG, HC*. The Curve *OKF* goes above

above the Curve *EGH* (after the Intersection in *Q*) into *R* suppose, and the other falls below, as suppose at *S*. Now if two Curves as *QR*, *QS*,

cut in *Q* the Curve *QR* departing from *QS*, 'tis plain that some Point, as *R*, may be taken in the Curve *QR*, from whence a Right Line, as *RT*, drawn to another Line, as *YT*, shall be equal to *QY*, the Line from *Q*, the common Section of the Curves to the same Line *YT*. This follows from the Nature of Curve Lines in general. Now let us suppose these Curves that cut thus to have the Line *YT* for their common *Asymptote*; then from the general Nature of Curves, we can find the Point *R*, from whence *RT* shall be $= QY$, but upon the Hypothesis that *YT* is an *Asymptote*, 'tis impossible that *RT* should be $= QY$, for the Lines intercepted between the Curve and its *Asymptote*, are still less and less, and therefore *RT* must be less than *QY*, because of the *Asymptote*; and from hence 'tis certain, that two Curves, which have one and the same *Asymptote*, can never cut each other.

VII. Two equal Curves of the same sort, whose *Asymptotes* are parallel, with themselves be equidistant in all their Points. These Curves are supposed to be such as have but one *Asymptote* a piece.

Let *EF* be the *Asymptote* of the Curve *BCD*, and *AH* the *Asymptote* of the Curve *EIK*; and the Curves being by the Hypoth. of the same kind and equal, therefore $EB = EA$, and $IG = CM$, and $DN = KH$, and $IG + IM = CM + IM$, and so $DN + NK = KH + NK$; but $KH + NK = IG + IM$ (for *EH* is a Parallelogram) therefore $CM + IM = DN + NK$, that is, $CI = DK$; and so in all other Points from whence the Curves are equidistant.

VIII. The same thing is true also of equal Curves of the same sort that have two *Asymptotes* each, but with a Limitation. Suppose *LO* to be one

common *Asymptote* to both Curves, and *PN* the other for the Curve *BCD*, as *LH* is for the Curve *EIK*; where the lower Curve cuts the

Asymptote of the upper in *E*, drawing *BEA* parallel to *OL*; 'tis evident that from the Points *B* and *E* to the Parts of *D* and *K* infinitely, the Curves are equidistant from one another: For by the Hypothesis, the Points *P* and *L* are the Concourses of the *Asymptotes*, and $PE = LA$, BE, CM, DN , are ever $= EA, IG, KH$, &c. from whence the Conclusion follows as before.

ASYNDETON, is a Figure in Grammar, implying a Defect or want of Conjunctions in a Sentence (as *Polyasyndeton* is a Redundancy of them) as in this Instance, *Græculus Esuriens, in Cælum iusseris, ibit*; where the *Si* before *Iusseris* is omitted.

ATCIEVEMENT, in Heraldry, signifies the Coat of Arms of any Gentleman duly Marshalled with Supporters, Helmet, Wreath and Crest, and with Mantles and Woods, or as the Herald calls it, with *Heaume* and *Timbre*, i.e. with *Helmet* and *Crest*. Such are usually hung out on the Fronts of Houses after the Death of the Lord, Lady, Master, or some considerable Person; and are now corruptly called *Hatchments*.

ATHANOR, a kind of digesting Furnace in Chymistry, fix'd and large, and made with a Tower, which is contrived so as to keep a constant Heat for 14 Days, a Month, &c. or the Heat may be increased or diminished at pleasure, by opening or shutting the *Registers*.

ATHEROMA, a sort of Tumour or Swelling consisting of a thick and tough Humour like Pap, contained in a Bag or Membranous Coat. It neither causes Pain, nor changes the Colour of the Skin. It doth not easily yield to the Touch, nor leaves any dint after it is compressed.

ATHYMIA, is a Dejection or Anxiety of Mind.

ATLAS, in Anatomy, is the first *Vertebra* of the Neck under the Head; so called, because it seems to hold up the Head: it wants Marrow.

ATMOSPHERE, is the lower part of the Region of the Air or Ether, with which our Earth is encompassed all round; and up into which the Vapours are carried, either by Reflection from the Sun's Heat, or by being forced up by the Subterranean Fire.

The Pressure of the *Atmosphere*, Mr. Boyle undertakes to demonstrate from many Experiments, as,

1. That two polished Marbles of about th *Sul* Inches Diameter, and which would in the 1 being Air sustain a Weight of 80 *lb*. before they it in the fall asunder, would, in the exhausted *Ed*, and by fall asunder with a Pound, and sometimes in it, half a Pound Weight. Nay, thoughnd other such

Receiver was evacuated, the upper Marble being let down to touch the other, it would by no means adhere to it; yet when this was tried after the Re-admission of the Air into the Receiver, the Marbles then, on their being brought to touch each other, would as strongly adhere as at the first. *History of Experiments*, P. 288.

The Height of the *Atmosphere* is variously conjectured: *Kepler* makes it about eight Miles; but other eminent and later Astronomers, especially the Learned and Diligent *Ricciolus* makes it probable, that the *Atmosphere* may be at least fifty Miles high.

Mr. Boyle makes the common Height of the *Atmosphere*, when the Mercury in the *Baroscope* is at 30 Inches, to be 35000 Foot, or seven Miles; but this Account is upon a Supposition, that all our Air is of the same Density and Weight from the Surface of the Earth to the Top of the *Atmosphere*; which can by no Means be supposed, and therefore he rightly concludes it must be much more. Nay, in his Book against *Linus* he suggests, that 'tis probable it may be some *Hundreds*, and even *Thousands* of Miles high, in case the *Atmosphere* be not a bounded Portion of the Air, but reach as high as it.

The same Honourable Philosopher got a hollow Cylinder of Brads to be exactly turned by a good Artift, whose Length was 3 Inches; and the Diameter of its Bore just an Inch: This had a Bottom nicely fitted to it; and then being filled with Quickfilver (the Weight of the Cylinder being before known) it held as much as weighed 17 Oz. 1 Drachm, 45 gr. Troy. This being multiplied by 10 (because the Barascope then shewed the Mercury to be at 30 gr.) gave 14 lb. 2 oz., and above 3 drachms Troy, for the Weight of a Column of Mercury of an Inch in Diameter, and 3 Inches in Length. And so much consequently was the Weight of a Column of Air of an Inch in Diameter, and of the whole Height of the *Atmosphere*.

Hence, knowing the Proportions of Cylinders,

(which see under Cylinder) 'tis easy to calculate the Weight of a Cylinder of Mercury, and consequently of Air to the Top of the *Atmosphere*, of any given Diameter. For as 1. the Square of the Diameter of the Cylinder above-mentioned, is to the Square of the given Diameter of the Cylinder sought (which, if it were two Inches Diameter, will have its Square 4) :: So is the Weight of the Cylinder above-mention'd, to the Weight of that sought. Work as in the Rule of Three, and you have your Desire.

In Mr. Boyle's Description of his Statical Baro-
scope, he tells us, That he found a Pillar of Air in-
cumbent on a square Inch, to weigh 18 lb. $\frac{1}{2}$ Troy.
From which Account I calculated the Weight
of the whole Air, all round the Globe, to be
8,990425732208000000 Pounds Troy, which a-
grees nearly with the Weight of it calculated by
Mr. Pascal (tho' he proceeded a very different way)
for he makes it to be 8,283889440000000000.

Mr. Halley by undoubted Experiments, found that the Weight of Mercury to Water, is as $13\frac{1}{2}$ to 1, or very near it; and that the Specific Gravity of Air to Water, is as 1 to 800; so that the Weight of Mercury to Air, is as 10800 to 1; and a Cylinder of Air of 10800 Inches or 900 Feet, is equal to an Inch of Mercury; so that were the Air of an equal Density like Water, the whole Atmosphere would be no more than $5\frac{1}{2}$ Miles high; and in the Ascent of every 900 Feet, the Barometer would sink an Inch. But the Expansion of the Air encreasing in the same Proportion as the incumbent Weight of the Atmosphere decreases, that is, as the Mercury in the Barometer sinks, the upper Parts of the Air are much more rarified than the lower, and each Space answering to an Inch of Quick-silver, grows greater and greater; so that the Atmosphere, must be extended to a much greater Height.

To determine the Height of the Mercury at any assigned Height of the Air; or having that given, to find the Height of the Place where the Barometer stands.

Since the Expansion of the *Air* is Reciprocally as the Height of the *Mercury*, it is evident, that by the help of the Curve of the *Hyperbola* and its *Asymptote*, the said Expansions may be expounded to any given Height of the *Mercury*.

For by the 65th Prop. Lib. 2. Conic. *Mydorgii*, the Rectangles *ABCE*, *AKGE*, *ALDE*, &c. are always equal; and consequently the Sides *CB*, *GK*, *LD*, &c. are reciprocally, as the Sides *AB*, *AK*, *AL*, &c. If then the Lines *AB*, *AK*, *AL*, be supposed equal to the Heights of the *Mercury*, or the Pressures of the *Atmosphere*, the Lines *CB*, *GK*, *LD* answering thereto, will be as the Expansions of the *Air* under those Pressures, or the Bulks that the same quantity of *Air* will occupy; which Expansions being taken infinitely many, and infinitely little (according to the Method of Indivisibles) their Sum will give the Spaces of *Air*, between the several Heights of the *Barometer*; viz. the Sum of all the Lines between *CB* and *GK*, or the Area *CBKG* will be proportioned to the Distance or Space intercepted between the Levels of two Places in the *Air* where the *Mercury* would stand at the Heights represented by the Lines *AB*, *AK*; so then the Spaces of *Air* answering to equal Parts of *Mercury* in the *Barometer*, are as the Areas *CBKG*, *GKLD*, *DLFM*, &c. But these Areas are proportionate to the Logarithms of the Numbers expressing the Ratios of *AK* to *AB*, of *AL* to *AK*, of *AM* to *AL*, &c. as was demonstrated by *Gregory St. Vincent*; so then, by the common Table of Logarithms, the Height of any Place of the *Atmosphere*, having any assigned Height of *Mercury*, may most easily be found; for the Line *CB* in the *Hyperbola*, whereof the Area's design the Tabular Logarithms, being 0,0144765; 'twill be as 0,0144765, to the difference of the Logarithm of 30, or any other lesser Number, so 900 Feet, or the Space answering to an Inch of *Mercury*, if the *Air* were equally prest with 30 Inches of *Mercury*, and every where alike to the Height of the *Barometer* in the *Air*, where it will stand at the lesser Number of Inches: And by the Converse of this Proportion may the Height of the *Mercury* be found, having the Altitude of the Place given.

Upon these Suppositions 'twill appear, that at the Height of 41 Miles the *Air* is so rarified, as to take up 3000 times the Space it occupies here, and at 53 Miles high, it would be expanded above 300000 times; but 'tis probable that the utmost Power of its Spring cannot exert it self to so great an Extension, and that no part of the *Atmosphere* reaches above 45 Miles from the Surface of the Earth.

This is further confirmed from the Observations of the *Crepusculum*, which is observed commonly to begin and end when the *Sun* is 18 Degrees below the *Horizon*; for supposing the *Air* to reflect Light from its most rarified Parts, and that as long as the *Sun* illuminates any of its *Atoms*, they are visible to an Eye not intercepted by the Curvature of the Earth; it will follow that the Proportion of the Height of the whole *Air*, to the Semi-diameter of the Earth, is much about, as 1 to 90, or as the Excess of the Secant of about 8½ Degrees to the Radius. For if *E* be the Eye of the Observer, *S* a Place where the *Sun* sets at the end of Twilight in *E*, and the Ark *ECS*, or *TCA*, be found 18 Degrees, the Excess of the Secant of half thereof *ECH*, would be the Height of the

Air, viz. *GH*. But the Beam of the *Sun* *ASH*, and the visual Ray *EH*, do each of them suffer a Refraction of about 32 or 33 Minutes, whereby being bent inwards from *H* towards *G*, the Height of the *Air* need not be so great as if they went strait; and having from the Angle *ECS* taken the double Refraction of the Horizontal Ray, the half of the Remainder will be 8½ Deg. *secriter* whose Secant being 10111, it follows, that as 10000 to 111, so is the Semi-diameter of the Earth, supposed 4000 Miles, to 44, 4 Miles, which will be the Height of the whole *Air*, if the Places *ES*, whose visible Portion of the *Atmosphere* *ERZH*, and *SHKB* just touch one the other, be 18 Degrees asunder.

At this Height the *Air*, is expanded into above 3000 times the Space it occupies here; and we have seen the Experience of condensing it into the 60th part of the same Space; so that it should seem, that the *Air* is a Substance capable of being compres'd into the 180000th part of that Space it would naturally take up when free from Pressure.

ATMOSPHERE of consistent Bodies: The Honourable Mr. Boyle hath written a small Essay on this Subject, in which he proves, that very many, and therefore probably all solid, firm and consistent Bodies (i. e. such as are not Fluid) have, at some certain times (at least) effluvia of Particles of Matter which exhale from them: For he found, that many such Bodies would in a little time be very sensibly diminished in Weight: That some Electrical Bodies, as Amber and Glass, would exert that Property uniformly all round them when they were heated; which they usually exhibit upon Rubbing or Chafing; viz. That of attracting small Bodies to them: That Glass, Stones and hard Metals, would, on being rubb'd one against another, strongly emit not only sensible, but even offensive Odours, &c.

ATOME, is such a very small Particle of Matter, that it cannot Physically be cut or divided into lesser Parts: *Epicurus* and his Sect of Philosophers, first called the component Principles of all Bodies, which they supposed to be infinitely small and hard, by this Name of *Atoms*. These *Atoms* may be supposed to have these 4 inseparable Properties; 1. That they are all of the same Nature, Substance or Matter; for all Matter abstracted from Form is the same. 2. That they have all some Magnitude or Quantity; for they are not Indivisible Points, but Physical Bodies of some (though small) determinate Bulk. 3. They have also all of them some determinate Figure or Shape. And, 4. They must have also, each of them, some real Gravity or Weight. To these *Sextus Empiricus* adds *ἀνιστορία* or Renitency; but this rather may be supposed to be the Consequence of their being Solid and Inseparable, which they are, as they are *Atoms*.

The Original Qualities of *Atoms* can only be their Size and their Figure, and these taken together make their Form.

ATONY, is a Faintness, Infirmary or Defect of Strength.

ATRA Bilis, is supposed to be a kind of a Sulphureous Terrene and Adust Salt, which being bred in the Body (some will needs have it in the Spleen) is circulated about in the Blood, and by that means makes and undue Fermentation in it, and is the Occasion of Melancholly and other such like Distempers.

ATREUS, is one whose Fundament or Privy Parts are not perforated.

ATROPHY or *Tabes*, a Consumption arising from want of Nourishment, and when either the whole Body, or some particular Limb, withers and decays away. Though *Tabes* is often taken only for an Ulcer in the Lungs, from whence the whole Body by degrees decays and perishes.

ATTACHIAMENTA Bonorum, a Distress taken upon the Goods or Chattels of any one sued for Personal Estate or Debt by the Legal Attachiators or Bayliffs, as a Security to answer the Action.

ATTACHIAMENTA de Spinis & Bosco, is the Privilege granted to the Officers of a Forest to take to their own use Thorns, Brush and Windfall, within such Precincts or Liberties committed to their Charge.

ATTACHMENT, (in Law) is a Taking or Apprehending by Command or Writ: It differs from an *Arrest* in this, that an *Arrest* lies only upon the Body of a Man, whereas an *Attachment* is sometimes on the Goods only, and sometimes on Body and Goods.

ATTACHMENT of Privilege, either gives Power to apprehend a Man in a Place privileged, or by Vertue of an Office or Privilege, to call another into that Court whereunto himself belongeth.

ATTACHMENT Foreign, is a Process which is used to attach the Goods of Foreigners found within the Liberty or City, for a Debt due to the Party himself.

ATTACHMENT of the Forest, is a Court held there every 40 Days throughout the Year.

ATTACK of a Siege, (in the Art of War) is the Effort made by the Besiegers with Trenches, Mines, Galleries and Breaches, in order to make themselves Masters of a Fortrefs in Storming one of its Sides.

ATTACK False, is that which is not vigorously prosecuted, serving only to make a Diversion among the Besieged, and to oblige them to divide their Forces, that the true *Attack* may be carried on with greater Success.

To **ATTACK in Flank**, is to attack both Sides of the Bastion.

To gain a Place by **Right Attack**, is to carry it by formal *Attack* and regular Works, without a general Storm.

ATTAINDURE, is when a Man hath committed Felony or Treason, and Judgment is passed upon him. The Children of a Person attainted of Treason cannot be Heirs to him, or any other Ancestor; and if he were Noble and Gentile before, thereby his Posterity are degraded and made Base; and this Corruption of Blood cannot be salved but by an Act of Parliament, or unless the Judgment be reversed by Writ of Error.

ATTAINT, (in Law) is a Writ that lies where a false Verdict is given by twelve Men, which, if found to be a false Verdict, the twelve Men are *Attaint*, and the Verdict shall be, that their Meadows shall be egged, their Houses broken down, their Woods turned up, and their Lands and Tenements forfeited to the King. But if it pass against him that brought that *Attaint*, he shall be imprisoned, and grievously ransomed at the King's Will.

ATTAQUES: See *Attack*.

ATTENTION, is to register in the Memory

those Trains of Idea's which continually offer themselves to the Mind, and are taken notice of.

ATTENUATING Medicines, are those things which opening the Pores with their Acute Particles, cut the thick and viscous Humours in the Body into such small Particles as that they may easily be circulated through the Vessels, and so there is made by degrees an

ATTENUATION, or lessening of the Power or Quantity of the Morbifick Matter.

ATTICK, a kind of Order in Architecture after the Manner of the City of Athens. *Vitruvius* makes it the Name of a *Basis*, which the Modern Architects have since given to the Dorick Pillar. In our Buildings, the *Attick* is a little Order placed upon another much greater, having, instead of Pillars, nothing but *Pilasters* of a particular Form or Fashion.

ATTIRE, the Heralds call the Horns of a Stag or Buck his *Attire*.

ATTIRE, in Botany, signifies, according to Dr. *Grew*, the third part belonging to the Flower of a Plant; of which the two former are the *Empalement* and the *Foliation*. This *Attire* he finds to be of two kinds, *Semini-form* and *Florid*; the *Semini-form Attire* consists of two Parts, *Chieues* (or the *Stamina*, as some call them) and *Semets* or *Apices*, one upon each *Attire*. The *Florid Attire* is usually called *Thrams*, as in the Flowers of Marigold, Tansy, &c. These *Thrams* the Dr. calls *Stems*, which consist of two, but most times of three Pieces; the outer Part of the *Suit* is the *Flower*, whose Body is divided at the Top like a *Cowslip* Flower into 5 Parts or distinct Leaves.

ATTOLLENS Auriculam, is a Muscle which consists of divers fleshy Fibres, and is annexed to that Part of the *Pericranium* that covers the Temporal Muscle, whence it descends directly to its Implantation at the Superiour Part of the second Wrinkle of the Cartilage of the Ear. Its Name shews its Use.

ATTOLENS Oculos, or *Superbus*, one of the six Pairs of Muscles that belong to the Eye, serving to lift them upwards.

ATTOLENS Nares, a Muscle of the Nose, whose Name shews its Use.

ATTOLLENTES, are a Pair of Muscles which acting both together, draw all the upper Lip directly upward and outward; but if only one, then one Side of the Lip is drawn obliquely.

ATTONITUS, *Stupor*, seu *Morbus Attonitus*: See *Apoplexy*.

ATTORNATO faciendo vel recipiendo, is a Writ which a Man owing Suit to a County, Hundred, Wapentake, or other Court, and desiring to make an *Attorney* to appear for him, whom he doubteth whether the Sheriff or Bayliff will admit or not, purchaseth to command him to receive and admit him.

ATTOURNMENT, (in Law) is when one is Tenant for term of Life, and he in Reversion or Remainder grants his Right or Estate to another, then it behoves the Tenant for Life to agree thereto; and this Agreement is called an *Attournment*.

ATTRACTING, or *Drawing Medicines* or Things, are those which opening the Pores with their little Particles, and dilating the Humours and expelling them, where their Resistance is smaller, not only shews the Parts, and makes them Red,

Red, but by driving more Vapours and Humours out of the Skin and Fleſh, than can make their way thro' the thick inner Skin, gather them under it, and ſwell it into little Bladders.

ATTRACTION, is the drawing of one thing to another. Whether among the Operations of Natural Bodies one upon another, there be any ſuch thing as *Attraction*, properly ſo ſpeaking, is a Queſtion that hath been much debated amongſt Philoſophers: And perhaps moſt of thoſe Effects which the Ancients, not knowing ſo well the Cauſes of, did uſe to attribute to *Attraction*, may now be very well ſolved by *Puſſion*. See *James Bernoulli, de Gravitate Aetheris, Amſterdam 1683, in 8°*. However the Word is retained by good Naturaliſts, and in particular, by the Excellent Sir *Iſaac Newton* in his *Principia*; but without there determining any thing of the *Quality* of it, for he doth not conſider things ſo much Phyſically, as Mathematically. This therefore being pre-miſed, he lays it down as an Axiom; That ſince *Action* and *Re-action* are always equal and directly contrary to each other; therefore if any thing Attract another, it is it ſelf alſo as much attracted by that other thing; taking *Attraction* in the largeſt and moſt general Senſe, for the *Conatus* of one Body towards another, however it be cauſed. And in *Cor. 1. Prop. 58.* he ſhews,

1. That if two Bodies mutually do attract each other (by which he means the ſame as *gravitate* towards one another) by Forces proportionable to their Diſtances, they will deſcribe both about the common Centre of Gravity, and about one another Concentric Ellipſes; and *vice verſa*, if any Body do deſcribe ſuch Figures, their Gravitating or Attracting Forces are proportional to their Diſtances.

2. That if they Attract each other with Forces proportional to the Squares of their Diſtances, they will deſcribe both about the common Centre of Gravity, and alſo about one another, *Conick Sections*, having their *Umbilici* in the Centre about which the Figures are deſcribed; and *vice verſa*, &c.

3. He demonſtrates alſo, That any Particle of Matter within the Superficies of any Sphere or Globe, is attracted or gravitates by a Force proportional to its diſtance from the Centre; but without the Surface of the Sphere, by a Force proportional to the Square of its diſtance from the Centre, *Prop. 73, 74. Lib. 1.*

Hence it will follow, he ſaith,

1. That at equal Diſtances from the Centre of Homogeneous Spheres, The *Attraction* will be as the Sphere.

2. And at any Diſtance whatever, the *Attraction* is as the Sphere divided by the Square of the Diſtance.

3. Which laſt holds alſo in the Attractions of Spheres towards one another; i. e. the Attractions are as the attracting Globes divided by the Squares of the Diſtances, tho' the Globes mutually attract each other.

The Quantity of the Force of Attraction in all Bodies at equal Diſtances, is exactly proportionable to the Quantity of Matter in the Attracting Body, as being in reality nothing but the Reſult or Sum of the united Forces of all thoſe ſingle Particles of which it is compoſed. See *Vol. II.*

ATTRACTIVE, the ſame with *Attracting*.

ATTRIBUTE, is whatever Property belongs properly to any Subſtance or Being, and is affirmed of it, or duly attributed to it, or predicated of it, as the Logicians ſpeak.

ATTRITION, in Phyſick, is the Rubbing of one thing againſt another; as when Amber and other Electric Bodies are rubb'd, to make them attract or emit their Electric Force.

ATTRITION, in Theology, is a Sorrow for offending God, ariſing from the Apprehenſion of being obnoxious to Punishment and Miſery on the Account of ſuch Offence.

ATTURNEY, or Attorney, in a Legal Acceptation, ſignifies one appointed by another Man to do any thing in his ſtead, and is as much as *Procurator* or *Syndicus* in the Civil Law; or *Attorneys* are ſuch Perſons, as are by the Conſent, Commandment or Requeſt of another, to take heed, ſee to, and to take upon them, the Charge of another Man's Buſineſs in his abſence.

AVANT Foſſe, or Ditch of the Counterſcarp, in Fortification, is a Moat or Ditch full of Water running round the Counterſcarp on the outſide next the Campaign at the Foot of the *Glacis*. It is not eligible to have ſuch a Water-Ditch where it can be drained dry; becauſe it is a Trench ready made for the Beſiegers to defend themſelves againſt the Sallies of the Beſieged. Beſides, it hinders putting Succours into the Place, or at leaſt makes it more difficult ſo to do.

AVAST, a Word uſed very commonly aboard a Ship, ſignifying to ſtop, hold or ſtay.

AUDIENCE Court, is a Court belonging to the Archbiſhop of Canterbury, of equal Authority with the *Archies Court*, tho' inferior both in Dignity and Antiquity.

AUDIENDO or Terminando, is a Writ, but more properly a Commiſſion, directed to certain Perſons, when any Riotous Aſſembly, Inſurrection, or heinous Miſdemeanour, or Treſpaſs is committed againſt any Place.

AUDITA Querela, is a Writ that lies where one is bound in a Statute or Recogniſance, or where Judgment is given againſt him for a Debt, and his Body in Execution thereupon; for if he have a Releaſe, or any other ſufficient Diſcharge, but has no Day in Court to plead it, then he ſhall have this Writ againſt him which hath recovered, or againſt his Executors.

AUDITORY Nerve is the ſeventh Pair of Nerves that comes from the *Medulla Oblongata*, ariſing from the hinder part of the *Proceſſus Annularis*; it enters the Hole in the inner Proceſs of the *Os Petroſum*. It is divided into two Branches; that which is ſoft is called *Portio Mollis*, and it is diſtributed into the Labyrinth, *Cochlea*, and the Membranes which cover the Cavities of the Ear. That which is hard, is called *Portio Dura*; it goes out of the Ear by the Hole which is between the *Proceſſus Maſtoideus* and *Styloides*; it is divided into two Branches, of which one goes to the Muſcles of the Tongue, or *Os Hyoides*, and it gives a ſmall Branch to the eighth Pair; the other is diſtributed in the External Ear, Noſe, Lips and Cheeks.

AUDITOR, according to our Law, is an Officer of the King or ſome other great Perſon, which yearly, by examining the Accounts of all under Officers accountable, makes up a general Book; with the Difference between their Receipts and Charge, and their Allowances, commonly called *Allocations*; as namely, the Auditors of the Exchequer

quer take the Accounts of those Receivers, who collect the Revenues of the Aumentation, as also of the Sheriffs, Escheators, Collectors and Customers, and set them down, and perfect them.

AUDITORS of the *Prest* or *Imprest*, are Officers in the *Exchequer*, who take and make up the great Accounts of Ireland, Berwick, the Mint, and of any Money *imprest* to any Man for the King's Service.

AUDITOR of the *Receipts*, is an Officer of the *Exchequer* that files the Teller's Bills, and makes an Entry of them, and gives the Lord Treasurer a Certificate of the Money received the Week before. He maketh *Debentures* to every Teller, before they pay any Money, and taketh their Accounts: He keepeth the *Black Book of Receipts*, and the *Treasurer's Key* of the *Treasury*, and seeth every Teller's Money lock'd up in the New Treasury.

AVE, see *Aile*.

AVELANE, the Form of a Cross which the Heralds give us, which resembles four Filberds in their Husks or Cases, joined together at the great End; from whence it seems to take its Name, for a Filberd is *Nux Avellana*.

ADVENTURE, (but more properly) *Adventure*, is a Term in Law signifying a Mischance, causing the Death of a Man without Felony, as when he is suddenly drowned or burnt, falling into the Water or Fire, or killed by any Disease or Mischance.

AVENUE, (in Fortification) is an opening or inlet into any Fort, Bastion, or such like Place.

AVERAGE, (in Law) is that Service which the Tenant owes to his Lord, to be done by the Beasts of the Tenant.

It also signifies a certain Contribution which Merchants and others pay proportionably towards their Losses that have their Goods cast away in a Tempest, for the saving of the Ship or Goods, or the Lives of them that are therein.

AVERIIS *captis in Withernam*, is a Writ for the taking of Cattel to his use, that hath his Cattel unlawfully taken by another, and driven out of the County where they are taken, that they cannot be replevy'd.

AVERMERT, (in Law) is where a Man pleads a Plea in Abatement of the Writ, or Barr of Action, which he says he is ready to prove, as the Court will award. This offer to prove the Plea is called an *Averment*.

AVERPENY, is to be quit of divers Sums of Money for the King's Arrearages.

AVERRUNCATION, in Agriculture, signifies the lopping off superfluous Branches.

AUGE, an Astronomical Term, the same as *Apogæum*, is that Point of the Orbit, wherein a Planet being, is furthest distant from the Central Body about which it revolves, and is then slowest in Motion, inasmuch that from this Point the distance of a Planet is reckoned, to find thereby the Inequality of its Motion.

AUGMENTATION, was the Name of a Court erected by King Henry the Eighth, for the encrease of the Revenues of the Crown, by the Suppression of the Abbies and Religious Houses: This Court was dissolved in Queen Mary's Reign; but the Office of *Augmentation* remains to this Day, wherein there are many Records of great use and importance.

AUMONE, (Tenure in *Aumone*) is a Tenure *per liberam Eleemosynam*, as where Lands are given to some Church, or Religious House, upon Condition that some Service or Prayers shall be offered

at certain times for the good of the Donor's Soul.

AVOWEE, is he to whom the Right of *Advowson* of any Church appertaineth, so that he may present in his own Name; and is called *Advowee*, for a difference from those that sometimes present in another's Name, as a Guardian that presenteth in the Name of his Ward: And also to be distinguished from those which have the Lands whereunto an *Advowson* appertaineth, but only for term of their Lives, of Years, or by Intrusion, or by Disseisin.

AVOWRY (a Law Term) is, when one takes a Distress for Rent or other thing, and the other sues *Replevin*; now he that took the Distress justifying the Act, is said to *Avow* it.

AURICULÆ Cordis, are two *Appendages* to the Heart, seated at its Basis over the Ventricles; they are so called from some Resemblance that they bear to the Ears of a Man's Head. They arise from a long Basis, and end in an obtuse Point, thereby forming an obtuse Triangle. They are of the same Fabrick and use with the Ventricles over which they stand, being Muscles as they are, made up of the same order of Fibres, which are carried into opposite Tendons; whereof that at the Basis of the Heart is common to it and the *Auricula*, and the other runs along their upper part. The Right *Auricle* is larger and softer than the Left. The Superfices of both is smooth when they are full, but wrinkled when empty, and more so in the Left than in the Right One. On being cut open they exhibit many fleshy Columns running from the Upper Tendon to the Lower, and between them there are pretty deep Furrows or long Cavities, but fewer in the Right Auricle than in the Left. They are dilated and contracted in like manner as the Heart is, but at different times; for the *Systole* of the Ventricles is at the same time with the *Diastole* of the Auricles and *vice versa*; so that the Auricles are receiving their Blood from the Veins, while the Ventricles are expelling theirs into the Arteries: But when the Ventricles are relaxed and empty in their *Diastole*, then the Auricles force the Blood into them by their *Systole*. They are nourished by Branches of Arteries springing from the *Coronaria*, which Dr. *Ruysh* (who seems first to have taken notice of this) calls therefore *Arterie Auriculares*, and no doubt but they have Branches also of Veins to attend them. Their Use is to receive the Venal Blood which comes immediately out of the *Vena Cava* and *Pulmonaris*, and to measure it as it were (saith *Gibson*) into the Ventricles; and to expel it thither with the greater Force, the Internal Fibres or Columns of their Cavity arising from their Root where they are joined to the Basis of the Heart, reach directly outwards towards the *Vena Cava* and *Pulmonaris*; and in the *Diastole* of the *Auricula*, grasp the Blood contained in their Cavities like so many Fingers, and squeeze it into the Ventricles, now relaxed in their *Diastole*.

AURIGA, a Constellation consisting of 23 Stars in the Northern Hemisphere.

AURIPIGMENTUM, yellow Arsenick.

AURUM Fulminans, or *Saffron of Gold*, is thus made; put a *Drachm* of thin Plates of Gold into a Matraiss, and then pour on it by little and little (or else there will be so great an Effervescence, that the Matter will boil over the Glass) 3 or 4 *Drachms* of *Aqua Regalis*. Set the Matraiss in warm Sand, and when the Ebullitions are over, the *Mentrum* will have dissolved as much of the Gold

Gold as it can contain. Pour off the Solution, by Inclination, into another Glass, and then pour into the Mixture gradually, some of the Volatile Spirit of *Sal Armoniack*, or Oil of *Tartar per deliquium*, and the Gold will precipitate to the Bottom of the Glass: Let it stand a while till all is fallen down, then pour off the Liquor, and wash the Powder carefully with warm Water till it grows insipid: Then dry it in a Paper by a gentle Fire, taking care it do not fire, which 'tis apt to do with a terrible Noise. If you dissolve a *Drachm* of Gold, there will be 4 *Scruples* of *Aurum Fulminans* well dried. It takes its Name from its fulminating or making a great Noise like Thunder, when 'tis heated over the Fire in a Spoon, for it will go off like a Gun, but without doing any Mischief, its Force being chiefly downward. The Effect seems to come from some Parts of the *Aqua Regalis*, which remain still sticking in the Gold, and these being of a very Spirituous and Volatile Nature, do break out with great Violence when the Powder comes to take Fire.

Those who would know a way to make as great, but yet a much less expensive Noise, may see the Word *Pulvis Fulminans*. If halftis Weight of Sulphur powdered, be mingled with *Aurum Fulminans*, its fulminating Quality will be destroyed.

Though on several Trials designedly made to make Gun-powder take Fire in Mr. Boyle's exhausted Receiver, it could not be effected; yet he found that *Aurum Fulminans* would take Fire there, and go off, both by means of a Burning-Glass, and of a Piece or hot Iron.

AURUM Mosaicum, is made by mixing and subliming Mercury, Tin, Sulphur and *Sal Armoniac* all together.

AURUM Potabile: The Alchymists pretend to be able to separate the Salt and Sulphur of Gold, and then dissolving it in a Liquor, it may be drank, and therefore is called *Aurum Potabile*: But this is a meer Imposture, the *Aurum Potabile* being nothing usually but some rich Cordial Liquor with Pieces of Leaf-Gold in it.

AUSTERE Tact, is such an one as moderately constringes the Mouth and Tongue with some Austerity, as is the Tact of unripe Fruits.

AUSTRAL, the same with *Southern*: Thus,

AUSTRAL Signs, are the six last Signs of the *Zodiack*; so called, because they are on the South Side of the *Equinoctial*.

AUTHENTICKS, the Word *Authentick* signifies of good Authority; and therefore the 3d Volume or Tome of the Civil Law, is called *The Authenticks*, from the Greek Word *αὐθεντικόν*, because it hath its Authority from it self, and proceeding from the Emperor's own Mouth; or else that they are Originals to other Writings which are transcribed out of them. They are a Volume of new Constitutions, set out by *Justinian* the Emperor, after the *Code*, and brought into the Body of the Law, under one Book.

There is not in these that good Order and Method observed, as there is in the *Code*, or in the *Digest*; but as any doubtful Point came to be considered, you have here the Princes Determination of it; and that set down as the Cases occasionally occurred.

The whole Volume is divided into Nine *Collations*, *Constitutions* or *Sessions* (I mean in the Latin Version, for in the Greek there is not this Division into *Collations*) and these are subdivided

into 188 *Novels*, each of which is distributed into several Chapters. They are called *Novels*, because they were *New Laws* in comparison of the *Code* and *Digest*; just as the *Constitutions* of the Emperors which were newly published after the *Basilica* were called the *Novels* of *Leo*, *Nicephorus*, *Michael*, &c.

AUTOGRAPHY, is the peculiar Hand Writing of any particular Person; or the Original of any Treatise or Discourse, in respect of a Copy.

AUTOMATA, are Mechanical or Mathematical Instruments or Engines, that going by a Spring, Weight, &c. seem to move of themselves, as a Watch, a Clock, &c.

AUTOPSY, is Ocular Inspection, or seeing a thing with our own Eyes.

AUX, the same with *Apogon*.

AUXILIARY Verbs, in Grammar, are such as help to form or conjugate others; as *to have* and *to be* in the *English* Tongue, *Estre* and *Avoir* in the *French*, *Italian*, *Spanish*, &c.

AUXILIUM Cuius, a Precept or Order of Court, for the citing or convening of one Party at the Suit of another.

AUXILIUM Petere, in Law, signifies to pray Suit in a Cause; that is, when an inferior Tenant is impleaded, and not capable to defend the Right in his own Name; he prayeth Aid of the Superior Lord to assist and justify his Plea.

AUXILIUM Regis, King's Aid, or Money levy'd for the King's Use, and publick Service.

AUXILIUM Vicecomitum, the Aid or Customary Dues paid to the Sheriff, for the better support of his Office.

AWARD, (a Term in Law) properly signifying the Judgment of one that is neither assigned by Law, or appointed by the Judges for the ending a Matter in Controversie, but is chosen by the Parties themselves that are at variance.

AWN, in Botany, *Arista*, is the Beard growing out of the Husk of Corn or Grass.

AWNING, aboard a Ship, is when a Sail, a Tarpaulin, or the like, is hung over any part of the Ship above the Decks, to keep off the Sun, the Rain, or the Wind. In a Long-Boat, they make an Awning by bringing the Sail over the Yard and Stay, and boring it out with the Boat-Hook.

AX or *Axe*, the same with *Axis*, which see.

AXILLAR Veins, are the two Branches of the ascending Trunk of the *Vena Cava*, called *Rami Subclarii*, which running obliquely under the *Clavicule*, as soon as they are past them, and go up to the Arm-pits, are called *Axillares*: And each of these parts it self into two Veins, the *Cephalica* and *Basilica*.

AXILLARY Artery, is that part of the *Subclavian* Branches of the ascending Trunk of the *Aorta*, that is got out of the *Thorax* and comes into the Arm-pits.

AXIOM, is such a common, plain, self, evident and received Notion, that it cannot be made more plain and evident by Demonstration, because 'tis its self much better known than any thing that can be brought to prove it; as, *That nothing can be where it is not: That a thing cannot be and not be at the same time: That the Whole is greater than a Part: That where there is no Law, there is no Transgression*, &c.

AXIS, is the third *Vertebra* from the Skull.

AXIS of a Cylinder, is that Quiescent Right Line,

Line, about which the Parallelgram is turned, which by its Revolution forms the Cylinder.

AXIS of a Conick Section, is a Line passing through the Middle of the Figure, and perpendicular to the Ordinates.

AXIS of a Figure, is a Streight Line, conceived to proceed from the Vertex to the Base.

AXIS of a Circle or Sphere, is a Streight Line passing through the Center from one Side to another; and is the same with the Diameter.

AXIS of the World, is an imaginary Line conceived to pass through the Center of the Earth from one Pole to another.

AXIS of the Zodiack, is also conceived to pass through the Earth, and to be terminated in the Poles of the Zodiack.

AXIS of Rotation or Circumvolution, is an imaginary Line, about which any plain Figure is conceived to be turned to make a Solid: Thus a Sphere is conceived to be made by the Rotation of a Semi-circle about its Diameter, and a Right Cone by that of a Right angled Triangle about its Perpendicular.

AXIS Secundus, in the Hyperbole and Ellipsis, is the Conjugate Diameter, which see. This is sometimes called the *Axis Rektus*.

AXIS, in Opticks, is the Ray which of all that are sent to the Eye falls perpendicularly on it, and which by consequence, passed through the Center of the Eye.

AXIS Common or Mean, is a Right Line drawn from the Point of Concourse of the two Optick Nerves through the Middle of the Right Line which joins the Extremity of the same Optick Nerves.

AXIS of Incidence, in Dioptricks, is a Right Line drawn through the Point of Incidence, and perpendicular to the Refracting Surface.

AXIS of Refraction, is that which is made by the Ray of Incidence, directly prolonged on the Inside of the second Medium by the Ray of Refraction.

AXIS of any Glass (in Opticks) is a Right Line drawn perpendicularly through the Centre of the Glass; or if it be a Convex Glass, through the thickest Part; if a Concave, through the thinnest Part (which in each is called the Pole of the Glass) directly on to the Centre of the Sphere, the Glass Figure is a Segment of.

AXIS in Peritrochio, is a Machine for the raising of Weights, consisting of a Cylindrical Beam (which is the *Axis*) lying Horizontally, and sup-

ported at each End by a Piece of Timber; and somewhere about it, it hath a kind of Tympanum

or Wheel, which is called the *Peritrochium*, in whose Circumference are Holes made to put in Staves (like those of a Windless or Capstain) in order to turn the *Axis* round the more easily, and thereby to raise the Weight required by Means of a Rope which winds round the *Axis*. See Vol. II.

AXIS Indeterminate of an Hyperbola, is a Right Line which divides into two equal Parts, and at Right Angles, an infinite number of Lines drawn parallel to one another within the Hyperbola.

AXIS Determinate, in that Figure, is a Right Line drawn between the Vertexes or Tops of the opposite Sections or Hyperbola.

AXIS Conjugatus, in the Hyperbola: See Conjugate.

AZIMUTH, is an Arch of the Horizon comprehended between the Meridian of the Place, and any other *Azimuth Circle*; or contained between the Prime Vertical, and any other *Azimuth Circle*.

To find the *Azimuth* at any time: See the 11th Case of Oblique angled Spherical Triangles under the Word Trigonometry.

To find the Sun's *Azimuth*, as also the Hour, by the Globe, having the Sun's Place and Altitude given.

Rectify your Globe, and fit the Quadrant; then turn both Globe and Quadrant about till the Sun's Place cut the given Altitude in the Quadrant; for then the Index shews the Hour, and the Quadrant the *Azimuth* in the Horizon.

To find the Sun's *Azimuth* at Six, having the Latitude of the Place, and the Sun's Declination given.

Say, As the Co-Sine of the Latitude: Is to the Radius :: So is the Co-Tangent of the Sun's Declination: To the Tangent of the Sun's *Azimuth* at Six.

Example. Let the Latitude be 51 Deg. 30. Min. and the Sun's Declination be 11°. 30'.

Then to the Ar.co. of the } 51°. 30'. — 0,205850
Co-Sine of
Add the Co-Tangent of 11°. 31'. — 10,690891

Sum is the Tangent of 83°. 50'. — 10,896741
which is the *Azimuth* at Six required.

To find the Time when the Sun will be exactly on the East or West *Azimuth*, having the Sun's Declination and Latitude of the Place given.

Say, As the Co-Tangent of the Declination: Is to the Co-Tangent of the Latitude: : So is Radius: To the Sine of an Ark; which converted into Time, shews the Hour from Six.

Example. Suppose the Declination be 11°. 31'. The Latitude of the Place 51°. 30'.

Then to the Ar.co. of the } 11°. 31'. — 9,309108
Co-Tangent of
Add the Co-Tangent of 51°. 30'. — 9,900605

Sum is the Sine of 09°. 12'. — 19,209713
which is 48 Minutes of an Hour.

Therefore

Therefore the Sun will be due *East* in the Morning 12 Minutes before 7, and *West* in the Evening 12 Minutes after 5.

To find the *Azimuth*, having given the Latitude of the Place, the Sun's Altitude at Six, and present Altitude.

In *Summer*.

Say, As the Co-sine of the Altitude : Is to the Tangent of the Latitude :: So is the Difference between the Sines of the Sun's Altitude at 6, and present Altitude : To the Sine of the *Azimuth* from *East* to *West*.

In *Winter*.

Say, As the Co-sine of the Altitude : Is to the Tangent of the Latitude :: So is the Sum of the Sines of the Sun's Altitude at 6, and present Altitude : To the Sine of the *Azimuth* from *East* or *West*.

AZIMUTH *Compass*, is an Instrument made in a large Box, with Jambols and a broad Limb, having 90 Deg. diagonally divided, with an Index and Thread to take the Sun's Amplitude or *Azimuth*, in order to find the Difference between the *Magnetical Meridian* and the *Sun's Meridian*, which shews the *Variation* of the *Compass*.

AZIMUTH *Magnetical* : See *Magnetical Azimuth*.

AZIMUTHS, or *Vertical Circles*, are great Circles intersecting each other in the *Zenith* and *Nadir*, (as *Meridians* or *Hour-Circles* do in the *Pole*) and cutting the *Horizon* at *Right Angles*.

On the *Globes* these *Circles* are not drawn, but

are represented by the *Quadrant of Altitude* when it is Screwed in the *Zenith*.

And on these *Azimuths* is reckoned the Sun's Altitude, when he is not on the *Meridian*.

AZOTH, among the *Chymists*, signifies sometimes an *Universal Medicine*, sometimes the *Mercury* of a *Metal*.

AZURE, the *Herald's Term* for a *Blue Colour* in the *Coats* of all *Persons* under the *Degree* of a *Baron*; but in the *Escutcheons* of the *Noblemen* 'tis called *Saphir*; and in those of *Sovereign Princes* 'tis called *Jupiter*. In *Engraving* 'tis represented by *Strokes* or *Hatches* drawn only *Horizontal*ly, thus, as in the annexed *Figure*.

AZUGUS or **AZYGOS**, is a notable Branch of the *Vena Cava*, called *Vena sine pari*, because it is single, having no Fellow. It descends thro' the right side of the Cavity of the *Thorax*; and when it is come as far as the *Eighth* or *Ninth Vertebra*, it begins just to keep the *Middle*, and sends forth on each Side *Intercostal Branches* to the *Interstices* of the *Eight* lowest *Ribs*, and there is divided into two Branches, of which the *Larger* descends to the *Left*, betwixt the *Processes* of the *Diaphragm*, and is inserted sometimes into the *Cava* above or below the *Emulgent*, but oftner into the *Emulgent* it self. The other, which goes down on the *Right-hand*, enters the *Cava*, commonly a little above the *Emulgent*, but very seldom is joined to the *Emulgent* it self.

BAC

BACCIFEROUS Plants, whether Trees, Shrubs or Herbs, are such as bear Berries; and Berries are Fruits covered with a thin Membrane, in which is contained a Pulp, which grows soft and moist when ripe, and contains the Seed within the Subtance. The Bacciferous Herbs are the *Chamemorus*, *Smilax aspera*, *Bryonia Alba* and *Nigra*, *Angelica Baccifera*, *Aconitum Racemosum*, *Solanum Racemosum Americanum*, *Hypoglossum*, *Laurus Alexandrina*, *Oxymyrsine*, *Polygonatum*, *Lilium Convallium*, *Monophyllum*, *Mandragora*, *Herba Paris*, *Solanum Lethale*, *Malum Insanum*, *Solanum Vulgare*, *Alfine Baccifera*, *Solanum Somniferum*, *Alkekengi*, *Asparagus*, *Vitis Idæi pallustris*, &c.

The Bacciferous Trees, Mr. Ray divides into four kinds.

1. Such as bear a Caliculate or Naked Berry, the Flower and Calix both falling off together, and leaving the Berry bare; as the *Sassafras* Tree, &c.
2. Such as have a Naked, Monopyrenous Fruit, i. e. containing in it only one Seed; as the *Arbutus Terebinthus*, *Lentiscus*, *Viscus*, *Phyllæa*, *Sambucus Aquaticus*, *Lawreola*, *Chamelea Germanica* (or *Meze-reon*) *Viburnum*, *Cornus*, *Rhamnus*, &c.
3. Such as have also a Naked but Polypyrenous Fruit; i. e. one containing two or more Kernels or Seeds within it; as the *Talaminum*, *Ligustrum*, *Alnus*, *Berberis*, *Alaternus*, *Sambucus Vulgaris*, *Vitis*, the Tea Plant, *Eunonymus Vulgaris*, *Agrifolium*, *Rhamnus Catharticus*, *Capparis*, *Erica Baccifera*, &c.
4. Such as have their Fruit composed of many Acini or round soft Balls (for the Word *Acinus*, in Botany, is rather a Grape than a Grape-stone) set close together like a Bunch of Grapes; as the *Uva Marina*, *Rubus Vulgaris*, *Rubus Idæus*, and the *Rubus minor fructu Cereleo*.

BACCIVOROUS Creatures, are such Animals as feed upon Berries.

BACCERIND Thief, (a Term in Law) signifying a Thief taken with the Manner (as the say) i. e. having on his Back or about him, those things he hath stolen. It is by some taken for an Offender against Vert or Venison in the Forest.

BACCHIUS, is a Foot of a Latin Verse, consisting of three Syllables, where the first is short, and the two last long, as *Egejus*: This is the Reverse of a *Dactyle*.

BACILLI, are those Medicines which are of a long round Figure like a Stick, &c.

BACK STAYS, of a Ship, see *Stays*.

BACK-STAFF, the same with *Davis's* Qua-

drant, or the *English* Quadrant, as 'tis called by the

BAC

French. 'Twas invented by one Capt. *Davis* a *Welchman*; and is a Sea Instrument of good use to take the Sun's Altitude at Sea. It consists of three Vanes *A*, *B* and *C*; and of two Arches.

The Vane at *A* is called the *Horizon Vane*; that at *B* the *Shade Vane*; and that at *C* the *Sight Vane*. The lesser Ark *B* is of 60 Degrees, and that of *C* (or *f g*) of 30 Degrees. In time of Observation the Shadow Vane *B* is set upon the 60 Arch just to an even Degree of some Altitude less than you judge the Complement of the Sun's Altitude will be, by 10 or 15 Degrees. The *Horizon Vane* is put on at *A*, and the *Sight Vane* on the 30th Ark *f g*; and then the Observer's Back being turned to the Sun (whence the Name of *Back-Staff* or *Back-Quadrant*) he lifts up the Instrument, and looks thro' the *Sight Vane*, rising or falling the Quadrant till the Shadow of the upper Edge of the *Shade Vane* fall on the upper Edge of the Slit in the *Horizon Vane*; and if then you can see the *Horizon* thro' the said Slit, the Observation is well made: But if the Sea appear instead of the *Horizon*, move the *Sight Vane* lower towards *g*; If the Sky appear, move it upwards towards *f*: and so try till it comes right.

Then observe how many Degrees and Minutes are cut by that Edge of the *Sight Vane*, which answers to the *Sight Hole*, and to them add the Degrees cut by the upper Edge of the *Shade Vane*: The Sum is the Sun's Distance from the Zenith, or the Complement of his Altitude.

To find the *Meridian Altitude* by this Instrument, you must continue the Observation as long as you perceive the Altitude to be increasing; which you will find by the Sea's appearing still thro' the Slit instead of the *Horizon*, and as you move the *Sight Vane* lower: But as soon as ever you see the Sky appear instead of the *Horizon*, the Altitude is then diminishing, and you must desist; and adding as before the Degree and Minutes on the two Arks together into one Sum, it gives the Sun's Zenith Distance, or his Co-Altitude; and this subtracted from 90°. leaves the true Altitude above the *Horizon*.

That excellent Astronomer Mr. *Flamsteed*, contrived a Glass Lens or double Convex to be placed in the Middle of the *Shade Vane*, which makes a small bright Spot on the Slit of the *Horizon Vane*, instead of the Shade: And this is a great Improvement, if the Glass be truly made, for by this Means the Instrument may be used in Hazy Weather, and a much more accurate Observation made in clear Weather, than could be by the Shadow.

But after all, this Quadrant is by no Means so accurate as could be wished; and a large heavy Brass Astrolabe must needs be a much better Instrument.

BACULE (in Fortification) is a kind of Port-Cullis or Gate made like a Pit-fall with a Counterpoise, and supported by two great Stakes. 'Tis usually made before the *Corps de Garde* advanced near the Gates.

BACULOMETRY, according to some, is the Art of measuring accessible and inaccessible Lines, by the help of one or more Staves.

BADGER

BADGER (in Law) is one that is Licenced to buy Corn or other Victuals in one Place, and carry it to another.

BAILE or *Bale*; the Seamen call lading or casting the Water by Hand out of a Boat *Bailing*; and when the Water is thus Bailed out, they say, the Boat is freed. They call also those Hoops that bear up the Tilt of a Boat *Bailes*.

BAILE (in Law) is the setting at liberty one Arrested or Imprisoned upon an Action either Civil or Criminal, under Sureties taken for his Appearance at a Day and Place certainly assigned: And there is both *Common* and *Special Baile*; *Common Baile* is in Actions of small Prejudice, or slight Proof, in which Case any Sureties are taken: *Special Baile* is given in Cases of greater Weight, who must be subsidy Men at the least, and they according to the Value.

BAILEMENT (a Term in Law) signifying the Delivery of things, whether Writings or Goods, to another, sometimes to be delivered back to the Bailor, that is, to him that so delivers them, sometimes to the use of him to whom they are delivered; and sometimes to a third Person.

BAILIFF, is an Officer that belongs to a Manor, to order the Husbandry, and hath Authority to pay Quit-Rents issuing out of the Mannor, fell Trees, repair Houses, &c. This Officer is he whom the ancient Saxons called a Reeve.

BAILIFF Errant, is one that the Sheriff makes and appoints to go about the Country to execute Writs, to summon the Country Sessions, Assizes, &c.

BAILIFF Franchises, are those which are appointed by every Lord within his Liberty, to do such Offices within his Precincts, as the *Bailiff Errant* doth abroad in the Country.

BAILIWICK, is the Jurisdiction of a Bailiff within his Lord's Franchise.

See the General Rule for Constructing Equations: See Constructions of Equations.

BALANI, are certain Excreences usually growing to the Shells of the larger sorts of Sea Shell-Fishes.

BALANUS (as it is called by some) or *Glans*, is the Nut of the Yard covered with the Foreskin; sometimes the *Clitoris* is so called. It often also signifies a Suppository. *Blanchard.*

BALL and Socket, is an Instrument made of Brass, with a perpetual Screw to hold any Telescope, Quadrant, or Surveying Instrument, on a Staff for Surveying, Astronomical, or other uses.

BALLANCE or *Libra*, is one of the Six simple Powers in Mechanics, which serves to find out the Equality or Difference of Weights in heavy Bodies. It is only a double Lever whose *Hypomochlion* is at the Centre of its length.

BALLANCE of the Air, see *Barometer*.

BALLANCE of a Watch or Clock, is that part of it, which by its Motion regulates and determines the Beats: The circular Part of it is called the *Rim*, and its Spindle the *Verge*: There belongs to it also two *Pallars* or *Nuts*, which play in the Fangs of the Crown-wheel. In Pocket Watches that strong stud, in which the lower *Pevet* of the *Verge* plays; and in the Middle of which one *Pevet* of the Crown-wheel runs, is called the *Potans*, or rather *Potence*. The wrought Piece which covers the *Ballance*, and in which the upper *Pevet* of the *Ballance* plays, is the *Cock*. The small Spring in new Pocket Watches is called *Regulator*.

BALLANCE or *Libra*, is the Name of one of the twelve Signs of the Zodiac; into the first Degree of which when the Sun comes, the Autumnal Equinox happens, and is the 12th of September.

BALLAST of a Ship, is some heavy Matter, as Stones, &c. laid in the Hold next to the Keelson or false Keel, in order to keep a Ship stiff, so that she may bear the more Sail. The Words about it are *Trench the Ballast*, i. e. divide it into two or more Parts. The Ballast is *Shot*, that is, 'tis run over from one Side to the other: When a Ship hath not Ballast enough, they say she is *Walt*.

BALLESTER, or *Balluster*, in the Capital of the *Ionick Column*, is the lateral Part of the Scroll which makes the *Curl-turf*.

BALLISTA, an ancient Warlike Engine to cast or shoot Darts or Stones, to batter and shake City Walls.

BALLIVO amovendo, is a Writ to remove a Bailiff out of his Office, for want of sufficient living in his Bailiwick.

BALLON or *Balon*, is the French Word for a large Receiver or Vessel used in Chymistry, to receive what is distilled or drawn off by the Fire.

BALLON, in Architecture, is taken for a round Globe, or top of a Pillar.

BALLS or *Ballers*, a frequent Bearing in Coats of Arms; but they are never called so in Heraldry, but according to their several Colours have the following Names;

Besants, when the Colour is Or.

Plates, when 'tis Argent.

Hurts, when 'tis Azure.

Torteauxes, when 'tis Gules.

Pomeis, when 'tis Vert.

Pellets or *Agresses*, when Sable. Some write it *Ogresses*.

Golpes, when Purple.

Orenges, when Tenne.

Guzes, when Sanguine.

And these Nine contain all the Colours usually mentioned Heraldry.

BALLUSTRADE, in Architecture, signifies a Row of little turn'd Pillars, high enough for a Man to rest his Elbows on, fixed upon a Terrace, or upon the Top of a Building; or to make any Separation between one Part of it and another.

BALNEUM, a Word much used by the Chymists; it properly signifies a Vessel of Water, in which the Body or Cucurbite containing any Matter to be distilled is placed, that so the Water heating, may heat the Cucurbite gently and by degrees. And this is what they call corruptly.

BALNEUM Mariæ; but it should be *Balneum Maris*, i. e. a Sea or Water Bath. And in respect to the Mildness of the Heat in this way of Distillation, where the Fire never touches the Cucurbite immediately. They call several other gentle ways of Distillation by the Name of *Balneum*, as.

BALNEUM Vaporosum, where the Vessel containing the Matter to be distilled heated by the Steam of hot or boiling Water.

BALNEUM Arenæ or *Sineris*; which they call also sometimes *Balneum Brenojum*, and *Balneum Cinereum*, is when the Cucurbite, or Retort, or Vessel holding the Matter to be distilled is placed in a Pot of Sand or Ashes, and so is heated by the Heat of the Sand or Ashes.

BALSAM, signifies, 1st. The Juice of an Arabian Tree called *Opobalsamum*, to which are allied the Natural Balsams, as that of *Toli*, *Peru*, &c.

2^{dly}. A sometime thick and odoriferous, spirituous and penetrating Substance, of the Consistence of an Ointment, as *Apoplextick Balsam*, *Balsam of Roses*, &c.

3^{dly}. A sort of Liquors drawn or extracted from Gums and Resinous Substances with Spirit of Wine.

4^{thly}. This Name is given also by the Chymists to the Solutions and Preparations of some Salts, as *Balsam of Saturn*, *Tartar*, *Sal-gemm*, &c.

5^{thly}. Some particular Preparations of Medicines in this Form are called by this Name, as *Balsam of Sulphur*, &c.

BALSAM of Saturn, is a Solution of *Saccharum Saturni* made with Spirit of Oil of *Turpentine*, and digested till the Matter hath gained a Red Tincture.

BAN, is a Proclamation made at the Head of a Body of Troops, or in the several Quarters of the Army, by sound of Trumpet or beat of Drums, either of observing or Martial Discipline, for declaring a New Officer, punishing a Soldier, or the like.

BANDELET, is a French Term for one of the Ornaments in Architecture, which they call also *Regle*: 'Tis greater than the *List*, but a little less than what they call a *Platte Bande*; it encompasses the Pillar quite round about like a Ring.

BANK, in Common Law, signifies the Bench or Seat of Judgment: But there is another sort of *Bank*, where there is a great Sum of Money let out to use, returned by Exchange, or otherwise disposed to Profit.

BANKRUPT, one that hath consumed his Estate, or is run out in his Trade.

BANNIMUS, the Form of Expulsion of any Member from the University of *Oxford*, affixing the Sentence, up in some Publick Place, as a Denunciation or Promulgation of it.

BANQUETTE, in Fortification, is a little Foot Pace or Elevation of Earth in Form of a Step, or the Bottom of a *Parapet*, or that which the Musqueteers get up to discover the *Counterscarp*, or to fire upon the Enemies in the *Moat*, or in the *Counterway*. These *Banquers* are generally a Foot and a half high, and almost three Foot broad.

BARAK or *Baraque*, is an *Hutt* like a little Cottage for Soldiers to lie in the Camp: Formerly those for the Horse were called *Baracks*, and those for the Foot *Hutts*; but now *Barack* is used for both indifferently. They are made usually when the Soldiers have no Tents, or when an Army lies long in a Place in bad Weather, because they keep out Cold and Wet much better than Tents. They are generally made by fixing four strong forked Poles in the Ground, and then laying four others across them; then they build up the Walls with Sods, Wattles, or what the Place affords: The Top is either Planked or Thatched, or covered with Turf, as they have Convenience.

BARBE, a Military Word: To fire an *Barbe* is the fire the Cannon over the *Parapet*, instead of putting them through the Embrazures; but then the *Parapet* must be but 3 Foot and $\frac{1}{2}$ high.

BAROCO, one of the barbarous Words expressing the Syllogistick Moods in Logic; and in this Mood *Baroco*, the first Proposition must be an universal Affirmative, and the two other Negatives.

BAROMETER, is an Instrument for estimating the Minute Variations of the Weight or

Pressure of the Incumbent Air, consisting of a long Tube of Glass, hermetically sealed at one End, and

being filled with *Quick-silver* (according to the *Torricellian Experiment*) is inverted, so as to have the open End of it immersed in *Stagnant Quick-silver*, contained in a larger Glass under it, and exposed to the Pressure of the outward Air: Out of which open End (after such Immersion) the *Quick-silver* in the Tube being suffered to run as much as it will into the *Stagnant Quick-silver*, in which that Mouth or open End is immersed, there is wont to remain a Cylinder of *Quick-silver*, suspended in the Tube about 28, 29, or 30 Inches high; measuring from the Surface of the *Stagnant Quick-silver* perpendicularly; but more or less within such Limits, according as the Weight or Pressure of the Air incumbent on the external *stagnant Quick-silver* exposed to it, is greater or lesser, leaving the upper Part of the Tube void, or at least empty of common Air.

Dr. Hook's Contrivance to enlarge the Divisions of the *Barometer* in any given Proportion.

The Glass this *Barometer* is represented by the adjoining Figure; the Cylinder *A* may be of what Diameter you please, the bigger the better, but it need not be above two Inches long; the Cane *AD* must be so long, that the upper Part of the Cylinder *B* may be 29 Inches + such a Part of the Height of the other Cane *BC*, as the Weight or Specific Gravity of the Liquor that is to fill that Cane is to the Specific Gravity of *Mercury* below the Line *ab*, in the Cylinder *A*. The third Cylinder *C* may be as high as you please above the Cylinder *B*, but is most conveniently made, so as the Square of the Diameter of the Cane *BC* be to the Square of the Diameter of the Cylinders *B* or *C* (which must be exactly equal) as the rise of the

Mercury

Mercury in the Cylinder *B*, is to the whole Length of the Cane *BC*; for in this case there will be nothing superfluous, but the Divisions enlarged to the utmost advantage.

To fill this *Baroscope*;

Let a small Hole be left at the top of the Cylinder *A*, and another near the top of the Cylinder *B*; this latter being well stopp'd, pour in as much *Mercury* at the other Hole in *A*, as shall fill both Canes as high as the Level of the said Hole; which done, stop either by Hermetically Sealing it, or else by a drop of Sealing-wax (the Glass being first ground rough to make it stick) the Hole in *A*; then opening the Hole in *B*, draw off as much of the *Mercury* of the Cane *BC* till it will run no longer; which done, stop firmly the Hole in *B* (which you may do as you please, there being no Pressure against you) and you will have the Cylinder *A* evacuated of *Air* for your purpose, and the height of the *Mercury* will be as usual in the ordinary *Plain* and *Wheel-Barometers*.

Then pour into the Cane *BC* as much Spirit of Wine tinged with *Chocchine* and Oyl of Turpentine, equal Parts of each, as shall stand above the Surface of the *Mercury*, so many Feet as you make the enlarged Scale of your *Barometer*, or as is between the middle of the Cylinders *B* and *C*, and you will find the *Mercury* sink in the Cane *BC*, and rise in the Cane *AD*, in such proportion, that each 13 Feet of Oyl and Spirit, will raise the *Mercury* 10 Inches: Then you must pour on, by the Cane *BC*, so much *Mercury* as will fill up the Cylinders *A* and *B* to such heights, considering the present weight of the *Atmosphere*, that the Surface of the *Mercury* in both, may at the utmost Limits, (which have not in *England* been found to exceed 30,6 and 28,6 Inches) always fall within the Bodies of the Cylinders, and never enter into the Canes.

The Effect of this *Baroscope* will be, that when the *Atmosphere* is heavy, and the *Mercury* raised high in the Cylinder *A*, and retired out of *B*, the Spirit of Wine will descend into the Cylinder *B*, and the Oyl of Turpentine will fill the Cane, so as to make the Partition of the two Liquors near the Cylinder *B*. But on the contrary, when the Air is light, the *Mercury* will sink in *A*, and rise in *B*, so as to drive the Spirit of Wine into the Cane, and the Oyl of Turpentine into the Cylinder *C*; so that the Section of the two Liquors will be near *C*, and the Variation of the height of the *Mercury* will be enlarged into almost the length of the Cane, without that the Counter-pressure from the Liquors will not be in the least altered, the Height and Weight of the Incumbent Cylinder being always the same.

The Ingenious Mr. *Hawksbee* (that invented the new Cupping-Glasses without Fire, now generally used: See his *Air-pump*) shewed me a *Baroscope* where the *Mercury* rose and fell 60 Inches with very great ease, and without breaking or dividing; and it may very easily be made for 100 or 200 Inches, if a frail small thin Glass Tube can be blown and drawn of that length, and that it were as easily manageable.

The *Torricellian* Experiment is made in a Tube of about 31 Inches in length, with a small Ball, or rather Cylindrical Cavity on the Top; at the Bottom of this Tube, at *A*, is a very small Cistern with *Mercury* in it, and communicating with the free Air, into which the lower End of the Tube *AB* is put; then at a very Acute Angle, is the

small Tube *CD* placed with its open Orifice in the aforesaid Cistern, and just under the Surface of the *Mercury* in it. And thus when the *Atmosphere* is high and heavy (that is in dry and fair Weather) the *Mercury* being pressed up into the Tube *BA*, leaves but little in the Cistern, and consequently there is but a little Weight of *Mercury* there, to press any out into the Tube *CD*, and consequently then the *Mercury* will fall or descend towards *C*. But when in contrary Weather, the *Mercury* falls out of the Tube *AB*, there will be more in the Cistern, and consequently the *Mercury* must ascend further, or run higher up into the Tube *CD*. And this is so tender and nice, that while I was in the Room, and looking on it, which was not above an Hour, the *Mercury* ascended near 2 Inches (for Rain) in the slope Tube.

One great Advantage this Way of managing a sloping Tube, seems to have above the Common One, which is, that the *Mercury* here moves all together in a Body, without breaking or dragging a Tail after it.

See the Figure of the Plate belonging to the Word *Air-Pump*.

Baroscope Statical: So Mr. Boyle calls an Instrument which he invented to estimate the Variations of the Air's Gravity, and is thus describ'd.

A very large and thin Glass Bubble (or if such an one cannot be procured, 2 or 3 smaller ones added together may do) was counterpoised in a very tender Balance which would turn with the 64th Part of a Grain, and then all being hung up in a Frame, he found, that as the Air grew lighter and thinner, the Bubble would preponderate very manifestly; but when the Air grew thicker and denser, the Scale in which the Weights were, would grow heavier, and mount up the Bubble. And this Effect he found would continue and answer exactly to the rise and fall of the *Mercury* in the common *Barometer* or *Baroscope*.

The Grounds on which this Noble Gentleman went in contriving this Instrument, were these:

1. He considered, that tho' at first setting of it up, the Bubble and the Weights would be in *Æquilibrium*, because he carefully made them so; yet the Bulk of the Bubble did exceed that of the Metalline Counterpoise, by near 200 times (be it more or less, according to the Specifick Gravity of the Weights used) and therefore he considered.

2. That, according to the Laws of Hydrostatics, when two Bodies being of the same absolute Weight, but very different Bulks, come to be weighed in another Medium, they can no longer be equiponderant: For if the Medium be heavier or denser, the greater Body will be more buoyed up there than it was before, and constantly will abate of its Weight; but if the Medium should be lighter and rarer, the contrary Effect would follow, and the Weight would be heavier than the Bubble. He considered also, that this must be the Case of the Air, whose Specifick Gravity is continually changing, according to the various Effluvia it receives from the Terraqueous Globe, and consequently, that it must needs be now denser, now rarer, and accordingly more or less buoy up the Bubble.

Our Author hints, that this Instrument is capable of several Improvements; and tho' in many Cases the common *Baroscope* be preferable before it, yet this hath some Advantages above that; as, 1. That this is more parable than the other;

L. for

for many Persons can more easily get a Pair of good Scales and a Glass Bubble, than they can a Tube and Mercury for the common *Baroscope*; and this also is much more easily fitted up than that. This *Stratical Baroscope* is also much more easily carried from Place to Place. This *Baroscope* may be adjusted to the ordinary one, by finding what Weights answer exactly to every half Quarter of an Inch of the rise and fall of the Mercury; and these may help us to guess at the usual Variations of the Weather, by shewing how much is wanting to bring the Scales to an *Equilibrium*.

Also an Arch of a Circle, well graduated, may be fitted so as that the Tongue of the Balance shall play freely by it, and there shew the Change of the Gravity of the Atmosphere, without the Addition of any new Weights at all.

WHEEL-BAROMETER, is a Contrivance for the applying of an *Index* to any Common *Baroscope*, whether the Glass be only a single Cane, or have a round Bolt-head at the Top; and by the Means thereof, the Variation of the Altitude of the *Mercurial Cylinder*, which at most is hardly 3 Inches, may be made as distinguishable as if it were 3 Foot or 3 Yards, or as much more as is desired.

The *Wheel-Barometer* was invented by Dr. Hook, the Manner whereof is visible in the Figure, where *ABC* represents the Tube, which may be either Blunt or with a Head, as *ABC* (by which latter Shape, more room is allowed for any remainder of Air to expand the better.) This is to be filled with Quick-silver, and inverted as commonly, and put

into a Vessel of Stagnant Mercury, made after the Fashion of *IK*, that is, having its Side about 3 or 4 Inches high, and the Cavity of it equally big both above and below; and if it can be (besides that Part which is filled by the End of the *Mercurial Tube* that stands in it) of equal Capacity with the Hollow of the Cane about *B*, for then the Quick-silver rising as much in the Hollow of *I*, as

it descends at *B*, the Difference of the Height in the Receiver *I*, will be just half the usual Difference. And if the receiving Vessel *IK* have a bigger Cavity, the Difference will be less; but if less, the Difference will be greater. But whether the Difference be made hereby bigger or less, 'tis no great Matter, since by the Contrivance of the *Wheel* and *Index*, the least Variation may be made as sensible as is desired, by diminishing the Bigness of the *Cylinder E*, and lengthening the *Index FG*, according to the Proportion requisite.

But this *Wheel-Barometer* not answering fully the designed Exactness, because the Mercury is apt to stick about the Sides of the Glass, and would rise and fall by Leaps, and all at once; and because also 'tis very difficult to adjust the Ball and Thread, &c. and that the Instrument is very apt to be out of Order, &c. 'tis now out of use. And therefore in *Philos. Transact.* N. 185, the Doctor gives us another Contrivance, (which he had thought of in the Year 1668) by putting the Spirit of Wine, or some other Liquor that will not freeze, upon the Mercury; which was designed to rise as the Mercury falls, and fall as it rises. And by this Means he could, he saith, enlarge the Divisions as much as he pleased.

MARINE BAROMETER, is an Instrument contrived by Dr. Hook, for the Use of those that would make a Philosophical Experiment at Sea.

For the *Mercurial Barometer* requiring a perpendicular Posture, and the Quick-silver vibrating therein with great Violence upon any Agitation, is therefore incapable of being made at Sea, (tho' it hath lately been contrived to be made portable) so it remain'd to find out some other Principle, wherein the Position of the Instrument was not so indispensably necessary: For this the above-named Person invented. Its Description and Uses the Ingenious Capt. Halley in *Philos. Transact.* N°. 269. gives as follows.

It is about 40 Years since, that the *Thermometers* of Robert de Fluhibus, depending on the Dilatation and Contraction of included Air by Heat and Cold, have been disused, upon discovery, that the Air's Pressure is unequal; that Inequality mixing it self with the Effects of the Warmth of the Air in that Instrument; and instead thereof, was substituted the sealed *Thermometer* including Spirit of Wine (first brought into England out of Italy by Sir Robert Southwell) as a proper Standard of the Temper of the Air, in relation to Heat and Cold, that *Aethereal Spirit* being of all the known Liquors the most susceptible of Dilatation and Contraction, especially with a moderate Degree of either Heat or Cold.

Now this being allow'd as a Standard, and the *Thermometer* that includes the Air being graduated with the same Divisions, so as at the time when the Air was included to agree with the *Spirit-Thermometer* in all Degrees of Heat and Cold, noting at the same time the precise Height of the Mercury in the common *Barometers*; it will readily be understood, that wheresoever these two *Thermometers* shall agree, the Pressure of the Air is the same it was when the Air was included and the Instrument graduated; that if in the *Air-Thermometer*, the Liquor stand higher than the Divisions marked thereon, corresponding with that on the Spirit Glass, it is an Indication that there is a greater Pressure of the Air at that time, than when the Instrument was graduated. And on the

the contrary, it is to be concluded, when the Air-Glass stands lower than the Spirit, *viz.* that then the Air is so much lighter, and the Quick-silver in the ordinary Barometers lower than at the said time of Graduation.

And the Spaces answering to an Inch of Mercury, will be more or less, according to the Quantity of Air so included, and the Smallness of the Glass Cane in which the Liquor rises and falls; and may be augmented almost in any Proportion, under that of the *Specifick Gravity* of the Liquor of the Thermometer to Mercury, so as to have a Foot or more for an Inch of Mercury, which is another great Convenience.

In these Parts of the World, long Experience has told us, That the Rising of the Mercury forebodes Fair Weather after Foul, and an Easterly or Northerly Wind; and that the falling thereof, on the contrary, signifies Southerly or Westerly Winds, with Rain and Stormy Winds, or both; which latter it is of much more consequence to provide against at Sea than at Land; and in a Storm, the Mercury beginning to Rise, is a sure Sign that it begins to abate, as hath been experienced in high Latitudes, both to the Northwards and Southwards of the Equator.

The Form of this Instrument is represented by the following Figure.

AB represents the Spirit Thermometer graduated from 0, or the Freezing Point, through all the possible Degrees of Heat or Cold of the Air, at least in these Climates.

CD is the Air-Thermometer, graduated after the same Manner with the like Degrees.

EF is a Plate applied to the Side of the Thermometer CD, graduated into Spaces answering to Inches, and Parts of an Inch of Mercury, in the Common Barometers.

L 2

G, a Hand standing on the Plate, at the Height of the Mercury thereon, as it was when the Instrument was graduated; as suppose here at 29½ Inches.

L M a Wire on which the Plate EF slips up and down, parallel to the Cane of the Thermometer CD.

K, any Point at which the Spirit stands at the time of Observation; suppose at 38 on the Spirit-Thermometer; slide the Plate EF till the Hand G at 38 on the Air-Thermometer, and if the Liquor therein stand at 38 likewise, then is the Pressure of the Air the same as at the time of Graduation, viz. 29, 5; but if it stand higher, as at 30 at L, then is the Pressure of the Air greater, and the Divisions on the sliding Plate against the Liquor, shew the present Height of the Mercury to be 29, 7 Inches.

This may suffice as to the Manner of using it.

Capt. Halley had one of these Glasses with him in his last Southern Voyage; and he saith, it never failed to give him early Notice of a Storm, and of all the bad Weather they had.

The same Ingenious Gentleman, in *Philos. Transact.* N. 187, hath an excellent Discourse upon the Reasons of the Rise and Fall of the Mercury in Fair and Foul Weather: the Substance of which is as follows.

1. He premises the commonly observed Phenomena of the Mercurial Baroscope; which are,

1. That in Calm Weather, when the Air is inclined to Rain, the Mercury is commonly low.

2. That 'tis generally high in good, serene, settled, fair Weather.

3. That it sinks lowest of all on very great Winds, though they are not accompanied with Rain; with Relation to the Point of the Compass the Wind blows upon.

4. That, *ceteris paribus*, the greatest Height of the Mercury is found, when an Easterly or North-Easterly Wind blows.

5. That in Calm Frosty Weather the Mercury generally is high.

6. That after very great Storms of Wind, when the Mercury hath been low, it usually rises again very fast.

7. That more Northerly Places have a greater Alteration of the Rise and Fall of the Mercury than the more Southerly.

8. That within the Tropicks, and near them, there is little or no Variation of the Mercury's Height in all Weathers.

As to which two last Phenomena's, Mr. Patrick, the Famous Barometer-maker, tells me, That he hath certain Accounts, that the greatest Variation of the Baroscope is in the Latitude of 45°. N. or S. and that the Rise and Fall gradually decreases towards the Equator and Poles, so as in either of those Regions scarcely to vary at all.

The Theory that Mr. Halley advances to solve all which Phenomena, is this:

1. He supposes the principal Cause of the rise and fall of the Mercury, is from the variable Winds, which are found in the Temperate Zones, and whose great Inconstancy here in England is most notorious.

2. A second Cause is the uncertain Exhalation and Precipitation of Vapours lodging in the Air, whereby it comes to be at one time much more crowded than at another, and consequently heavier; but those latter, in a great measure, depend up-

on the former. Now from these Principles, he explicates the several Phenomena of the Barometer.

1. Why in Calm Weather, the Air being inclined to Rain, the Mercury is commonly low?

That the Mercury's being low is an Indication of Rain, because the Air being light, the Vapours are no longer supported thereby, as being become specifically heavier than the Medium wherein they floated; so that they descend towards the Earth, and in their fall meeting with other Aqueous Particles, they incorporate together, and form little drops of Rain; but the Mercury's being at one time lower than at another, is the Effect of two contrary Winds blowing from the Place where the Barometer stands; whereby the Air of that Place is carried both ways from it, and consequently, the incumbent Cylinder of Air is diminished, and accordingly the Mercury sinks; as for Instance, if in the German Ocean it should blow a Gale of Westerly Wind, and at the same time an Easterly Wind in the Irish Sea; or if in France it should blow a Southerly Wind, and in Scotland a Northern, it must be granted me, that that part of the Atmosphere, impendant over England, would thereby be exhausted and attenuated, and the Mercury would subside, and the Vapours which before floated in those parts of the Air, of equal Gravity with themselves, would sink to the Earth.

2. Why in serene, good, settled Weather, the Mercury is generally high? That the greater height of the Barometer, is occasioned by two contrary Winds blowing towards the place of Observation, whereby the Air of other Places is brought thither, and accumulated; so that the Incumbent Cylinder of Air being increased both in Height and Weight, the Mercury pressed thereby, must needs rise and stand high, as long as the Winds continue so to blow; and then the Air being specifically heavier, the Vapours are better kept suspended, so that they have no Inclination to precipitate and fall down in Drops, which is the reason of the serene good Weather which attends the greater heights of the Mercury.

3. Why, upon very great Winds or Storms, though accompanied with no Rain, the Mercury sinks lowest of all, with relation to the Point of the Compass upon which the Wind blows?

This is caused by the very rapid Motion of the Air in these Storms; for the Tract or Region of the Earth's Surface wherein these Winds rage, not extending all round the Globe; that Stagnant Air, which is left behind, as likewise on the sides, cannot come in so fast as to supply the Evacuation made by so swift a Current; so that the Air must necessarily be attenuated when and where the said Winds continue to blow, and that more or less according to their Violence. Add to which, that the Horizontal Motion of the Air, being so quick as it is, may in all probability take off some part of the perpendicular Pressure thereof; and the great Agitation of its Particles, is the reason why the Vapours are dissipated, and do not condense into Drops, so as to form Rain, otherwise the natural Consequence of the Air's Rarefaction.

4. Why, *ceteris paribus*, the Mercury stands highest upon an Easterly or North-Easterly Wind?

This happens because that in the Atlantick Ocean, on this side 35th degree of North-Latitude, the Westerly and South-westerly Winds blow almost always Trade; so that whenever here the Wind comes up at East and North-East, 'tis sure to be check'd

check'd by a contrary Gale, as soon as it reaches the Ocean; wherefore, according to what is made out in the Second Remark, the Air must needs be heaped over this Island; and consequently the Mercury must stand high, as often as these Winds blow. This holds true in this Country, but is not a general Rule for others, where the Winds are under different Circumstances; and he himself hath sometimes seen the Mercury here as low as 29 Inches upon an Easterly Wind, but then it blew exceeding hard, and so comes to be accounted for by what was observed upon the third Remark.

5. *Why in calm frosty Weather the Mercury generally stands high?*

The Cause thereof is, That it seldom freezes but when the Winds come out of the Northern and North-Eastern Quarters; or at least, unless those Winds blow at no great distance off, for the Northern Parts of Germany, Denmark, Sweden, Norway, and all that tract from whence North-Eastern Winds come, are subject to almost continual Frost all the Winter; and thereby the lower Air is very much condensed, and in that state is brought hitherwards by those Winds, and being accumulated by the Opposition of the Westerly Wind blowing in the Ocean, the Mercury must needs be prest to a more than ordinary height, and as a concurring cause, the shrinking of the lower Parts of the Air into lesser room by cold, must needs cause a descent of the upper Parts of the Atmosphere, to reduce the Cavity made by this Contraction to an Equilibrium.

6. *Why after very great Storms of Wind, when the Mercury has been very low, it generally rises again very fast.*

This, he tells you, he has frequently observed, and once found it risen an Inch and a half in less than six Hours, after a long continued Storm of South-West Wind. This seems to be occasioned by the sudden accession of new Air to supply the great Evacuation which such continued Storms make thereof in those places where they happen, and by the Recoil of the Air, after the Force ceases that impelled it; and the reason why the Mercury rises so fast, is, because the Air being very much rarified beyond its mean Density, the neighbouring Air runs in the more swiftly to bring it to an Equilibrium; as we see Water runs the faster for having great Declivity.

7. *Why in more Northern Places, the Variations of the Barometer are greater than in more Southerly?*

The Truth of the matter of fact is proved from Observation made at Clermont and Paris, compared with others made at Stockholm, as may be seen in the Appendix to Mr. Pascal's Book, *De l'Equilibre des Liquors*. The Reason seems to be, that the more Northern Parts have usually greater Storms of Wind than the more Southerly, whereby the Mercury should sink lower in that Extrem; and then the Northern Winds bring the condensed and ponderous Air from the Neighbourhood of the Pole, and that again being check'd by a Southerly Wind, at no great distance, and so heaped, must of necessity make the Mercury in such case stand higher on the other Extrem.

8. *Why near the Equinoctial, as at Barbadoes and St. Helena, there is very little or no Variation of the Height of the Barometer?*

This Remark, above all others, confirms the Hypothesis of the variable Winds, being the cause of these Variations of the Height of the Mercury, for

in the places above-named, there is always an easy Gale of Wind blowing nearly upon the same Point, viz. E. N. E. at Barbadoes, and E. S. E. at St. Helena, so that there being no contrary Current of the Air, to exhaust or accumulate it, the Atmosphere continues much in the same state: However, upon Hurricanes, the most violent of Storms, the Mercury has been observed very low but this is but for once in 2 or 3 Years, and it soon recovers its settled state of about 29½ Inches: And there is no doubt but the same thing is in the East Coast of Africa, and in India, where the Monsoons or Winds are Trade for half the Year one way, and half the Year another; only 'tis probable, that there may something worth noting happen, about the time of the change or shifting of the Winds; which might be obtained if any Body had the Curiosity to keep the Barometer at our Factories in India.

Snowden Hill in North-Wales was measured by Mr. Caswell with Mr. Adams's Instruments, and found to be 1240 Yards high.

Mr. Halley found by 3 exact tryals the Mercury in the Baroscope descended at its top 3 Inches, 8 Tenths, and something more, and perhaps 4 Inches may be near enough Truth; if so, then divide 1240 by 4, the Quotient is 310 Yards; so that any fall of the Mercury 1 Inch, argues an Ascent of just 310 Yards in height; but according to Mr. Halley's Account of 3, 8 Inches, he makes 30 Yards height to answer to one tenth of an Inch fall; we therefore allow just 30 Yards (for Mr. Halley thought the fall of the Mercury more than 3, 8 Inches;) if so, then if Dr. Hook's new Baroscope will bear Divisions of one tenth of an Inch into ten more sensible Parts (as I believe it will) each of those ten Parts will answer to 3 Yards, and so by its help one may take the Level of Places very well, to convey Water, &c.

When the Mercury is at 30 Inches in the Baroscope (whence may be computed the middle height) the Atmosphere is 5 Miles and ½ high (that is, supposing the Air to be of the same Density all along; tho' in all probability it is not, but grows more rare in proportion to its Height, which will much encrease the Height of the Atmosphere.)

The Ingenious Mr. Derham, Rector of Upminster, in *Philos. Transf. N. 236*, gives an Account of some Experiments he made at the Top and Bottom of the Monument; where he found, that at the Height of 32 Feet, the Mercury fell ⅙ of an Inch; and at about 164 Feet, ⅔ of an Inch, &c.

He there also describes a Portable Barometer; which he conceives might be of great use in such Experiments.

In *Philos. Transf. N. 237*, he gives a Contrivance to measure the Height of the Mercury in the Barometer, by a Circle on one of the Weather Plates, to the Hundredth Part of an Inch exactly.

In *Philos. Transf. N. 240*, Mr. Stephen Gray shews also a Method of measuring the Height of the Mercury in the Barometer, by adapting a double Microscope furnish'd with a Micrometer to the Baroscope, by Means of which, the Mercury's Variations may be observed to the Thousandth Part of an Inch.

The following Rules to judge of the Weather by the Barometer, I had from Mr. John Patrick in Ship-Court in the Old Baily, the Torricellian Operator; and they are the Result of his own long Experience and Observation.

Rules and Observations on the various Rising and Falling of the Mercury, to foreknow the Weather by the Barometer.

1. It hath been observed, That the Motion of the Mercury doth not exceed 3 Inches in its rising or falling, in the *Barometer* of the Common Form.

2. That its least Alterations are to be minded, in order to the right finding the Weather by it.

3. The rising of the Mercury presages, in general, fair Weather; and its falling, Foul, as Rain, Snow, high Winds, and Storms.

4. In very hot Weather the falling of the Mercury forebushes Thunder.

5. In Winter the Rising presages Frost; and in frosty Weather, if the Mercury falls three or four Divisions, there will certainly follow a Thaw; but in a continued Frost, if the Mercury rises, it will certainly Snow.

6. When foul Weather happens soon after the falling of the Mercury, expect but little of it; and judge the same when the Weather proves fair soon after the Mercury has risen.

7. In foul Weather, when the Mercury rises much and high, and so continues for two or three Days before the foul Weather is over, then expect a continuance of fair Weather to follow.

8. In fair Weather, when the Mercury falls much and low, and thus continues for two or three Days before the Rain comes, then expect a great deal of Wet, and probably high Winds.

9. The unsettled Motion of the Mercury denotes uncertain and changeable Weather.

10. You are not so strictly to mind the Words that are engraven on the Plates, tho' for the most part it will agree with them, as the Mercury's rising and falling; for if it stands at much Rain, and then rises up to changeable, it presages fair Weather; altho' not to continue so long as it would have done if the Mercury were higher; and so on the contrary.

And I think my self obliged in Justice to tell the World, That I have never seen better Weather-Glasses of all kinds made any where, than by Mr. Patrick; who doth really deserve all possible Encouragement for the many Experiments he hath made in order to improve the *Barometer*, and which he is always very willing to shew to all Ingenious and Curious Persons. And tho' I cannot be of Dr. Leigh's Opinion, who in P. 16. and 180 of his *Natural History of Lancashire*, &c. saith, Mr. Patrick's Experiments demonstrate, that the Suspension of the Mercury in the Tube is not caused by the Weight of the Incumbent Atmosphere, since on a very careful Examination of all Mr. Patrick's Experiments, I find them all accountable by the Doctrine of the Gravitation of Fluids; yet do I really believe the making and considering those Experiments, hath given Mr. Patrick many useful Hints for the Improvement of this Instrument, and will continue to do so daily. His *Pendulous Barometer* is very curious and nice, the Scale being graduated for it by an Air-Pump; it hath no Cistern of Stagnant Mercury at the Bottom of the Tube, as in the common Torricellian Experiment; and the Mercury rises and falls about 12 Inches instead of 3, as in the ordinary Barometer: And in a *Diagonal* one (which he very handsomely fits about the Frame of a large Looking-Glass, with a Thermometer also by it the Mercury rises and falls near 30 Inches; and) consequently, the changes of the Weather will be much

sooner perceptible in these Instruments, than in the *Barometers* of the common Form.

BARON and *Feme*; the Term in Heraldry, when the Coats of Arms of a Man and his Wife are born *per Pale* in the same Escutcheon, the Man's always on the *Dexter* Side, and the Woman's on the *Sinister* or Left. But here the Wife is not an Heiress, for then her Coat must be born by the Husband on an Inescutcheon or Escutcheon of Pretence.

At Common Law these words signify only a Man and his Wife.

BAROSCOPE, the same with *Barometer*: Which see.

BARR of the Port: See *Shackles*.

BARR, in Heraldry, is a smaller *Fesse*, containing but the fifth Part of the *Field*, whereas the *Fesse* contains the *Third*.

BARR (in Law) is when the Defendant in any Action pleads a Plea which is a sufficient Answer, and destroys the Action of the Plaintiff for ever.

BARR FEE, is a Fee of twenty Pence, which every Prisoner acquitted of Felony pays to the Sheriff or Goaler.

BARREL, is a pretty large Cavity behind the *Tympanum* of the Ear; it is about three or four Lines deep, and five or six wide. It is lined with a fine Membrane, on which there are several Veins and Arteries. In this Cavity there are four small solid Bones, not covered with a *Periosteum* as the rest of the Bones of the Body are.

BARREL: See in *Fusley*.

BARRELS of Earth, used in Fortification, are as it were half *Hogheads*, which being fill'd with Earth, serve for Parapets; as also to break the Galleries made in the Ditch, and to roll into the Breaches.

BARRETOR (in Law) signifies a common Wrangler, stirrer up, or maintainer of Suits and Quarrels, either in Courts or in Country.

BARRETRY, a Word used in Policies of Insurance for Ships, and signifies Dissentions and Quarrels among the Officers and Seamen.

BARRIERS, in Fortification are great Stakes, about four or five Foot high, placed at the distance of eight or ten Foot one from another, with their Transoms or overwart Rafter, to stop either Horse or Foot that would enter or rush in with Violence. These *Barriers* are commonly set up in the void Space between the Cittadel and the Town in Half-moons, &c.

BARRICADO, a Warlike Defence of empty Barrels and such-like Vessels fill'd with Earth, Carts, Trees cut down, against an Enemy's Shot or Assault; but generally are Trees cut with six Faces, which are cross'd with Battoons as long as a Half-Pike, bound about with Iron at the Feet. These are usually set up in Passages or Breaches to keep back as well the Horse as Foot.

BARRISTERS, in Common Law, are of two sorts; 1. The Outward or *Uter Barristers*, who by their long Study in, and Knowledge of the Law (which must be for a Term of seven Years at least) are called to publick Practice, and undertake the Defence of their Clients Causes: These always plead without the Barr. 2. The *Inner Barristers*, who because they are either *Attorney*, *Solicitor*, *Serjeant*, or Council to the King, are allowed, out of Respect, the Privilege of Pleading within the Barr. But at the Rolls and some other inferior Courts, all *Barristers* are admitted within the Barr. *Blunt*.

BARRULET, in Heraldry, is the Half of the *Closet*, and the Quarter of the *Barr*.

BARRY, when an Escutcheon is divided *Bar-ways* into an even Number of Partitions; 'tis to be expressed in Blazon by the Word *Barry*, and the number of Pieces is to be specified. But if the Divisions be odd, then the Field must be first nam'd, and the number of Bars express'd. See *Paly*.

BARRY-BENDY, is when an Escutcheon is divided evenly, both *Barr* and *Bend-ways*; as thus.

Barry, Bendy, Argent, and Sable.

BARRY-PILY, is when a Coat is thus divided; and 'tis to be Blazoned, *Barry-Pily*, of eight Pieces.

Vid. Guillim, P. 279.

BARTER, a Word used for the Exchange of Wares for Wares.

BARYPHONY, is a Difficulty in Speaking.

BASE, in Fortification, is the exterior Side of the Polygon, viz. the Imaginary Line which is drawn from the *Flank'd Angle* of a *Bastion* to that which is opposite thereto.

BASE or *Basis*, in Architecture, is the Foot of a Pillar that sustaineth it, or that Part which is under the Body, and lies upon the Pedestal or Zocle when there is any: Therefore 'tis not used for the lowest Part of a Column, but for all the several Ornaments or Mouldings which reach from *Apophyses* or the rising of the Shafts of Pillars to the Plinth.

BASE FEE, or *Base Estate*, is a holding at the Will of the Lord.

BASE COURT (in Law) is any Court that is not of Record.

BASE of a *Triangle*, any one Side of a *Triangle* may be called the *Base*, but usually, and most properly that Side which lies parallel to the *Horizon* is taken for the *Base*. 'Tis also the same as to any other Right lin'd Figure.

BASE of any *Solid Figure*, is its lowermost Side, or that on which it stands.

BASE, of a *Conick Section* (if it have one) is a Right Line in the *Hyperbola* and *Parabola*, arising from the common Intersection of the *Secant Plane* and the *Base* of the *Cone*.

BASE, the least sort of Ordnance, the Diameter of whose Bore is 1½ Inch, Weight 200 Pound, Length 4 Foot, Load 50 Pound, Shot ½ Pound Weight, and 1½ Inch Diameter.

BASE RING, of a Cannon, is the great Ring next behind the Touch-hole.

BASE POINT, in an Escutcheon: See *Escutcheon*.

BASE TENURE, or holding by Villanage or other customary Service, as distinguish'd from the Higher Tenure, in *Capite*, or by Military Service.

BASILARE OS, the same with *Sphenoides*.

BASILICA, is the inner Vein of the Arm, called *Hepatica*, the Liver Vein, it being the inferior

Branch of the *Axillaris*, divided into 3 Branches under the Tendon of the *Musculus Pectoralis*.

BASILICA, in the Ancient Architecture, was a great Hall which had two Ranges of Pillars, and two Isles and Wings with Galleries over them. These great Halls were at first made for the Palaces of Princes, afterwards they were turned into Courts of Justice, and at last into Churches.

BASILICK CONSTITUTIONS, were an Abridgment and Reform of the Laws of *Justinian*, made in the Reigns of *Basilus* and *Leo* (whence they had their Name) and were in force in the Eastern Empire till its Dissolution.

BASILICUS, *Cor. Leonis*, a fixed Star of the first Magnitude in the Constellation *Leo*; its Longitude is 145°. 21'. Latitude 00, 26'. Right Ascension 147 Deg. 47. Min.

BASIOGLOSSUM (see *Hypploglossum*) is a Pair of Muscles that depress the Tongue: It arises fleshy from the Basis of the Os *Hyoides*.

BASIS, in Anatomy is the upper and broader Part of the Heart, opposite to the *Mucro* or Point: Also the Foundation of the Bone *Hyoides*.

BASKETS of Earth: See *Corbeils*.

BASIS, in Music, is the lowest of all the Parts thereof, which serves as a Foundation to the others.

BAS-RELIEF: See *Relief*.

BASS ENCEINT, or *Bass Enclosure*, the same with the *Fausse Bray* in Fortification, which see.

BASTON, in Fortification, is now what was anciently called a *Bulwark*: It consists of two *Faces*, as many *Flanks*, formerly a *Gorge*. It is usually made at the Angles or Forts, of a large heap of Earth, sometimes lined with Stone, but usually faced with Sods. The Lines terminating it are two *Faces*, two *Flanks*, and two *Demigorges*. The Union of the two *Faces* makes the outmost Angle, called the *Angle of the Bastion*. The Union of the two *Faces* to the two *Flanks*, makes the *Side Angles* called the *Shoulders* or *Epaules*; and the Union of the two other Ends of the *Flanks* to the two *Curtains*, forms the *Angles of the Flanks*.

BASTIONS Solid, are those that have their Earth equal to the Height of the *Rampart*, without any void Space toward the Centre.

BASTIONS Void or Hollow, are those that have a *Rampart* and *Parapet* ranging only round about their *Flanks* and *Faces*, so that a void Space is left toward the Centre, and the Ground is there so low, that if the *Rampart* be taken, no Retrenchment can be made in the Centre, but what will lie under the Fire of the Besieged.

FLAT BASTION, is that which is built on a Right Line.

CUT BASTION, is that which makes a Retrenching Angle at the Point; and is sometimes called,

BASTION with a Tenaille, whose Point is cut off, and makes an Angle inwards, and two Points outwards: This is done when Water, &c. hinders carrying the Bastion to its full extent, or when it should be too sharp.

BASTION Composed, is when the two Sides of the interior Polygon are very unequal, which makes the *Gorges* also unequal.

BASTION Deformed, is that which wants one of its *Demi-Gorges*, because one Side of the Interior Polygon is so very short.

BASTION *Demi*, hath but one Face and Flank, and is usually before a Horn-work or Crown-work. This is also called an *Epaulement*.

BASTION *Double*, is that which on the Plain of the great Bastion hath another Bastion built higher, leaving 12 or 18 Feet between the Parapet of the lower and the Foot of the higher.

BASTION *Flat*, if the Distance between the Angles of the Interior Polygon be double the usual length, then a Bastion is made in the middle before the Curtain; but it generally hath this disadvantage, that unless there be an extraordinary Breadth allowed to the Moat, the turning Angle of the Counterfcarp runs back too far into the Ditch, and hinders the Sight and Defence of the 2 opposite Flanks.

BASTION *Regular*, is that which hath its due proportion of Faces, Flanks and Gorges.

BASTON, a *French* word in Architecture, the same with the *Tore*; in Heraldry the same with *Abuton*: Which see.

BATHMIS, is a Cavity in the Bone of the Arm or Shoulder, on each side one; whereinto, when the whole Hand is stretched forth and bended, the Process of the undermost and lesser of the long Bones of the Cubit enters. This is also called *Trochlea*.

BATRACHUS, is a Tumour under the Tongue, which makes Men croak like a Toad, when they speak. *Blanchard*.

BATTAILE, is an ancient Trial in our Law, which the Defendant in Appeal of Murder, Robbery, or Felony, might chuse, that is to fight with the Appellant, for proof whether guilty or not; grown obsolete and wholly disused.

BATTALION, is a Body of Infantry of about 6, 7, or 800 Men, of which usually $\frac{1}{4}$ are Pikes in the middle, and the other $\frac{3}{4}$ are Muskets posted on the Wings; But the Number of Men is by no means certain. *Battalions* are usually drawn up six deep, or with six Men in File, or one before another; those in length or side by side being called *Ranks*. Some *Regiments* consists of but one *Battalion*; but when they are Numerous they are divided into several *Battalions* according to their Strength; and so that every one may be about 7 or 800.

The *Battalions* of *French* Guards have commonly but 5 Companies, because each Company consists of 150 Men. But of other *French* *Regiments* there go 16 Companies to a *Battalion*, because they are but 50 Men in a Company. Of the *Swiss* Guards 4 Companies make a *Battalion*, because each Company hath 180 Men.

When a *Battalion* is to be formed out of the Companies of several *Regiments* in a Garrison, &c. then those of the Eldest *Regiments* post themselves on the Right; those of the Second on the Left, and so all other successively on the Right and Left, till the youngest fall into the Centre. The Subaltern Officers take their Post before their Companies, the Captains on the Right and Left according to their Degree.

Battalions are divided into 3 Divisions, the Musqueteers in the Right and Left, and the Pikes in the middle. In Marching, when there is not Room for so great a Front, they break into Subdivisions as the Way and Ground will allow.

The great Art of drawing up a *Battalion* is to dispose it so as that it may best resist a Party of Horse in an open Field, and that it may with advantage engage with either Horse or Foot.

BATTERY (in Law) is an Act that tends to the breach of the Peace of the Realm.

BATTERY, in Fortification, is a place raised on purpose where Cannon are planted, from thence to play upon the Enemy; the Platform on which they are fix'd being made of Planks that support the Wheels of Carriages, so as to hinder the Weight of the Cannon from sinking them into the Ground, and incline somewhat towards the Parapet to check the Recoiling of the Pieces.

BATTERIES of a *Camp*, are Places to plant great Guns on, and are usually surrounded with a Trench and *Pallisadoes* at the Bottom, as also with a Parapet on the top, having as many Holes as there are Pieces of Artillery; and with two Redouts on the Wings, or certain Places of Arms capable of covering the Troops that are appointed for their Defence.

In all Batteries the open Spaces left to put the Muzzles of the great Guns out, are called *Embrasures*, and the Distances between the *Embrasures* *Merlons*. The Guns are generally about 12 Foot distant one from another, that the Parapet may be strong, and the Gunners have room to work.

BATTERY *Sunk* or *Buried*, is when its Platform is sunk or let down into the Ground so that there must be Trenches cut in the Earth against the Muzzles of the Guns, for them to fire out at, and to serve for *Embrasures*. This sort of Battery which the *French* call *En Terre*, and *Ruinante*, is generally used on the first making of Approaches, to beat down the Parapet of any Place.

BATTERIES *Cross*, are two Batteries which play athwart one another upon the same thing, forming there an Angle, and beating with more Violence and Destruction, because what one Bullet shakes, the other beats down.

BATTERY *d' Enfilade*, is one which scours or sweeps the whole Length of a Strait Line.

BATTERY *en Echarp*, is that which plays obliquely.

BATTERY *d' Revers*, or *Murdering Battery*, is one that bears upon the Back of any Place.

BATTERY *Joint*, or *par Camerade*, is when several Guns play at the same time upon one Place.

BATTEURS *d' Estrade*, or *Scours*, are Horsemen sent out before, and on the Wings of an Army, a Mile, or two, or three, to make Discoveries; which they give an account to the General.

BATTLEMENTS, are the Tops of the Walls of Buildings made in the Form of *Embrasures* and *Merlons*, as in Fortified Places.

BATTOLOGY, is a vain and foolish Repetition of the same Words over and over again in any Discourse; like the trifling Poet *Batrus* mentioned by *Ovid*, who introduces him saying, *Montibus (inquit) erant et erant sub montibus illis*.

BATTOONE, a Term in Heraldry, signifying a 4th Part of a *Bend sinister*: It is the usual Mark of Illegitimacy, and is always born coupé, or cut off after this manner.

It also signifies the Earl Marshall's Staff.

BAY, is a Term used by Geographers and Seafaring Men, for an Arm of the Sea coming up into the Land, and terminated in a Nook. It is a kind of Lesser Gulph, bigger than a Creek, and

larger in the Middle within, than 'tis at the Entrance into it; which Entrance is called the *Mouth of the Bay*.

BEACONS, are Fires maintained on the Sea-Coasts, to prevent Ship-wracks, and to give notice of Invasions, &c.

BEADLE (in Law) signifies a Messenger or an Apparitor of a Court, that cites Men to the Court to appear and answer.

BEAK, or *Beak-head*, of a Ship, is that Part of it which is fastened to the *Stem*, and is supported by a *Knee*; and is the becoming Part or Grace of a Ship.

BEAM COMPASSES, is an Instrument made in Wood or Brass, with sliding Sockets to carry several shifting Points, in order to draw Circles with very long Radii: They are of good use in large Projections for drawing the Furniture on Wall Dyals, &c.

BEAMS of a Ship, are the great main cross Timbers which hold the Sides of a Ship from falling together, and which also support the *Decks* and *Orlops*. The *Main Beam* is next the *Main Mast*, and from it they are reckoned by First, Second, or Third Beam. The great Beam of all is called the *Midship Beam*.

BEAR, a Word used by Seamen in several Senses. They say a Ship *Bears Ordinance*, when she carries any great Guns: She *Bears a good Sail*, they say, when a Ship having her Sails abroad in a Gale of Wind, sails upright in the Water. When a Ship sails toward the Shore, she is said to *bear in with the Land*: When a Ship that was to Windward comes under another Ship's Stern, and so gives her the Wind, she is said to *Bear under her Lee*. If a Ship sails into an Harbour with the Wind large, or before the Wind, she is then said to *Bear in with the Harbour*; and when a Ship keeps off from any Land, she is to *Bear off from it*. When a Seaman would express how any Cape or Place lieth from another, he saith it *beareth off so, or so*. In Conding also, they say, *Bear up the Helm*, i. e. let the Ship go more large before the Wind; and *Bear up Round*, that is, let the Ship go between her two *Sheets*, directly before the Wind. Lastly, There is another Sense of this Word in reference to the *Burthen* of a Ship (which Word is derived from hence) for they say a Ship *Bears*, when having too slender or *Lean* a Quarter she will sink too deep into the Water, with an over-light Freight, and thereby can carry but a small Quantity of Goods.

BEAR, is also used in Heraldry: He that hath a Coat of Arms is said to *Bear* in it the several Charges or Ordinaries that are in his Escutcheon; as if there are 3 Lions Rampant in it, he is said to *Bear 3 Lions Rampant*.

BEAR; there are two Constellations of the Stars called by this Name, the *Greater* and *Lesser Bear*, or *Ursa Major* and *Minor*. The Pole Star is said to be in the Tail of the *Lesser*, because that Star is never above 2 Degrees distant from the N. Pole of the World.

BEARING, in Navigation, signifies the Point of the Compass that one Place *bears* or stands off from another.

BEASANTS: See *Balls*.

BEATS, in a Watch or Clock, are the Strokes made by the *Wings* or *Pallets* of the Spindle of the Ballance; or of the *Pads* in a Royal Pendulum.

To find the *Beats* of the Ballance in all Watches going, or in one turn of any *Wheel*.

Having first found out the number of Turns which the *Crown-wheel* hath in one turn of the *Wheel* you seek for (by the Direction given under the Word *Turn*) and then those turns of the *Crown-wheel* multiply'd by its Notches, will give you half the number of *Beats* in that one turn of the *Wheel*: because the *Ballance* or *Swing* hath two Strokes to every Tooth of the *Crown-wheel*: For each of the two *Pallets* hath its Blow against each Tooth of the *Crown-wheel*: Wherefore it is, that a Pendulum that strikes Seconds, hath its *Crown-wheel* only 30 Teeth. To explain what hath been said, take this Example (being the Numbers of a Sixteen

Hour Watch) wherein the Pinion of
 4) 32 (8 Report is 4, the *Dial-wheel* 32, the
 Great-wheel 55, the Pinion of the
 5) 55 (11. *Second-wheel* 5, &c. The Number
 5) 45 (9. of Notches in the *Crown-wheel* 17,
 5) 40 (8. being multiplied into 6336 (the Product arising from the continual Multiplication of the Quotients 8, 11, 9, 8) gives 107712 for half the number of *Beats* in one turn of the *Dial-wheel*; for 8 times 17 is 136, which is half the number of *Beats* in one turn of the *Centrate-wheel* 40; and 9 times 136 is 1224, the half *Beats* in one turn of the *Second-wheel*; and 11 times 1224 is 13464, the half *Beats* in one turn of the *Great-wheel* 55; and 8 times 13464 makes 107712, before found. Which, if multiplied by the two *Pallets*, that is, double it, it gives 215424, which is the number of *Beats* in one turn of the *Dial-wheel*, or 12 Hours. If you would know how many *Beats* this Watch hath in an Hour, 'tis but dividing the *Beats* of 12 Hours into 12 Parts, and it gives 17952, the Train of the Watch, or *Beats* in an Hour. If this be divided into 60 Parts, it gives 299, and a little more, for the *Beats* in a Minute. And so you may proceed to Seconds and Thirds if you will.

By the *Beats* and Turns of the *Fusy*, the Hours that any Watch will go, may be found thus;

As the *Beats* of the Ballance in one Hour: Are to the *Beats* in one Turn of the *Fusy*: So is the number of the Turns of the *Fusy*: To the continuance of the Watches going:

Thus, 20196 : 26928 :: 12 : 16.

To find the *Beats* of the Ballance in an Hour; the Proportion is,

As the Hours of the Watches going: To the number of Turns of the *Fusy*: So are the *Beats* in one Turn of the *Fusy*: To the *Beats* in an Hour:

Thus, 16 : 12 :: 26928 : 20196.

To find the *Beats* of a Ballance in one Turn of the *Fusy*; you have this Proportion;

As the number of the Turns of the *Fusy*: Is to the continuance of the Watches going in Hours: So are the *Beats* in one Hour: To the *Beats* of the Ballance in one Turn of the *Fusy*:

That is, 12 : 16 :: 20196 : 26928.

BECHICKS, are Medicines good against a Cough. They are called also *Herbical Medicines*, *Blanchard*.

BED, of the Carriage of a Great Gun, is that thick Plank which lies immediately under the Piece, being as it were the Body of the Carriage.

BELANDRE, is a sort of little Vessel with Sails and Tackle like an Hoy, but Broader and Flatter: The covering of the Deck is raised up half a Foot higher than the Gunwale, Gunnel, or *Plat-board*, as the *French* call it, and between the Gunnel and the Deck there is a Passage left free, for the Seamen to walk upon: They are chiefly used to carry Merchant's Goods, and are seldom above 24 Tun.

Some will have them called *Pylanders*, because they seldom go out of sight but Sail by the Land.

BELAY, aboard a Ship, signifies the same as *Eastern*: Thus they say *belay the Sheat*, or *Tack*, that is, *fasten it to the Kennel*, &c.

BELENOIDES, is the process or shooting forth of the Bone called *Aliformis*, which is fixed in the Basis of the Skull. *Blanchard*.

BELLANDER: See *Belandre*.

BEND; at Sea they say *Bend the Cable*, when 'tis to be seized and made fast to the Ring of the Anchor; and to *Bend two Cables*, is all one with them as to tie them together. To *unbend the Cable* is to loosen it from the Ring of the Anchor, which is done when a Ship designs to be long at Sea. To *bend a Main-Sail*, is to make it fast to the Yard in its proper place.

BEND, one of the eight Honourable Ordinaries in Heraldry, containing a 5th when uncharged, but when charged a 3d. part of the Escutcheon. It's made by 2 Lines drawn thwartways from the *Dexter Chief* to the *Sinister Base Point*; thus. He beareth Or, a *Bend Sable*.

A *Bend* is subdivided into a

BENLET, which is the 6th part of the *Shield*; a *Garret*, which is the Moiety of a *Bend*; a *Cot*, which is the 4th part of a *Bend*; and a *Ribbon*, which is the Moiety of a *Cot*.

There is also a *Bend Sinister*, which is drawn from the *Sinister chief Point* to the *Dexter base*, and this is subdivided into the *Serape* or *Scarp*, and the *Batoone*, which latter is the 4th part of the *Bend*.

This *Batoone* is the most usual Mark of Illegitimacy, but then it never extends it self quite athwart the *Shield*, but is cut off a little at each End.

When 2 straight Lines drawn within the *Bend* run nearly parallel to the outward Edges of it, that is called *Voiding*, and he that bears it is said to bear a *Bend voided* thus

He beareth *Ermine*, a *Bend voided Gules*.

BENDY, the Term in Blazonary for an Escutcheon being divided *Bendways* into an even Number of Partitions; but if they are odd the Field must first be named, and then the Number of the *Bends*.

BENIGN Diseases, are those which are not attended with *Anomalous*, and extremely Violent Symptoms.

BERME, in Fortification, is a little Space of Ground three, four, or five Foot wide, left without, between the Foot of the *Rampart* and the side of the *Moat*, to receive the Earth that rolls down from thence, and to prevent its falling into the *Moat*. Sometimes for more Security the *Berme* is *Palisaded*.

BERTYING a *Ship*, by some is meant the raising of the Ship's Sides.

BESAIL (in Law) is a Writ that lies for the Heir, where his Great Grand-father was seized the Day that he died, or died seized of Land in Fee-simple, and a Stranger enters the Day of the Death of the Great Grand-father, or abates after his Death, his Heir shall have a Writ against such a Disseisor or Abater.

BEVEL, an Instrument well known to Builders, Carpenters, and Bricklayers, and used adjusting of Angles.

BEVILLE, a Term in Heraldry, signifying Broken, or opening like a Carpenter's Rule. Thus he beareth *Argent a chief Beville vert*, by the Name of *Beverlis*.

BEWPLEADER, is a Writ that lies where the Sheriff, or other Bailiff in his Court will take a Fine of the Party, Plaintiff or Defendant, to the end that he shall not plead fairly, &c.

BEZANTS or *Besants*, a Term in Heraldry for Round Plates of Gold without any Stamp, which are born frequently in Coats of Arms: *Guillim* says, a *Besant* or *Besant* is taken for a Massy-Plate of Gold of 101 lb. and 2 Ounces weight; tho' some think they were smaller Pieces stamp'd at *Bizantium* or *Constantinople*; whence the Name.

BEZOAR *Animale*, according to some, is the Liver and Heart of Vipers dried and powdered.

BEZOAR *Minerale*, is an Evaporation of the Solution of Butter of Antimony in Spirit of Nitre, till a white Mass remain at the bottom: On this new Spirit of Nitre is poured, and the Liquor evaporated again; and this is a third time repeated; then the Matter is Calcin'd for about half an Hour, which will turn it into a white Powder fit for use.

Mr. Poyle calls it *Bezoardicum Minerale*.

BEZOARDICUM or *Bezoarick Remedies*, or *Cordial*, are such as are endued with a Vertue to resist and expel Poison and Malignity.

BEZOARDICUM *Joviale*, is a *Regule* made by melting 3 Ounces of *Regule* of Antimony with 2 Ounces of *Block-Tin*, which being powdered is mixed with 6 Ounces of *Sublimate Corrosive*, and then is distilled off in a kind of Butter; which Butter is afterwards dissolved in Spirit of Nitre (of thrice its weight) and then the Solution is distilled three times. The *Bezoar* will remain at the bottom; which must be powdered and washed, and then mingled with Spirit of Wine, and digested till it grow insipid.

BEZOARDICUM *Lunale*, is made by mixing 8 Ounces of Rectify'd Butter of Antimony, with an Ounce of fine Silver, and then dissolved in Spirit of Nitre, which must be poured on gently fresh and fresh till all the Ebullitions are over, then the Spirit is drawn off from the Matter with a gentle Heat (with three Rectifications) and then the *Bezoar* is managed like the *Jovial Bezoar*: Which see.

BEZOARDICUM *Martiale*, is a Dissolution of *Crocus Martis* made by Reverberation (or at least as much of it as can be effected) in Butter of Antimony; and then Spirit of Nitre is poured on it, and they proceed as in the other *Bezoardick Preparations*.

BIBITORY *Muscle*, is by some said to be that *Muscle* that draws down the Eye towards the Cup when we drink.

BICEPS,

BICEPS, is a Muscle of the Cubit, so called because it hath two Heads or Beginnings ; the first, or outmost, arises with a long round Tendon from the upper part of the Brink of the *Acetabulum Scapulae*, and runs under the Ligament of the Articulation in a *Sulcus* or Channel on the Head of the Shoulder-bone, where it is inclosed by a proper Ligament. In its descent it begins to grow fleshy as it marcheth under the Termination of the Pectoral Muscle, where dilating it self into a large fleshy Body, in-joyns with its other Head or Beginning. The latter ariseth with a somewhat board, flat and long Tendon at the extremity of the *Processus Caracoides Scapulae* ; in its descent it strictly adheres to the *Coracobrachialis*, (wherefore some Authors not rightly describing that Muscle amongst those of the Arm, have mistaken it for a fleshy beginning of this.) But then parting from it, both these Heads compose a large fleshy Belly, which becoming Tendinous near the *Cubiti*, is commonly said to be inferted by a strong round Tendon to the Tubercle at the upper Head of the *Radius*. But we (says *Couper*) have observed this Tendon to be double, the External of which being thin, passeth obliquely over the *Musculus Pronator Radii Teres*, and Membrane-like expanding it self, joins with the *Membrana Communis Musculorum*, which embraceth all the External Muscles of the *Carpus* and Fingers : when this Muscle asteth the *Cubiti* is bended.

BICEPS, a Muscle of the Leg, called sometimes *Biceps Femoris*, to distinguish it from the *Biceps Cubiti*. It hath two Heads, the superior and longest of which ariseth with a round Tendon from the Protuberance of the *Ischium* ; in its descent it becomes large and fleshy, and in above half its Progress lessens it self again, where it is joined with its other Head, having a broad, partly Tendinous and partly Fleshy beginning from the *Linea Aspera* of the *Os Femoris*, immediately below the Termination of the *Gluteus Maximus* ; it being thus united, grows Tendinous, as it marcheth in a Channel on the External *Appendix* of the *Os Femoris*, becoming perfectly Tendinous at its Implantation to the Superior *Epiphysis* of the *Fibula*. Its use is to help bend the *Tibia* ; it is likewise employed in turning the Leg, together with the Foot and Toes, outwards, when we sit with the Knees bended.

BIGAMY, signifies, either, as formerly, those that were married more than once, which was then an Impediment that hindered a Man from being a Clerk ; or as used in Common-Law, to have more than one Wife at the same time.

BIGHT or *Bite*, is any turn or part of a Rope that lies compassing ; and therefore when they cannot take the End of a Rope in Hand, the Seamen say, give me a *Bite*.

BILANCHIS *Deferendus*, is a Writ directed to a Corporation, for the carrying of Weights to such a Haven, there to weigh the Wools that such a Man is Licensed to Transport.

BILANDER, see *Belandre*.

BILDGE, of a Ship, is the Bottom of her Floor, *Bildge Water* therefore is that which by reason of the Flatness of a Ship's Bottom lies on her Floor, and cannot go to the Well of the Pump ; and consequently the *Dutch*, whose Ships are often of this Form, do much use a sort of Pumps called *Bildge Pumps*, or as we call them *Burr-Pumps*, to carry off this *Bildge Water* : Also when a Ship strikes on a Rock, they say, *She is Bildged*. And *Billage*

is the Breadth of her Floor when she lies aground.

BILE, or the *Gall*, is a Liquor partly Sulphureous, and partly Saline, which is separated from the Blood of Animals in the Liver ; for the receiving and evacuating of which there have been reckoned only two Vessels or Passages, that is, the *Gall-bladder* and the *Porus Biliaris*. By this latter there flows a thicker but milder ; by the former a thinner, and more Acrimonious and Fermentative Choler into the Intestine. But besides these, there have been lately found out a Third, which we shall describe by and by.

The *Gall-bladder*, called in Greek *κυστις χοληδον*, in Latin *Vesica biliaria*, or *Folliculus fellis*, is a hollow Bag placed in the under or hollow Side of the Liver, and in Figure representeth a Pear. It is about two Inches in length, and one in breadth, where broadest.

By its upper Part it adheres to the Liver, which doth afford it a Hollowness to lodge in ; but the lower Part, which hangeth without the Liver, resteth upon the Right Side of the Stomach and the Colon, and doth often dye them both Yellow.

It hath three *Membranes*, one *Common*, which is thin and outmost. This springing from the Membrane of the Liver, only covereth that Part which hangeth without the Liver. The two other Membranes are *proper*. The middle is thick and strong, and muscular, and hath three Ranks of *Fibres* ; the outmost are transverse, the middle oblique, and the innermost straight. But some will allow only two Ranks, *viz.* the Straight, which run lengthways of it, and are outer ; and the Transverse or Annular, which are the inner.

The inmost Coat is Nervous, or Tendinous as it were ; and to the inside of this there adhereth a kind of Glandulous Coat. The Glands herein do separate from the Arteries a kind of Mucous Humour, which serves to defend the *Vesica* from being irritated by the Acrimony of the Choler contained in it.

Besides these two *proper* ones, *Verbeey* affirms there is a Third, betwixt that I called *common*, and the middle, and says, it is so evident, that he wonders this quick-sighted Age has not yet discover'd it. It is interwoven with whitish *Fibres* drawn diversely and irregularly, and has abundance of Nerves and Sanguiferous Vessels running thro' it, whose chief Branches run mostly from its Neck towards its Bottom ; and upon this Account this Coat may be termed *Vascular*. In fat People it contains much Fat, and with a little Labour is separated into divers Flakes (or Plates.)

It hath two *Parts*, the *Bottom* and the *Neck*.

The *Bottom* is its larger or wider Part that contains the Choler, and is of the same Colour with the Bile that is in it ; whence it commonly looks Yellow, but sometimes Greenish, Blackish, &c.

The *Neck* (otherwise called *Meatus Cysticus*) is its narrower Part, being but about as wide as a Goose-quill, and about two Inches long. Betwixt this and the *Vesica* there is a certain Fibrous Ring, which much straitens the Passage, and so hinders the two hasty Repletion of the *Vesica*. The other End of the Neck is joined to the *Porus Biliaris*, and they both make the *Ductus Communis* or common Passage of the Choler, which is inserted into the Beginning of the *Jejunum*, or the End of the *Duodenum*. *Peucernus* has observed, that in many

ny Birds, and some Fishes, this *Meatus* does not join the *Porus bilarius*, but is inserted separately into the Guts.

The Ancients (whose Opinion is of late stiffly defended by Dr. Cole) thought that the Choler in the Gall-bladder was received in by its Neck from the *Porus bilarius*, and that it passed out into the common Duct the same way. And to obviate the Objection, that there uses not to be a Reciproca-tion of Humours in the same Vessel (at the same time especially.) Dr. Cole supposes, that the Gall passes out of the Gall-bladder only in the time of the distribution of the Chyle, but at all other times it is received into it from the *Porus*, and is stored up in it against the next Occasion. But not to enter into this Dispute, I think Dr. Glisson's Account of it the more probable, which is this: The ordinary way of filling the Gall-bladder, is by its Fi-brous Roots that are dispersed thro' the Liver. The whole Trunk of these Roots enters that Part of the Bladder where 'tis strained by a Fibrous Ring. This Trunk indeed hardly equals the Hun-dredth Part of the Roots of the *Porus bilarius*; yet it distributes some Twigs and Capillary Vessels in-to the hollow Side of the Liver. But if you open the Gall-bladder with a Design to understand the Manner of the Insertion of this Trunk into it, truly you will not easily find it. For tho' this Duct do penetrate the said Bladder, and the Hu-mour contained in it be discharged thereinto; yet there is hardly any Print or Sign of this Hole in the Inside of the Bladder: Which ought not to seem hard to be believed by any one, if he re-member the Insertion of the Ureters into the *Vesica*; for tho' these do far exceed this Trunk in Width, yet one can hardly find their Insertion if he cut open the Bladder and look for it. The best way (that I could yet find) to discover the Inser-tion of this Trunk (if you will open the Gall-bladder, and search for its Entrance into it) is thus; look carefully for a certain little and spongy Pro-tuberance near the Orifice of the Bladder hard by the *Meatus Cysticus*; for the aforesaid Trunk, I think, is pretty plainly inserted into that Pro-tuberance.

This Protuberance is called a Valve by *Spigelius*.

Besides this Mr. Perault has found out another new Conduit for the Bile, which he calls *Ductus cyst-hepaticus*, because it is common both to the *Vesicula* and the *Porus Hepaticus* (or *Bilarius*.) This Duct has three Roots, which being subdivided into numerous Twigs, are dispersed thro' the Pa-renchyma of the Liver, amongst the Branches of the *Vena Cava* and *Porta*: These Roots grow into one Trunk, which creeping along the Surface of the hollow Side of the Liver, has a double Im-plantation; one into the *Porus Bilarius*, two Inches and an half before the said *Porus*'s, uniting with the *Meatus Cysticus*; and another into the middle of the *Vesica* (on that Side of it which adheres to the Liver) with a Valve. This Valve seems to be formed of the inner Membrane of the *Vesica*, and also a proper one, and may be said to be a kind of middle Valve, between the Nature of the *Sig-moides* and *Triglochin* (or *Triscapus*) of the *Vena Ar-teriosa* and *Arteria Venosa* in the Heart. Betwixt its Insertion into the *Porus Bilarius*, and this into the *Vesica*, there is about six Inches length. It contains a thinner Choler in it than the *Porus Bi-larius*.

Jo. Alph. Borallius (Professor of the Mathema-ticks at Naples) from the continual and speedy Ef-flux of the Bile by the *Ductus Communis* into the *Duodenum*, believes, that there is a particular Cir-culation of it: For he affirms, That in a Day's time, from a Person fasting, there pass thirty four Pound of Bilious Juice into the *Duodenum* by the common Duct, whereas the whole Mass of Gall is not two Pound: Whence he concludes, that so great a quantity of Gall cannot be produced in the Liver by way of Fermentation, but that it is separated Mechanically, without the help of any Ferment, only by *Cibration*, from the Minute Ves-sels of the *Porta* thro' the Pores of the Glandules of the Liver, as the Urine is separated in the Kid-neys; so he infers, that there is a particular Cir-culation of the *Bilis* thro' the *Abdomen*, performed by the *Vene Mesurice* into the Trunk of the *Porta*, thence to the Liver, thence thro' the Bilious Ves-sels into the *Duodenum*, to return again by the Me-sarack Veins. He that would enquire more into this Novel, and (to me) improbable Opinion, may consult his *Opus Posthumum (pars altera) de mo-tu Animalium*.

It has been taught by several Anatomists, That its Neck or *Meatus* has sometimes two, sometimes three *Valves*, to hinder the Recourse of the Cho-ler; but *Diemerbroeck* professes he could never find any, but only that the Egress of the *Vesica* was very strait, and its Neck wrinkled. Dr. Glisson de-clares also, That he has open'd very many Vessels of this kind, and never yet saw a Valve in any of them: But he thinks that the Fibrous Ring (a-bove-mention'd) did impose upon those who have thought there was a Valve. Besides, upon tryal he has often found, that the Bile by a light Com-pression of the Fingers, has fluctuated to and a-gain out of the *Cystis* into the *Meatus*, and on the contrary; as also out of the *Meatus* into the *Du-ctus Communis* and back again: Which certainly could not be, if there were any Valve in the way, for that would hinder the one or other of these Motions.

The *Vesica Fellea* hath two Veins called *Cystica Gemellæ*, which spring from the *Porta*. It hath Twigs of Arteries proceeding from the right Branch of the *Cœliaca*; and it hath a small thread-like Sprig of a Nerve from the Mesenterical Branch of the *Intercostal*.

Many times Stones are found in it, which are lighter and more spongy than those of the Uri-nary Bladder, and will swim above Water, which these latter will not do.

The other Passage which carrieth the thicker sort of Choler, is called *Porus Bilarius*, or *Meatus Hepaticus*, because it passes directly from the Liver to the *Ductus Communis*.

Within the Liver, its Trunk and Branches are invested with a double Coat; its proper one which it retains without the Liver also, and another that is common to it with the *Porta*, called *Capsula Com-munis*, which it has from the Membrane of the Liver. In this common Coat this *Porus* and the *Porta* are so closely enwrapped, that you would take them but for one Vessel, till you hold it ei-ther up to the Light (which will discover Vessels of two Colours in it) or very dexterously rip up the *Capsula*, and so lay them open. Its Roots within the Liver are equally divided with those of the *Porta* every where, saving that little Space where the Roots of the *Vesica* are spread in the

Sinuus

Sinuous and Right-side of the Liver. So that having spoken above of the Divisions of the Roots of the *Porta*, I shall only observe, that they are far larger and more numerous than those of the *Vesica*, drawing Choler from all the Parts of the Liver (saying whither the Roots of the Bladder reach) and that more thick and viscous, yet less Acrimonious.

This *Porus* seems to be a more necessary Part than the *Vesica*; for many Creatures, as Harts, Fallow Deer, the Sea-Calf, &c. and those which have a whole Hoof, as an Horse, &c. have no Gall-Bladder, but there is none that is destitute of this.

Without the Liver it is as wide again as the *Meatus Cysticus*, with which it is joined at two Inches distance from the Liver, and both make the *Ductus Communis Choleodochus*.

It has no *Valve* in its whole Progress; only the *Ductus Communis*, where it enters the Intestine, having pierc'd the outer Coat, passes betwixt that and the Middlemost about the twelfth Part of an Inch, and at last opens with a round Mouth into the Intestine. So that this oblique Insertion (as that of Ureter into the Urinary Bladder) serves instead of a *Valve* to hinder any thing from regurgitating out out of the Gut into this Duct, especially the inmost Tunicle of the Intestine hanging so flabby before its Mouth, that when any thing would enter in, it claps close upon it and stops it.

As to any *Angustomies* of the Roots of any of these Biliary Vessels, with those of the *Vena Porta*, such indeed have been much talk'd of, but without truth, for their extreme Twigs or Capillaries terminate in the *Parenchyma* of the Liver, out of whose Grape-stone-like Glandules they imbibe the Choler there separated from the Blood; as is the Case of the Capillaries of the *Cava*, for they receive the Blood it self imported by the *Porta*, in like manner, without any Inosculation.

The Use of all these *Vessels* may sufficiently be learned by what has already been said of them; though some are of Opinion, that not only Choler, but other superfluous Humours are evacuated by them, especially upon taking a Purge.

The Ancients lookt upon the *Bile* as a meer Excrement, or at least, to be of no other use than by its Acrimony to promote the Excretion of the Guts: Which Opinion continued as long as the Liver was thought to be the *Vas Sanguificans*. But when once that *Viscus* was discovered to have scarce any other Office, then to separate the Choler from the Blood, it hath seem'd unreasonable to suppose so large a Bowel was made only for the separation of a meer Excrement; and therefore its now generally believed, that the *Bile* is the proper Ferment for both the Chole and the Blood. A very good Account of the manner of which *Dionbroeck* gives us, as follows: The Blood flowing into the Liver by the *Porta*, out of the Gaffrick and Melarick Veins (and, it may be, a little by the Hepatick Artery) is mixed with an Acrimonious, Saltsiff, and Subacid Juice (made in the Spleen, of the Arterious Blood flowing thither by the Arteries, and of the Animal Spirits by the Nerves) which is brought into the *Porta* by the *Ramus Splenicus*. Now both these being entred the Liver by the Branches of the *Porta*, by means of this said Acrimonious and Acid Juice, and the Specifick Vertue or Coction of the Liver, the Spirituous Particles, both Sulphureous and Salt, lying

hid in the said Viscous Blood, are dissolved, attenuated, and become also a little Acrimonious and Fermenting; a certain thinest part whereof like most clear Water, being separated from the thicker Mafs of Blood, by means of the conglomerated Glands placed mostly in the hollow Side of the Liver, is carrid from thence by many Lympheducts, as has been said. But the Fermentaceous Spirits of greater Acrimony, mixed with the thicker and more viscid sulphureous Juices (for Sulphur is viscid) and more strongly boiled, when as through the Clamminess of the Juices in which they inhere, they cannot enter the conglobated Glands, nor from them the Lympheducts, and yet through their fierce Ebullition are separated from the Blood (as Yest from Beer) these Fermentaceous Spirits, I say, being sever'd with the Juice in which they inhere, become bitter, and are called *Bile*; which *Bile* being transcolated through the Grape-stone like Glandules in the Roots of the *Porus Biliaris*, and of the Gall-bladder, passes through them by the *Ductus Communis* into the *Duodenum* or *Jejunum*, where it is presently mixed with the Pancreatick Juice, and both of them with the Alimentary Mafs, concocted in the Stomach, and now passing down this way, which it causes to ferment. And because at its first Entrance it is more Acrimonious, and has its Vertue entire, and so causes the greatest Ebullition with the Pancreatick Juice; hence the Milky Juice contained in the Mafs concocted in the Stomach is more readily, and in greatest quantity separated in the *Jejunum*, and by innumerable Lacteal Vessels (which are more numerous in this than the other Guts) it is more quickly driven on towards the *Receptaculum Chyli*, and this is the Reason that this Gut is always so empty. But in the following Guts, because the Fermentaceous Spirits are a little pall'd, the Effervescency becomes slower and less efficacious, and the Chyle is more slowly separated from the thicker Mafs, and therefore they have fewer *Vena Lactea*. At length what remains of this fermenting Matter, is mixed with the thicker *Feces* in the great Guts, where by its Acrimony it irritates them to Excretion.

BILINGUIS (in Law) is that Jury which passes between an *Englishman* and an *Alien*; whereof part ought to be *Englishtmen*, and part *Strangers*; this is vulgarly called *Party-Jury*.

BILL, is all one with an *Obligation*, only when it is in English it is commonly called a *Bill*, in Latin an *Obligation*. Or a *Bill* is a single Bond without a Condition; and *Obligation* is a Bond with a Penalty and Condition. Also a Declaration in Writing, that expresses the Grievance and Wrong which the Complainant has suffered by the Party complained of; or else some Fault committed by him against some Law or Statute of the Realm.

BILL of Store, is a kind of Licence granted at the Custom-house to Merchants, to carry such Stores and Provisions as are necessary for their Voyages Custom-free.

BILL of Surreance, is a Licence granted at the Custom-house to a Merchant, to suffer him to Trade from one *English* Port to another, without paying Custom.

BILLA VERA (a Law Term) signifying the Indorment of the Grand Inquest upon any Presentment or Indictment which they find to be probably true.

BILLET, a Bearing very common in Heraldry of this Form. *Argent Billette* a Cross engrailed Gules, by the Name of Heath. 'Tis called here *Billette*, because the Billets are supposed to be all over the Field, but sometimes they are not above six, &c. and then they are numbered. *Gullim* faith, it represents a Letter folded up, and not a Billet of Wood. *Bloom* faith Billets must be numbered, if not above 10.

BIMEDIAL, a Term in Mathematicks, if two *Medial Lines*, as *AB* and *BC* commensurable only
 $A | \text{---} B \quad C | \text{---}$
 in Power, containing a Rational Rectangle, are compounded, the whole *AC* shall be irrational, and is called a *first Bimedial Line*, 38. e. 10. *Eucl.*

BINOCLE, is a kind of Dioptrick Telescope fitted so with two Tubes joining together in one, as that you may see a distant Object with both Eyes together.

BINOMIAL ROOT, in Mathematicks, is a Root composed of two Parts or Members, and no more, connected together by the Sign $+$: Thus $a + e$, or $5 + 3$ is a *Binomial Root*, consisting of the Sum of those two Quantities; If it have three Parts, as $a + b + c$, 'tis called a *Trinomial*, &c. if it have four Members, 'tis called a *Quadrinomial*, &c.

BIOLYCHNIUM, is what some call the *Vital Flame*, or Life of Animals. See *Flamma Vitalis*.

BIOVAC, in War, is a Guard at Night performed by the whole Army; which either at a Siege or lying before an Enemy, every Evening draws out from its Tents or Huts, and continues all Night in Arms before its Lines or Camp to prevent any Surprise. When the Troops are much harassed, or there is no great dread of the Enemy, the *Biovac* is allowed to be sufficient if the two Front Ranks by turns stand under Arms, while the Rear Ranks rest on the Ground. To raise the *Biovac*, is to return the Army to their Tents or Huts at break of Day.

BIPARTITION, the same with *Bissection*, or dividing a thing into two equal Parts.

BIQUINTILE, an Aspect of the Planets, when they are 144 Degrees distant from each other.

BIRTH or *Birthing*; the Seamen call a due or proper distance observed between Ships lying at an Anchor or under Sail a *Birth*; and so also they do the raising or bringing up the Sides of a Ship. Also the proper Place aboard for a Mess to put their Chests, &c. is called the Birth of that Mess. Also a convenient Place to Moor a Ship in, is called a *Birth*.

BISUTH, or *Tin Glass*, by the Ancients was thought to be a natural Marcasite or Mineral; but *Lemmy* faith, 'tis a kind of *Regulus* or Tin, and assures us, that good Bismuth may be made with *Tin*, *Tartar* and *Salt Peter*; and some mix *Arsenick* also with it, for which Reason it ought not to be taken inwardly. Its Flowers and Magistery are used as Cosmetics; and the *Pewterers* also do use Bismuth to render their Work more Beautiful, and to make the Metal ring the better.

BISSECTION, a Term in Geometry, signifying the Division of any Quantity into two equal Parts or Halves; the same with *Bi-partition*: Thus

to bisect any Line, is to divide it into two equal Parts.

BISSEXTILE, the same in *Chronology* as our Leap-Year; and the Reason of the Name is because in every 4th Year they accounted the 6th Day of the Kalends of March twice; for once in four Years, the odd Hours (above 365 Days) made up just an whole Day, which was inserted into the *Calendar* next after the 24th of February.

BITE, in the Sea-Phrase, is the compassing or bringing about of a Rope or Cable; the Seamen call holding by that Part of a Rope which is quilled or rowled up, *holding by the Bite*.

BITTACLE, is a Fram of Timber standing in the Steerage of a Ship just before him that Steereth, and in it is placed the *Compass*, by which the Ship is kept in her Course, and finds her way.

BITTER, any Turn of a Cable about the Bitts is called a *Bitter*; and 'tis used that the Cable may be let out by little and little. And when a Ship is so stop'd by a Cable, they say she is *brought up to a Bitter*. Also that End of the Cable which is used to be wound or belayed about the Bitts, they call the *Bitter End of the Cable*.

BITTS (aboard a Ship) are two great Pieces of Timber, on, or through whom goeth the *Cross Piece*, placed usually abaft the *Manger* in the *Loof* of the Ship, to *belay* (or fasten) the Cable thereto when she is at Anchor: Their lower Ends are fastened into the *Riders*; and in great Ships their middle Parts are bolted to two great Beams cross the *Bows*; and yet in great Storms they are fain to fasten the Cable to the Main Mast, to strengthen the Bitts, and to secure the Bows, which are sometimes else torn from the Ships.

There are *Fore Top-sail Shear Bitts*, whose use is to *belay* or fasten the *Fore Top-sail Sheats*.

And there are also the *Fore-jeer Bitts*, which serve to *belay* or fasten the *Fore-jeer*.

BIVALVE, is a Word used by the Writers of Natural History for both such Shell-Fishes as have two Shells, as Cockles, Muscles, Oysters, &c. which are said to be of the *Bivalve* kind; and also for the *Siliqua* or Seed-Pods of such Plants as open all their whole Length to discharge their Seeds, such as Beans, Pease, &c. for those the Botanists say have a *Bivalve Siliqua*.

BIVENTER: See *Digastricus*.

BLACKMAIL, signifies a certain Sum of Money, (or rather only of) Corn, Cattel, &c. given by the Poor People in the North of England, to the most powerful Persons in those Parts, or in the Hundreds, for a Protection against Thieves and Robbers.

BLAKNESS, the Colour so called, seems to arise from such a peculiar Texture and Scituation of the Superficial Parts of any black Body, that it doth as it were dead the Light falling upon it, and reflect none, or very little of it, outwards to the Eye. See *Colour*, and Vol. II.

BLACK-ROD, is the *Huisfier* or Usher belonging to the most Noble Order of the Garter; so called from his *Black-Rod* which he carries in his Hand: He is also of the King's Chamber, and Usher of the Lord's House in Parliament.

BLADDER, see *Vesica*.

BLASS, a Word used by *Van Helmont*, as *Blanchard* faith, to signify the Motion of the Stars, &c.

BLAZONING, in Heraldry, is displaying or expressing the Parts of a Coat of Arms in their proper

proper Colours and Metals; for to lay Colour on Colour, or Metal on Metal is false Heraldry.

In Blazoning a Coat of Arms, you must always begin with the Field, and then next proceed to the Charge; and if there are many things born in the Field, you must name first that which is immediately lying upon the Field. Your Words must be very short, and truly proper and expressive, without any Expletives, needless Particles, or Repetitions. In the Blazon of a Coat of Arms, such Terms for the Colours must be used as are agreeable to the Station and Quality of the Bearer: All Persons beneath the Degree of a Noble, must have their Coats blazoned by Colours and Metals; Noblemen by precious Stones; and Kings and Princes by Planets.

BLENCH, (in Law) is the Title of a kind of Tenure of Land; as to hold Land in *Blench*, is by Payment of a Sugar-Loaf, a Bever Hat, a couple of Capons, and such like; if it be demanded in the Name of *Blench*, i. e. *nomine Alba firmæ*. See *Alba firma*.

BLINDS, in Fortification, are certain Pieces of Wood, Branches of Trees laid across from one Side of the Trench to the other, to sustain the *Bavins* or Hurdles laden with Earth; and serve to cover the Pioneers from above, and are commonly used when the Works are carried on towards the *Glacis*, and when the Trench is extended in Front toward the Place.

BLISTERING Plasters, see *Vesicatoria*.

BLOCKADE, in the Art Military, is the encompassing any Town or Place so all round with Armed Troops, that 'tis impossible any kind of Supplies can be brought to it, and so it must be starved or surrender; but there is no Design of taking it by Attack, &c. And when any Place is in this Condition, 'tis said to be *Blocked*.

BLOCKADING, is when the Besiegers take Care to stop all Ways and Passages, and all Intelligence that may be sent into or out of the Town or Fort that is block'd up, but the Place is not regularly besieged, nor attack'd in Form.

BLOCKS, are the Pieces of Wood aboard a Ship in which the Shivers are placed, and wherein go the running Ropes. Of these Blocks some are single, some double, and some have 3, 4 or 5 Shivers in them. They are distinguished and named by the Ropes they carry, and the Uses they serve for. When in the Haling of any Tackle or Halliard to which there do belong two Blocks, they happen to meet, then they cry *Block and Block*.

BLOOD: In *Phil. Transact.* N. 191, is an Estimate of the Quantity of the Blood in a Human Body, and of the Celerity of its Motion by Dr. *Allen Moulin*.

Dr. *Lower* was probably mistaken when he computed the Quantity of Blood in an Ordinary Man to be about 20 Pounds; and the Computation of Dr. *Moulin*, That the Blood is about $\frac{1}{3}$ of the Weight of the whole Animal, seems much rather to the Truth; for then an ordinary Man may be supposed to have about 8 or 10 Pounds of Blood in him.

Of the Circulation of the Blood, Dr. *Gilson* gives this Account.

Seeing by a continual Reciprocation of the Pulse there is a constant Expulsion of Blood from the Heart into the Arteries, and as continual an Influx of Blood into it out of the *Cava*; and seeing the *Cava* from whence the Supply is, is never dry;

nor, on the other Hand, the Arteries that receive the Blood continually from the Heart, unduly swell'd with it; it necessarily follows, that this Motion proceeds circularly, viz. that the Blood is continually driven out of the Heart into the Arteries out of these into the Parts to be nourished; from whence it is resorbed by the Capillary Veins, which conduct it back through the larger into the *Cava*, and so at length it returns to the Heart again. The Invention of which Circulation is owing to our Country-man Dr. *Harvey*, and may be proved undeniably by these Reasons.

1. From the great quantity of Blood that is driven out of the Heart into the Arteries at every Pulse. For though the Ancients who knew not this Circulation, imagined that only a drop or two was expelled by every *Systole*, which they were necessitated to suppose, to avoid the great Diffention that the Arteries must be liable to, if any considerable Quantity issued into them; yet it is certain and demonstrable, that there must needs an Ounce or more be driven into them each time. For (taking it for granted that there is no other way for any Liquor to pass from the Stomach to the Kidneys, but through the Heart along with the Blood) seeing, if some Men at some times drink three Pints of Drink, they shall piss it out again in half a Hour, yea more of *Tunbridge* Waters in that space; and seeing, secondly, that there is commonly as much Blood as Serum that flows to the Kidneys (the Blood returning back by the emulgent Veins) it is clear, that by the two Emulgent (which are none of the largest Arteries) there must pass in Half an Hour's time six Pound of Liquor, all which must come from the Heart; and how much more then may we conceive to be driven through all the other Arteries that run through the whole Body? This is more accurately evinced by Dr. *Lower's* Experiment, which is this: I cut asunder (says he) both the *Cervical* Arteries in a large Dog, and at the same time through an Hole made in the Left Side of his Breast over-against the Heart, I comprès'd the Trunk of the *Aorta* below the Heart, with my Finger, to hinder any Blood from descending by it; and lastly, I took Care also to straiten the *Brachial Arteries* under the *Axillæ*, by which Means almost all the Blood was driven out of the Heart through the *Cervicals*, (besides that which was sent into the *Vertebrales*) and which is wonderful to be related, within the 20th Part of an Hour the whole Mass issued out; so that it is not to be denied but that it all pass through the Heart in that space. And though it may be granted, that amidst such Wounds and Tortures the Heart does beat somewhat quicker than at other times; yet the same thing is partly evident from the Wounds in the Limbs when some notable Artery is cut asunder; for it is strange in how small a time a Man will bleed to death, even at that one Artery. Yea, we may give a great guess how much Blood is sent out at every Pulse, even from the ordinary opening of one Vein in the Arm, from whence a notable quantity of Blood will issue in a short time; how much may we then suppose will flow out of all the Veins, if they were opened at one time? Seeing then 'tis evident, that so great a quantity of Blood is expelled out of the Heart at every *Systole*, and that for all that the Arteries are not unduly distended, nor any Part swell'd by it neither, and yet the *Cava* and other Veins emptied, 'tis certain that the Blood that's driven

driven into the Arteries flows back to the Heart by the Veins in a constant Circulation.

2. A second Argument to prove it, may be taken from the Valves in the Veins, which are so framed that Blood may freely flow through them out of the lesser Veins into the greater (and so into the Cava) but not, on the contrary, out of the greater into the less. Yea, if one blow into the Cava through a Pipe, there will no Wind pass into the smaller Veins; but on the contrary, if you blow up the lesser Veins, the Wind will readily pass to the larger, and so to the Cava.

3. And lastly, the same thing is more clear by the Ligature in Blood-letting: For whether you let Blood in the Arm or Foot, you always tie the Fillet above where you intend to make the Orifice, and then the Vein below the Ligature will presently fill and grow tumid, but above it will fall and almost disappear. Which must needs be from hence, for that the Blood being driven along the Arteries towards the extrem Parts, returns by the Veins and ascends upwards, which coming to the Ligature, and being stop'd there, swells the Vein below the Ligature, and spurts out as soon as the Orifice is made; but when the Fillet is loosed again, the Blood flows no longer out thereat, but holds on its wonted Chanel in the Vein, and the Orifice closes up again.

Having sufficiently demonstrated the Circulation of the Blood, we will shew two things farther; *First*, How the Blood passes out of the Arteries into the Veins; and *Secondly*, in how long time the whole Mass of Blood may be supposed to pass through the Heart in its ordinary Circulation.

As to the *First*, it was the Opinions of *Riolanus*, That the Blood circulated only through the larger Vessels by Anastomosis or Inosculation of the Veins with the Arteries; and that that which run into the smaller, was all spent on the Nutrition of the Parts. But it is clear, that there must be a Circulation even in the smallest, from the great Quantity of Blood that will flow out of the least Artery in the Hand or Foot when it is cut, which is very absurd to imagine to be all spent on the Nourishment of the respective Part. Now there are but two Ways whereby the Blood can be supposed to pass out of the Arteries into the Veins, *viz.* either by the Former's being continued to or opening into the latter by Inosculation, or else by the Capillary Arteries letting out their Blood into the Pores of the Substance of the Parts, on whose Nutrition part is spent, and the remainder imbibed by the gaping Mouths of the Capillary Veins. That it is necessary to admit of this latter Way, is evident, because if part of the Arterial Blood did not issue into the Substance of the Parts, they could not be nourished by it; for while it is in the Vessels, it may and Warmth issued to the Parts through which it flows, but cannot nourish them, seeing even the Vessels themselves are not nourished by that Stream of Blood that glides along their Cavity, but by Capillaries running through their Coats; and if the Blood be driven into the Substance of the Parts, and that in a greater Quantity than suffices for their Nourishment (as was just now shewn that it is) what is superfluous must needs enter the Mouths of the Capillary Veins, from whence it goes forward to the larger, and so to the Heart: But seeing this way of transfusing the Blood thro' the Substance of the Parts, has seemed to some not to answer to that hasty Circulation of it we

have demonstrated; they have thought it necessary also to admit of the former way, namely, Anastomoses, by which the Veins are continued to the Arteries, and that not only in their larger Branches (as that notable one of the Splenick Artery with the Splenick Vein) but also in their smaller Twigs in the extrem Parts. But we must consider, that in a living Body the solid Parts are infinitely more porous and permeable than in a dead; so that tho' the Anatomists find their Substance so dense and close as to make it seem almost impossible they should permit so quick a Passage to the Blood through them; yet he should rather believe it, than suppose such Anastomoses as he cannot discover (though it were not difficult to find them out if they had any existence.) For abating that single one of the Splenick Artery with the *Ramus Splenicus* of the *Porta*, and perhaps some of the *Arteria* with the *Vena Pulmonarie* is the Lungs, none of the latest most accurate Anatomists have been able to find out any. And as for that mentioned, it seems rather to be of an Artery with an Artery (such as are frequent in several Parts of the Body, as are also of one Vein with another) than of an Artery with a Vein.

And *Secondly*, as to the Space of Time in which the whole Mass of Blood may ordinarily circulate through the Heart, it is probably much shorter than many have imagined; for supposing that the Heart makes two thousand Pulses an Hour (which is the least Number any speak of, and some have told twice as many) and that at every Pulse there is expelled an Ounce of Blood (which we may well suppose, seeing the Ventricles are wide enough to contain two Ounces, and that it is probable both that they are filled near full in the *Diastole*, and that they are near, if not quite emptied by the strong Constriction of the Heart in the *Systole*) seeing the whole Mass usually exceeds not four and twenty Pound, it will be circulated six or seven times over through the Heart in the space of an Hour. And by so much the oftner, by how much the Blood come short of the supposed Quantity, or the Pulse either naturally, or by a Fever, Spirituous Liquors, or violent Motion, is rendered more frequent; by which quick Motion the Blood itself is kept from Coagulation and Putrefaction, and the Parts are cherished with vital Heat, which Heat of the Parts is much according to the Slowness or Rapidity of the Circulation, So when we sit still, and the Pulse is slow or rare, we grow cold; but when upon running or any violent Exercise, the Pulse becomes more frequent and quick, we become hot.

As to the manner how Blood is made of Chyle, and of its Heat and Colour, and whether the Body be nourished by it, the aforesaid Dr. gives the following Account.

According to Dr. *Harvey's* Observations, there appears in an *Embryo* a *punctum saliens*, or red beating speck, which is Blood, before any the least Lineament of the Heart; so that whatever Instrument of Sanguification the Heart may appear to be afterwards, it, contribute nothing to the making of the first Blood; but it seems rather to be made for the Blood's sake, to transmit it to all the Parts of the *Embryo* or *Fetus*, then the Blood to be made by it. But it must be confessed, that things proceed in the grown *Fetus* far otherwise than they do in the first formation: For the Parts of an *Embryo* are nourished and increased before it hath a Stomach to concoct any thing, and yet in a perfect *Fetus*,
none

none can deny, that the Stomach does concoct and prepare Nourishment for it: So it moves before the Brain is formed to perfectly as to be able to elaborate Animal Spirits; and yet after it is perfected, every one knows that the Brain does elaborate such Spirits, as being sent into all the Parts of the Body by the Nerves, enables them to move. In like manner, though there be Blood in the Embryo before the Heart be formed, yet after it be perfected, nothing will hinder but it may at least contribute to Sanguination.

We will suppose then, that as all the other Parts are formed by the *Vita Plastica* or generative faculty of the (first) Vegetative and (then) Animal Soul, seated in the *Ovum*, and receive their first encrease by the Assimilation of the *Colligamentum*; but as soon as they are perfected, and the *Fetus* excluded, are nourished by the Blood; so the Blood it self as being at first made in like manner, as soon as the Veins, Heart and Arteries are completed so as it cannot circulate by them, may not improperly be said to be nourished by the Chyle or Nutritious Juice, the Heart assisting the Assimilation of the one into the other. And this is done in this manner: The Chyle ascending by the *Ductus Thoracicus*, and flowing into the Subclavian Vein together with the returning Venal Blood, is poured by the *Vena Cava* into the right Auricle, and so into the right Ventricle of the Heart in its *Diastole* or Relaxation; then by its *Systole* or Contraction it is driven out from thence into the Lungs, from whence it ascends again into the left Auricle first, and then into the left Ventricle of the Heart, out of which it is expelled through the *Aorta*, and passing along with the Blood through the Arteries of the whole Body, returns again with it by the Veins to the Heart. For it undergoes many Circulations before it can be assimilated to the Blood: Which is evident, both because it is the Chyle (but little altered) that is separated in the *Placenta Uteri* for the nourishment of the *Fetus*, and in the Breasts for the Infant to suck, in the form of milk; and also from hence, that if one be let Blood four or five Hours (or later) after a full Meal, there will a great quantity of the milky Chyle it self swim a top of the coagulated Blood. But every time the new infused Chyle passes through the Heart with the Blood, the Particles of the one or more intimately mixed with those of the other in its Ventricles, and the Vital Spirit and other active Principles of the Blood work upon the Chyle; which being full of Salt, Sulphur and Spirit, as soon as its *Compages* is loosened by its Fermentation with the Blood in the Ventricle of the Heart (especially, but also in the Arteries) the Principles having obtained the liberty of Motion do readily associate themselves, and are assimilated with such parts of the Blood as are of a like and suitable nature; so that at length all the Mass of Chyle that is capable of being turned into Blood is sanguified; and what is not, is evacuated by Urine or Stool, or other proper Emunctory.

It is a very difficult Question, by what means the Blood acquires its Heat: In order to the Resolution whereof, it will be necessary to consider how many ways a *Liquid Body* is capable of being heated, and those (according to Dr. Willis) are three: First, by setting it to something that is hot; so Water is made hot by being set on the Fire, or in the Sun, or a Stove, or by dissolving Lime in it. Secondly, When Saline Corrosives, which are of a contrary

nature, being mixt with one another, or with Sulphureous, act one upon another, and by the great struggling, and agitation of their Particles do often excite heat, yea sometime Smoke and Burning; as when Spirit and Butter of Antimony, or when *Aque Stigia* and Oyl of Turpentine are mixt together; as also when Corrosive Liquors eat into Metallick Bodies, they often grow hot. Thirdly, (which is the only way besides that a Liquid grows hot) when some Humour abounding with Sulphur or much Spirit; is set on Fire by holding a Flame to it, and so grows hot by Deflagration, as Brandy, &c. There are other ways indeed of Calcification, as Fermentation, Putrefaction and Attrition, whereby thicker or solid Bodies often grow hot, but in Liquid they produce no such effect. Thus Leven becomes (somewhat) hot by Fermentation, and Dung or wet Hay by Putrefaction; but neither way will a Liquid Body wax hot: For though Wine, Cyder, &c. ferment so much as to burst the Sides of the Hog-shead, yet they are not actually hot; nor will Blood become so, when it is let out of the Body, dispose it how you will in fit Glasses to ferment or putrefie. Indeed the Blood within the Body is fermented, and is thereby deperated, but it is not heated by such Fermentation, as neither is any other Liquid. Neither does the heating by Attrition agree to it; for though solid Bodies are heated by being rubb'd one against another; yet shake and agitate Liquids as much as you will, they shall be never the warmer for it. Therefore there are only those three ways first mentioned whereby actual Heat can be produced in any Liquid, let us see to which of them the Incalcescence of the Blood ought to be ascribed.

First, Both the Ancients and most Moderns are of Opinion, that the Blood is heated the first way, viz. by the admotion of something that is hot. Thus the former hath taught that the *Innate Heat* and the latter, that the *Vital Flame* is lodged in the Heart, and heats the Blood as it passes through it: But both these Opinions fall to the Ground, since it is clear, that the Heart is a *clear Muscle*, and contains no fit Fuel for perpetuating a Flame, or I know not what implanted Heat: For though it must be acknowledged, that the Circulation of the Blood depends on the continual Motion of this Bowel, yet the Heart derives it Heat wholly from the Blood, and not the Blood its Heat from the Heart.

Secondly, This Heat cannot be caused in the Blood the second way, because its Liquor in a Natural State is always Homogeneous; and tho' it abound with Salt, yet that is only Volatile, Mild, and Benign. Nor can any one discover either in the Heart, or in any other Place, a Saline or otherwise Heterogeneous Mineral, by acting whereupon, or corroding whereof, the Sanguineous Liquor should conceive Heat.

Thirdly, As to the third way, whereby Liquids grow hot, though it seem an hard saying, that the Blood is accended; yet seeing we can attribute its Incalcescence to no other cause, why should we not impute it to this? especially seeing the proper passions of Fire and Flame agree to the Life of the Blood.

For the chief and most essential requisites to continue a Flame, are these three; First, That a free and continual access of Air be granted to it as soon as it is kindled; Secondly, That it enjoy a constant Sulphureous Pabulum or Fuel; and Thirdly, that it be ventilated, whereby as well its fuliginous, as thicker Recrements may be continually amended

from it; And seeing these agree to the *Vital Flame* as well as to the *Elementary*, it seems very rational to affirm, that *Life is self is a kind of Flame*.

Thus far that Learned Author, whom the Latin Reader will do well to consult, discoursing farther on this Subject, in his *Exercit. Medicophysica de Sang. incallescencia five accensione*.

Dr. *Henshaw* thinks that the dissimilitude of Parts between the Chyle and Blood is so great, that it becomes immediately the cause of an extraordinary Ebullition upon their mixture together; which is very much encreased by the Reciprocal Motion of the Lungs, whereby the Blood is wrought almost into a Froth or Foam by that time it gets into the left Ventricle of the Heart. Which sudden excess of Heat, is not unlike what happens upon the mingling several Chymical Liquors together, as Spirit of Wine, and Spirit of Turpentine, and other such like, where the Heat becomes so great, that it often endangers the Vessels they are contained in. He affirms (contrary to Dr. *Willis*, and I think to the Truth) that new Wine or Must, while it ferments, is hot, and that if the Juice newly pressed out of the Grapes were added to it as it begins to cool, it would again renew its Ebullition, and its Warmth would be continued so long, as one should persist to do so: In like manner he thinks it is the Warmth in the Blood continued by the new Affusion of Chyle, which renews its Fermentation, and consequently invigorates its Heat.

Diemerbroeck is of Opinion, That the *Vital Spirit* (by which he understands the most subtile part of the Blood) while through its great Volatility it always endeavours to fly away, does continually agitate the other thicker Particles of the Blood, with which it is intangled and detained from flight, and is diversly vibrated by them, and beat back; and so the whole Mass being kept in a continual fermentative Motion, there is produced in it an Heat, which in a great Agitation is great, and in a mean, mean; and in a small, small.

I might cite other Opinions concerning the reason of this Heat, but they generally fall it with some of those mention'd; of which I shall not make my self an Umpire, but think that Dr. *Willis* has said enough in his above-cited *Exercitation*, to evince that it is not caused either of these latter ways, viz. by Fermentation, or by Agitation of the Particles of the Blood in the manner *Diemerbroeck* describes it; and whether the accension of the Blood be the more probable reason of it, let the Reader Judge.

Why the Blood should be of a red Colour rather than any other, no satisfactory reason (I think can be given, but the Will of the Creator, though some attribute it to the Heart, others to the mixture of Salt and Subacid Juices with Sulphureous, because from such a Mixture there results a Red Colour, as appears in the Distillation of *Sal Nitre*, (which contains many Sulphureous Particles in it,) or by the pouring Oyl of Vitrol upon Conserve of Roses, or other thing that is of a palish Red (if it contain any thing of Sulphur) for it will be thereby made of a most deep Red. We will not spend time to shew in how many Respects these Instances differ from the *Phenomenon* under Consideration, but shall content our selves with inquiring from whence the Difference of Colour arises between the Venal and Arterial Blood. Every one knows that when Blood is let out of a Vein into a Porringer, the *Coagulum* is of a florid Scarlet Colour in its Surface,

but of a dark Red from the Superficies to the Bottom, and of such a Colour it appears as it streams out of the Orifice of the Vein. But if an Artery be cut, the Stream then looks of a far brighter Colour, like the Superficies of the Venal Blood when it is coagulated in a Porringer. Now the Arterial Blood receives not this florid Colour in the Heart, but in the Lungs. For if it received it in the Heart then might the Right Ventricle be supposed to give it as well as the Left; but that it does not do so, is clear by this Experiment of Dr. *Lower's*. If you open the *Vena Arteriosa* which receives the Blood out of the Right Ventricle, the Blood differs nothing in Colour from the Venal, but its cruddled part looks every whit as black. But if one open the *Arteria Venosa* as it is entering into the Left Ventricle, it has the perfect Colour of Arterial Blood, which shews, that as it owes not that Colour to the Left Ventricle any more than to the Right (being not yet arrived at it) so it must receive that Alteration of Colour in the Lungs, in which the Nitrous Air being diffused through all the Particles of the Blood, is intimately mix'd with it, and (if you will) accends it. For if there be any such thing as a *Flamma Vitalis* (properly so called) in Animals, though the Blood (or Chyle rather) be to it instead of the Oil or other Matter whereon it feeds, yet it oweth the continuance of its burning to the Air, without the continued Inspiration of which the Animal cannot live, but instantly dies, even as a Candle is presently extinguished, if you put it in a close Place where the Air cannot come to it, or by some Engine be suck'd from it. But this by the bye; for I must confess, that (how plausible soever this Opinion may seem on other Accounts) this Alteration of the Colour of the Blood by the Air in the Lungs, is no sufficient Argument to prove any such Vital Flame, seeing the Arterial Blood being extravasated, retains its florid Colour, when no doubt if ever there was any accension the Flame is extinguished. But this Scarlet Colour is owing merely to the Mixture of the Particles of the Air with the Blood in the Lungs, from which it transpires in a great measure through the Pores of the Skin, while the Blood circulates in the Habit of the Body, out of the Arteries into the Veins, whence the Venous Blood it self, when extravasated, appears of a Scarlet Dye in its Surface, which is merely from its being exposed to the Air; for if one turn the congealed Blood in a Porringer upside down, the Bottom, which at the turning is blackish, will in a little while turn to a lighter Red.

Though we have confessed, that the Chyle does circulate through the Body several times before it be perfectly assimilated to the Blood; yet we do not think that it passes into the Nourishment of the Parts in the Form of Chyle. And therefore when speaking of the Nutrition of the *Fetus* in the Womb, we often mention'd a *Nutritious Juice* (which was Chyle a little alter'd;) we did not call it so with respect to the solid Parts of the *Fetus*, but to the Blood it self, whose *Pabulum* or Nourishment it is, as soon as the Umbilical Vein is formed, as the Blood is of the Body. For as to the encrease of the first delineated Parts of an imperfect *Embryo*, that is far different from ordinary Nutrition.

The Blood then consisting of Particles of a different Nature, each particle passes into the Nourishment of that Part which is of the same Nature with it:

it: So the Salt and Sulphureous Particles being equally mix'd, are agglutinated and assimilated to the Fleſhy or Muſculous Parts; the Oily and Sulphureous to the Fat; the Salt and Tartareous to the Bones, &c. Now this is not done by any Election or Attraction of the Parts, as if they pick'd and chuſ'd (with a kind of Diſcretion) ſuch Particles of the Blood as are ſuitable to their own Nature, for the Maſs of Blood is equally and indifferently carried to all the Parts: But there is that diverſity of Figure both in the ſeveral Particles of the Blood, and in the Pores of each Part, that in the Circulation thro' the Habit of the Body, ſome ſtick in theſe, and others in thoſe, where they are faſten'd and united to the Subſtance of the reſpective Parts; and thoſe which thro' their peculiar Figure are unapt to adhere to one or other, return again to the Veins, and ſo to the Heart, where they receive ſome new Alteration: So that as *the Life of the Fleſh is in the Blood* (according to *Levit. 17. 11.*) ſo has it its vital Heat and Nouriſhment from it alſo.

BLOOD-WIT, is a Word uſed in Ancient Charters of Liberties, and ſignifies an Amerciament for ſhedding Blood; ſo that whoſoever had it given him in his Charter, had the Penalty due for ſhedding Blood granted him.

BLOODY-HAND, is the Apprehenſion of a Trefpaſſer in the Foreſt againſt Veniſon, with his Hands or other Part Bloody, tho' he be not found Chafing or Hunting. *Manwood*, Part 2. C. 18.

BLUFF-HEADED; a Ship is ſaid to be ſo, when ſhe hath but a ſmall Rake forward on, and that her Stern is ſet too ſtrait up.

BOCEHET, is a Deceit of any thing boil'd over again. *Blanchard*.

BOARD, a Word variously uſed at Sea: To go into a Ship is called *going a-board*; to be within the Ship, is ſaid to be *within Board*, and to be without the Ship, is ſaid to be *without Board*; when a thing is thrown into the Sea, they ſay it is *heaved over board*; when it ſlips down by the Ship's Side, they ſay it *ſlips by the Board*; when two Ships touch one another, they ſay they are *Board and Board*; that Side of the Ship that is to Windward, they call the *Weather-Board*; when a Ship lies up to Windward, ſometimes upon one Tack, and ſometimes upon another, they ſay *She makes a Board*, or *Boards it up*; and if ſhe advances much at one Turning or Tack, they ſay *She makes a good Board*; when they leave Land behind the Ship, they ſay they leave the Land on *Back-board*; to enter a Ship in a Fight, is called *Boarding of her*.

BOAT-ROPE, in a Ship, is that Rope by which the Ship tows her Boat at the Stern.

BOAT-SWAIN, or (as the Seamen call him) *Boorſon*, is an Officer a-board a Ship who hath Charge of all her Rigging, Ropes, Cables, Anchors, Sails, Flaggſ, Colours, Pendants, &c. He alſo takes Care of the Long-Boat and its Furniture, and ſteers her either by himſelf or his Mate. He calls out the ſeveral Gangs and Companies a-board to the due Execution of their Watches, Works and Spells; and he is alſo a kind of Provost Marſhal, ſees and puniſhes all Offenders that are ſentenced by the Captain or Court Marſhal of the whole Fleet.

BOCARDO, the fifth Mood of the third Figure in Logick, in which the Middlemoſt Propo-

ſition is an univerſal Affirmative, the firſt and laſt particular Negatives.

BLOCKLAND, was formerly that which we now call Free-hold Land, or Land held by Charters; and it was by that Name diſtinguiſhed from *Folk-land*, which was Copy-hold Land.

BODY; the Chymiſts uſually call that Veſſel which holds the Matter in Diſtillation of the Spirit of Vegetables a *Body*. 'Tis called alſo a *Cucurbiture*, where ſee its Figure.

BODY, in Geometry, is that which hath three Dimenſions, Length, Breadth and Thickneſs; as a Line is formed by the Motion of a Point, and a Superficies by the Motion of a Line, ſo a Body is formed by the Motion of a Superficies.

BODY, in Natural Philoſophy, is uſually defined to be a Subſtance impenetrably extended; or which having *Partes extra Partes*, cannot be in the ſame Place with, or penetrate the Dimenſions of any other Body. And this Property Sir *Iſaac Newton* expreſſes by the Word *Solidity*; and according to his excellent Philoſophy, the Idea of a Body is that which is *extended, ſolid and moveable*.

BODIES Regular, ſee *Regular Body*.

BOLONIAN Stone, is a ſmall, grey, weighty, ſoft, ſulphureous Stone, about the bigneſs of a large Walnut, and being broken, hath a kind of Chryſtal or Sparry Talk within it. It is found about *Bolonia* in *Italy* (whence its Name) and in many other Parts of the ſame Country, and in great quantity at the Foot of Mount *Palermo*; where a Shoemaker, one *Vimenzo Coſciarolo*, gathering up theſe Stones, carried ſome of them home and calcined them, hoping to extract ſome Silver out of them; but inſtead of his Aim, he diſcovered this ſtrange *Phenomenon*, that the Stone, when expoſed to Light, would retain it, and afterwards ſhine in the Dark. After this, tho' the Stone was much celebrated for its ſhining Quality, yet the Manner of preparing it, to exhibit this *Phenomenon* was not truly and fully known or diſcovered to the World, till one Mr. *Homborg* a German Phyſician, living at *Paris*, took the Matter into freſh Conſideration, and made a Journey into *Italy* to enquire about the Stone, and its manner of Calcination; and 'tis he that hath given us the following Proceſs to prepare it; which *Lemmy* in the laſt Edition of his *Chymiſtry*, P. 707. puts down to this Effect.

Take ſeven or eight *Bolonian Stones*, and raſp off all their Coat or Heterogeneous Earth about them till the Stone begins to glifter and ſhine; then powder one of them in a Brazen Mortar, (which Circumference is of abſolute neceſſity, for elſe the Stone will not ſhine) and ſift the Powder finely, and moiſtening the other ſeven with clear Brandy very well, roll them up and down in the Powder till their Surface be all covered with it. Then having provided a ſmall Furnace of Earth, round, and about a Foot high, beſides the Dome, and near a Foot and half in Diameter; the Aſh-room muſt have two Doors to give the Fire the more Air, one of them right againſt the other; the Hearth need have none, but only three or four hollow Cuts or Notches (as in the Figure) the Dome ſet on it for Reverberating the Fire on the Matter; the Grate ought to be of fine Braſs or yellow Copper, which helps to render the Stone Luminous, and the Holes in it muſt be ſmall.

B, the Furnace all together, *l*, the Hearth of the Furnace separated from the Dome and Ash-room, that the Hollows or Notches may appear.

m, the Ash-room with the Brass Grate. *n*, the Dome by it self, with its Ring to take it on and off.

All things being thus ready, put into the Furnace five or six kindled Coals to heat it, and when they are half wasted, fill the Furnace up to the Holes or Notches with small Cinders, and then lay your Stones covered with the Powder upon them; then cover them with other Cinders that the Furnace may be full: Lastly, fix on the Dome, and without touching it any more, let the Coals and Cinders burn to Ashes. When the Furnace is half cold, separate the Dome, the Hearth, and Ash-room, and you will find on the Grate the Stones calcined: Lay the Grate softly on white Paper, and gathering up the Stones carefully keep them in a Box with Cotton.

If these Stones be exposed to the Light in the open Air, as in one's Hand out of a Window, &c. (but not to the Sun-beams) for about a Minute, and then carried into a dark Place, they will for some time appear like kindled Coals, tho' without any sensible Heat; the Light will abate by little and little, but may be recovered anew, by the Stones being again exposed to the Light of the Day, as before. This surprizing Quality, if well used, they will retain for 2, 3, or 4 Years; and when 'tis lost, it may in part be recovered again by a new Calcination after the same manner.

If you draw any Figures on Paper with the White of an Egg, and while they are wet, strew on them the Crust of this calcined Stone powdered; then dry them in the Shade, put them in a Frame, and cover them with a Glass: They be-

ing exposed to the Light with the Glass Cover on, will at any time shine if removed into a dark Place.

BOLT-HEAD, *vid. Matrass*.

BOLT-ROPE, is that Rope into which the Sail of a Ship is fixed or made fast.

BOLTS, in a Ship, are Iron Pins, of which there are these several sorts; 1. *Ring-Bolts*, which serve for the bringing to of the Planks, and those Parts whereto are fastned the Breeches and Tackles of the Ordnance. 2. *Drive-Bolts*, and these are used to drive out other Bolts. 3. *Ser-Bolts*, which are employed for the forcing of the Planks and the other Works, and bringing them close one unto another. 4. *Rag-Bolts*, which are on each Side full of Jaggs or Barbs to keep them from flying out of the Holes wherein they are driven. 5. *Clench-Bolts*, which for the same End are clenched, that is, made fast at the Ends where they come thro'. 6. *Fore-Bolts*, which are made like Locks, with an Eye at each End, whereinto a Fore-lock of Iron is driven to prevent starting out. 7. *Fender-Bolts*, made with long and thick Heads, and are struck into the uttermost *Bends* or *Wales* of a Ship to save her Sides from Bruises and Hurts; and thence take their Name.

BOLUS, in a Mineral Sense, is a kind of Earth, and which Dr. Grew supposes to be a Bed, as it were, the *Materia Prima* of Opacous Stones and Metals; into which he thinks those of the said *Bolus* are transmuted by being concerted with divers Salts and Sulphurs, which fly in upon them successively.

BOLUS, is a Medicine taken inwardly, of a Consistence something thicker than Honey, and the Quantity for one Dose is as much as may be conveniently taken at a Mouth-full.

BOMB-CHEST, is a kind of Chest, which being filled with Gun-powder and *Bombs* (according to the intended Execution) is placed under Ground to blow it up into the Air, together with those that stand upon it. These *Bomb-Chests* are frequently used to drive Enemies from a Post they lately seized, or whereof they are about to take Possession; and are set on fire by the Means of a Sand-dige fastened at one End.

BOMBS or *Granada-Shells*, are hollow Balls of Cast Iron, which are filled with whole Powder, and sometimes with Nails, Pieces of Iron, &c. along with it. Their use is to be shot (out of Mortar-pieces) into besieged Towns, to annoy the Garrison, fire Magazines, &c. The largest are about 15, and some 18 Inches in Diameter. From these Bombs, being used in the besieging of Towns, we say such a Place was *Bombarded*.

BON-GRACE (in a Ship) is a kind of Frame made of old Ropes or Junks of Cables, which, in those who sail into Cold Latitudes, are laid out at the Bows, Sterns and Sides of the Ships, to preserve them from being injured by the great Flakes of Ice.

BONA Notabilia, (in Law) is where a Man dies, having Goods to the Value of 5 Pounds, in divers Diocesses, then the Archbishop ought to grant Administration; and if any inferior Bishop do grant it, it is void.

BONA Patria, a Term in Law, signifying an Assize of Country-Men, or good Neighbours; sometimes called *Affisa bona Patria*, when twelve, or more, are chosen out of the Country to pass upon an Assize; and they are called *Juratores*, because

cause they swear judicially in presence of the Party.

BONES, of an Animal Body. A Bone is by Anatomists defined to be a similar Part, most dry, cold, hard, inflexible, void of Sense, and affording Stabiliment and Form to the whole Body.

The Integral or Constituent Parts of Bones are their *Periosteum* or investing Membrane, their *Substance*, *Pores*, *Marrow*, *Glands*, *Vessels*, &c. of which take the following short Account from Dr. *Haver's Osteologia*.

The *Periosteum* hath two Sorts or Series of Fibres, the under deriv'd from the *Dura Mater*, the upper from the Membrane of the Muscles that lies upon it; which Fibres lie one upon the other, but are not interwoven one with another.

The under Fibres run all parallel directly from one End of the Bone to the other, and are continued from one Bone to another by Means of the Ligaments that join them together in their Articulations, upon which they pass.

The outer hold the same Course with the Fibres of the Muscle from whence they are derived, sometimes straight, sometimes oblique, sometimes transverse, and when they have run so far as to make up their Part of the *Periosteum*, he thinks they are inserted into the Bone, and are succeeded by others from some other Muscles. Some of the Tendons of the Muscles also propagate Fibres to make some Part of the *Periosteum*; but others penetrating it, are immediately inserted into the Bone.

The inner Superficies of the *Periosteum* sticks as close to the Bone as if it were glued to it; and besides, the *Periosteum* has little *Fibrellæ* or Threads continued from it, that enter into the Substance of the Bone, which gives them (probably) some internal Sense.

The *Uses* he ascribes to it, are, 1. To be a Tegument to the Bones. 2. To convey Spirits into the Substance of the Bones for maintaining their Heat, for preserving their Sensibility, and to assist in the Work of their Accretion and Nutrition, by means of the Minute Fibres it emits into them. 3. To help to set Limits to the Growth and Extension of the Bones, as the Bark is sometimes observed so to bind young Trees, that it is necessary to open it before they can have the Liberty of thriving. 4. It is serviceable in the Conjunction of the Bones and their Epithyses (while these are Cartilaginous) also of the Bones which are joyned by Sutures or Harmony, and in the Connexion of the Bones and their Cartilages. 5. To join the Heads and Tendons of the Muscles fast to the Bones; namely, of such Tendons as do not penetrate it (as some do not.)

Having done with the *Periosteum*, he comes to the Substance of the Bones, which he describes after this manner. He says, they consist of *Lamellæ* or Plates lying one upon another, and these of small Strings or Fibres running lengthways of the Bones (like as we see in Whale-bone;) which Strings, though some of them run to the very Extremities of the Bones, and others approach near to them, do not terminate there, so as to have distinct Ends, but they are, where they may be thought to terminate, still continued, and run transversely, and as it were arched, that the Strings of one Side of the Bone proceed as to meet and be united to those that are propagated from the opposite; and this at both Extremities, that they are a Continuation, though not in the Figure, yet in

the Manner of a Ring; therefore they are not all of a length, but in every Plate they fall one shorter than another.

In several Bones the *Lamellæ* are disposed diversly: In those Bones which have a large Cavity, they are on every Side contiguous and closely united; but in those which have not any great Cavity, but are altogether spongy within: Many of the internal *Lamine* are placed at some Distance from one another in all their Length, having betwixt them a Cavernous Substance or small bony Cells; and so have also those Bones, which have a large Cavity, some of those lesser Cells at both their Extremities.

Next he comes to their *Pores*, and says, That in the Bones, whose Plates are Contiguous, there are *Pores* through and between the Plates, besides those which are made for the Passage of the Blood-Vessels; and these are of two sorts: The one penetrate the *Lamine*, and are transverse, looking from the Cavity to the external Superficies of the Bone. The second sort are formed between the Plates, which are Longitudinal and Straight, tending from one end of the Bone towards the other, and observing the Course of the Bony Strings. The first kind are formed not only in the first internal *Lamine*, but in every one, even to the outermost, though the nearer they are to the Cavity, the greater is the number of the Pores. And as they pass, they do not observe any such order as to lie directly one under another, to form any continued Passage from the Cavity to the external Plate. The second kind, viz. the Longitudinal, are not to be observed, but by good Glasses, unless it be now and then in some particular Bones. By these it is that the Medullary Oil diffuses it self, and is immediately beneficial to the Plates. The other (viz. the Transverse) and but subordinate to these, and rather designed for the Passage of the Marrow into them, than for the immediate Communication of it to the Substance of the Bone.

The *Medulla* contained in the Bones; consists (besides the Blood-Vessels) of an investing Membrane, in which are included Membranous Lobules and Bags, and in these Bags *Vesiculae* or Glandulous Bladders, very much like the Vesicular Substance of the Lungs. And these Glandular Bladders serve both for the Separation of the Medullary Oil from the Mass of Blood, and for the Reception and Conservation of it. In an Human Bone which he had preserved till the Medullary Oil was wholly evaporated, he found these *Vesiculae* remaining dry, but entire, and their Substance representing, in a manner, a Sponge. They seem to have Pores or immediate Passages out of one into another (as have also the Bags) by which the Oil has a freer Course to the Joints and Substance of the Bone, for whose Benefit it was designed. By the Strictest Enquiry he could never find any thing like Ducts (as pass from other Glandules) and indeed these are not here necessary, because the Oil is not carried from the Glandular Vessels to any large Receptacle, but flows out of the Superficies of the Marrow in as many Places as there are transverse Pores in the internal Lamel. The *Medulla* serves to oil the Substance of every Bone, which the drier it were, the brittle it would be: It lubricates also their Articulations, and hinders their Ends from being worn or over-heated with Motion; and it moistens likewise the Ligaments, by which they are tied one to another. But in these two last *Uses* it

is assisted by the Mucilage which is separated by the *Glandulæ Mucilaginosæ* (as he calls them) which he has observed in all the Articulations of the Bones, and are of the Conglomerate Kind, of which he speaks more in the next Chapter.

Now the manner of the Medullary Oyls insinuating it self through a Bone, and its being dispensed to all the Parts of it, is this: It first passes, being Liquid (as it all is while the Animal is alive) out of the Cavity, through the transverse Pores of the first Internal *Lamina*, and not having Pores of the same kind directly subjacent in the next Place to transmit it towards the outside of the Bone, it flows into the Longitudinal ones formed between these two (the first and second) Plates, and being carried along in them till it find some transverse Pores in the second Plate, it passes through these, which when it has done, it is obliged again to alter its course, to run into and flow along the straight Pores between the second and third *Lamina*. Thus it passes through and between the Places successively, till it has made its way to the External Plate.

Thus the Medullary Oyl is dispensed in all the Bones to those Plates which are contiguous, and have no intermediate Cavities to entertain any Medullary Glands of their own: But where the Plates stand at some distance (as they do in such Bones as have not any great Cavity) there are the small Caverns (above-mention'd) which are capable of containing some Medullary Glands, from whence the Plates have more immediately, and without the former method of Conveyance, the benefit of the Marrow.

He divides the *Blood-Vessels* of the Bones into *Nutritious* and *Medullary*. The most considerable of the Nutritious enter at the ends of the Bone, viz. the Artery at one end, and the Veins at the other. The Medullary commonly enter the Sides of the Bones (and that obliquely, as the Ureters do the Bladder) both by one *Foramen*.

There are no Nerves that are inserted into them (except into the Teeth) but these only run through the *Periosteum* that invests them.

Some Bones have large Cavities in them, as *Os Humeri*, and *Femoris*, the *Ulna* and *Radius*, *Tibia* and *Fibula*, the Bones of the *Metacarpus* and *Metatarsus*, of the Fingers and Toes, and of the *Os Hyoides*; to which may be added, the lower Jaws; though the Cavity compared with the magnitude of the Bone, hardly deserves to be filed large: Besides these large Cavities which are in the inside of the Bones, there are lesser Cells or Caverns in their Substance, which are found in all the Bones, even those which have a large Cavity. But of these before, when we spoke of the Distribution of the Marrow.

Besides the large Cavities and Caverns in the Inside or Substance of the Bones, most have *Superficial Cavities* or *Sinus's* which Dr. *Havers* distinguishes into *Sulci* or *Forrows* (which are the long ones) and *Pits*, as he calls the shorter ones. And they have besides, *Holes* for the Nutritious and Medullary Vessels, as was but just now observed.

On the outside of the Bones there are also to be observed, their *Prominences* or *Protuberances*, of which there be two kinds; for it is either a continued part of the Bone jetting manifestly above its plain Superficies, for the more commodious insertion of the Muscles, &c. and is called *Apothysis*, a *Process*; or else it is like an additional Bone grow-

ing to another by simple and immediate Contiguity, (and generally softer and more porous than it) and is called *Epithysis*, an *Appendage*. If the Protuberance of the Bone be round, it is called its *Caput*; under which is the *Cervix*, as in the upper-end of the Thigh-bone: If it be flat, it is called *Condylus*; if sharpe, *Corone*, from the similitude they have to other things, as *Styloides*, *Coracoides*.

Their *Uses* are many; for they serve, 1. For the Firmitude and Sustainment of the Body, like Beams and Pillars in Houles. 2. For a Defence to some Parts; so the Skull defends the Brain, the Ribs the Parts contained in the Breast. 3. For Progression or Walking, of which they with the Muscles are the only Instruments. 4. They give Shape to the Parts of the Body. These are their general Uses; as to their particular Uses, those will be shewn as we describe them severally.

BONIS non amovendis, is the Writ to the Sheriff of London, &c. to charge him, that one condemned by Judgment in a Nation, and profecting Writ of Error, be not suffered to remove his Goods until the Error be try'd.

BONNET, in Fortification, is a certain Work raised beyond the *Counterescarp*, having two Faces which form a Salient Angle, and as it were a small *Ravelin* without any Trench. The Height of this Fortification is three Foot, and it is environ'd with a double Row of Pallisadoes, ten or twelve Paces distant from each other. It hath a Parapet three Foot high; and is like a little advanc'd *Corps du Guard*.

BONNET a *Prestre*, or the *Priest's Cap*, in Fortification, is an Out-work having at the Head three Salient Angles, and two Inwards: It differs from the double *Tenaille* only in this, that its Sides instead of being Parallel are made like a Swallow's Tail, that is, narrowing or drawing close at the Gorge, and opening at the Head.

BONNETS, in a Ship are small Sails set on upon the Courfes, or her Main-Sail and Fore-Sail; when they are too narrow or shallow to cloath the Mast. The words are, *Lace on the Bonnet*, that is, fasten it to the Courfe; *Shake off the Bonnet*, that is, take it off the Courfe.

BOOM: That long piece of Timber with which the Clew of the Studding Sail is spread out, is called, the *Studding Sail-Boom*. A Boom is also used sometimes to spread or Boom out the Clew of the Main or Fore-Sail. The Seamen say a Ship comes *Booming* when she makes all the Sail she can. Also those Poles with Bushes or Baskets on the Top, which are placed to direct how to steer into a Channel, are called *Booms*, and by some *Beacons*.

BOOTES, the Name of a Northern Constellation of the fixed Stars; of which one in the Skirt of his Coat is called *Arcturus*, and is of the first Light on Magnitude. This Constellation is also called *Arctophylax*, and consists of 34 Stars.

BORBORYGM, a rumbling Noise in the Guts. *Blanchard*.

BORDLANDS, is the Demefns which Lords keep in their own Hands, for the maintainance of their Board or Table.

BORDURE, a Term in Heraldry, for an Ancient Difference in a Coat of Arms, whereby several Families of the same Name, or Persons bearing the same Coat are distinguished one from another. 'Tis a cutting off from within the Escutcheon all round it, about $\frac{1}{4}$ of the Field; and if the Line that constitutes the *Bordure* be frait, and

and the *Bordure* be plain, as they call it, then in Blazoning you must only name the Colour of the *Bordure*, as here, he beareth *Gules a Bordure Or*; without saying a *Plain Bordure*.

BORDURES, are sometimes *Engrailed*, *Gobonated*, *Inveiled*, *Indented*, *Counter Compny*, *Vairy*, *Checky*: Which see under those Words. If a *Bordure* be charged with any Parts of Plants or Flowers, they say *Verdoy of Trefoiles*, or whatever Flower it be. If the *Bordure* consist of *Ermins*, *Vairy* or any of the Furs, the Term is *Purflew of Ermins*. If the *Bordure* be charged with *Marlets*, the Word is, charged with an *Enalyron of Marlets*, &c.

BOREAL or *Northern Signs*, are the fix first Signs of the *Zodiack* or those on the *Northern* side of the *Equinoctial*.

BOROUGH *Englisb* (a Term in Law) is a customary descent of Lands or Tenements in some Places, whereby they come to the youngest Son; or if the Owner have no Issue, to his youngest Brother.

BOROW or *Borough*, signifies with us a Corporate Town, that is not a City.

BOROG-HEAD or *Head-borough*, is the chief Man of the *Decury* or Hundred.

BOSPHORUS (in Geography) is a long narrow Sea running in between two Lands, by which two Continents are separated; and by which way a Gulf and a Sea, or two Seas have a Communication one with another, as the *Thracian Bosphorus*, now called the *Straits of Constantinople*.

BOTANICKS or *Botany*, is that part of the Art of *Medicine* which describes and enumerates the several Virtues of Plants; and that part of *Natural History* which teaches rightly to distinguish the several Kinds and subordinate Species of Plants, Trees, Shurbs, &c. one from another, and which gives just Descriptions of them. And he that is accurate in this Art is called a good

BOTANIST: See Schemes of the several kinds of Plants under the word *Plant*.

BOTHRION, the Name of a kind of hollow, narrow, and hard Ulcer in the Eyes. *Blanchard*.

BOTTONY, a Term in Heraldry for one of their Crosses of this Figure, *Argent a Cross Botrony Sable*, by the Name of *Winwood*.

BOW, of a Ship, is that part of her which begins at the *Loof* and *compassing* Ends of the *Stem*, and ends at the *Sternmost* part of the *Fore-Castle*. If a Ship hath a Broad Bow, they call it a *Bold Bow*: If she hath a narrow thin Bow, they say she hath a *Lean Bow*. The Piece of Ordnance that lies in this place is called the *Bow Piece of Ordnance*; and the Anchors that hang here are called her *Great* or *Little Bower*.

BOW, a Mathematical Instrument made in Wood, formerly used by Seamen to take the Altitude of the Sun.

BOW, also, is a Beam of Wood or Brads with three long Screws, that govern or direct a Lath of Wood or Steel to any Arch; used commonly to draw Draughts of Ships, Projection of the Sphere,

or where-ever 'tis requisite to draw large Arches.

BOW-SPRIT, is a kind of Mast, resting slopeways on the Head of the main Stem, and having its lower End fastned to the *Partners* of the *Fore-Mast*, and farther supported by the *Fore Stay*: It carries the *Sprit-sail*, *Top-sail*, and *Jack-staff*; and its Length is the same with the *Foremast*.

BOWER, any Anchor carried at the Bow of a Ship is called her *Bower*: There are usually carried 2 there, the first and second *Bower*; but the greatest Anchor is carried in the Hold.

BOWLING, or rather *Bow-Line*, is a Rope fastned to the *Leach*, or middle part of the outside of the Sail; it is fastned in three or four parts of the Sail, which is called the *Bowling Bridle*; but the *Mizen Bowling* is fastned to the lower end of the *Yard*. All Sails have it except *Sprit-sail*, and *Sprit-sail Top-sail*, and therefore those Sails cannot be used close by a Wind; for the use of the *Bowling* is to make the Sails stand sharp, or close, or by a Wind: The Words belonging to it are these, *Sharp the Bowling*, *Hawl up the Bowling*, *Set fast the Bowling*, that is, pull it up hard, or hale it more, forward on; but when they say, *Ease the Bowling*, *check* or *run up the Bowling*; they mean, let it more slack.

BOWLING KNOT, is a Knot that will not slip, by which the *Bowling Bridle* is fastned to the *Cargles*.

BOWSE, a Sea Term, signifying as much as *Hale* or *Pull*. Thus haling upon a Tack, is called *Bowling upon the Tack*. And when they would have the Men pull all together they cry, *Bowse away*.

BOX and Needle, is the application of a small Compass to a *Theodelite*, and is used in *Surveying*, &c. to find out the Situation of Places, by the pointing of one end of the *Magnetical Needle* towards the North.

BOY, of an Anchor: See *Buoy*.

BOYAU, or *Branch of the Trenches*, in Fortification, is a particular Ditch separated from the main Trench, which in winding about encloseth different Spaces of Ground, and runs parallel with the Works and Fences of the Body of the Place; so that when two Attacks are made near one to another, the *Boyau* sometimes makes a communication between the *Trenches*, and serves as a *Line of Contravallation* not only to hinder the *Sallies* of the *Besieged*, but also to secure the *Miners*. But when 'tis a particular Cut that runs from the *Trenches* to cover some Spot of Ground, it is then drawn parallel to the Works of the Place, that it may not be *Enfiladed*; that is, that the Shot from the Town may not scoure along it.

BRACED, the Term in Heraldry for the intermingling of three *Chevronells*, thus;

Azure, a Chief Or, and three *Chevronells* Braced in the Base of the *Escutcheon*, by the Name of *Fitz-hugh*.

BRACES, are Ropes belonging to all the Yards of a Ship except the *Mizen*, two to each *Yard*; there is a *Pendant* seized to the *Yard Arms*, at whose other end there is a *Block*, through which the *Brace* is reeved, and their use is to *Square the Yard*, that is, to set it *Square*; to *Brace the Yard*, that is, to bring it to either side; to *Traverse the Yard* that is,

is, to let it any way overthwart; and to Right the Yard, that is, to bring it so that it shall stand at Right Angles with the Length of the Ship. All Braces come afterward on, the Main Brace comes to the Poop, the Main Top-sail Brace to the Mizzen top, and thence to the Main Shrouds; the Fore and Fore-top-sail Braces come down by the Main and Main-top-sail Stays; and so of all the rest. But the Mizzen Bowling serves for a Brace to that Yard, and the Cross-Jack Braces are brought forwards to the Main Shrouds whenever a Ship sails close by a Wind.

BRACHIÆUS Externus, is a Muscle of the Cubit, which seems to be the third beginning of the *Gemellus*; its Origination is continued from above the middle of the inferiour and back part of the *Os Humeri* to its Cavity, which receives the *Olecranium* Extension of the Cubit, where joining with the Tendinous Outside of the *Gemellus*, it is inserted with it as above said.

BRACHIÆUS Internus, is a Muscle of the Cubit, which derives its Name from its Situation, lying partly under the *Biceps*: It ariseth fleshy from the Internal Part of the *Os Humeri*, at the Insertion of the *Deltoides* and *Coracobrachialis* Muscles, and descending over the Juncture of the Cubit with the Arm-bone, it's inserted partly fleshy and partly Tendinous to the Superior and Forepart of the *Ulna*: Its use is to help bend the Cubit.

BRACHIOLUM, is a kind of Index or Label put upon Astralabes and other Projections of the Sphere; and by some English Writers is called a *Creeeping Index*.

BRACHYCATALECTICK Verse: See *Deposition*.

BRACHYGRAPHY, is the Art of Short-hand.

BRACKETS (in a Ship) are small Knees serving to support the Galleries; and so those Timbers are called that support the *Gratings* in the Head.

BRADYPEPSY, is slow Digestion, proceeding from a depraved Disposition of the Acid Ferment in the Stomach. *Blanchard*.

BRAILS, are small Ropes reeved thro' Blocks which are seized on either side the Ties, a little distance off, upon the Yard; so that they come down before the Sails of a Ship, and are fastned at the Skirt of the Sail to the Crengles. Their use is, when the Sail is furled a-crofs, to hale up its Bunt, that it may the more readily be taken up or let fall. These Brails belong only to the two Courses and to the Mizzen Sail. The word is, *Hale up the Brails*, or which is all one, *Brail up the Sails*; for the meaning is, that the Sail should be haled up, in order to be furled, or bound close to the Yard.

BRAIN (see *Cerebrum* and *Cerebellum*) in the general Sense of the Word, is taken for all the soft Substance which is contained within the whole Skull, and which the *Greeks* comprehended under the Word *ἑνκεφαλον*. It is the general Organ of Sense, in which the Soul, the Governour of the Body, perceives and judgeth of the Sensations of all the Sentient Parts; and out of which, as out of a Fountain, it communicateth the Animal Spirits (bred in the Brain) by the Ducts and Rivulets of the Nerves to all the Sentient Parts of the Body; and thereby endows them with the Faculty of performing Animal Actions.

The Brain being of so loose a Substance, and the Skull wherein it is inclosed so hard that the Saw or Chisel are necessary to break through it, the Brain must needs be very much flattened or compressed thereby; and after the Skull is divided, in the very pulling of it off, the vascular Connection

or the *Dura Mater*, and it with the *Pia Mater* and *Arachnoid* (and that also of the one with the other) being torn in funder, the Parts into which Vessels are inserted, are necessarily much violated: And lastly, after the Covers are removed, several parts of the Brain being of such difficult access, that others must be quite spoiled, before one can come to a view of them, and these also thereby in part violated: Upon all these accounts a true Anatomy of the Brain, as to its Contiguities, Connections, Cavities or Venticles, &c. must be very difficult; so that 'tis no wonder the Observation of Anatomists are so different, and so opposite to one another. But this by the bye, let us next discourse of the Brain more generally.

If by *Brain* we understand the whole *ἑνκεφαλον* (or all that which is contained within the Skull) it is not of one Substance, but divers; and is distinguished by the particular Names of the *Cerebrum*, (in special) the *Cerebellum* and the *Medulla oblongata*. Nor is the *Cerebrum* (properly so called) it self of a like Substance, but consisting of a Cortical and Medullar Part (called *Corpus Callosum* and these differ in their Nature, Colour and Consistence. Which difference *Malpighius* thus describes: The *Cortex* (being of an Ash-colour) he says, is Glandulous: The outside of the Glands is covered with the *Pia Mater*, and its Blood-Vessels, which penetrate deep into their Substance; (each Gland having a Twig of both an Artery and a Vein:) Their inner side sends forth a white Nervous Fibre, like a proper Vessel, as it were, so far as their Brightness and Whiteness permit one to discover. These Fibres make up all the *Pith* (or *Corpus Callosum*) which is of a more close and solid Substance than the *Cortex*. They are flattish round, and are not unlike those white Bodies, or *Intestinnula*, which the Testicles are made up of; and in the Venticles of the Brains of Fish they are so apparent, that if you hold them betwixt you and the Light, they represent the small Teeth of an Ivory Comb. He saith, they are inserted by their Ends into (or rather arise out of) the *Cortex* or Ash-coloured outer part of the Brain, and seem all of them to have their egres out of (or rather ingres into) the Trunk of the Spinal Marrow within the Skull.

Whether they be hollow or not, or whether as they are collected into a Bundle, they have not Pores and Interstices arising therefrom, which transmit a peculiar Juice into the Nerves continued to them, he leaves undetermined; because they neither admit of Ligature, nor can Sense make any discovery thereof. Dr. *Ridley* (from *Leuwenhoeck*) offers at a yet finer Description of these two Parts of the Brain, which the curious Reader may find in his *Anatomy of the Brain*, P. 89, &c. For the other Parts of the *Encephales*, viz. the *Cerebel* and *Medulla oblongata*. See these words.

The Brain receives Blood by Arteries derived from the *Carotides* and *Cervical*, whose Capillaries are dispersed chiefly through its Cortical Part. These Arteries are so large and numerous, that a third part, at least, of the whole Mass of Blood is conveyed hither by them; which seeing through the smallness of the Brain it cannot be consumed in its Nutrition, *Malpighius* thinks it probable, that the Coagulative (or Concrescible) Serum is filtered as it were in the *Cortex*, (or Glandulous Part) of the Brain from the Arterial Blood, and that the Fibres of the *Cortex Callosum*, as so many Roots implanted into the said *Cortex*, imbibe this Serum and convey it to the *Medulla Oblongata* as the Trunk from

from whence it is derived into the Nerves as the Branches, and is derived and is there the *Succus Nervo*, if not the Animal Spirit it self. Part nourishes the Brain it self, and what is superfluous to both these uses, is partly refused by the *Veins* of the *Meninges* (whose Twigs reach all the several Glands of the *Cortex*) and partly repositied in the *Sinu's* of the *Dura Mater*, by the Arteries themselves, out of which it is resorbed by the Internal Branches of the Jugulars, and thereby conveyed back to the Heart. The Arteries inosculate one with another (*i. e.* the Right *Carotides* with the Left) and so do the Veins also; but not the Arteries with the Veins. It is from the Pulse of the Arteries altogether, that the beating (or *Systole* and *Diastole* as it were) of the Brain proceedeth.

A Man of all living Creatures hath the biggest Brain; for it weigheth four or five Pound in some, and is as big again as an Ox's Brain.

The outer Surface is full of Windings, like those of the Guts, which are severally invested with the *Pia Mater*, as also tied together by it. The whole Brain is much of the same Shape with the Head, *viz.* roundish, but with bunchings out towards the Forehead.

BRANCH of the Trenches: See *Boyan*.

BREACH, in Fortification, is the Ruins which are made in any part of the Works of a Town, &c. either by playing Cannon, or springing Mines, in order to storm the Place, or take it by Assaults. They say, Make good the Breach, Fortifie the Breach with *Chevaux de Frise*, Make a Lodgment on the Breach; Clear the Breach; or move away the Rubbish of it, &c.

BREAK Ground, in Fortification, signifies to begin the Works for carrying on the Siege about a Town or Fort.

BREAMING, of a Ship: See *Erooming*.

BREAST-FAST, a Rope in a Ship made fast to some part of her forward-on, to hold fast her Head to a Warp, or the like.

BREAST-HOOKS, in a Ship, are the *Compas-fing* Timbers before, which help to strengthen her Stern, and all her Fore-part.

BREAST-ROPEs, in a Ship, are those which fasten the Parrels to the Yards.

BREAST-WORKS, the same with *Parapet*.

BREDWITE (in Law) seems to have been that Imposition of Fines or *Amerciaments* for Defaults in the Affize of Bread.

BREECHINGS; so the Seamen call those Ropes with which they *lasso fast*, or fasten their great Guns to the Ship-sides.

BREEZE, a shifting Wind, blowing from the Sea or Land for some certain Hours of the Day or Night.

BREGMA or *Pregma*, is the Fore-head Bone, according to some Writers, but its rather the *Sinciput*.

BREVE, the same with *Brief*.

BREVE *Perquirere*, to purchase a Writ or Licence of Trial in the King's-Court, by the Plaintiff, *qui breve perquiruit*. Hence the present usage of paying 6s. and 1d. where the Debt is 40l. and 18s. where the Debt is 100l. and so upward in Suits of Money due upon Bond.

BREVE *Reſto*, a Writ of Right, or Licence for a Person ejected, to Sue for the Possession of an Estate detained from him.

BREVE-VAS, a short Vein passing from the Stomach to the Veiny Branch of the Spleen. 'Tis commonly called the *Vas Breve*.

BREVIBUS or *Rotulis liberandis*, is a Writ or Mandate to a Sheriff, to deliver unto the new Sheriff, chosen in his room, the County with the appurtenances, *una cum Rotulis Breuibus*; and all other things belonging to that Office.

BREVIS, also is the Name for one of the Muscles of the Radius, serving to turn the Palm of the Hand upwards.

BRIBORS (a French Law term) signifying one that pilfereth another Man's Goods.

BRICOLS, are by some said to be Engines, formerly used to batter the Walls of the Towns or Castles.

BRIDGE Flying, a Term in Fortification: See *Pont Volant*.

BRIEF (or Breve) a Term in Law, signifying Process that Issues out of the Chancery or other Courts, commanding the Sheriff to summon or attack A, to answer to the Suit of B, &c. But more largely it is taken for any precept of the King in Writing under Seal, issuing out of any Court, whereby he commands any thing to be done for the furtherance of Justice and good Order.

BRIGADE, is a Party or Division of a Body of Soldiers, whether Horse or Foot. There are two sorts of Brigades according to the French way of accounting. (1.) A Brigade of an Army, which is a Body of Horse consisting of 10 or 12 Squadrons, or a Body of Foot of 5 or 6 Battalions: And this way an Army is sometimes divided into eight Brigades, four of Horse, and four of Foot. 2. A Brigade of a Company of Cavalry, is its third Part, when it consists only of 50 Officers; but its sixth Part when of 100. *Grand Dictionnaire Francoise*.

BRIGADIER, is he that commands any Brigade.

BRIGANTINE, is a small light Vessel which can both Row and Sail well, and is either for Fighting or giving Chase: It hath about 12 or 15 Benches for the Rowers, one Man to a Bench; all the Hands aboard are Soldiers, and each one hath his Musket lying ready under his Oar. *Great Fr. Dict. of Arts and Sciences*.

BRISURE, a Term by some Writers of Fortification, for a Line extended in Length from four to five Fathom, which is allowed to the *Certain* and *Orillon* to make a hollow Tower, or to cover the concealed Flank.

BRODE Halpenny, or Broad Half-penny, or Board-half-penny (a Term in Law) signifying, to be quit of certain Customs exacted for setting up of Tables or Boards in Fairs or Markets; and those that were freed by the King's Charter of this Custom, had this Word put in their Letters Patents; by reason whereof, at this Day, the Freedom it self, for brevity of Speech, is called *Broad Hal-penny*.

BROKEN Ray, or Ray of Refraction, in *Dioptricks*, is a Right Line, whereby the Ray of Incidence changeth its Rectitude, or is broken in traversing the second Medium, whether it be thicker or thinner.

BRONCHOCELE, is a Tumour in the Top or the middle Fistulous Part of the Wind-Pipe. *Blanchard*.

BRONCHOTOMY, is the Section of the Wind-Pipe in a Membraneous Part betwixt two of the Rings. It is used to prevent Suffocation in People troubled with a *Squinancy* or *Quinsy*.

BRONCHUS, is the Middle Fistulous Part of the Wind-Pipe, whose Fore Part is made up of so many little Rings; the upper Part is called *Larynx*, and

and the under *Vesicularis*. It serves for the Modulation of the Voice; and in Respiration.

The Ramifications of the *Aspera Arteria* or Wind-Pipe all over the Lungs, are called the *Bronchia* of the Lungs.

BROOMING; or *Brooming of a Ship*, is burning off the Filth she hath contracted on her Sides, with Straw, Reeds, &c. when she is on a Caren; or on the Ground; so that this is a kind of Graving.

BRUDGBOTE; or *Bridgebote*, a Law Term, signifying to be quit of giving Aid to the Repair of Bridges.

BRUMAL, is that which comes in Winter; as the *Brumal Solstice*, as some call the Winter one.

BRUSK: See *Tenny*.

BUBO, is the Groin; or Place from the Bending of the Thigh to the Privy-Parts; also a Tumour in the Groins; proceeding from the Pox or Pestilence. *Blanchard*.

BUBONOCÉLE, is a Rupture, when the Intestines fall into the Groin, or the outmost Skin of the *Scrotum*: Sometimes its taken for a Bubo or Swelling. *Blanchard*.

BUCCELLATION, by some Chymists, signifies a dividing into Gobbets.

BUCCINATOR, is the round circular Muscle of the Cheeks, thin and membranous, interwoven with various Fibres, and inseparably girt about with the Tunick of the Mouth. *Casseri* has observed a certain strong Band that grows outwardly in the Center of this Muscle, which spreading itself about the Cheek-bone, is terminated in a little slender Muscle directly opposite to that Part of the Face called *Bucca*: It arises from the Upper-Jaw-bone, and is fastned in the Lower, at the Roots of the Gums. Its Use is to move the Cheeks with the Lips; and serves as a Hand to the Teeth, whilst it tosse the Meat too and fro, and throws it upon the Teeth, that it may be more exactly chewed. This Muscle hath the Name of *Buccinator* from its forcing out the Breath of Trumpeters. Mr. *Cowper* saith, it springs not from the Ends of the Upper, nor Ends in that of the Under Jaw, nor is it of that Figure which vulgar Anatomists pretend, nor intermix'd with various Orders of Fibres; but that it arises broad and fleshy from the Fore Part of the *Processus Coronæ* of the lower Jaw, and from hence proceeding with direct Fibres, it adheres to the Gums of both the Jaws, and is so inserted to the Angle of the Lips. Besides its use in blowing the Trumpet, Horn, &c. it pulls the Mouth to one Side.

BUCOLICKS, are Pastoral Songs or Poems, such as the *Eclogues* of *Virgil*, and the *Idyls* of *Theocritus*.

BUDGE Barrels, are small Barrels filled with Gun-powder, having a Purse or Case of Leather made fast over their Head to prevent the Powder's taking Fire; they are used to carry the Powder in a-board a Ship.

BULBOUS Roots, are such as are described in the Word *Bulbus*.

BULBUS, in Botany, signifies the round Root of a Plant encompassed about with many Coats (like an Onion) one within another; or else set round thick with many small Scales; and which sends out many Strings or Fibres from the Bottom of the Bulb, or Base of the Root.

BULIMOS, or an Ox-like Appetite, that is, when the Hunger is somewhat greater than that

which is called *Fomes Canina*, or when the Stomach craves, but cannot receive, whereas in the other Case, the Eating is answerable to the Appetite. *Blanchard*.

BULK of a Ship, is her whole Content in the Hold for the Stowage of Goods.

BULK-HEADS, are Partitions made a-cross a Ship with Boards of Timber, whereby one Part is divided from another. The *Bulk-head* afore is the Partition between the Fore-Castle and Grating in the Head, and in which are the *Chafe Ports*.

BULLION, is taken for Gold or Silver in the Mafs or Billet; it is also the Place where Gold or Silver is brought to be tried and exchanged.

BULRUSH-BRIDGE, in Fortification, is a Bridge made of many Bundles of Bul-rushes bound together and covered with Planks, to secure a Passage over the Boggs, Marshes, and Fenny Places.

BULWARK, much the same (anciently) with a *Bastion* in Fortification: Which see.

BUNT of a Sail, is the middle Part of it, which is purposely formed into a kind of Bag or Cavity, that the Sail may receive the more Wind: It is chiefly used in Top-sails; for Courses are for the most part cut Square; or at least with a small Allowance for Bunt or Compass. They say the *Bunt* holds much *Leeward-Wind*; i. e. the *Bunt* hangs too much to Leeward.

BUNT-LINES, are small Lines made fast to the Bottom of the Sails in the middle Part of the *Bolt-Rope* to the Crengle, and so are reaved thro' a small Block seized to the Yard; their use is to trice up the Bunt of the Sail for the better furling of it up.

BUOY: A *Buoy* at Sea is a Piece of Wood or a Barrel fastned so as to float directly over the Anchor, that so the Men that go in the Boat to weigh the Anchor may certainly know where it lies. The Term of Art is, *Stream the Buoy*, that is, let the Anchor fall while the Ship has way. From hence the word *Bouyant* signifies any thing that is floating or floatable.

To *buoy up a Cable*, is to fasten some Piece of Wood or Barrel, &c. to the Cable near the Anchor, that the Cable may not touch the Ground when they suspect the Ground to be foul (that is, Rocky) lest the Cable should be fretted and cut off.

BUOYS, are also used at Sea to discover Rocks and Shelves, by being fastned over them.

BURBREACH (a Term in Law) is to be quit of Trespasses committed against the Peace in City or Borough.

BURGAGE, is a Tenure proper to Cities, Boroughs and Towns, whereby the Burghers, Citizens or Townsmen, hold their Lands or Tenements of the King, or other Lords, for a certain Rent.

BURGMOTE, is a Court of a Borough or City.

BURGHBOTE, is a Contribution towards the Building or Repairing of some Castles or Walls of Defence, or towards the Building of a Borough or City: From which Duty several Persons had obtained an Exemption by the Ancient Charters of our *Saxon* Kings; whence the Word is often taken for the Liberty or Exemption from such Customary Service.

BURGLARY, naturally signifies the Robbing of a House, but in a Legal Sense is a Felonious entering

tring into another Man's Dwelling; wherein some Person is, or into a Church in the Night-time, to the End to commit some Felony, or to Kill some Man, or to Steal somewhat thence, or do some other Felonious Act, albeit he executes not the same.

BURNING-GLASS. One M. *Villette* made a Metalline Burning Conclave at *Lyons in France*, of a round Figure, 30 Inches Diameter, and of about 100 lb. weight. The *Focus* or burning Point being distant from the Conclave about 3 Foot; and its Bigness, that of $\frac{1}{2}$ of a *Louis D'Or*: It would melt Iron in 40 Seconds, Silver in 24, Copper in 42; and turn'd Quarry Stone into Glass in 45, and Mortar in 53 Seconds: It melted a piece of Watch Spring of Steel in 9 Seconds. *Phil. Transf. N. 6.*

After that *Villette* made another of 34 Inches Diameter, which would melt all sorts of Metals of the thickness of a Crown Piece in less than a Minute, and vitrify Brick in the same time. *Phil. Transf. N. 49.*

Francis Smithwick, Esq; F. R. S. produced before the Royal Society, Feb. 27. 1664, 2 Burning Concave Glasses, of a Figure not Spherical; one of 6 Inches Diameter, and its *Focus* 3 Inches distant from the Center; the other of the same Diameter but less Concave, and its *Focus* 10 Inches distant. Those when approached to a large Candle lighted, did somewhat warm the Faces of such as were 4 or 5 Foot distant at least; and when held to the Fire, burned Gloves and Garments at 3 Foot distance from the Fire: He did also with the deeper of them, in the presence of Bishop *Ward*, turn a Piece of Wood into Flame in 10 Seconds of Time, and with the shallower in 5 Seconds, in *Autumn*, about 9 in the Morning, and the Weather gloomy. *Phil. Transf. N. 33.*

BURNING-ZONE: See *Zone*.

BURSALIS: *Vid. Marsupialis.*

BURTON, on Board a Ship, is a small Tackle to be fastned any where at pleasure, consisting of two single Pulleys: Its use is to hoist small things in or out: and this will purchase more than a single Tackle with two Blocks.

BUST, is a Term in Sculpture, signifying a Figure or Statue of but one half of a Human Body; the Head, Shoulders and Breasts appear, but no Arms, and it is made tapering from the Breast downwards.

BUSTROPE, *i. e. Boum Versatio*, the turning of Oxen when they Plow the Ground: This (as

Marius Victorinus tells us) was the Antient manner of Writing among the *Romans*, who at first writ as it were in Furrows, the first Line beginning at the Left-hand went to the Right, and then the second beginning at the Right-hand was continued back to the Left; and so it lookt like the Furrows of Land Plowed by Oxen.

BUTT, in the Sea Language, is the End of any Plank which joins to another on the outside of a Ship under Water; and therefore when a Plank is loose at one end, they call it *Springing a Butt*; to prevent which, Ships are usually bolted at the *Butt Heads*, that is, at the Planks End.

BUTTER of *Antimony*, or as some call it, the *Ice Oyl* of that Mineral is a great *Caustick* made by uniting the Acid Spirits of Sublimate Corrosive with Regulus of Antimony, thus,

Six Ounces of Regulus is mix'd with a Pound of Sublimate, both powdered, and then the matter is put into a Glass Retort, whose half must be empty; Distill in Sand with a small Fire at first, a little clear Oyl; then encrease the Fire, and a white thick Liquor like Butter will come forth; which if a Pan of Coals be not applied to melt it, will choke up, and it may be, break the Neck of the Receiver; continue the Fire till the Red Vapours come. Then unlute the Receiver, and if you have a mind to recover the Mercury, apply another filled with Water in its room, the Quicksilver will run over into the Water. This *Butter of Antimony* is used to eat Proud Flesh, and to cleanse Ulcers.

BUTTER of *Tin*, is made after the same manner, of one part of Tin in Powder and three parts of Sublimate Corrosive; and what is very strange of this Jovial Butter, it is continually emitting Fumes, or Smoaking.

BUTTOCK of a Ship, is that part of her which is her Breadth right a Stern from the Tack upwards; according as a Ship is built broad or narrow at the Transom, she is said to have a broad or a narrow Buttock.

BUTTRESS, is an Arch or Mass of Stone serving to support the sides of a Building, Wall, &c. on the outside: They are chiefly used in such Buildings as are of the *Gothick* manner.

BY-LANDER, See *Belandre*.

BY-LAWS, are Orders made in Court-Leets or Court-Barons by common consent, for the good of those that exact them, and which extends farther than the Publick Law binds. *Blunt.*

BYQUARTILE, the same with *Biquartile*.

C A D

CABALLINE *Alloes*, is a courser fort, which being generally used by Farriers to purge Horses, is called by this Name of *Caballine Alloes*.

CABLE of a Ship, is (as is well known) a great Rope of 3 Strands, which being fastened to the Anchor holdeth the Ship fast when she rides. The Sea Terms about it are, 1. *The Cable is well laid*, that is, is well wrought or made. 2. *Serve the Cable*, or *Plat the Cable*, that is, bind it about with Ropes, Clouts, &c. to keep it from galling in the Hawse. 3. *To splice a Cable*, is to make two Pieces fast together, by working the several Strands of the Rope one into another. 4. *To Quale the Cable*, is to roll it up round in a Ring, of which the several Rolls one upon another are called *Cable Tires*. 5. They say, *Pay more Cable*, that is, let it more out from the Ship, that the Boat which carries the Anchor may the more easily drop it into the Sea; and sometimes they say *Pay cheap the Cable* (i. e.) put or hand it out apace. In the same Sense, as *Pay more Cable*, they say also *Veer more Cable*, that is, hand or let more out. When two Cables are spliced together, 'tis called *A Short of a Cable*.

CABOSED (*Spanish*) the Term in Heraldry for the Head of any Beasts, being cut off just behind the Ears by a Section parallel to the Face, or by a perpendicular Section; whereas *Couping* is usually expressed by an Horizontal one, and is never so close to the Ears as *Cabosing*.

CABURNS (in a Ship) are Lines used to bind Cables withal; they are usually made of *Rope Yarn* or *Spun Yarn*.

CACATORIA *Febris*, is an intermittent Fever (so called by the famous *Sylvius*) accompanied with a violent Purging, which is sometimes griping and very painful, extremely afflicting and weakning to the Patient.

CACHECTICUS, is one that has an ill Habit of Body.

CACHEXY, is an ill Habit of Body, proceeding from a bad Disposition of the Fluids and Humours; whence lingering Fevers, Consumptions and Dropsies are contracted: In this Disease the Face is often Pale and Discoloured, and the Body big and swollen. *Cachexia*, taken also in a large Sense, is opposite to *Diæxia*, and as a good Habit of Body is common to all sound Parts, so an ill one is propagated by all the ill Parts. Strictly, *Cachexy* is only taken for an ill Disposition of the Habit of the Body; and *Euxexia*, on the contrary, for a good Disposition of the Humours, or Blood, and Body. *Blanchard*.

CACOCHYMY, is the abundance of ill Humours in the Blood; and it is either Ulcerous, Bilious, Pituitous, Melancholick, Acid, Salt or Sharp. *Blanchard*.

CACOTHESES, *Chironium Ulcus*, or *Telephium*; is a Disease or Ulcer beyond Cure, which is called a Malignant Ulcer; this happens when an Ulcer is Callous or Sinuous, under which there sometimes lie little putrified Bones that have fallen down. *Blanchard*.

CADENCE, or *Clofe*, in Musick, is a kinds of Conclusion of the Tune, which is made of all the Parts together in divers Places of any Key.

C A L

CADUCUS *Morbus*, or the *Epilepsy*, is a Convulsive Motion of all the Parts of the Body, more especially in the Hands and Feet, accompanied with a Deprivation of the Inward and Outward Senses.

CÆCUM *Intestinum*, the Blind Gut, so called because one End of it is shut up inasmuch that *Fæces* and *Chyle* both come in and go out at the same Orifice. Its Use in Man is obscure, as being very small and commonly empty.

CÆSAREAN *Section*, the cutting open of a Woman's Belly or Womb, to make way for the Child to be taken out.

CÆSURA, in Grammar, is when in a Latin or Greek Verse there remains a Syllable after a Foot, and that Syllable ends the Word. Of this they reckon four sorts, *Triemimeris*, *Penthemiris*, *Heptemimeris* and *Ennemimeris*: Which see.

If it were not for this *Cæsura*, few Verses could be made to run well; as is plain in these two, where there is no *Cæsura* at all,

*Auræa Carmina, Juli, scribis, maxime vaturn
Urbem fortem cepit nuper fortior Hostis.*

CAISSON, or Superficial *Fourneau*, is a Wooden Case or Chest, into which 3, 4, 5, or 6 Bombs, according to the Execution they are to do, or as the Ground is firmer or looser (sometimes the Chest is, only filled with Powder) when the Begged dispute every Foot of Ground, this *caisson* is buried under some Work the Enemy intends to possess himself of, and when he is Master of it, they fire it by a Train conveyed in a Pipe, and so blow them up. Thus they say after the Mine had destroyed the Bonnet, *A Caisson was buried under the Ground thrown up, and the Enemy advancing to make a Lodgment on the Ruins of the Bonnet, the Caisson was fired, and blew up the Post the second time.*

CAISSON, is also a covered Waggon to carry Bread or Ammunition.

CALAMUS *Scriptorius*, is a certain Delatation in or about the 4th Ventricle of the Brain, whose lower Part is inserted into the *Medulla Oblongata*, making there a Cavity in Shape of a Pen; whence it was anciently called *Calamus Scriptorius*.

CALCANEUS, or Os *Calcis*, the *Heel Bone*, is a Bone of the *Tarsus*; it lies under the *Astragalus*, to which it is articulated by the *Ginglymus*. Behind it has a large Protuberance which makes the Heel, and into which the *Tendo Achillis* is inserted; and before it has a Cavity which receives a Part of the Os *Cubiforme*.

CALHOIDEA, are three little Bones in the Foot, which, with others, make up that Part of the Foot succeeding the Ankle; and *Fallopins* calls them *Cuneiformia*, because they are made like Wedges.

CALCINATION, is the Solution of a mixed Body into Powder by Fire, or any corroding things, as *Mercury*, *Aquaforris*, &c. and when Horns, Bones, Hoofs, &c. are hanged over boiling Water (or other Liquor) till they have lost their Mulcilage and will easily be powdered, this by some Chymists, is called *Calcination Physyosophical*.

CAL-

CALCINATION of Copper : See *Æs Ustum*.

CALCINATION of *Flints*, or of *Crystal*, *Pebbles*, &c. is made by heating them red hot, and then casting them, whilst so, into cold Water or Vinegar ; for after this is done 4 or 5 times, they will be very friable, and easily powdered, for which end they are calcined.

CALCINATION of *Lead*, melt the Mettle in an Earthen Pan unglazed, keep it stirred over the Fire with a *Spatula*, till it be reduced into a Powder. This is what they call *Calx* of *Lead*, and by this Means the Metal is made more open and fit to be wrought upon by Acids. *Lead*, as well as *Tin*, sensibly encreases its Weight in Calcination.

CALCINATION of *Tin*. Put *English Tin* into a large Earthen Pan unglazed in a great Fire, and then the *Tin* will melt ; continue the Fire very strong for 36 Hours, stirring the Matter with an Iron *Spatula* from time to time ; then take it off the Fire and let it cool, and you will have the *Calx* of *Tin*. The *Tin* will encrease its Weight in this Operation, for 32 Ounces of Metal will yield 34 Ounces of *Calx*.

CALCINATION of *Vitriol*, is usually of the Green sort ; 'tis put over the Fire in an Earthen unglazed Pan ; the *Vitriol* will dissolve into a kind of Water ; then 'tis boiled till the Moisture be consumed, or till it return into a greyish Mass. This is called *Vitriol Calcined to Whiteness*. Then if it were kept long over a strong Fire, it would turn Red, and is then called *Colcothar*.

CALCIS : See *Calcanens*.

CALCULATION of Clock and Watch-work : See *Clock* and *Watch-work*.

CALCULUS Differentialis, is the Arithmetick of the infinitely small Differences between variable Quantities : This, in *England*, we call the *Arithmetick of Fluxions* : See *Fluxions*.

CALCULUS Integralis, is the Method of finding the proper flowing Quantity of any given Fluxion ; and is the Reverse of the *Calculus Differentialis*, which finds the Fluxion from the flowing Quantity.

CALENDAR, or *Almanack*, is a Political Distribution of Time accommodated to Use, and taken from the Motions of the Heavenly Bodies : Of this kind are those Annual Books wherein the Days of the Month, the Festivals, the Sign the Sun is in, the Sun's Rising and Setting, the Changes of the Moon, &c. are exhibited ; which we also call *Almanacks*. But the Word *Calendar* seems to come from the *Calendæ*, which, amongst the *Romans*, were the first Days of every Month.

There have been many Corrections and Reformatations of the *Calendar* : The first was made by *Numa Pompilius* ; and this afterwards was much improved by *Julius Cæsar*, and was by him called the *Julian Account*, which, in our Nation, and some other Places, is still retained, and is called *Old Style*.

Pope Gregory the XIIIth pretended to reform it again, and ordered his Account to be current, as it still is in all the *Roman Catholick Countries*, where 'tis called the *Gregorian Calendar* ; and with us *New Style* : It now begins eleven Days before ours.

A particular Account of the Nature of the *Julian* and *Gregorian Account*, see in a Book called, *The Julian and Gregorian Year* : And how both are pretended to be reform'd, see in a sticht Pamphlet called, *The Reformed Calendar* : Printed for Sam.

Manship, at the Ship near the Royal-Exchange Cornhill, 1701.

CALENDAR Astronomical : See *Astronomical Calendar*.

CALENDUS, so the *Romans* call'd the first Days of every Month, from the Greek Word *καλέω*, *voco*, to call ; because anciently counting their Months by the Motion of the Moon, there was a Priest appointed to observe the Times of the New Moon ; who having seen it, gave Notice to the President over the Sacrifices, and he called the People together, and declared unto them how they must reckon the Days until the *Nones*, pronouncing 5 times the Word *καλέω*, if the *Nones* happened on the 5th Day, or 7 times if they happened on the 7th Day of the Month.

CALIBRE, or *Caliper*, is the Bigness, or rather Diameter of a Piece of Cannon, or any Fire Arms, at the Mouth.

CALIPERS, is an Instrument made like a Sliding-Rule, to embrace the two Heads of any Cask, to find the Length. There is also the *Gunnars Calipers* or *Compasses* for finding the Diameter of the Ball, and Bore of the Gun.

CALIPER Compasses, are *Compasses* used by *Gunnars*, with crooked or bowing Legs, to measure the Diameters of Bullets and Cylinders of Guns.

CALKING or *Cauking* of a Ship, is driving in Oakum, or something of that kind, into the Seams of the Planks, to prevent the Ship's Leaking.

CALLICREAS : See *Pancreas*.

CALLIPICK Period, was an Improvement of the Cycle of *Meton* of 19 Years, which *Callippus*, a famous *Grecian Astronomer*, finding in reality to contain 19 of *Nabonassor's* Years, 4 Days and $\frac{11}{30}$ he, to avoid Fractions, quadrupled the *Golden Number*, and by that Means made a new Cycle or Period of 76 Years ; which time being expired, he supposed the Lunations or Changes of the Moon would all happen on the same Day of the Month, and Hour of the Day, that they were on 76 Years before.

CALLOUS : A Swelling is said to grow *Callous*, when 'tis hardened, as sometimes the Lips of a Wound. This is derived from

CALLUS, which is a kind of Swelling without Pain, like Skin contracted by too much Labour. *Blanchard*.

CALTHROPS : See *Chanse-trapps* or *Cowse-feet*.

CALVA, the Hairy Scalp, or upper Part of the Head, which either by Disease or Old Age grows Bald first.

CALX, in Chymistry, is that which is produced by Burning or Calcination (which see) of any Metal or Mineral in a Crucible, &c.

CALX, is the second Bone in that Part of the Foot which succeeds the Ankle, bigger and stronger than the rest ; oblong and grows backward, that a Man may stand more strongly upon it, and not fall so easily backward.

CALX also is that which by Calcining is either turned into *Alcoal*, as *Calx Saturni*, or at least is made friable, as *Hart's-Horn* burnt.

CALX of *Antimony* : See *Antimonium Diaphoreticum*.

CALX of *Gold* : Though it hath been look'd upon as a thing of great Difficulty, yet the Noble Mr. Boyle tells us, that if you grind well together a thick *Amalgama* of Gold and Mercury, with at least

least an equal Weight of finely powdered Sulphur, and then put the Mixture to sublime in a proper Glass, there will rise, by Degrees of Fire, a Cinnabar; and this will leave behind it a finer Calx of Gold than is to be had by some far more difficult Processes. See the *Mechan. Product of Volatility*.

CALYX, in Botany, signifies the Cup which contains or encloses the Flower in any Plant; and sometimes 'tis used for the Flower it self when its Figure is like that of a Rose, and not yet having its Leaves Expanded.

CAMBRING, the Sea-man say a Deck lies *Cambring* when it doth not lie Level, but higher in the Middle than at either End. Also if her Keel is bent in the Middle upwards (which may happen from her lying a-ground on a place where neither her Aft nor Fore-part do touch it, and from many other Reasons taken from her make) they say she is *Chamber-keel'd*.

CAMERA Obscura: See *Obscura Camera*.

CAMPAIGN, is a Military Term, signifying the Space of Time during which Armies are maintain'd every Year in the Field. So a Man is said to have made twenty Campaigns, when he hath spent so many Years in War-like Service in the Field.

CAMP Flying, is a strong Body of Horse and Foot commanded usually by a Lieutenant General, which is always in Motion, both to cover our own Garrisons, and to keep the Adverse Army in continual Alarm.

CANAL, is a Word frequently used by Anatomical Writers, to signify a Channel or Passage, thro' which any Juices or Fluids of the Body do flow.

CANALICULUS Arteriosus, is a Vessel betwixt the Arterious Vein in the Lungs, and the great Artery in the *Fœtus*; for its obliterated in Adult Persons: It's Use in *Fœtus*'s is, that the Blood may be discharged by this *Ductus* out of the Arterious Vein, into the great Artery, because that the Blood is not accended in the Lungs, for want of Respiration in the Womb.

CANCER, one of the 12 Signs of the Zodiack, drawn on the Globe in the form of a Crab, and thus marked ☊. Thro' the beginning of this Sign passeth a Circle parallel to the Equinoctial, called the *Tropick of Cancer*, or the Northern *Tropick*; to which Circle, when the Sun comes, it makes the *Summer Solstice*, and is turning his Course back again towards the Equinoctial.

CANCER, an Ulcerous Disease: See *Carcinoma*.

CANICULA, the same with *Canis Minor*.

CANINA Fames, or *Dogs-Appetite*, is an inordinate Hunger attended with a Vomiting and a Looseness, which proceeds from a depraved Action of the Stomach, craving Food in a greater Measure than Nature requires.

CANINI, are two Teeth in each Jaw, one on each side of the *Incisivi*; they are pretty thick and round, and they end in a sharp Point; they have each one Root which is longer than the Roots of the *Incisivi*; their proper use is to pierce the harder kinds of Meat.

CANINUS, a Muscle of the Lip, serving to put the Lips upwards.

CANIS Major & Minor, the greater and lesser Dog, are two Constellations of Stars drawn upon the Globe in Figure of this Animal; and the greater

of them hath in his Mouth that vast Star called **CANICULUS**, or the *Dog-star*, which rising and setting with the Sun from about the 24th of July to the 28th of August, gives occasion to that time which is usually very Hot and Sultry, to be called the *Canicular* or *Dog-days*.

CANNA Major: See *Tibia*.

CANNA Minor: See *Fibula*.

CANNON Royal, is a Piece of Ordnance 8 Inches Diameter in the Bore, 12 Foot long, weighs 8000 lb. its Charge 32 lb. of Powder; its Ball of 48 lb. weight, and 7 Inches $\frac{1}{2}$ in Diameter, shoots point blank 185 Paces. This is the same with a Cannon of Eight.

CANNON, a Piece of Ordnance: See *Ordnance*.

CANON, in Mathematicks, is a Rule to solve all things of the same Nature with the present Enquiry: Thus every last step of an Equation in Algebra is such a Canon, and if turned into Words is a Rule to solve all Questions of the same Nature with that proposed. Canon also is the Word for the Tables of Logarithms, Artificial Sines, Tangents, and Secants, which are of admirable use in Trigonometry. 'Tis also the Name of a Surgeon's Instrument, which they make use of when they sew up Wounds.

CANONICAL Equations: See *Quadratick Equations*.

CANON-LAW, is a Collection of Ecclesiastical Rules, Definitions and Constitutions taken from the Ancient, General and Provincial Councils, the Writings and Resolutions of the Fathers of the Church, and the Rescripts of Popes. This Law is modelled according to the Form of the Civil, and is reduced into 3 Volumes. The first is called the *Decrees of Gratian*, and is composed of the Ancient Canons, and Collected from the Ancient Councils and Writings of the Fathers.

The 2d Volume is called the *Decretals*; and doth contain the *Decretal Epistles* or *Rescripts* of Popes, and chiefly from Alexander III. to Gregory IX. by whose Authority it was compiled.

The 3d Volume is called *Sextum*; and contains the Rescripts of the Popes from Gregory IX. to Boniface the VIII. by whose Authority it was Collected. To the End of this Volume are added the *Clementina*, which are the *Constitutions* of Clement V. enacted in the Council of Vienna, as also the *Extravagants*, which are some Rescripts of Pope John XXII. and some other Popes. They were called *Extravagants*, because not contained in the Body of the *Canon Law*; which is composed of the three lately mentioned Volumes.

CANTHUS or *Hircus*, is the Angle or Corner of the Eye; which is either the greater or the Internal, or the less, or External.

CANTON, an Ordinary in Heraldry, framed of two strait Lines, one drawn perpendicularly from the Chief, and the other so from the Side of the Escutcheon. This is always less than a Quarter of the Field; and if drawn from the Left Corner of the Escutcheon, is called a *Canton Sinister*. Its Form is thus; He beareth Ermin, a Canton Argent charged with a Chevron Gules, by the Name of Middleton.

CANVAS-BAGS, or *Earth-Bags*, *Sacs a Terre*, as the French call them, are Bags holding about a Cubick

Cubick Foot of Earth, and are used to raise a Parapet in haft, or to repair one that is beaten down: They are chiefly used when the Ground is Rocky and affords no Earth to carry on the Approaches, then are these Bags of Earth very necessary, which can be filled at another place and removed at pleasure: These Bags are sometimes upon occasion filled with Powder, of which they hold about 50 Pound.

CAP, in a Ship, is a Square Piece of Timber, put over the Head or upper End of any Mast, having a round Hole to receive a Mast. By these Caps the Top-Masts and Top-Gallant-Masts are kept steady and firm in the Tressel-Trees, where their Feet stand, as those of the lower Masts do in the Steps. They call also that Piece of Lead which is put over the Touch-hole of a great Gun to keep the Prime from being wasted or spilt, the Cap of the Gun.

CAP-SQUARES, are broad Pieces of Iron on each Side of the Carriage of a great Gun, and lock'd over the Trunnions of the Piece with an Iron Pin: Their use is to keep the Piece from flying out of the Carriage, when 'tis shot off with its Mouth lying very low, or as they call it, under Metal.

CAPACITY (in Law) signifies the Ability of a Man, or Body Politick, to give or take Lands or other things, or sue Actions.

CAPACITY, in Geometry, is the solid Contents of any Body: Also our Hollow Measures for Wine, Beer, Corn, Salt, &c. are called Measures of Capacity.

CAPE, is a Writ Judicial, touching Plea of Lands or Tenements; and divided into *Grand-Cape* and *Petit-Cape*, both which takes hold of things immoveable, and seem to differ in this, that the *Grand-Cape* lieth before Appearance, and *Petit-Cape* afterwards.

CAPE, or Promontory is any high Land running out with a Point into the Sea, as *Cape Verde*, *Cape-Horn*, the *Cape of Good Hope*, &c.

CAPE *Parvum*, is a Writ that lieth in case where the Tenant is summoned in Plea of Land, and cometh at the Summons, and his Appearance is of Record; and after he maketh Default at the Day that is given to him, then this Writ shall go for the King.

CAPE *ad Valentiam*, is a Writ of Execution or a Species of *Grand Cape*, so called of the End whereunto it tendeth: In the *Old Nat. Erev.* it is thus described; This Writ lieth, where any impleaded of certain Lands, and he vouches to warrant another, against whom the Summons *ad Warrantizandum* hath been awarded, and the Vouchee comes not at the Day given; then if the Demandant recover against the Tenant, he shall have his Writ against the Vouchee, and shall recover so much in Value of the Vouchee's Land, if he have so much; and if he have not so much, then the Tenant shall have Execution by this Writ, of such Lands and Tenements as descend to him in Fee-simple; or if he purchase afterwards, the Tenant shall have against him a Re-summons, and if he can say nothing, he shall recover the Value.

Note, This Writ lies before Appearance.

CAPELLE, a bright fixed Star in the Left Shoulder of *Ariga*, whose Longitude is 77 Deg. 16 Min. Latitude 22 Deg. 50 Min. Right Ascension 73°. 7'.

CAPIAS, is a Writ of two sorts, one before Judgment, called *Capias ad Respondendum*, in an Action Personal, when the Sheriff upon the first Writ of Distress, returns *nihil habet in ballive nostra*; and the other is a Writ of Execution after Judgment, which are of divers kinds, as these following.

CAPIAS *conductus ad proficiendum*, is a Writ for taking up such as having received Prest Money to serve the King, flink away, and come not in at the time: This is an Original Writ directed to the Serjeant at Arms, to arrest and bring them in, having included a Clause of Assistance.

CAPIAS *pro fine*, is, where one being by Judgment fined unto the King, upon the same Offence committed against a Statute, doth not discharge it according to the Judgment, for by this is his Body taken and committed to Prison, until he content the King for his Fine.

CAPIAS *ad Satisfaciendum*, is a Writ of Execution after Judgment, lying where a Man recovers in an Action Personal, as Debts, or Damages, or *Detinue* in the King's Court; and he against whom the Debt is recovered, and hath no Lands nor Tenements, not sufficient Goods, whereof the Debt may be levied: For in this Case he that recovereth shall have this Writ to the Sheriff, commanding him, that he take the Body of him against whom the Debt is recovered, and he shall be put in Prison until Satisfaction made.

CAPIAS *uilegatum*, is a Writ of Execution which lieth against him that is out-law'd upon any Suit, by which the Sheriff, upon the Receipt thereof, apprehendeth the Party out-lawed for not appearing upon the *Exigent*, and keepeth him in safe Custody till the return of the Writ, then bringeth him into Court, there further to be ordered for his Contempt.

CAPIAS *uilegatum & Inquiras de bonis & catallis*, is a Writ all one with the former, but it gives a farther Power to the Sheriff, besides the Apprehension of his Body, to enquire of his Goods and Chattels.

CAPIAS *in Withernamum de homine*, is a Writ that lieth for a Servant in *Withernam*.

CAPIAS *in Withernam de Averis*, is a Writ that lieth for Cattle in *Withernam*.

CAPILLAMENTS, *Capillamenta*, are those small Threads or Hairs (whence the Word) which grow up in the middle of a Flower, and are adorned with little Knops at the Top: Those Knops are called the *Apices* of a Flower; and these *Capillaments* are called the *Stamina*.

CAPILLARY Plants, are such as have no main Stalk or Stem, but grow to the Ground, as Hairs to one's Head, and which bear their Seeds in little Tufts, Bunches or Protuberances on the Back-side of their Leaves, whence by some they are called *Dorsipare* and *Tergiferae*. And these are either with an

Undivided Leaf, as the *Hemionitis* and the *Phyllitis*; or with a

Singly divided Leaf; and these have the Leaf either cut or jagged in, but not divided into *Pinne* clear home to the main Rib; as *Polypodium*, *Lonicitidis*, *Scolopendria*, *Adiantum*, *Acrostichon Thal*.

Or else divided quite home to the Rib, and hanging like *Pinne*; as the *Chamaefelix Marina* and the *Trichomanes*. Others have the Leaf

Doubly divided, or at least once subdivided; the first Division being into *Branches*, and the 2d into *Pinne*;

Pinne;

Pinne; as the *Hemionites Multifida*, the *Filix mas*, the *Filix Palustris*, *Filix Saxatilis*, the *Adiantum Album*, and *Nigrum*. And others have the Leaf

Treble divided, or twice subdivided, viz. first into Branches, then into little Twigs, and after this into *Pinne*; and these are the *Filix Scandens* of *Brasile*, the *Filix Florida* or *Osmunda Regalis*, the *Filix mas Ramosa*, the *Filix Femina Vulgaris*, the *Adiantum album Floridum*, and the *Dryopteris Nigra*. Ray's *Historia Plantarum*.

CAPILLARY Vessels, small Veins and Arteries, like Thread or Hairs.

CAPILLATION, according to some Writers, is a Fracture in the Skull, so small that it can scarce be found, which yet often proves mortal.

CAPITATÆ Plantæ, in Botany, are such Plants whose Flowers are composed of many edged and hollow little Flowers; and Mr. Ray calls them by this Name, because their Scaly Calyx (or Cup of the Flower) most usually swells out into a large and round Belly, containing within it the Pappous Seed; as *Carduus*, *Centaury*, *Knopweed*, *Cinara*, *Cirsium*, *Lappa maj.* *Gyanus*, &c.

CAPITAL of a Bastion, in Fortification, is a Line drawn from the Angle of the Polygon to the Point of the Bastion, or from the Point of the Bastion to the Middle of the Gorge. These *Capitals* are from 35 to 40 Fathom long, that is to say, from the Point of the Bastion to the Place where the two Demigorges meet.

CAPITAL Line: See *Line*.

CAPITAL, or *Chapital*, or *Chapiter*, signifies in Architecture the Top of a Pillar; and this is different, according to the different Orders.

CAPITE, is a Tenure that holds immediately of the King, as of his Crown, be it by Knightservice or Soccage, and not of any Honour, Castle or Mannor.

CAPITULUM, in Botanicks, is the Head or Flowing Top of any Plant, being composed of many Flowers and Threads (or *Stamina*) closely connected in a Globous, Circular or Discous Figure; as the Flowers of *Blew-bottles*, *Scabiins*, *Carduus*, &c.

CAPONNIERE, in Fortification, is a covered Lodgment of about 4 or 5 Foot broad, encompassed with a little Parapet of above two Foot high, which serves to support the diverse Planks laden with Earth.

This Lodgment is large enough to contain 15 or 20 Soldiers, and is usually placed upon the Extremity of the Counterfarp, having sometimes several little Embrasures made therein, commonly called *Mardresses*. They are generally on the Glacis, or in dry Moats.

CARPÆ Saltantes, is the Term for a fiery Meteor or Exhalation which sometimes appears in the Atmosphere, and is not fired in a straight Line, but with Inflexions or Windings in and out.

CAPEOLARIA Vasa, in an Animal Body, are such as twine about like the *Capreoli* or Tendrils of Vines.

CAPREOLUS, in Botany, is the Clasp or Tendril, by which the Vines and such like creeping Plants fasten themselves to those things which are designed to support them.

CAPREOLATÆ Plantæ, are such Plants as turn, wind and climb along the Surface of the Ground, by Means of their *Capreoli* or Tendrils; as *Gourds*, *Melons*, *Cucumbers*, &c.

CAPRICORN, the Goat, one of the Zodiacal Signs marked thus, ♈: Through the first Degree of it, the Southern Tropic, or the Tropic of *Capricorn* passes at 23°. 30'. Distance from the Equator.

CAPSTAN, or as the French write it *Cabestan*, others *Capstaud*, of a Ship, is of two kinds, the Main *Capstan*, and the *Jeer Capstan*.

The Main *Capstan* is that piece of Timber which is placed next behind the Main-Mast, its Foot or lower End standeth in a *Step*, on the lower Deck; and its Head is between the two upper Decks. Its several Parts are thus called; the smallest Part of it the *Spindle*; the Brackets set unto the Body of the *Capstan* close under the *Barrs*, they call the *Whelps*. The main Substance or Post of the whole Piece is the *Barrel*, through which the *Barrs* go. The *Pawl* is a Piece of Iron, bolted to one End of the Beams of the Deck, close to the Body of the *Capstan*; to stop the *Capstan* from turning back; and this Stoppage they call *Pawling the Capstan*. The use of the *Capstan* is to weigh the *Anchors*; to hoise up, or strike down *Top-Matts*; to heave any weighty thing, or to strain any Rope that requireth main force.

The *Jeer Capstan* is placed in the same manner as the Main *Capstan*; between the Main-Mast and the Fore-Mast, and its Use is chiefly to heave upon the *Jeer Rope* (which see) or to heave upon the *Viol*, and to hold off by when the Anchor is weighing.

The Terms belonging to the Use of the *Capstans* are, *Come up Capstan*, that is, slack the Cable which you heave by; in which Sense also they say, *Launch out the Capstan*; *Pawl the Capstan*, is, stop'd it from going back, as was above hinted.

CAPSULA Communis, of *Glisson*, is a Membrane proceeding from the *Peritoneum*, and including both the *Porus Biliaris* and the *Vena Portæ* in the Liver.

CAPSULA Seminalis, in Botany, is the *Cafe* or *Husk* that holds the Seed of any Plant.

CAPSULÆ Atrabilarie, the same with the *Renes Succenturiari*: Which see.

CAPSULÆ Seminales, in Anatomy, are the extreme Cavities of the Vessels which convey the *Semen* in an Animal Body; they are dilated like little Coffers, which by two small Holes emit the *Semen* received from the Testicles into the little Seminary Bladders, that it may either be preserved there against the time of Coition, or be reduced into Blood by the Lymphetick Vessels. *Blanchard*: See *Testes* and *Testicle*.

CAPTION, when a Commission is executed, and the Commissioners Names subscribed, and returned, that is called the *Caption*.

CAPUT Mortuum, is that thick dry Matter that remains after Distillation of any thing, but of Minerals especially; and very commonly it denotes only that which remains of *Vitriol* in its Distillation, which they call *Colcothar Vitrioli*: See *Earth* and *Terra Damnata*. This *Caput Mortuum*, though in some Cases there be but little, if any, Active Principle left in it, yet is never pure, and the *Colcothar Vitrioli*, if exposed to the Air, will turn into *Vitriol* again.

CARAT: A *Carat* of Gold is properly the Weight of 24 Grains or one Scruple; so that 24 Carats make an Ounce.

If an Ounce of Gold be so pure, that in its Purification (with Antimony, or otherwise) it loses nothing at all; 'tis then said to be Gold of 24 *Carats*: If it lose one *Caret*, 'tis then Gold of 23 *Carats*; and if it lose two *Carats* in its Purification, 'tis called Gold of 22 *Carats*, &c. But perhaps there is no such thing as Gold of 24 *Carats*, for it will retain some small Portion of Silver or Copper, putrify it as long as you will.

A *CARAT* of Diamonds, Pearls, or Precious Stones, is the Weight of four Grains only.

CARBUNCULATION, is the blasting of the new sprouted *Buds* of Trees or Plants, either by excessive Heat, whereby the Texture of the Fibres of the Vegetable are so dissolved, that its Pores become wholly changed; or else by excessive Cold, which compresses its Fibres so, that the Pores thereby are shut up, and leave no Passage for the Alimentary Juice.

CARBUNCULUS, the same with *Ambrax*.

CARCUS, is an Iron Case or hollow Capacity about the Bigness of a Bomb, sometimes made all of Iron (except two or three Holes through which the Fire is to blaze) and sometimes made only of Iron Bars or Hoops, and then covered over with Pitched Cloth, Hemp, &c. and filled with several kinds of Materials for firing of Houses: They are thrown out of Mortar-Pieces, like Bombs, into Besieged Places, &c.

CARCINODES, a Tumour resembling a *Cancer*. *Blanchard*.

CARCINOMA, *Carcinus*, or *Cancer*, is a Tumour that arises round, hard, livid, painful; at the Beginning as big as a Pea, but afterwards its surrounded with great swelling Veins, which resemble the Feet of a Crab (though not always) whence the Name. *Blanchard*.

CARD: See *Chard*.

CARDIACA, is a Suffocation of the Heart from a Polypus or coagulated Blood. *Blanchard*.

CARDIADICUM, a *Cordial*, is a Medicine which (as they formerly thought) corroborates the Heart; but it rather only puts the Blood into a fine gentle Fermentation, whereby the Spirits formerly decayed, are repaired and invigorated, so that the Blood, by consequence, circulates more easily and briskly.

CARDIACUS Plexus, is a Branch of the eighth Pair of Nerves of the *Par Vagus*, which about the first or second Rib, is sent from its descending Trunks, and is bestowed upon the Heart and its Appendage.

CARDIALGIA, is a gnawing Pain sometimes felt in the *Scrobiculus Cordis*; or, as *Blanchard* saith.

CARDIALGIA and *Cardiognor*, the Heart-burning, is a Gnawing or Contraction of the Nerve, called *Par Vagus*, and the intercostal implanted in the Stomach, proceeding from a pungent vellicating Matter in the Ventricle; so that the Heart being strained and contracted by Consent with the Stomach, occasions sometimes a Swooning away.

CARDINAL Winds or *Points*, are the South, West, North and East Points of the Compass; and also the Equinoctial and Solstitial Points of the Ecliptick, are called the 4 *Cardinal Points*.

CARDINAL Signs, are those Signs of the Zodiac called *Aries*, *Libra*, *Cancer* and *Capricorn*.

CARDIOGMOS, the same with *Cardialgia*.

CAREEN: A Ship is said to be brought to a *Careen*, when the most Part of her Lading, &c. being taken out, there is laid by her Side another

Ship or Vessel lower than her, unto which she is haled down as low as Occasion requires, as to the 4th or 5th Strake, and there kept by the Weight of Ballast, Ordinance, &c. as well as by Ropes, lest it should strain her Masts too much. 'Tis done with a Design to trim her Sides or Bottom, to caulk her Seams, or to mend any thing that is at fault under Water: And from hence if a Ship lie on one Side when she Sails, they say, *She Sails on the Careen*.

CARIATIDES: See *Caryatides*.

CARIES, is the Corruption of a Bone from the continual Afflux of vicious Humours, or from their Acrimony and Malignity, or from a Bruise that some way affects the Bones, or from sharp Medicines, &c. *Blanchard*.

CARINA, is a Term used both by the Anatomists for the first Rudiments of the entire *Verrebra*, as they appear in a Chicken's Embryo while 'tis in the Shell, because it is crooked in the Form of the Keel of a Ship. And also the Botanists for the same Reason use the Word *Carina*, to express the lower *Petalum* of a *Papilionaceous* Flower. The Leaves also of the *Alphodelus* they say are *Carinated*.

CARLING Knees, are those Timbers which go athwart the Ship, from her Sides to the Hatchway, and which bear up the Deck on both Sides.

CARLINGS, are Timbers in a Ship lying Fore and Aft along, from one Beam to another; on these the Ledges rest, on which the Planks of the Deck are made fast. All the *Carlings* have their Ends let into the Beams, which is called *Culvertail*.

CARMINATIVE Medicines, are Remedies that dispel or discuss Wind, either by appeasing the Fermentations that occasion it, or by making it thin, and opening the Pores that it may be expelled. *Blanchard*.

CARNATION, is a Term in Painting, signifying such Parts of an Human Body as are drawn naked, without any Drapery, or which express the bare Flesh; and when this is done Natural, Bold and Strong, and is well coloured, they say of the Painter, that his *Carnation* is very good.

CARNEL, the Building of Ships first with their Timber and Beams, and after bringing on their Planks, is called *Carnel-Work*, to distinguish it from *Clineb-Work*. Those Vessels also which go with *Mizen-Sails* instead of *Main-Sails*, are by some called *Carnels*.

CARNIVEROUS Animals, are such as feed on Flesh wholly or chiefly.

CARNOSITY, is a more than ordinary Fleishiness in any Part of the Body.

CARNOUS, Flethy; whence the *Membrana carnoſa* or *Panniculus carnosus* takes its Name, which is a Flethy Membrane covering the whole Body.

CARO, the Fleth of an Animal Body, is by Anatomists defined to be a Similar and Fibrous Part, soft and thick: They account it Five-fold; 1. *Muscular*, *Fistular* or *Fibrous*, as is the Substance of the Heart and other Muscles. 2. *Parenchymous*, as the Lungs, Liver and Spleen were thought to be by the Accidents: But since the use of Glasses, 'tis plainly discovered, that there is no such thing as a *Parenchyma*, properly speaking, but that all the *Viscera*, as well as other Parts of the Body, are *Vascular*, and nothing but a *Plexus* or Net-work of small Vessels and Canals. They call the Fleth of the Stomach and Guts. 3. *Viscerous*; and they reckon a Fourth sort, which they call *Glandulous*; as is

that of the Pancreas, the Tonfils, the Breasts, &c. And, 5. They call the Flesh of the Lips, Gums, of the Glans of the Penis, &c. *Spurians*, as being of a different Constitution from all the rest.

CARO, a Botanic Word for the Pulp, Flesh or soft Substance contained within any Plant, or its Fruit, such as the Pulp of *Cassia*, *Tamarinds*, *Prunes*, &c.

CAROTIDES, are Arteries in an Animal Body so called; they spring from the ascending Trunk of the *Aorta* or great Artery at the same Place, nearly where the Subclavian Arteries arise; here the Trunk begins to be divided into two Branches, which are these *Carotides*; they ascend directly upwards (though the Right sometimes arises from the right *Subclavian*) and at their rise are sustained by the *Thymus*; then having bestowed Twigs on the Larynx, Tongue, the Muscles of the *Os Hyoides*, and the adjacent Glands, they pass up on each Side by the Sides of the Wind-Pipe to the *Faucet*, together with the Internal Jugular Vein, and there are subdivided into the *External* and *Internal* Branches.

The *External* is smaller, and is dispersed into all the Muscles of the Cheeks, Forehead, Temples, Lips, and in general, through all the outer Parts of the Head and Face.

The *Internal*, which is larger, sends first some more Twigs to the Larynx, Tongue, and so also to the Glands behind the Ears, and the spongy Parts of the Palate and Nose: Then it entrenches the upper Jaw, and bestows a small slip on the Root of each Tooth (as the *External* did on the Roots of the Teeth of the lower Jaw) whereby sharp Humours flowing in upon them, sometimes cause a very painful Tooth-ach. The remainder of it climbs upon the Skull, being about its *Basis* divided into two Branches; the *left* and hinder whereof having sent one slip to the inner Muscles of the Neck, and another through the Hole of the uppermost *Ventebra* into the Membrane that invests the Spinal Marrow, ascending further, enters the Skull at the Hole by which the sixth Pair of Nerves (commonly called) comes out, and creeping along the *Dura Mater*, ends near its *Sinus* (which yet some say it enters.) The larger Branch, tending upwards, is carried through the bony Channel in the Wedge-like Bone, with a winding Duct to the *Sella Equina*; at whose *Basis*, after it hath sent out a Twig on each Side into the *Dura Mater*, it opens it self into many small Slips, which being interwoven with those of the Cervical Artery (above-mentioned) make the *Rete Mirabile*, which is more observable in Beasts than in Men, yet it is not all spent on the said Slips, but perforating the *Dura Mater*, it enters the *Pia Mater*, with two notable Branches, which being divided into very small Twiggings, are mingled with those of the Cervical Artery, with which they pass out of the Skull, and accompany the Spinal Marrow even to the Loins. Afterwards it sends a small Branch thro' the second Hole of the Wedge-like Bone with the Optick Nerve, out of the Skull to the Eye: And yet still supplying more Twigs to the Substance of the Brain and *Pia Mater*, and being united with some other Twigs of the Cervical Artery, it makes the *Plexus Choroïdes*.

CARPIA, is a Tent that is put into a Wound or Ulcer to cleanse it.

CARPUS, commonly *Brachiale*, the first Part of the Palm of the Hand: *Hesychius* calls it that

Part of the Arm which is betwixt the lowermost Part of the Cubit and the Hand, or the Wrist; it consists of eight small Bones, with which the Cubit is joined to the Hand. *Blanchard*.

CARRIAGE of a great Gun, is the Frame of Timber on which a Piece of Ordnance is laid, fixed and mounted. The common Proportion is $1\frac{1}{2}$ of the Length of the Gun for the Carriage, the Wheels $\frac{1}{2}$ of the Length of the Piece in Height, and 4 times the Diameter of the Bore of the Gun, gives the Depth of the Planks at the Fore-end, in the Middle $3\frac{1}{2}$.

CARTILAGE, is a white Part, drier and harder than a Ligament, and softer than a Bone; it is by some said to be a similar and Spermatick Part, but falsely; for it's no more made of Seed, than any other Parts; it renders Articulation more easy, and defends several Parts from the Injuries from abroad. In aged Persons the Cartilages commonly grow Bony.

They have a Membrane just like the *Periosteum*, and 'tis indeed but a Continuation of it.

CARTOUCHE, the same with Carriage.

CARTRIDGES, or *Carthyages*, are Cases of Paper, or as they now are usually made for the King's Ships, to prevent Danger from Fire in a Gun not well spunged, of Parchment; fitted exactly to the Bore of a Piece of Ordnance, and containing its due Charge of Powder. There are also Tin Cartridges, in which the Paper or Parchment ones are both formed and carried.

CARUNCULÆ *Myrtiformes*, are the Wrinklings of the Orifice of the *Vagina*, or Membranous Inequalities; not to be reckoned in any certain Number, which in Women with Child, and after Child-birth are so obliterated, that they are altogether imperceptible; there are for the most part four of them. *Blanchard*.

CARUNCULÆ *Oculi*, are Glandules placed at each great Corner of the Eye, which separate Moisture for moistening the Eyes, the same with Tears, which afterwards by the *Puncta Lachrymalia*, placed in the Bone of the Nose, are discharged into the Nostrils. These are called *Caruncule Lachrymales* by some.

CARUNCULÆ *Papillares*, are Ten little Bodies that are in the Reins and Kidneys; they are properly little Bundles, which arise from the centring together of a great many small Channels, which the Reins are in a great measure made up of; and those receive the *Serum* from the little *Ductus's*, and convey it into the *Plexis*. *Blanchard*.

CARUS, is a Sleep, wherein the Person affected being pulled, pinched and called, scarce shews any sign of either hearing or feeling; it is without a Fever, greater than a Lethargy, and less than an Apoplexy. *Blanchard*.

CARYATIDES, an Order of Pillars in Architecture, in the Form of the Bodies of Women with their Arms cut off, and clothed in a Garment down to their Feet: These Figures do support the *Entablature*. There are some Columns of this Order in the famous Building at Bourdeaux, called the *Tuelleres*; and in the Great Hall of the *Swiss* Guards at the *Lowre* in *Paris*; where four *Caryatides* support a Gallery enriched with Ornaments very well cut.

The rise of this order of Pillars was this; The Inhabitants of *Carya* in *Peloponnesus* did once treacherously join with the *Persians* against their own Country; but the *Grecians* got the Battle, and put

put all the Male Inhabitants of *Carya* to the Sword, educating the City to Ashes. The Women they took Captives, and carried in Triumph: And the more to perpetuate the Memory of this base Action, they would not permit these Women ever to put off their Triumphal Vêtements; but ordered the Architects of those times to express them in that dress, as supporting the heavy Weight of their Edifices, instead of usual *Columns*.

The *Perfick Order of Pillars* had much the same Original: Which see. *Vitruv. lib. 2. c. 1.*

CASCABELL, is the hindermost round Knob or the utmost part of the Breech of a Piece of Ordnance.

CASCADE, an *Italian* Word, signifying a fall of Water, whether Natural or Artificial.

CASCAN, in Fortification, is a certain Hole or hollow Place in Form of a Well, from whence a Gallery dug in like manner under Ground is convey'd, to give Air to the Enemy's Mine. Some of these *Cascans* are more hollow than others, being usually made in the Retrenchment of the Platform near the Wall.

CASEMATE, in Fortification, sometimes is the Well with its several Subteraneous Branches or Passages dug in the Passage of the Bastion till the Miner is heard at work, and Air given to the Mine.

Also a certain Vault made of Mason's Work, in that Part of the Flank of a Bastion which is next the Curtain, on purpose to fire upon the Enemy, and to defend the Face of the opposite Bastion of the Moat.

Sometimes it consists of 3 Plat-forms one above another, the *Terreplan* of the Bastion being the highest. Behind the Parapet, which fronts along the Line of the Flank, there are Guns placed laden with Cartridges of small Shot to scour along the Ditch; and these are covered from the Enemy's Batteries by Earth-works Faced or Lined with Wall, and are called *Orillons* or *Epaulemens*. This is the best Defence a Place can have.

CASERN, in Fortification, is a little Room, or Lodgment, or Building, erected between the Rampart and the Houses of Fortified Towns, to serve as Apartments or Lodgings for the Soldiers of the Garrison, to ease the Garrison: There are usually 2 Beds in each *Casern* for six Soldiers to lie 3 and 3; but the third part being always on the Guard, there are but 4 left in the *Casern*, 2 in a Bed.

CASE-SHOT, is when Musket-Bullets, Stones, old Pieces of Iron, &c. are put up into Cafes and so shot out of great Guns. 'Tis chiefly used at Sea to clear the Enemy's Decks when they are full of Men.

CASKETS (in a Ship) are small Strings made of Sinnet, and fastened to the upper Part of the Yards in little Rings (which they call *Grommets*.) Their use is to fasten the Sail to its Yard when 'tis to be furl'd up. The biggest and longest of these is in the middle of the Yard, just between *Tyes*, and is called the *Breast Casket*.

CASSIOPEA, or *Cassiopeia*, the Name of one of the Constellations of the fix'd Stars in the Northern Hemisphere, consisting of 25 Stars, and is placed opposite to the *Great Bear* on the other side the *Pole Star*.

CAST a *Point of Traverse*, in Navigation, signifies to prick down on a *Chart* the Point of the Compass any Land bears from you, or to find on what

Point the Ship bears at any instant, or what Way the Ship has made.

CASTOR, a fix'd Star of the second Magnitude in *Gemini*, whose Longitude is 105°. 41'. Latitude 10°, 2'.

CASTOR and *Pollux*, are two *Meteors* which sometimes in a great Storm at Sea appear flicking to some part of the Ship, in the shape of Balls of Fire. Sometimes one is seen and then 'tis call'd *Helena*; both of them are by some call'd *Tyndarides*.

CASTOR and *Pollux*, a Constellation of the fix'd Stars; the same with *Gemini*, being one of the 12 Signs of the *Zodiack*.

CASU *Consimili*, is a Writ of Entry, granted where the Tenant by Curtesy, or Tenant by term of Life, or for the Life of another, doth alien in Fee, or in Tail, or for the Term of another's Life.

CASU *Proviso*, is a Writ of Entry given by the Statute of *Gloucester*, in case where a Tenant in Dower alieneth in Fee, or for Term of Life, or in Tail, and lieth for him in Reversion against the Alienance.

CATABIBAZON, the *Dragon's Tail* is so call'd because it goes exactly against the *Dragon's Head*.

CATACATHARTICKS, are Medicines that purge downwards.

CATACAUSTICKS, or *Caustick*s by *Reflection*.

Suppose an infinite number of Rays as *BA*, *BM*, *BD*, proceeding from the radiating Point *B*, and reflected at the Curve *AMD*, so that the Angles of Incidence be still equal to those of Reflection; the Curve *HFN* to which the reflected Rays are Tangents continually (or which continually touches the Productions of them *AH*, *MF*, *DN*) is called the *Caustick* by *Reflection*. Or it will amount to the same thing, if one says, that the *Catacaustick Curve* is that which is formed by joining the Points of Concourse of the several reflected Rays. Let the reflected Ray *HA* be produced to *I*, and take *AI = AB*, and suppose the Curve *ILK* described by the *Evolution* (see the Word *Evolution*) of the *Caustick* *HFN*, beginning at the Point *I*. Again, supposing the incident and reflected Rays *BM*, *MF* infinitely near to the incident and reflected *BM*, *MF*; and drawing out *FM*

to l , on the Centers F, B , let the little Arches MO, MR be described. These things promised, 'tis evident,

1. That the little Triangles MOm, MRm are always similar and equal. For the Angles at O and R are Right ones; and the Angle RmM, FmD are equal from the Supposition of the Angles of Incidence and Reflection, and $FmD = OmM$, as being vertically opposite; and the Hypothenuse Mm is also common to both Triangles: therefore they are similar and equal, and Om always $= Rm$.

2. 'Tis clear that Om is the Increment of LM , and Rm the Increment of BM , and these Increments are perpetually equal to one another. Therefore their respective Sums are so too; but the Sum of all Om (for the Portion AM of the reflecting Curve AMD) is $ML - IA$, and the Sum of all Rm (for the same Portion of the Curve AM) is $BM - BA$, which are therefore equal to one another.

3. From the Nature of Evolution, the Tangent of the *Causlick*, FL is the Portion of the Curve FH the Right-line HI , that is $FM + ML = AH + HF + IA$, and $ML - IA = AH + HF - MF$; but $ML - IA = BM - BA$, and therefore the Portion of the *Causlick* $HF = BM - BA + MF - AH$ perpetually. That is, the Portion of the *Causlick* HF formed from the reflected Rays of the Curve AM , is equal to the Difference of the incident Rays BM, BA , added to the Difference of the reflected Rays $M F, AH$. Or, taking any two incident Rays, as $B A, BM$, that Portion of the *Causlick* which is evolved while the Ray BA approached to a Coincidence with BM , is to the Difference of these Incidents + the Difference of their reflected Rays. Now knowing how to determine the *Evoluta* of any given Curve, the Invention of the *Catacauslick* from thence is easy.

Let the Point C be at the *Evoluta* of the reflecting Curve AMD , or which is all one, let MC be the Radius of the Concavity for the Point M ; and supposing the Arch Mm infinitely small, let Bm, Cm, Fm be drawn. Farther, upon the Centers B, F , let the little Arches MR, MO be described; and from the Point C , the Perpendiculars CE, Cg, CG, Cg , to the incident and reflected Rays. The Triangles MRm, MOm are similar and equal, as was shewn before, and $MR = MO$. Also the Triangles CEM and CGM are similar and equal, and so are Cem and Cgm ; for the Angles at E, e, G, g are right, and MC, mC are common, and $EMC = GMC$, and $emC = gmC$ (because MC, mC are Normals to the Curve by supposition of the *Evoluta*, and the Angles of Incidence and Reflection are equal) therefore CE

$= GC$, and $Ce = gC$, and consequently $CE - Ce = CG - Cg$, that is, $EQ = SG$. Lastly, the Triangles BMR and BEQ are similar, and so are FMO, FGS . Now let $BM = y, ME = MG = a$; therefore $BM + BE = 2y - a$; let $RM = OM = x$, and $FM = z$, wherefore $FG = a - z$, and let it be required to find z , which determines

the Point F in the *Causlick*. Then $EQ = \frac{yx - ax}{y}$, and $EQ + MR = \frac{2yx - ax}{y}$, also $SG = \frac{ax - xz}{z}$,

and $SG + MO = \frac{ax}{z}$. But by what was shewn before $RM = MO$, and $SG = QE$; therefore $EQ + RM = SG + MO$, viz. $\frac{2yx - ax}{y} = \frac{ax}{z}$, and $2yz - za = ya$, and $z (= MF) = \frac{ay}{2y - a}$. *Q. E. I.*

Corol. 1. If the incident Rays are parallel, then $z = \frac{1}{2}a$. For y in this Case is infinite, and therefore $2y - a = 2y$, the Quantity a vanishing if compared with y .

Corol. 2. If the incident Ray BM touches the Curve AMD in M , then $a (= ME)$ is $= 0$; and therefore $z (= MF = 0)$ also: From whence it follows, that the given Curve AMD , and the *Causlick* touch one another at the Point M .

Corol. 3. If the Radius of Concavity MC be $= 0$, then again $a = 0$, and $z = 0$; from whence it follows, that the Curve AMD and the *Causlick* do cut one another at the Point M , and make an Angle equal to the Angle of Incidence.

Corol. 4. If CM be infinite, then $a (= ME)$ is infinite likewise, and $z (= MF) = -y$; and in this Case of the infinite Distance of the Point C , the Arch Mm becomes a Right-line.

Corol. 5. 'Tis easy to apply all this that has been said, when the Curve AMD is convex to the Radiating Point B (in which Case we shall have $z = \frac{ay}{2y + a}$) and to shew when the reflected Rays will come converging or diverging.

Corol. 6. When the Curve AMD is a Geometrick Curve, the *Causlick* will be so too; for if AMD be a Geometrick Curve, the *Evoluta* will be so too; that is, all the Points c may be Geometrically determined, and from the *Evoluta*, the Points F of the *Causlick* may be Geometrically determined also. But farther, the *Causlick* upon this Supposition shall always be rectifiable too, for Right-lines may always be found equal to any Portions of it.

Corol. 7. 'Tis plain, that giving any 2 of the 3 Points B, C, F , that is, the Radiating Point, the Point of the *Evoluta*, and the Point of the *Causlick*, the 3d Point may be determined.

By this general Theorem and its Corollaries, the *Causlicks* of particular Curves are easily determined, however the Rays go, Converging, Diverging or Parallel; but we will suppose the simpler Case of parallel Rays. Thus in the common Parabola, if the incident Rays are parallel, and cut the Ax at Right-angles, that is, are co-incident with the Ordinates to that Ax, then we have $z = \frac{1}{2}a$; so that taking in each reflected Ray the Length of $\frac{1}{2}a$ (a being the reflected Ray intercepted between

tween the Point of Incidence, and the Point where the Normal from the Evoluta meets that reflected Ray) by this Means the several Points of the *Causlick* will be determined. The Length of the *Causlick* Curve also taken from the Vertex of the Parabola (where it begins) to any other Point, is equal to the Sum of the Incident and reflected Rays.

As suppose AMD were the Parabola, whose Vertex A , and Ax AK , and AHF were the *Causlick*, beginning at the same Point; now because the incident and reflected Rays at the Vertex are equal to nothing; that is, $AB=0$, and $AH=0$, therefore the Curve AHF ($=PM-BA+MF-AH$ by what was shewn before) $=PM+MF$.

bisected in H , a perpendicular HF to the reflected Ray MF gives the point F in the *Causlick*. The reflected MF is also equal to $\frac{1}{2}$ the Incident BM perpetually; for MC being $=r$, and $MP=y$, we have from the similar Triangles MPC , MFH ,

$$r:y::z:y. \text{ From hence 'tis clear, that}$$

the *Causlick* terminates at the point K , bisecting the Radius CB at Right Angles to AC . Again, the Portion of the *Causlick* $AF=3MF$, because $AF=PM+MF=y+z=y+\frac{1}{2}y$. But these hints of Examples may suffice, without descending to those of other Curves, which are to be done after the same manner from the general Theorems that these were, and the Constructions likewise to be deduced. 'Twould be no difficult matter to shew also what Curves these *Causlicks* are in every Example: As in the last case of the Circle, that the *Causlick* is a Cycloid formed by the Revolution of the Circle describ'd upon the Diameter HM , along the Quadrant describ'd with the Radius CH . That the *Causlick* of the vulgar Semi-cycloid when the Rays are parallel to the Ax of it, is also a vulgar Cycloid, describ'd by the Revolution of a Circle upon the same Base. That the *Causlick* of a Logarithm Spiral, is the same Curve, but only set in a different Position; and the like others.

CATACHRESIS, is a Trope in Rhetorick, by which Liberty is given to borrow the Name of a thing, though quite contrary to what it should be, because it cannot be otherways Express'd; as when we say a Silver Ink-horn; here Reason demurs at

the Expression; yet Necessity obliges us to make use of it. But perhaps *Ink-horn* is corrupted from *Inkern* or *Inker*.

CATACALIDA, is the Rib called the Subclavian. CATACousticks, or Cataphonicks, is the Science of Reflected Sounds, or which teaches the Doctrine and Properties of Echoes.

CATADIOPTRICAL Telescope, or Reflecting Telescope: See Telescope.

CATAGMA, is a breaking of Bones, or a Separation of the Continuum in the hard parts of the Body; which is affected with some hard Instrument forcibly impressed upon the part; whose Differences are taken from the Form, the Part, and several Accidents. Blanchard.

CATAGMATIC Medicines, are such as are used to help to Consolidate Broken Bones.

CATALEPSIS, or Catobus, is a Disease almost like an Apoplexy, being an Abolition of all the Animal Functions; except that the Respiration remains entire, and the Patient preserves the same Habit of Body that he had before he fell sick. Blanchard.

CATALEPTICK Verse: See Disposition.

CATALLIS Captis, Nomine Distributionis, is a Writ that lieth within a Borough, or within a House, for Rent going out of the same, and warranteth a Man to take the Doors, Windows, or Gates for Rent.

CATALLIS Reddendis, is a Writ which lyeth where Goods being delivered by any Man to keep unto a certain Day, and be not upon demand delivered at a Day; and is otherwise called, a Writ of detinue.

CATAPASMA, a fragrant Powder which is sometimes applied to the Scrobiculum Cordis, to strengthen the Stomach.

CATAPHORA, is the same with Coma; they only differ in this, that Cataphora is taken as the Genus to all sorts of Stupors that are not attended with a Fever. Blanchard.

CATAPLASM, is a topical Medicine of the consistence of a Pultise; it is usually describ'd two ways, either boiled, or without it; the former is more frequent, the latter of more efficacy: In the former, they are to take such Vegetables as are proper, as Roots, Herbs, Seeds, Flowers, Fruits, &c. adding proper Meals, or omitting them; all which are boiled up in a convenient quantity of Liquor, v.g. Water, Beer, Milk, Honey, &c. to the consistence of a Pultise: The latter is prepared commonly of Vegetables shred small with the infusion of so much Liquor only as may make it of the former Consistence. You may add here Meal, Crums of Bread, Oyls, Ointments, as in the former sort of Cataplasms. Blanchard.

CATAPTOISIS, is one Symptom of an Epilepsie, when Men fall suddenly to the Ground. Blanchard.

CATARACT, a Disease in the Eyes, and is twofold, either beginning, as a Suffusion only, or confirmed, as a Cataract, proper so call'd; the Incipient is but a Suffusion of the Eye when little Clouds, Motes, and Flies seem to fly before the Eyes; but the confirmed Cataract, is when the Pupil of the Eye is either wholly or in part covered, and shut up with a little thin Skin; so that the Sun-beams have not due admittance to the Eye. Blanchard.

CATARACT, is a Precipice in the Channel of a River, caused by Rocks, or other Obstacle stopping the Course of its Stream, from whence the Water falls with a great noise and impetuosity;

as the *Cataracts* of Nile, Danube, Rhine, &c.

CATARRHUS, is a Defluxion of Humours from the Head towards the Parts under it, as the Nostrils, Mouth, Lungs, &c. Some distinguish it by the Name of *Loryza*, when it falls on the Nostrils, by that of *Bronchus* when on the Jaws; and by the Word *Rhume*, when it falls on the Breast.

CATCHES, are those parts of a Clock that hold by hooking and catching hold of.

CATEGORIA and } the same with *Predicamen-*
CATEGREMA } *tum* in Logick: See *Predicament*.

CATENARIA, is the Curve Line which a Rope hanging freely between two Points of Suspension forms it self into. What the Nature of this Curve is, was enquired amongst the Geometers in *Galileus's* time, but I don't find any thing was done towards a Discovery till in the Year 1690, *James Bernoulli* published it as a Problem; which, about two Months after, *Leibnitz* declared he had found out, and would communicate within the Year: In December, 1690, *John* the Brother of *James Bernoulli* communicated an Investigation of it to the Editors of the *Acta Eruditorum*, which was publish'd afterwards June 1691: This *Catenary* or *Funicular* he saith he found not to be truly Geometrical, but of the Mechanical Kind, because its Nature cannot be expressed by a determinate Algebraick Equation; but *Leibnitz* gives its Construction Geometrically. In the Year 1697, the Month of August, Dr. *Gregory* published a Method of Investigation of the former and some other new Properties of this Curve which you will find there, from whence this Method of finding the general Property of the *Catenaria* is taken.

1. Suppose a Line heavy and flexible, the two Extrems of which I call *D* and *E* firmly fixed in those Points; by its weight it is bent into a certain Curve *FAD*, which is call'd the *Catenaria*.

2. Let *BD* and *bd* be parallel to the Horizon, *AB* perpendicular to *BD*, and *Dd* parallel to *AB*, and the Points *Bb* infinitely near to each other. From the Laws of Mechanicks any 3 Powers in *Aequilibrio* are to one another, as the Lines parallel to the Lines of their direction (or inclined in any given Angle) and terminated by their mutual Concourses. Hence if *Dd* expresses the absolute Gravity of the Particle *Dd* (as it will if we allow the Chain to be every way uniform) then *Dd* will express that Part of the Gravity that acts perpendicularly upon *Dd*, and by the Means of which this Particle endeavours to reduce it self to a Vertical Position; so that if this Lineola *d* be constant, the perpendicular Action of Gravity upon the Parts of the Chain will be constant too, and may therefore be expressed by any given Right Line *a*. Father, the Lineola *Dd* will express the Force which acts against that *Conatus* of the Particle *Dd* by which it endeavours to restore it self into a Position perpendicular to the Horizon) and hinders it from doing so: This Force proceeds

from the ponerous Line *DA* drawing according to the Direction *Dd*: and is (*ceteris paribus*) proportional to the Line *DA*, which is the Cause of it. Supposing the Curve *FAD*; therefore as before, whose Vertex (the lowest Point of the *Catena*) *A*, *ax* is *AB*, Ordinate *BD*, Fluxion of the Ax *Dd*=*Bb*, Fluxion of the Ordinate *dd*, the Relation of these two Fluxions is thus, viz. *d* *d* : *Dd* :: *a* : *DA* Curve; which is the Fundamental Property of the Curve, and may be thus expressed (putting *AB*=*x*, and *BD*=*y*, and *AD*=*c*)

$$\frac{y}{x} = \frac{c}{a}$$

CATHARPINGS, are small Ropes in a Ship running in little Blocks from one Side of the Shrouds to the other near the Deck, they belong only to the Main-Shrouds and Fore-Shrouds: Their use is to force the Shrouds taught, for the ease and safety of the Masts when the Ship rolls; they are also at the setting on of the Puttocks of the Shrouds, but there they do not run in Blocks, but are made fast.

CATHARTICK, is a purging Medicine which cleanses the Stomach, the Guts, and whatsoever is vitious and heterogeneous in the Blood, and throws it into the Common-Shore of the Guts. *Blanchard*. See *Purgatio* & *Vomitorium*.

CATHEMERINA Febris, the same with a *Quotidian*.

CATHETER, is a Fistulous Instrument which is thrust up the Yard into the Bladder, to provoke Urine when its suppressed by the Stone; or into whose Cavity an Instrument called *Itinerarium* is thrust to find out the Stone in the Bladder, that then the *Sphincter* of the Bladder may be shewn, and an Incision be made in the *Perineum*.

CATHETERISMUS, is the Administration or Operation of injecting any thing into the Bladder be a *Catheter* or a *Syringe*.

CATHETI, in a Right-angled Triangle, and the Sides including the Right-angle. If it be in the Singular Number, *Cathetus*.

CATHETUS, it signifies the Perpendicular only, the other Leg being called the Base. Also *Cathetus*, in *Catoptricks*, signifies a Line drawn from the Point of Reflection perpendicular to the Plane of the Glass.

CATHETUS, in Architecture, is taken for a Line supposed directly to traverse the Middle of a Cylindrical Body, as of a *Ballister* or Column. In the *Ionick* Chapter it is also a Line falling perpendicularly, and passing through the Center or Eye of the *Voluta*.

CATHETUS of Incidence, is a Right Line drawn from a Point of the Object, perpendicular to the Reflecting Line.

CATHETUS of Reflection, or *Cathetus of the Eye*, is a Right Line drawn from the Eye perpendicular to the Reflecting Line.

CATHYPNIA, a deep or profound Sleep; such as Men are in by taking Opitates, or by Lethargy, &c.

CATO-CATHARTICK Medicines, are such as work downwards, and purge by Stool only: These are called also *Catoreticks*.

CATOCHE, the same with *Catalepsis*.

CATOPSIS, the same with *Myopia*.

CATOPTRICKS, is that Part of the Science of Opticks which treats of *Reflex-vision*, and explains the

the Laws and Properties of *Reflexion*.

CATORETICKS, the same with *Cathersticks*.

CATT, or *Catt-Head*, a large piece of Timber so called in a Ship; 'tis fastened aloft over the *Hawse*, having at one end two *Shivers*, in which is reeved a Rope with a Block, and at the end of the Rope a large Hook, which is called the *Catt-Hook*: Its Use is to trife up the Anchor from the *Hawse* to the Top of the *Fore-Cuffle*, where there is fastened a *Stopper* (i. e. a piece of Rope spliced into it) at the Anchor, which serves to hitch the Hook of this *Catt-Rope* into the Ring of the Anchor.

CATT-HOLES, in a Ship, are Holes in her Stern above the Gun-Room Port, and through them, by means of a *Stem-fift* (that is, some Fastenings behind the Stern) to which a *Cable* or *Hawser* is brought, a Ship (upon Occasion) is heaved a Stern.

CAVALIER, in Fortification is a Heap or Mafs of Earth raised in a Fortrefs, to lodge the Cannon for scouring the Field, or opposing a Commanding Work. These *Cavaliers* are sometimes of a Round, sometimes of a Square Figure, the Top being bordered with a Parapet to cover the Cannon there-in mounted. There must be 12 Foot between Cannon and Cannon; and if they are raised on the Enclosure of any Place, whether in the Middle of the Curtin, or in the Gorge or Bastion, are generally 15 or 18 Foot high above the Terre-plan of the Rampart.

A *Cavalier* is sometimes called a *Double Bastion*, and is designed to overlook the Enemy's Batteries, and to scour their Trenches.

CAVA VENA; the greatest Vein in the Body descends from the Heart; so called from its great Cavity, and into it, as into a common Channel, do all the lesser Veins, except the *Pulmonary*, empty themselves. Its Root may very properly be said to be in the Liver; for by its Capillaries it receives the Blood that is transcolated through the Glandulous *Parenchyma* of the Liver, from the Capillaries of the *Porta*, and by its ascending Trunk conveys it to the Heart. These Capillaries emptying all the Blood exhausted out of the Liver into the *Cava*, it is presently divided into the *Ascending* and *Descending Trunk*. The *Ascending* enters the *Diaphragm* and goes to the *Thorax*. The *Descending Trunk* is somewhat narrower than the *Ascending*, and passes down along with the great Artery, continuing undivided till the fourth *Vertebra* of the Loins. But in the mean time sends forth divers Branches from its Trunk, as the *Vene Adipose*, *Emulgents*, *Spermaticks*, *Lumbares*; All these Veins being sent forth of the Trunk, by the time it is come to the fourth *Vertebra* of the Loins where it turns to behind the *Arteria Magna*, above or before which it had thus descended, and is then divided into equal Branches, called *Iliaci*, because they pass over the *Os Ilium*, &c. as they go down to the Thighs.

This Vein carries nothing to the Liver, but receives the Blood from thence, carrying it, and what it receives from its other Branches into the Right Ventricle of the Heart, that it may be there anewwipproved and inspirited.

CAUDA Lucida, the *Lion's Tail*, a fixed Star of the first Magnitude, whose Longitude is 167° 53'. Latitude 12°. 16'. Right Ascension 173°. 9'.

CAVIN, in Fortification, is a hollow Place proper to favour the Approaches to a Fortrefs, so that

one may advance therein under Covert towards the Enemy's, as it were in a Trench. If it be with-in Musket-shot, 'tis a Place of Arms ready made to Hand; and a Convenience for opening the Trenches out of Fear of the Enemy's Shot.

CAULEDON, is the breaking of Bones across, when the Parts of the Bones are so separate that they will not lye direct.

CAULIFEROUS Herbs or Plants, amongst the Botanists, are such as have a true *Caulis* or Stalk, as a great many have not.

CAULIS, is in Botany, the Stalk of any Herb, or the Stem or Trunk of a Tree.

CAUSA Matrimonii prelocuti, is a Writ which lieth in Case where a Woman giveth Lands to a Man in Fee-simple, to the Intent he shall Marry her, and refuseth so to do in reasonable time, being required thereunto by the Woman.

CAUSAL Propositions, are those that contain two Propositions joined together by Conjunction of the Cause (because, or to the end that) as, *Woe to the Rich, because they have their Felicity in this World. The Wicked are advanced, to the end, that falling from on high, their fall may be the greater.*

CASUALTY, is the Action or Power of a Cause in producing its Effect.

CAUSAM nobis significes, is a Writ which lyeth to the Mayor of the Town, or City, &c. that formerly by the King's Writ, being commanded to give Seisin unto the King's Grantee of any Lands or Tenements, doth delay so to do, willing him to shew Cause why he so delayeth the Performance of his Charge.

CAUSODES, the same with *Causus*: Which see.

CAUSTICK Curves: See *Cata-causticks* and *Dia-causticks*.

CAUSTICK Stones or Cauteries, are thus made of Lime and Gravelled Ashes: Put into a large Earthen Pan one Part of Quick-line, and two of Gravelled Ashes, or of Calcined Tartar, both powdered and mix'd; on these pour good store of hot Water, and then leave the Matter to infuse 5 or 6 Hours, then boil it a little: Then filtrate through Cap-paper, and evaporating the Liquor that passed the Filtre, a Salt will remain at the Bottom. Put this Salt into a Crucible, and melt and boil it till all the Humidity which came from the Water is exhausted. The Matter will still remain fluid; and when by trying some of it on the End of a Spatula, you find it of a due Consistence and that it looks like Oil in the Bottom of the Crucible, cast it into a Bason, and cut it, and form it into Pieces while it is warm; put them quickly into a strong Glass Bottle, with a ground Stopple of the same Metal, for they will dissolve and be spoiled if the Air come to them. These are the strongest *Cauteries* that can be made, and are soon and easily prepared.

CAUSTICKS, or *Escharoticks*, are those things which burn the Skin and Flesh into an hard Cruft, as burned Brass, unquenched Lime, sublimated Mercury, and hot Iron, &c.

CAUSUS, or a burning Fever, is that which is attended with a greater Heat than other continued Fevers, an intolerable Thirst, and other Symptoms, which argue an extraordinary Accension of the Blood. *Blanchard.*

CAUTERISATION, is an Artificial Burning made by a *Cautery*.

CAUTERIUM, is a Chyrurgeon's Instrument made of Iron, Silver or Gold, which after it's heated, has an actual Power of Burning into any thing; they differ in Bulk and Form.

It is sometimes taken for a *Potential Caustery*, prepared of *Lixiviums*, or Lime and Soap.

CAUTIONE *Admirtenda*, is a Writ that lieth against a Bishop holding an Excommunicate Person in Prison for his Contempt, notwithstanding that he offereth sufficient Caution or Pledge to obey the Commandments and Orders of the Holy Church from henceforth.

CAZEMATE, a Term in Fortification: See *Casemate*.

CEGINUS, a fixed Star of the 3 Magnitude in the left Shoulder of Bootes, whose *Longitude* is $194^{\circ}. 5'$. *Latitude* $49^{\circ}. 33'$. *Right Ascension* $215^{\circ}. 39'$. *Declination* $29^{\circ}. 27'$.

39'. Declination $29^{\circ}. 27'$.
CELE, is a Tumour or Swelling in any Part of
the Body.

CELERITY, is the Velocity or Swiftneſs of any Body in Motion; and it is defined to be an Affection of Motion by which any Moveable runs through a given Space in a given Time.

through a given Space in a given Time.

CELERRIMI *Descensus Linea*, the Curve of the swiftest Descent of any Body; or that in which an heavy Body descending by its own Gravity should move from one given Point to another in the shortest Time. This was proposed as a Problem by that excellent Mathematician M. *John Bernoulli*, Professor of Mathematics at *Groningen*; and he did afterwards shew that this Curve was the same with that which a Ray or Particle of Light describes in *Mediums* which are not uniform; for in such a Rarity effects the Ray after the same manner, as the Acceleration of Velocity doth the heavy Body in its Descent. For if any heavy Body descend from any given Point, and describe a Curve, and hath its Velocity in a Subduplicate Ratio of the Altitude: And if a Particle of Light coming from a given Point, and pass through a *Medium* whose Rarity increases in a Subduplicate Ratio of the Altitude or Depth, then will the Velocity of the Particle or Ray of Light, be in a Subduplicate Ratio of such Height or Depth; and consequently, since the Velocity becomes the same whether produced by the uniform Action of Gravity, or by the Rarity of the *Medium*, the Line of Descent or Motion, or the Curve described will be in both Cases the same. There have been published many Methods of Investigating the Nature of this Curve; and the following one (which is short, plain and easy) recommends it self to us with this Advantage, that two Noble Problems in two distinct Sciences, are solved at one and the same time, the one an Optical one, the other a Mechanical.

Let us imagine the Medium $ABCD$ to be made up of Fluids of several different Degrees of Denfities, but the Denfities (proceeding through

the several Intervals of the Parallels AC, Ce, Dh, Eh, Bo , to encrease or diminish in a certain Law. In this Example we'll suppose the Degrees of Rarity in the Fluids to encrease as we go from A towards B ; so that the Ray ab is turned by the Refraction into be , and be into eh , and eh into bl , &c. from the Perpendicular bc, ef, hi , &c. at the Points of Incidence, b, e, h , &c. the prick'd Lines being the several Incident Rays produced. The refracted Ray intercepted between the Points b and o , viz. $b e b l o$, is a Polygon made up of all the Refracted Rays $be, eh, h, &c.$ which defect from one another by the Angles of Refraction made at the several Points b, e, h , &c. Now if the Distances of the Parallels are less'd infinitely, the Polygon $b e b l o$ becomes a Curve Line; but also the Curve Ray in its Passage through the several Mediums, is supposed to take such a Course, that it comes from the Radiating Point to the Point to be enlighten'd in the shortest time, 'tis evident (since 'tis every where so throughout the Polygon $b e b l o$) that the Curve into which that Polygon degenerates (being the Curve which the Ray by the continual Refraction is bent into) is the Curve of swiftest Motion, or that by which the Light passes from the Point b to the Point o in the shortest Time. And since the Sines of the refracted Angles $c b e, f e h$, &c. are still as the Rarities of the Mediums in those several Points, that is, as the Velocities of the Globule of Light in those Places; and since also those refracted Angles are the Angles of the Inclination of the Lines be, eh , &c. to the Perpendiculars bc, ef , &c. 'tis clear that the Curve must have this Property, that the Lines of the Inclinations to a Perpendicular must be every where in the Ratio of the Celerities.

Now let the Law of the Rarity or Density of the Medium be what it will, we may thus in general proceed to determine the Curve. Let the Medium $FGDK$ be determined by the Horizontal Line FG to which AD is perpendicular, and is the Ax of the Curve AHE , whose Ordinate is HC ; and let the Ordinate HC still represent the Rarities of the Medium in the Depths AC , or which is all one, the Velocities of the Globule of Light in the Points of the Curve M . The incurv-

ved Ray, or the *Semeta* of the Globule is the Curve AMB , the Nature of which is to be enquired into. The Lines HCM and cnm are parallel to FG , and Mn parallel to AD . Let $AC =$

x , $Cc = Mn = xCM = y$, $nm = \dot{y}$, $AM = z$,

$Mm = z$, $HC = v$, and aa a stable quantity taken at Liberty. If we put Mm for Radius, 'tis plain that nm is the Sine of the refracted Angle (or of the Curve's Inclination to the Vertical Line Mn at the Point M) therefore since the Sines of those Angles are (as was said before) always as the Celerities, then $\frac{nm}{HC}$ is a constant Ratio, that

is, $\frac{\dot{y}}{v}$ is a constant Ratio; so that $\frac{\dot{y}}{v} = \frac{z}{a}$ (for the

Fluxions z being taken equal, as they may then

$\frac{z}{a}$ is also a stable Ratio) and $a\dot{y} = v\dot{x}$, and $a\dot{y}\dot{y} = v\dot{v}\dot{z}$, but $z\dot{z} = \dot{y}\dot{y} + \dot{x}\dot{x}$ therefore $a\dot{y}\dot{y}$

$v\dot{v}\dot{y} + v\dot{v}\dot{x}$, and $\dot{y} = \frac{a\dot{x}}{aa - v\dot{v}}$, which is

the general Equation in Fluxions for the Curve AMB . Now 'tis all one whether we consider the Increments of the Velocity as depending upon the Medium more or less resisting the Globule, or whether abstracting from all Consideration of a Medium, we suppose them to be the Effects of another Cause, but acting according to the same Law that was observed on the former, since on both Sides the Curve is supposed to be run in the shortest Time. Now if we imagine the Globule to be a heavy Body, and Gravity to be the Cause of the Acceleration; then the Curve AHE will be the common Parabola, since HC or v represents the Celerity for the Space x or AC ; and in this Curve v is as x^2 . The constant Line a being the Parameter, and so $v = \sqrt{ax}$; substituting this in the Room of v in the general Equation, we have

$y = \sqrt{\frac{x}{a-x}} \times x$. From hence it follows, that

the Curve of swiftest Descent, viz. AMD , is the vulgar Cycloid, the Diameter of whose generating Circle GLK is $= a$, and whose Base is AG , and Vertex K , GK being Perpendicular to AG . Two things set this in the clearest Light: 1. To prove that CM is $= arcGL - LO$; And 2, from thence that ML is $= arcLK$, which is the known Property of the Cycloid. That $CM = arcGL - LO$ is certain, in that the Fluxions of them are perpetually equal in all Points of the Curve. Let $LO = s$, and the $arcGL = c$, and its Fluxion $L\dot{p} = \dot{c}$; then since $s = ax - x\dot{x}$, we

have $\dot{s} = \frac{a\dot{x} - 2x\dot{x}}{2ax - x\dot{x}^2}$. Again, $\dot{c} = \frac{\frac{1}{2}a\dot{x}}{s} = \frac{a\dot{x}}{2s}$

$= \frac{a\dot{x}}{2ax - x\dot{x}^2} \frac{1}{2}$; therefore $\dot{c} - \dot{s} = \frac{2x\dot{x}}{2ax - x\dot{x}^2}$

$= \frac{x\dot{x}}{ax - x\dot{x}^2} = \sqrt{\frac{x}{a-x}} \times \dot{x} = \dot{y}$, wherefore

$c = s + y$, and $c - s = y$, viz. $CM = Arch GL -$

LO . Now if $CM = GL - LO$, then MO , which is $= CO - CM$, is $= CO - GL = LO$: But $CO = \frac{1}{2}$ Circle $GLK = GL + LK$; therefore MO , which is $= CO - GL + LO$, is $= GL + LK - GL + LO$; that is, MO is $= LK + LO$, and taking away LO , $ML = LK$: So that 'tis clear the Curve is the Cycloid above described. Q. E. I.

CELESTIAL Globe: See Globe.

CELLULÆ *Intestini Coli*; the little Cavities of the Gut Colon, are where the Excrements lodge some while, that they may refresh some adjacent Part with their Heat, and digest and ferment any Crudities. Blanchard.

CEMENT, is both the Name of a Past with which Plates of Gold being stratified are purified, and according to Helmont and many others, is any Lute by which the Necks of Vessels in Distillation are joined, or as we commonly say, cemented together. And also Cement is the same as,

CEMENTATION, which is one of the Ways of purifying of Gold, and as some say, of Silver; and 'tis thus done, Stratify in a Crucible thin Plates of Gold and Cement, i.e. the Past of that Name which is made of one Part of *Sal Armoniac*, two Parts of *Sal Gemme*, and four Parts of Potter's Earth or powder'd Brick, and covering the Crucible, make a violent Fire round about it, to calcine the Matter for 10 or 12 Hours, that the corroding Salts may carry off the Impurities of the Gold. But this Purification is by no means so good as that made with *Antimony* (which see under the Word *Purification*) for these Salts do sometimes leave other Metals remaining with the Gold, and besides, do often eat away the very Gold it self.

CENCHRIAS, is a sort of spreading Inflammation, running like Wild-fire; called also *Herpes Miliaris*, from the Resemblance it bears to the Seed of the small Grain called *Millet* or *Hyrse*. Blanchard.

CENCRIAS, a spreading Ulcer, the same with *Harpes Miliaris*.

CENEANGIA, is, with some, the same as *Phlebotomy* or Blood-letting.

CENTAURE, a Southern Constellation, consisting of 40 Stars.

CENTESM, is the Hundredth Part of any thing, and is commonly mention'd in our new Decimal Divisions of Degrees, Feet, &c.

CENTRAL-RULE, is a Rule found out and established by our Famous Mr. Tho. Baker, late Rector of *Nympton in Com. Devon*. whereby he finds the Center of a Circle designed to cut the Parabola in as many Points as an Equation to be constructed hath real Root. How by this Means he constructed all Equations as far as Biquadratics, you will find under the Word *Construction of Equations*: And the Demonstration of his Central Rule, I give here by it self.

The Rules of Mr. Baker are these,

$$1. \frac{L}{2} + \frac{q}{8L} = b = CD.$$

$$2. \frac{p}{4} + \frac{ppp}{6LL} + \frac{pq}{4LL} + \frac{r}{2LL} = d = DE.$$

Or by Contraffaction, because $L = 1$, as is supposed, to avoid Fractions,

thro' the *Vertex* of any *Diameter*; that is, by Position of the given *Center*; And Application of this new Property, (That the *Rectangle* made of the *Parameter* and *Difference* of the *Abscissa*, is equal to the *Rectangle* made of the *Sum* of the two *Ordinates* into their *Differences* (to express the *Ratio* of the *Radius* to the given *Line* of the *Parabola*; so having an *Equation* of four *Dimensions*, and rejecting the *Equals* on both *Sides*, he depresses it to a *Cubic*; but adjoining to it a *Quantity* for the *Homogeneous Comparisons*, thereby making the *Whole* equal to nothing, the *Equation* subsists in a *Biquadratic*, having all its *Terms*: If the *Circle* be supposed to pass not thro' the *Vertex* of the *Diameter*, but thro' a *Point*, which being joined with the *Vertex* and the *Center*, may terminate a *Right-angled Triangle*.

This *Equation* he compares with another like it, and equal to it; then by equating the *Co-efficients* of these two *Equations*, he presently discovers the *Central Rule*; whose universal Extent appears in *Biquadratic Equations*, affected under all *Parabolic Degrees*; for all the other *Cases* where any other *Terms* are wanting, are but *Corollaries*, or more compendious *Constructions* derived from the general *Rule*. So that the *Invention* of the *Rule* seems as much due to the last *Equation* of the *Co-efficient*, as to the *aforesaid Properties*, which is demonstrated by *Archimedes* in the *Section* of a *Parabolick Conoid* by a *Plane* parallel to the *Axis*, and is particularly used by *Slusius* in his *Analyticks*, who thereby constructs a *Biquadratic Equation*, keeping all its *Terms*. But then the *Analysis* of *Slusius* by breaking the *Equation* into two others to find two *Places*, is very different from that whereby our *Author* found his *Central Rule*; than which nothing can be expected more easy, simple or universal, seeing any *Parabola* being once for all described, will give all the *Roots*, true or false, of any *Equation*, without *Reduction* or any *Alteration* whatsoever.

CENTRE of a *Circle*, or of a *Sphere*, is that *Point* from whence all *Right Lines* drawn to the *Circumference* or *Surface* are equal. To find the *Centre* of a *Circle*, see *Chord*.

CENTRE of a *Dial*, is that *Point* where the *Axis* of the *World* intersects the *Plane* of the *Dial*; and from thence, in those *Dials* that have *Centres*, all the *Hour-Lines* are drawn. If the *Plane* of the *Dial* be parallel to the *Axis* of the *World*, it can have no *Centre* at all, but all the *Hour-Lines* will be parallel to the *Style*, and to one another.

CENTRE of an *Ellipsis* or *Oval*, is that *Point* where the two *Diameters*, the *Transverse* and the *Conjugate* intersect each other.

CENTRE of the *Equant*, in *Astronomy*, is a *Point* in the *Line* of the *Aphelion*, being exactly distant so far from the *Centre* of the *Eccentrique* towards the *Aphelion*, as the *Sun* is from the *Centre* of the *Eccentrique* towards the *Perihelion*.

CENTRE of *Gravity*, of any *Body*, is a *Point* on which a *Body* being supported, or from it suspended, all its *Parts* will be in *Equilibrio* to one another.

CENTRE (common) of the *Gravity* of two *Bodies*, is a *Point* in a *Right-line* connecting their *Centres*; and so posited in that *Line*, that their *distances* from it shall be reciprocally as the *weight* of these *Bodies*: And if another *Body* be placed in the same *Right-line*, so that its *distance* from a

ny *Point* in it be reciprocally as the *weight* of both the former *Bodies* taken together, that *Point* shall be the common *Centre* of *Gravity* of all 3, &c.

CENTRE of heavy *Bodies*, is in our *Globe* the same as the *Centre* of the *Earth*, towards which all heavy *Bodies* do as it were naturally tend.

CENTRE of an *Hyperbola*, is a *Point* in the middle of the *Transverse Axis*; and consequently, is without the *Figure*, and common to the opposite *Section*.

CENTRE of *Magnitude*, of any *Body*, is that *Point* which is equally remote from its extreme *Parts*.

CENTRE of *Motion*, of any *Body*, is that *Point* about which any *Body* moves when fastened any way to it, or made to revolve round it.

CENTRE of *Oscillation*, see *Oscillation*.

CENTRE of a *Regular Polygon* or *Regular Body*, is the same with that of the inscribed *Circle* or *Sphere*.

CENTRIFUGAL Force, is that *Force* by which all *Bodies* which move round any other *Body* in a *Circle* or an *Ellipsis* do endeavour to fly off from the *Axis* of their *Motion* in a *Tangent* to the *Periphery* of it. And this *Force*, as *Mr. Hugen* demonstrates is always proportional to the *Circumference* of the *Curve* in which the *Revolving Body* is carried round.

The *Centrifugal Force* of any *Body* to the *Centripetal*, is as the *Square* of the *Arch* which the *Body* describes in a given *Time*, divided by the *Diameter*, to the *Space* thro' which an heavy *Body* moves in falling from a *Place* where it was at rest in the same *time*.

If any *Body* swim in a *Medium* heavier than it self, (and in one lighter it cannot do so) the *Centrifugal Force* is the difference between the *Specifick Weight* of the *Medium* and the *Floating Body*.

What the *Centrifugal Force* in the *Planets* is, or the *Conatus Recedendi ab Axe motus*, the endeavour to recede from the *Axis* of the *Motion*; you will find explained under *Planets*; where the *Reason* of all their *Motion* is expounded.

CENTRIPETAL Force, is that *Force* by which any *Body* moving round another is drawn down, or tends towards the *Centre* of its *Orbit*; and is much the same with *Gravity*: See *Vis Centripeta*.

If a *Body*, being specifically heavier than any *Medium*, sinks in it, the excess of that *Body's Gravity* above the *Gravity* of the *Medium*, is the *Centripetal Force* of the *Body* downwards.

CENTROBARYCAL, is what relates to the *Centre* of *Gravity*.

CEPHALA, is an obstinate *Head-ach*.

CEPHALÆA, an old obstinate *Head-ach*.

CEPHALALGIA signifies in general, any pain of the *Head*, but is more especially taken for a new *Head-ach*.

CEPHALALGICA are *Medicines* which purge the *Head*. *Blanchard*.

CEPHALICA, a *Vein* which creeps along the *Arm*, between the *Skin* and the *Muscles*; it divides into two *Branches*. The *External Branch* goes down to the *Wrist*, where it joins the *Basilica*, and turns up the *Back* of the *Hand*, where it gives a *Branch* which makes the *Salvirella*, between the *Ring-finger* and the *Little-finger*. The *Ancients* used to open this *Vein* in *Diseases* of the *Head*, but since the knowledge of the *Circulation* of the *Blood*, there is no difference whether one be blooded in the *Cephalica*, *Mediana* or *Basilica*.

CEPHALICK Medicines, are Spirituous and Volatile ones, used in Distempers of the Head. Also the outermost Vein in the Arm is called *Cephalica*, because it used formerly to be opened in Diseases of the Head rather than any other.

CEPHALOPHARYNGÆI, signifies the first Pair of Muscles of the upper Part of the Gullet, which proceed from beside the Head and Neck, and are spread more largely upon the *Tunic* of the Gullet. *Blanchard*.

CEPHALOPHARYNGÆUM, is a Muscle that ariseth from that part where the Head is joined to the first *Vertebra* of the Neck; from thence marching down, it is spread about the *Pharynx* with a large *Plexus* of Fibres, and seemeth to make its Membrane. This straightens the Throat in swallowing.

CEPHALOPHONIA, is a Pain or Heaviness in the Head.

CEPHEUS, a Constellation in the Northern Hemisphere, consisting of 17 Stars.

CEPI Corpus, in the Common-Law, is a Return made by the Sheriff, that upon a *Capias Exigent*, or other Process, he hath taken the Body of the Party.

CERATIAS, according to some Writers, is a Horned Comet, sometimes appearing Bearded, and sometimes with a Tail or Train. Some Comets of this kind they will have to resemble the Figure of a New Moon; others that are Tailed, have a crooked Tail, bending either upward or downward; and others have their Tail of an equal Breadth or Thickness.

CERATODES, the same with *Cornea Tunica*.

CERATOGLOSSUM, is the proper Pair of Muscles belonging to the Tongue, proceeding from the Horns of the Bone called *Hyoidea*, and joined to the sides of the Tongue: Their use is to move or draw the Tongue straight into the Mouth, when they act jointly; but if either the one or the other be contracted singly, they move it to the Right or Left-side.

CERATUM or *Cerecloth*, is a Medicine applied outwardly, made of Wax, Oyls, and sometimes Dust intermixed, thicker than an Ointment, and softer than a Plaster.

CERCHNOS, is a certain *Asperity* of the *Larynx*, which to touch feels like a Collection of Juniper-berries, whence proceeds a little dry Cough. *Blanchard*.

CERCIS, is the second Bone of the Cubit, called *Radius*, because it's like the Spoke of a Wheel. *Blanchard*.

CEREA, are the Horns of the Womb in Brutes, wherein the *Fetus* is usually formed.

CEREBELLUM, is the hinder part of the Brain, consisting like the Brain it self, of an Ashy or Barkish Substance and a white Marrowy one, wherein the Animal Spirits which perform involuntary and meer Natural Actions, are supposed to be generated in Man; but not so in Beasts; it seems to consist of a great many thin Plates that lay upon one another.

CEREBRUM, the Brain, is strictly taken for the foremost part of the Substance, which is within the Skull; and it is a Substance of a sort peculiar to it self. Outwardly it is covered with the Skin called *Pia Mater*. It is wrought with many Turnings and Windings. Its exterior Substance is Ashy, wherein the Animal Spirits are thought to be generated: The Interior is white, which

receives the Animal Spirits from the former, and discharges them by the *Corpus Callosum*, and the *Medulla Oblongata* into the Nerves, upon which voluntary Actions do chiefly depend. Likewise the Brain is the Subject of Imagination, Judgment, Memory, and Reminiscence; for the Ideas or Species of things being received from the Organs of the External Senses, are carried to the common Senfory, or the Beginning of the *Medulla Oblongata*, and then by the *Corpora Striata*, and the *Corpus Callosum*, there the Judgment and Imagination are probably formed; but the Seat of the Memory is said to be in the Cortical Part of the Brain; and if the Idea's after some time chance to be called for out of the Place of the Memory, then it's properly said to be *Reminiscence* or Remembering. Sleep is likewise transacted in the Brain; concerning which see in its proper Place. *Blanchard*: See *Brain*.

CERTIFICATE (in Law) is used for a Writing made in any Court, to give Notice to another Court of any thing done therein.

CERTIFICATION of *Affre* of *Novel Dissaisin*, &c. is a Writ granted for the re-examining, or Review of a Matter passed by *Affize* before any Justices, and is called *Certification of new Discoveries*.

CERTIFICANDO de Recognitione Stapule, is a Writ directed to the Mayor of the Staple, &c. commanding him to certify the Chancellor of a Statute of the Staple, taken before between such and such, in Case where the Party himself detaineth it, and refuseth to bring it in.

CERTIORARI, is a Writ out of the *Chancery* to an Inferiour Court, to call up the Records of a Cause therein depending, that conscionable Justice may be therein administered, upon complaint made by Bill, that the Party which seeketh the said Writ, hath received hard *Dealing* in the said Court.

CERVICAL or *Vertebral Vessels*, are the Arteries and Veins that pass thro' the *Vertebrae* and Muscles of the Neck up to the Skull.

CERVICALIS Vena: *Vid. Vertebralis*.

CERUMINA, is the Filth or Wax of the Ear, which seems to be sweat out from the Cartilages: Others think it comes from the Glandules which border upon the Ears. It serves to hinder Dust, Motes or little Animals from getting into the Ear.

CERUSSE, or *White-Lead*, is Lead turned into a white Form by the Means of the Smoak or Vapours of boiling Vinegar.

CÆSARIAN Section or *Operation*, is the cutting open the Womb of the Mother to preserve the Child: And the

CÆSARIAN Birth, is that of a Child which is born this way; and those that were so, as *Cæsar*, *Scipio Africanus*, *Manlius*, &c. were called *Cæsares*, and *Cæsones*; a *Cæso matris utero*.

CESSAVIT, is a Writ that lieth upon this general Ground, that he against whom it is brought hath neglected to pay such Rents, or to perform such Service as he is tied to by his Tenure, and hath not upon his Land or Tenement sufficient Goods or Chattels to be distrained.

CETUS, the *Whale*, a Southern Constellation consisting of 23 Stars.

CHACONNE (in Musick) is a kind of *Sarabrand*, whose Measure is always Triple Time.

CHAFE, Seamen say a Rope chafes, when it galls or frets by rubbing against any rough and hard thing. Thus they say the *Cable* is chafed in the

the *Hawse*, when it is fretted or begun to be worn out there.

CHAIN, is an Instrument used in *Surveying*, to measure Land withall; of which there are several sorts, as,

1. A Chain of 100 Foot long, each Link being one Foot in length, and at each 10 Foot there is a Plate of Brass, with a Figure engraven thereon, to shew readily how many Feet are from the beginning of the Chain: And for more ease in accounting, there is, or should be, a Brass Ring at every five Links, that is, one between every two Plates.

This Chain is most commodious for measuring of large Distances or Lengths.

2. A Chain of 16 Foot and a half in Length, and made so as to contain 100 Links, with Rings at every 10th Length.

This Chain will be good to measure small Garden-Grounds or Orchards by Perch or Pole Measure.

3. A Chain of Four Pole or Perches in Length, which is 66 Foot or 22 Yards, for each Perch contains 16½ Foot. This whole Chain is divided into 100 equal Parts or Links, whereof 25 are a just Pole or Perch; and for ready accounting, there is usually a remarkable Distinction by some Plate or large Ring at the End of every 25 Links: Also at the End of every 10th Link, 'tis usual to fasten a Plate of Brass with Notches therein, noting how many Links are from the Beginning of the Chain.

This Chain of all others is the most commodious for Land-measure.

When you are to measure any Line by the Chain, you need to regard no other Denomination, but only Chains and Links set down with a Prick of your Pen betwixt them: Thus if you found the Side of a Close to be 6 Chains and 35 Links long, it must be put down thus, 6.35.

But if the Links be under 10, a Cypher must be prefixed; so 7 Chains and 9 Links must be thus set, 7.09.

How to cast up the Content of a Figure, the Lines being given in Chains and Links.

Having multiplied Length by Breadth or Base by the half Perpendicular, &c. according to the Rules for finding the Content of Figures under the Word *Area*.

Rule 1. From the Product cut off 5 Figures towards the Right-hand with a Dash of your Pen, fo shall those to the Left-hand again signify Acres.

2. If these five cut off to the Right-hand were not all Cyphers, multiply them by 4, and cutting off 5 Figures toward the Right-hand again, the rest will be Roods or Quarters.

3. Also, if amongst these five Figures cut off at the second Multiplication, there be any Figures besides Cyphers, then multiply all the five by 40, cutting off five again with a Dash, and those on the Left-hand signify Square Perches or Poles. As for Instance.

Having a Square Field given, whose Sides are each of them 7 Chains, 25 Links, the Content of this Square is required in Acres, Roods, and Perches.

Length 7.25
Breadth 7.25

3625

1450

5075

Acres 525625
4

Rood 102500
40

Perch 200000

Ans. 5 Acres, 1 Rood, and 1 Perch.

The Reason of this practical Rule is plain, if you consider that 5 Chains (or 20 Perches) in Length, and 2 Chains (or 8 Perches) in Breadth make an Acre (or 160 Square Perches); also 5 Chains multiplied by 2, is the same with 500 Links, by 200, which makes 100000 Square Links.

Wherefore 'tis evident, that 525625 Square Links, (i.e. the Product of 7.25 by 7.25) divided by 100000, that is, by cutting off 5 Figures on the Right-hand, leaves 5 Acres and 25625 Square Links over.

Also, if 25625 Square Links, do contain any Quarter or Quarters of an Acre; then 'tis but multiplying by 4, and dividing by 100000 (i.e. five cut off from the Products) they will contain so many Acres as now they do Quarters or Roods, for any number of Quarters multiplied by 4, produce the like number of Integers, and only Division reduces them to the right Denomination: So that 25625 multiplied by 4, gives 102500, which divided by 100000, leaves 1 Acre, and 2500 Quarters of Square Links over.

This last Remainder 2500 (being the true number of Square Links multiplied by 4) if multiplied by 40 (which is ¼ of 160) it must as often contain 100000 square Links, as the ¼ of 2500, i.e. 625, containeth the square Perches.

Thus, 100000 divided by 160 gives 625, as answering to 1 Perch: Also 2500 multiplied by 40, gives 100000, or 1 Acre (after Division) or five Figures cut off.

How by the Chain to take an Angle in the Field.

First, measure along the Hedge AB any small Distance, as A2, two Chains: Also measure along the Hedge AC what number of Chains you please, no matter whether they be equal to the former or not, as A3, two Chains: Then measure the Distance 2, 3, suppose it be 1 Chain 68 Links.

To plot which, draw the Line *AB* at pleasure, and set off 2 *Chains* from *A* to 2; then take in your Compasses the Distance *A3*, 2 *Chains*, setting one Foot in *A*; describe the Arch 2, 3; take also in your Compasses 1 *Chain*, 68 *Links*, set it from 2 to 3; and through the Point 3 draw *AC*, so you have the Angle *BAC* of the Field truly plotted.

The same may be otherwise performed thus;

Set a Stick in the Angle, and putting the Ring at one End of the Chain over it, take the other End in your Hand, and stretch out the Chain along the Hedge *AB*, and where it ends at 5, set a Stick; then stretch the Chain along the Hedge *AC*, and at the End thereof set another Stick, as at 4, then let loose the Chain from *A*, and measure the Distance 5, 4, which suppose 74 *Links*. Then plot it as before.

By this Means you may Survey a Field by going round the same with the Chain only, by taking all the Angles, and measuring the Sides. The same may be plotted by Direction given under the Word *Surveying*.

CHAIN-SHOT, is two Bullets, or rather half Bullets, with a Chain between them; their use is at Sea to shoot down Yards or Masts, or cut the Shrouds or any Rigging of a Ship.

CHAIN-WALLS, in a Ship, are the broad Timbers which are made jutting out of her Sides; to which with Chains the Shrouds are fastned, and by them spread out, the better to support the Masts.

CHAINS, in a Ship, are those Irons to which the Shrouds of the Masts are made fast to the Chain-Walls at the Ship's Sides,

CHALASTICK Medicines, are such as by their temperate and moderate Heat do comfort and strengthen the Parts to which they are applied.

CHALAZA, the Treadle of an Egg; every Egg has two of them, one in the obtuse, and the other in the acute End: There is more of them in the White, yea they stick closer to the Yolk, and are fastned to its Membrane. They are something long Bodies, more concrete than the White, and whiter, knotty, have some sort of Light, as Hail, whence they have their Name; for each *Chalaza* consists, as it were, of so many Hail-stones separated from each other by that White; one of them is bigger than the other, and further from the Yolk; is extended towards the obtuse End of the Egg; the other is less, and extends itself from the Yolk towards the acute End of the Egg. The Greater is made up of two or three Knots, like so many Hail-stones, which are moderately distant from each other, the less in order to succeed the greater.

It is also a Disease incident to Swine *Blanchard*.

CHALZIA, is a little Swelling in the Eye-lids like a little Hail-stone.

CHALCANTHUM Rubefactum, is only Vitrol calcined to Redness.

CHALLENGE (in Common-Law) signifies an Exception against Persons or Things; as a Prisoner may except against the partial impannelling of a Jury, or against the Insufficiency of the Jurors.

CHALOUPE: See *Shallop*.

CHALYBEAT, is that which partakes of the Nature of Steel; thus *Chalybeat Medicines* are a Preparation of Steel or Iron, or a Composition in which Steel or Iron is an Ingredient.

CHALYBEAT Crystals of Tar: See *Cream of Tartar*.

CHAMADE, is a Signal made by the Enemy, either by Beat of Drum or Sound of Trumpet, when they have any Matter to propound; as when they sound or beat a *Parley*.

CHAMBER, that Part of the Cavity of a great Gun where her Charge lies, is called the *Chamber*: Those Pieces which at Sea they call *Murtheers*, have *Chambers* which are put in at their Breeches.

CHAMBRANLE, an Ornament in Mafonry and Joyner's Work, bordering the three Sides of Doors, Windows and Chimneys. It is different according to the several Orders, and consists of three Parts, viz. the Top, called the *Traverse*, and the two Sides the *Ascendants*.

CHAMPARTY (in Common-Law) signifies a Maintenance of any Man in his Suit depending upon Condition to have Part of the things (be it Lands or Goods) when recovered.

CHANCE-MEDLEY (signifies in Law) the casual killing of a Man; not altogether without the Killer's Fault; though without an evil Intent.

CHANDELIERS, in Fortification, are Wooden Parapets made of two upright Stakes six Foot high, which support divers Planks laid across one another, or Bavins filled with Earth. They are made use of in Approaches, Galleries and Mines to cover the Workmen, and to hinder the Besieged from forcing them to quit their Labours. The only Difference between *Chandeliers* and *Blinds*, is, that the Former serve to cover the Pioneers before, and the Latter to cover them over Head.

CHANEL, in the *Ionick Capital*, is a Part which is somewhat hollow under the *Abacus* after the *Listel*, and lies upon the *Echinus*, having its Contours or Turnings on each Side to make the *Volutes*.

CHAOS: The ancient *Ethnick* Philosophers suppose the World to be formed at first out of a *Chaos*, that is a dark kind of turbulent Atmosphere, or a disorderly Sytem of Mixture of all sorts of Particles together, without any Regularity in any Respect. This the Greeks called *Ἥλον ἄερος*, *Zorodion*, and the Latins *Rudis Indigestaque Moles*—It is probable enough that the Notion came from *Moses*, who says, the Earth was without Form and void, and that *Darkness* was upon the Face of the *Abyss*: Though he gives no farther Description of it, nor tells us whence it took its Original, and came into such a confused State.

Mr. *Whiston* in his late new Theory of the Earth, supposes the ancient *Chaos*, the Origin of our Earth, to have been the Atmosphere of a Comet; for

which new, though indeed all things considered, not improbable Assertion, he endeavours to make out by many Arguments, drawn from the Agreement which appears to be between them: See his *Theory*, P. 69. So that according to him every Planet is a Comet formed into a regular and lasting Constitution, and placed at a proper distance from the Sun, revolving in a nearly Circular Orbit: And a Comet is a Planet either beginning to be destroyed or remade, that is, a Chaos or a Planet unformed, or in its Primeval State, and placed as yet in an Orbit very excentrical.

CHAPEAU, in Heraldry, is a Cap of Dignity used to be worn by Dukes; 'tis of a Scarlet Colour, lined with Ermines, and on it, as on a *Wreath*, the Crest of Noblemens Coats of Arms is born, and by it parted from the *Helmet*, which no Crest much touch immediately.

CHAPTERS (in Law) signifies a Summary or Content of such Matters as are to be enquired of, or presented before Justices in Eyre, Justices of Assize, or of Peace in their Sessions.

CHAPTERS, in Architecture, are the Crowns or upper Parts of a Pillar: Those that are destitute of Ornaments, are called *Chapiters with Mouldings*, such as the *Tuscan* and *Doric*; the first whereof is the most simple, having its *Abacus* Square without any Mouldings; but the *Abacus* of the other is crowned with an *Astragal* and three *Annulets* under the *Echinus*. All those that have Leaves and carved Ornaments, are termed *Chapiters with Sculptures*, and the finest of them is the *Corinthian*, which is adorned with two Rows of Leaves, as also eight greater, and as many lesser *Volutas* placed under a Body called a *Tympanum*. These are called usually *Capitals*.

CHAPPE, the Herald's Term for the Partition of an Escutcheon of this Figure; and they Blazon it thus, *Chappe Or*, and *Verr*.

CHARACTERISTICK of a Logarithm: See *Index* or *Exponent*.

CHARACTERS, are Marks, Signs, or Symbols of things invented by Artists, and peculiar to several Sciences, by which the Knowledge of the Things themselves is always more expeditiously and most times more clearly conveyed to the Learner; especially after he hath a little enured himself to them.

Characters used by Mathematicians, are chiefly in Geometry, Trigonometry and Algebra, and are as followeth:

= Is the Mark of Equality, though D. Cartes, I know not why, instead of it useth \propto , in which he is scarcely followed by any Body; and this (=) mark with him, or his Commentators, signifies the Difference of two Quantities when 'tis not known which is the greatest; which now a-days we mark thus ∞ . But now this Sign = is universally used for *Equal to*; and if you should see $a = 2b$, you must read it, a is equal to twice b .

+ Is in Algebra a Sign of real Existence in the Quantity it stands before, and therefore all Quantities that have no Signs are always suppo-

sed to have this Sign + before them. 'Tis called the *Affirmative* and *Positive Sign*, because it implies the Quantity to be of a Positive and Real Nature; and is directly contrary to the following Sign —.

This Sign + is also the Mark of Addition, and when you see $a + b$, you must read it a added to b ; or as the way usually is, a more b ; and you are to suppose it to be the Sum of those two Quantities a and b .

— Is the Note of Negation, Negative, Existence, or Non Entity in Algebra. And whenever it stands singly before any Quantity, it shews that Quantity to be no real one, but less than nothing; and therefore such Quantities are called *Negative*. Thus — 3 is a Negative 3, or 3 less than Nothing. And though such Quantities as these are only Imaginary, they have yet very great use in Algebra. And any one may have a distinct Idea of such a Negative Quantity, if he consider a Man to have in Cash, or be worth but 1000 Pounds, and yet to owe to 1500; for then that Man is certainly 500 l . worse than nothing; which Quantity of 500 l . in respect to him, will properly be expressed by putting this Negative Sign before it; for its truly to that Man — 500 l . or 500 l . less than, or worse than nothing.

This Character is also the Note of Substraction, and when you see $a - b$, you must read it, a , substrating or abating, or as the usual way is now, a less b ; implying, that the Quantity is the Difference between a and b , or the Remainder, when b the lesser is subtracted from a the greater. Therefore this Note (as also doth the foregoing) always belongs to the Quantity following it.

∞ Is the Character expressing the Difference between any two Quantities when is not yet discovered which is the greater: And therefore the Sign — cannot be used, because it always supposes the Quantity following to be less than what precedes it.

\times Is the Character of Multiplication, implying the Quantities on each Side the Sign, are to be multiplied one into another. Thus $a \times b$ is to be read a multiplied by b ; or the Rectangle between, or Product of a and b . But this Sign in Algebra is usually omitted, and the Quantities are put down like Letters in a Word. Thus ab signifies the Product of a multiplied by b . In compound Quantities the Sign is most times used, as $a + b \times c + d - e$.

\div Is the Mark of Division. Thus $a \div b$ signifies that the Quantity a is to be divided by b . But most times in Algebra the Quotient is expressed

Fraction-ways; as $\frac{a}{b}$ signifies the Quotient of a divided by b . Some Writers express it thus, $b) a$, (as in the common Division.

\odot Is the Character of Involution, as they call it, that is, of producing the Square of any Quantity, or of multiplying any Quantity into it self. In *Branker* and *Pell's Algebra*, and since that, in *Ward's* and others, 'tis placed in the Margin, and shews that the Step of the Equation against which it stands is to be multiplied by it self, or squared, or if it be a Square already, then to be raised up to that Power, which the Index set after the Character expresses, v. gr.

1 | ③ | 4 : a a a + 3 a a b + 3 b b a + b b b | shews

that the first Step of that Equation, which (was $n + b$) was, in the 4th Step, multiplied Cubically, or raised up to the 3d Power.

uu Is the Character of Evolution; that is, of Extraction of Roots out of the several Powers; and is the Reverse of the foregoing Sign ③.

: : Is the Mark of Geometrical Proportion disjunct, and is usually placed between two Pairs of Proportionals, as in the Golden Rule; thus 4 : 6 :: 8 : 12; and shews, that 4 hath the same Ratio to 6 that 8 hath to 12.

∴ Is the Mark of Geometrical Proportion continued, and implies the Ratio to be still carried on without any Interruption, as, 2, 4, 8, 16, 32, 64, 128 ∴. Some French Writers use this Mark for Arithmetical Proportion.

√ Is the Sign of Radicality, and shews (according to the Index of the Power that is set over or after it) that the Square Cube or other Root is extracted, or is to be so, out of any Quantity; as $\sqrt{25}$, or $\sqrt[3]{25}$, or $\sqrt{(2) 25}$,

signifies the Square Root of 25; and $\sqrt[3]{25}$, or $\sqrt{(3) 25}$, signifies the Cube Root of Twenty five. Sometimes this Radical Sign belongs to as many of the following Quantities as have a

Line drawn over them; as, $\sqrt{b + d}$ signifies the Square Root of the Sum of b and d added

together: And $\sqrt{(3) f + c - g - 3}$ signifies the Cube Root of the Sum of f and c , after g is subtracted from that Sum; and that after this, 3 is to be taken from the said Cube Root.

⌋ or ⌋ Is the Character of Greater, and

⌋ or ⌋ The Sign of the Lesser of any two Quantities.

|| Is the Mark for Parallel, and implies, that 2 Lines or Planes are equidistant one from another.

△ Triangle.

□ Square.

◻ Rectangle.

○ Circle, or Sol the Sun.

∨ Equi-angular or Similar.

≡ Equilateral.

∠ Angle.

⊥ Right-Angle.

⊥ Perpendicular.

:: Is the Mark for Arithmetical Proportion.

ȳ, ẋ, ȳ. Any Letters with Points so over their Heads, denote the Fluxions of variable Quantities: And if they have 2, 3 or 4 Points, they denote Second, Third or Fourth Fluxions: See Fluxions.

— 1, — 2, — 3, — 4, &c. are the Exponents of a Series of Fractions in a Geometrical Progression.

$\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, are the Exponents of \sqrt{x} , $\sqrt[3]{x}$, $\sqrt[4]{x}$, which therefore in the new Notations are written thus, $x^{\frac{1}{2}}$, $x^{\frac{1}{3}}$, $x^{\frac{1}{4}}$, &c. Also

$x^{\frac{1}{2}}$, stands for \sqrt{x} ; and in Fractions,

x^{-1} , x^{-2} , x^{-3} , stand for $\frac{1}{x}$, $\frac{1}{x^2}$, $\frac{1}{x^3}$, &c. Al-

so $x^{\frac{1}{2}} + \frac{1}{2}$ expresses the Product of $x^{\frac{1}{2}}$ into $x^{\frac{1}{2}}$, and $x^{-\frac{1}{2}} - \frac{1}{2}$ (or $x^{-\frac{3}{2}}$) is the Product of $x^{-\frac{1}{2}}$ into its self, or Square of $x^{-\frac{1}{2}}$.

$x^{\frac{1}{2}} - \frac{1}{2}$ (or $x^{\frac{1}{2}}$ is the Exponent of the Quotient of $x^{\frac{1}{2}}$ by $x^{\frac{1}{2}}$.

$\frac{a+b}{a+b}^{-1}$ Expresses an Unite divided by $a+b$.

$\frac{a+b}{a+b}^{-3}$ Is an Unite divided by the Cube of $a+b$.

$\frac{a+b}{a+b}^{\frac{1}{2}}$ Is the Biquadratic Root of the Cube of $a+b$.

---	---	--	--

CHARGE, in Heraldry, signifies whatever thing is born, in the Field of a Coat of Arms; whether Animal, Vegetable, or any other Representation or Figure. Proper Charges are called *Ordinaries*: Which see. Thus *Guillem*, but *Bloom* calls those *Charges* on which Rewards and Additions of Honour are often placed in a Coat of Arms, such as *Cantons*, *Quarters*, *Gyrons*, *Flaks*, &c.

CHARGE, the Seamen call a Ship, a *Ship of Charge*, when she draws much Water, or swims deep in the Sea; and sometimes it's us'd for an unweildy Ship that will not ware nor steer, for such a one they say also is a *Ship of Charge*.

CHARLES's WAIN, seven Stars in the Constellation called *Ursa Major*.

CHART, is a Draught projected for the use of Seamen, Discovering the Sea-coasts, Sands, Rocks; and is sometime taken for the *Nautrical Compass*.

CHARTA *Pardonationis se defendendo*, is the Form of a Pardon slaying another Man in his own Defence.

CHARTA *Pardonationis utlagarie*, is the Form of a Pardon for a Man that is outlawed.

CHARTER-PARTY, is an Indenture of Covenants and Agreements made between Merchants or between Owners of Ships and the Masters and Sea-faring Men, touching their Affairs, or Commanders.

CHARTIS Reddendis, is a Writ which lies against him that hath Charters of Feoffment, de-

livered him to keep, and refuseth to deliver them.

CHASE, to *Chafe* is to pursue a Ship at Sea, which is called *Giving Chase*. A *Stern Chase* is when the Chaser follows the Chased a-stern, directly upon the same Point of the Compass: To lie with a Ship's Fore-foot in a *Chafe*, is to sail and meet with her by the nearest distance, and so to cross her in her way, or to come across her Fore-foot. A Ship is said to have a *good Chase*, when she is so built forward on, or a-stern, that she can carry many Guns to shoot forwards or backwards, and so hath either a *good Forward*, or a *good Stern-Chase*.

CHASE-GUNS, are such whole Ports are either in the Head (and then they are used in *chasing of others*) or in the Stern, which are only useful when they are purfued or chased by any Ship or Ship.

CHASE *of a Gun*, is its whole Length.

CHAUSE-TRAPPES, or Coltraps, in *Fortification*, are Iron Instruments with four Spikes about 4 Inches long, made after such a manner, that whatsoever way they fall, one Point will always lie uppermost like a Nail. They are usually scatter'd and thrown into Moats and Breaches to gall the Horses Feet, and to stop the hasty approach of the Enemy.

CHECKY, the Herald's Term for a Bordure or Ordinary that hath more than two Rows of Checkers; for if it hath only one, they call it *Counter-composed*.

CHEEKS, are (in a Ship) two Pieces of Timber fitted on each Side of the Mast at the Top, serving to strengthen the Mast there; and also having Holes in them (which are called *Hounds*) through which the *Ties* run to hoist the Yards.

Also the uppermost Rail or Piece of Timber in the Beak of a Ship; and those on each Side the *Trail Board*, are called the *upper and lower cheek*. The *Knees* also which fasten the Beak-Head to the Bows of a Ship are called *cheeks*; and so are the Sides of any Block, as also the Sides of a Ship-Carriage for a Piece of Ordnance.

CHIEF, one of the Eight Honourable Ordinaries in Heraldry, containing a Third Part of the Field, and determined by one Line, either straight or crooked, that is, *Invested, Engrailed, &c.* drawn through the Chief Point of the Escutcheon. Thus the Field is *Gules, a Chief, Argent*. He beareth *Gules, a Chief Girelle, or Embattelée, Argent*.

Sometimes one Chief is born upon another, which is called *Surmounting*, and it is usually expressed by a Line drawn along the upper part of the Chief; for if the Line be drawn along the lower Part of the Chief, it is called a *Fillet*. The former of these is an Addition, the latter a Diminution of Honour. *Chief Point*: See *Escutcheon*.

CHEMIN de Ronds, in Fortification, is the way of the Rounds, or a Space between the Rampart and the low Parapet under it for the Rounds to go about. The same with the *Fausse Bray*.

CHEMISE, in Fortification, is a Wall with which a Bastion, or any other Bulwark of Earth is lined for its greater Support and Strength; or it is the Solidity of the Wall from the *Talus* to the Stone Row.

CHEMOSIS, is the Tumour of the *Albugineous Tunick* that maketh the Black of the Eye appear Concave, being a very great Inflammation of the Eyes with vehement Pain, both the Eye-lids being turned the Inside out, so that the Eyes can scarcely be covered with them, whilst the White of the Eye stands higher, and the Red runs over most Part of the *Iris*.

CHERSONESUS, a Term in Geography, being the same with *Peninsula*, and signifies a Part of the Land enclosed all round about with Water, except one narrow Neck, by which it joins to the Main Land; and that Neck is called an *Isthmus*.

CHESSE-TREES, are two small Pieces of Timber with a Hole in them, on each Side of the Ship, a little before her *Loof*, for the Main Tack to run through, and to which it is haled down.

CHEVAUX de Frise, or *Friseland Horse*, in Fortification, is a large Joist or Piece of Timber about a Foot in Diameter, and ten or twelve in Length; into the six Sides thereof are driven a great number of Wooden Pins about six Foot long, crossing one another, and having their Ends armed with Iron Points. Their chief Use is to stop up Breaches, or to secure the Avenues of a Camp from the Inroads both of Horse and Foot. They are much the same with *Turn-pikes*.

CHEVILS, or *Keils*, are small Pieces of Timber nailed to the Inside of a Ship to *belay* or fasten the *Sheets* and *Tacks*.

CHEVRON, one of the Honourable Ordinaries in Heraldry: It represents two Rafters of an House set up as they ought to stand, and was anciently the Form of the Priestesses Head Attire. It contains the Fifth Part of the Field, and is Figured thus:

He beareth *Gules, a Chevron Argent*, by the Name of *Fulford*. The *Chevron* is divided into the

CHEVERONEL, which is the Moieties of a *Chevron*; and a *Couple-Close*, which is the fourth Part.

CHICANRY, is a trickish and guileful Practice of the Law.

CHILIADS; so the *Tables of Logarithms* are frequently named by many Authors.

CHILOGON, a Regular Plane Figure of 1000 Sides and Angles; of which, though the Eye can form no distinct View, we may have a very clear Idea in the Mind; and can easily demonstrate, that the Sum of all its Angles are equal to 1996 Right ones; for the internal Angles of every Plane Figure, are equal to twice as many Right Angles as the Figure hath Sides; except those 4 which are about the Point in the Middle, from whence the Figure is resolved into Triangles.

CHIMES of any Clock: How to calculate Numbers for them, and to fit and divide the *Chime-Barrel*: See in *Watch-Work*.

CHIRAGRA, is a sort of Gout in the Hands only.

CHIROGRAPHER, is he that in the Common-Pleas, ingrosses Fines acknowledged in that Court into a perpetual Record (after they are acknowledged and fully passed by those Offices by whom they are first examin'd) and that Writes and delivers the Indentures, one for the Buyer, and another for him that sells, and makes another indented Piece, containing also the Effect of the Fine, which he delivers over to the *Custos Brevium*, which is called the *Foot of the Fine*. The *Chirographer* also, or his Deputy, proclaims all the Fines in the Court every Term, according to the Statutes, and then repairing to the Office of the *Custos Brevium*, there endorses the Proclamations upon the Back-side of the Foot thereof, and always keeps the Writ of Covenant, as also the Note of the Fine.

CHIROMANCY, the same with *Palmastry*, is a pretended way of Divination, telling of Forturities, presaging Futurities, or discovering the Tempers and Constitutions of Persons by a ridiculous Inspection into the Hand, and Observation of Wrinkles and Strokes of the Skin.

CHIVES, is the Botanic Word by which our Mr. Ray renders the Latin *Apices*: Which see. But Dr. Grew calls the *Stamina* on which the *Apices* are fixed, by this Name of *Chives*.

CHLOROSIS, or *Morbus Virginis* commonly *Icterus Albus*, or the *Green-sickness*, seems to be a kind of Phlegmatick Pituitous Dropsy, arising from an Obstruction of the Menfes, want of Fermentation in the Blood, and Detention or Depravation of the Ferment in the Womb; whereupon the Muscu-

Muscular Fibres being obstructed, they become Lazy and unfit for Action. *Blanchard.*

CHOANA, is a sort of Cavity or Tunnel in the *Basis* of the Brain, by which the serous Excrements are brought down from the Ventricles of the Brain to the *Pituitary Glandules*; also the *Pelvis* of the *Reins*, of which in its proper Place. *Blanchard.*

CHOLEDOCHUS *Ductus*, is the Communion of the *Ductus* or *Porus Biliaris* with the *Ductus Cysticus*, into one Passage, and is thence called the *Ductus Communis Choleodochus*. This goes obliquely to the lower End of the *Duodenum*, or the beginning of the *Jejunum*; and creeping obliquely between the Tunicks of the Intestine, hath the Return of the *Bile* hindered (as by a Valve) from coming into the *Ductus* again.

CHOLER: See *Bile*.

CHOLERA *Morbus*, is a depraved Motion of the Ventricle and the Guts, whereby the *Bilious Excrements* are discharged in great plenty upwards and downwards. *Blanchard.*

CHOLOGOGUES, are Medicines which purge *Choler*, Sulphureous and Bilous Humours; as *Rhubarb*, *Senna*, &c. according to the old Notion.

CHONDROSYNDESMUS, the joyning or uniting of the Bones by a Cartilage placed betwixt them.

CHORD, in Geometry, is a Right Line connecting the Extremities of any Arch of a Circle, and is otherwise called a *Subtense*.

Prop. I.

A Chord (*bc*) is bisected by a Perpendicular (*ad*) drawn from (*a*) the Center.

For the Triangle *abe* is an *Isoceles*, (because $ea = ba$) and therefore the Perpendicular *ad* bisects the *Base* or Chord *bc* (10. e. 1. *Encl.*) and consequently the Ark *bc* is also by this Means bisected. From whence are deducible and demonstrable these

Problemes.

1. To make a Circle pass thro' any three Points given, nor lying in a Right Line.
2. To find the Center of any Circle.
3. To compleat a Circle from an Ark given.
4. To describe a Circle about any Triangle given.

1. Let the three Points be *ABC*; join *AB* and *AC*, which bisect in *D* and *E*, by drawing the Perpendiculars *DO* and *EO*: The Point *O*, where they cross one another, must be the Center, because they both pass thro' it by this Proposition. With the Distance *AO* draw the Circle, and the Demonstration will be plain.

2. If the Circle had been given, or any Part of it, as suppose the Ark *CAD*, and the Center of the Circle had been required: You need only mark out any three Points in the Circumference; as suppose *A, B, C*; then proceed as before, you'll find the Center *C*.

3. The same way also you may describe a Circle about the Triangle *ABC*; for the Perpendiculars that bisect any two Sides of the Triangle, will, where they cross, find the Center *C*, from whence a Circle being drawn, it shall circumscribe the Triangle *ABC*. The Demonstration is the same with the former.

N. B. The Center of a Circle may very easily be found by the Square thus; Apply the Corner of the Square any where to the Circumference, as suppose at *A*; and draw *DR* between the Points where the Legs cut the

Circumference. The Line bisected, shall give *C* the Center of the Circle; for the Angle *DAR* being a Right one, *DR* must be the Diameter, by 31. e. 3. *Encl.* The half of which *DC* or *CR* must be the Radius.

CHORDA Membrana Tempani, is a certain Nerve coming from the third Branch of the fifth Pair, extended above the Membrane of the Tympanion or Drum of the Ear, and which goes also to the Muscles of the Malleolus, and then joins the *Portio Dura* before it comes out of the Cranium.

CHORDAPSUS, so *Celsus* names it, barbarously called *Miserere me*; by others *Iliaca Passio*, by others *Volubulus*, commonly *Ileus*; is an Ejection of the Excrements at the Mouth only, because the Peristaltick or Vermicular Motion of the Guts, whereby the Excrements are excluded, becomes inverted. *Blanchard*.

CHOREA Sancti Viti, is a sort of Madnefs, which formerly was very common amongst some People, wherein the Person affected laid not down, but ran hither and thither dancing to the last Gasp if they were not forcibly hindered. *Horslius* says, That he hath spoke with some Women, who paying a Yearly Visit to the Chapel of Saint *Vitus*, which is near the City *Ulme* in *Sweedland*, have been taken with such a Violent fit of Dancing Night and Day, together with a sort of Frantickness in the Mind, that they fall together like so many People in Extasies; and are sensible of little or nothing for a Year together till next *May*, about which time they perceive themselves so tormented with a Restlessness in their Limbs, that they are forced to repair to the same place again about the Feast of Saint *Vitus* to Dance.

CHOREUS, vulgarly called *Trocheus*, is the Foot of a Latin Verse, consisting of two Syllables, where the first is long, and the last short, as *Anrus*; so that this is the Reverse of an *Iambus*.

CHORIAMBUS, is the Foot of a Latin Verse compounded of a *Chorus* and an *Iambus*; it consists of four Syllables, of which the first and last are long, and the middle ones short; as *Historie*.

CHORION, is the outer Membrane involving the *Fœtus* in the Womb; 'tis pretty thick, smooth within, but rough without-side to which the *Placenta* adheres: It hath many Vessels which spring from the *Placenta*, and from the Umbilical Vessels. The former are dispersed thro' it before the *Fœtus* is shaped (as *Diemerbroek* affirms) but the latter not till the Navel-Rope is grown out to a just length; at which time they enter in it, and are intermixt with the former, and from this Membrane are inferted into the *Placenta* to which the *Chorion* adheres. This Membrane, the *Chorion*, is always single, tho' the *Fœtus* be *Twins*, tho' then there is a double *Amnion*, treble, quadruple, &c. if the *Fœtus* are 3, 4, &c. Originally the *Chorion* did invest the *Ovum*, but when that is brought down into the Womb, and is become a Conception, this Membrane imbibes the Moisture of that part very plentifully; for while the Conception lies loose there, and is fastned to no part by any Vessels which go from it, or come to it, it seems to have its increase just as the Egg hath in the Body of the Hen; which whilst it is in the *Racemus* or Knot, hath no other Substance but the Yelk; and when it drops off from thence, and descends thro' the *Infundibulum*, it receives no Alteration, but when it comes into the Cells of the Process of the *Uterus*, it begins (saith *Harvey*) to gather a *White*, altho' it yet stick to no part of the *Uterus*, nor hath any Umbilical Vessels: But just as the Eggs of Frogs and Fishes gather themselves a *White* out of the Water, so doth there come out of the *Plicæ* or Wrinkles of the Womb

an Albugineous Moisture, whence the Yelk (by its vegetative and innate Heat) gathers and concocts its *White*. After this manner doth the *Chorion* imbibe that Albugineous Matter, which from the first Conception encreases daily in it (and which transudes thro' the *Amnion* in which the *Embryo* swims) till the Umbilical Vessels and the *Placenta* are formed; from and thro' which the *Fœtus* may then receive its Nourishment. And the Liquor which this *Chorion* imbibes, *Dr. Gibson* takes to be the Nutritious Juice which oozes into the Cavity of the *Uterus* out of the Capillary Orifices of the Hypogastrick and Spermatick Arteries, and is of the same Nature with that which is afterwards separated in the *Placenta*, and carried to the *Fœtus* by the Umbilical Vein, and with that also which abounds in the *Amnion*, even till the Birth: For the Plastic or Vegetative Virtue is only in the *Ovum* it self, and the Augment that the first Lineaments of the *Fœtus* receives, is only by Apposition of this Nutritious Juice. But the *Chorion* is grown so dense and thick by that time the *Placenta* and Umbilical Vessels are formed, that it is not capable of imbibing more; but that which in this time is in it, doth in a little while transude into the *Amnion*, and so it self becomes empty, and gives way to the encrease of the *Allantoïdes* (which from hence begins to appear) and whose Liquor encreases daily as the *Fœtus* grows near to the Birth. This Opinion, which seems indeed very probable, the Learned *Dr. Gibson* in his *Anatomy* (last Edition, p. 220.) proposes only as a Conjecture, and submits it to the Censure of the Learned.

CHOROGRAPHY, is a particular Description of some Country, as of *England*, *France*, or any Shire or Province in them, &c.

CHOROIDES, is the folding of the *Carotidal Artery* in the Brain, wherein is the *Glandula Pinalis*: It is also the *Uvea Tunica*, which makes the Apple of the Eye.

CHROMATICK, a Term in Musick, being the second of the three kinds, which abounds in Semi-tones, and contains only the least *Diatonical Degrees*. It is recorded in History, that *Timotheus* the *Milesian* first invented this sort of Musick, in the time of *Alexander the Great*, and the *Spartans* banished him because being accustomed only to the *Diatonick* kind, they judged the *Chromatick* to be too soft.

CHRONOLOGY, in the common Sense of the Word now, is the Arithmetical computing of Time for Historical Uses; so as thereby truly to date the Beginnings and Ends of Princes Reigns, the Revolutions of Empires and Kingdoms, Battles, Sieges, or any other Memorable Actions.

CHRONOMETRUM *Perpendicularum*, or *Chromoscopium*, the same as *Pendulum*: Which see.

CHRONOSCOPE, the same with a *Pendulum* to measure Time: See *Pendulum*.

CHRYSOCERAUNUS Pulvis, is the same with *Aurum Fulminans*: Which see.

CHRYSTAL Mineral: See *Sal Prunella*.

CHRYSTALS of Copper: See *Vitriol of Copper* or *Venus*.

CHRYSTALS of Silver, or *Vitriol of the Moon*, is an Operation in Chymistry, where by the Body of Silver is opened and reduced into the form of a Salt by Spirit of Nitre. 'Tis done thus; Dissolve an Ounce or two of Silver in about three times the Weight of *Aqua Fortis*, or which is better, good Spirit of Nitre. Evaporate the Dissolution in a Glass

Glass Cucurbit and over a Sand-heat till about $\frac{2}{3}$ of the Liquor is blown off, then let the Remainder stand without stirring it, and it will shoot into Crystals, which take out, and when they are dry, keep them in a Viol well stopp'd. These Crystals are used to make an Eschar, by touching any part with them. They are also given inwardly in Dropsies sometimes, from two to six Grains, and they will purge gently. The Purgative Quality in these Crystals (there being no such thing either in the Silver or the Spirit of Nitre) must arise from the new Texture and Conformation of the Parts of both, happening from this Union of the Parts of the Silver with those of Spirit of Nitre.

These Crystals may easily be revived into good Silver again, if you put them to dissolve, as they will readily do in a Vessel of hot Water, in the bottom of which you shall have laid a Plate of Copper; the Silver will precipitate down in a white Powder, which gather, wash and dry, and then melt it in a Crucible with a little Salt Petre, 'twill run into good Silver of the same weight as at first.

CRYSTALS of Tartar : See *Cream of Tartar*.

CRYSTALLINE Heavens, in the Ptolemaick System were two. One served them to explain the slow Motion of the fixed Stars, and caused them (as they thought) to move one Degree Eastward in about 70 Years.

The Second helped them out in solving a Motion, which they called the Motion of *Trepidation* or *Libration*; by which they imagined the Sphere to swag from Pole to Pole.

CRYSTALLINE Humour of the Eye : See *Humours*.

CRYSTALLIZATION, is an Operation in Chymistry, by which the Salts dissolved in any Liquor are made to shoot into little prettily figured Lumps or Fragments, which they call *Crystals*, from their being pellucid or clear like Crystal. In order to bring the Salts duly to *Crystallize*, you must gently evaporate part of the Moisture; for if there be too much Liquor in proportion to the Salt, it will not coagulate or crystallize at all; and if there be too little, the Salts will all run into one another, and not crystallize regularly. The general Rule to know when enough of the Moisture is evaporated, is when a little Skin begins to be on the Surface of the Liquor.

CHYLE, is a white Juice in the Ventricle and Intestines, proceeding from a light Dissolution and Fermentation of the Victuals, especially of their Sulphur and Salt with which Edible things abound, and which by the Invention of the *Acid Humour* in the Ventricle becomes white; for if you pour an Acid upon any Liquor that is impregnated with Sulphur and Volatile Salt, it presently turns Milky, as is obvious in preparing Milk of Sulphur, or the Resinous Extracts of Vegetables. Nay, Spirit of Harts-horn and of Soot, abounding with Volatile Salt, if it be mix'd with an Acid, or with but plain Water, grows to be of a Milky Colour: At last the Chyle after a Commixtion and Fermentation with the Gall, and the Pancreatick Juice, either Volatile or Acid, passing the *Lacteal Veins*, &c. is mixed with the Blood. It is called in Latin also *Chymus*, *Blanchard*. As to the manner how this chyle is first made and perfected, see

CHYLIFICATION, which is the Action of the Stomach, Guts, &c. in the making of Chyle, and 'tis done thus, as I find the Accurate Mr. William Couper, Chyrurgeon, hath accounted for it in a Paper published in *Philos. Transactions*, N, 220.

The Aliment which is usually taken down into the Stomach of Adult Persons, is such whose Grossness of Parts requires *Mastication* or *Chewing*: In order to which, the *Dentes Incisores* are sometimes employed to divide it from the more Bulky Part, and to receive it into the Mouth; and then the lower Jaw being variously moved by its proper Muscles *Mastication* is begun, and carried on by the Assistance of the Tongue, Cheeks, and Lips, the two first still applying the less divided Parts of the Aliment to the *Dentes Molares* till there is an equal Communion of all its Parts; nor is the Action of *Mastication* merely performed for dividing the grosser Parts of the Aliments, but divers of the Muscles employed in the Motion of the lower Jaw, are at the same time also serviceable in hastening the *Saliva* or *Spittle*, separated from the Blood by the Parotid Glands, those of the lower Jaw, and under the Tongue, into the Mouth; the Saliva Glands of the Cheeks and Lips also contributing their Juice; do altogether joyn with the Masticated Aliments, before, or at the same time it's made fit to be swallowed; which Action is called *Deglutition*.

Deglutition is thus performed: The Aliment, as well what's fluid as that masticated, being lodged on the Tongue, which does somewhat hollow it self by means of its own proper Muscular Fibres, for the more commodious entertaining the larger Quantity, its Tip and Sides are applied to the Indices of all the Teeth of the upper Jaw, (and *Gingivæ* or Gums of those that want Teeth) the Tongue is suddenly drawn up by the *Musculi Styloglossi* or *Myloglossi*, together with those Muscles which pull the *Os Hyoides* upwards; at the same time the Fauces are drawn up, and their Cavity enlarged by the *Musculi Stylopharyngei*; and about two thirds of the Tongue's superiour Surface is adequately applied to the Roof of the Mouth; the *Epiglottis* from its Position being consequently depressed, does thereby cover the *Glottis* or *Rimula* of the *Larynx*, and prevents any part of the Aliment from descending into the Wind-pipe: In this part of the Action of *Deglutition* the Glands under the Tongue, and excretory Ducts of those of the lower Jaw are compress'd, and their separated Liquors or Spittle voided by their *Papillæ*, situated at the lower part of the *Frenum* or Ligament of the Tongue; and this is done by the *Musculus Mylo-Hyoidæus*; when the Aliment by the abovementioned Motion of the Tongue, is forced into the Fauces or upper part of the Gula; at the same time the *Gargareon*, together with the *Uvula* are drawn upwards by the *Musculi Sphænostaphili*, by which means any part of the Aliment is hindered from ascending into the *Foramina Narium*: The Fauces by the *Musculus Pterygopharyngeus* and *Oesophagus* are contracted, whereby the Aliment is not only compress'd into the Gula, but the Matter separated from the Blood by the Glands of the Fauces, especially of those large ones called *Tonsillæ*, is forced out of their Cells or Excretory Ducts, to join with it in its descent to the Stomach by Gula, through which the latter passes by the Action of its Muscular Fibres.

The Aliment thus impregnated with *Saliva* in *Mastication* and *Deglutition* being received into the Stomach, there meets with a Juice separated from the Blood by the Glands of that Part whose Excretory Ducts open into the Cavity of the Stomach: By the commixture of these Liquors, whether of *Saliva* or the Juice of the Stomach a pro-

per *Menstruum* is compos'd, by which the Parts of the Aliment are still more and more divided by its insinuating into their Pores, and by which the Air before imprison'd in their less-divided Parts, is not only set more at liberty, but by the natural Heat, it must necessarily suffer such a Rarefaction, as that thereby the whole Stomach becomes still more and more distended; hence it is we have less Appetite sometime after eating (when this Intumescency is made) than we had immediately after; hence also arise those frequent *Eruptions* from divers Aliments, as old Pease, Cabbage, and divers other Vegetables we frequently eat; all which become very much disturbing in deprav'd Appetites and weak Stomachs. Though we have not us'd the Word *Fermentation*, yet we do not suppose the Dissolution of the Aliment within the Stomach can be done at least without an Intestine Motion of its Particles with the *Menstruum*; but we have omitted that Term, because it may be apt to lead us into an Idea of a greater Conflict than in truth there really is.

At the same time this Intumescence an Agitation of the Matter is made in the Stomach, the Contents of the neighbouring excretory *Ductus*'s namely, the Bile in the Gall-Bladder and Liver-Ducts, and Pancreatick Juice in the *Ductus Pancreaticus*, are compress'd into the *Intestinum Duodenum*, through the Extension of the Stomach it self; the reflux Blood of the Stomach at that instant being in some measure retarded, whereby the *Muscular Fibres* are more liable to be contracted.

Nor can we conceive how the Liquor of the Stomach, after having joyn'd with the *Saliva* and Aliment, should be still so plentifully excreted from the Glands of that Part, as to irritate its Internal Membrane, and excite its *Muscular Fibres* to contract, since the Muscles of the *Abdomen* would, like as in Vomiting, be drawn into a Consent of Co-operating, and the Aliment would be forcibly rejected by the Mouth: Besides, should the Liquor of the Stomach be so disturbed in *Chylification*, what would it be so soon as all its Contents were discharged? The Irritation the Stomach undergoes in Hunger, we are firmly perswaded does not arise but through an Accumulation of the *Saliva* in the Stomach, in conjunction with the Liquor of the Glands of that Part; whence it is we rather discharge the Spittle at that time by the Mouth, than to suffer any more of it to descend into the Ventricle: Hence proceeds what we call the *watering of the Mouth*; hence also, when the *Saliva* is vitiated, the Appetite is deprav'd.

The Stomach, by means of its *Muscular Fibres* contracting it self, does gradually discharge its Contents by the *Pylorus* into the *Duodenum*, in which Gut, after a small *Semicircular* Descent, it meets with the Pancreatick Juice and Bile; both which joyning with it, renders some Part of the Aliment more fluid, by still disuniting the grosser Parts from the more pure; and here *Chylification* is made perfect.

The Bile which abounds with *Lixivial* Salts, and apt to intangle with the grosser Parts of the Concocted Aliment, stimulates the Guts, and deterges or cleanses their Cavities of the *Mucous Matter*, separated from the Blood by the Glands of the Guts, and lodged in their Cavities; which not only moistens the Insides of the Guts, but de-

fends the Mouths of the *Lacteal* Vessels from being injured by *Alien Bodies* which often pass that way.

The Contents of the Intestines moving still on by means of the *Peristaltick* or Worm-like Motion of the Guts, whilst those thinner Parts fitted for the Pores of the *Lacteal* Vessel called *Chyle*, is absorbed by them, the thicker move still more slowly on, and by the many Stops they continually meet with by the *Connivent Valves*, all the *Chyle* or thin Parts are at length intirely absorbed, the Remains being merely *Excrementitious*, are only fit to be excluded by Stool.

The Analogous White Appearance of the *Chyle*, whether in the Stomach or Intestines, and always in the *Vene Lactea* and *Thoracic Duct*, may be seen in the Commixtures of divers Liquids, which separated exhibit no such Appearance; nor is this *Phenomenon* any otherwise than a Transposition of Particles, whether by a *Menstruum* insinuating into them, dividing them into gross Globules, as an Acid into Sulphur, as Vinegar with Oil, &c. or else by Precipitation, as when a Gum-mous or Resinous Body is dissolved in a Spirituous *Menstruum*, and mixed with a Phegm; so Tincture of Myrrh and Benjamin, &c. make a milky Appearance in common Water,

The Longitudinal and Transverse Order of the Fibres of the Guts, are the Instruments by which the *Peristaltick* Motion of them is performed, which Motion is not only necessary for punishing their Contents forwards, but by reciprocal Contraction of the *Muscular* Fibres of the Guts, and Apposition of their *Connivent Valves*, the Mouths of the *Lacteals* are disposed to receive what is fitted for them; hence it is we can by no Means make any Fluid whatever pass from the Cavity or the Guts into those *Lacteal* Vessels in a dead Animal.

A further use of this Contraction of the *Muscular* Fibres of the Intestines, is to accelerate the *Chyle* in its Progress in the *Lacteals*, till the *Lympha* derived from the Extremities of the Arteries of the Guts joins with it; which Conjunction is made in the *Lacteals* before they leave the External Surface of the Intestines. By this Means the Progression of the *Chyle* is made towards the *Mesenterick* Glands, into whose Cells it is received, where it again mixes with a Juice brought in by the Arteries of each Gland; which Juice or *Lymphatick* Liquor not only farther dilutes the *Chyle*, like that from the Arteries of the Intestines, but adds a fresh *Impetus*, by which its Motion is farther carried on through the *Vasa Lactea secundæ generis*; (arising out of each *Mesenterick* Gland, and discharging their Contents into the *Receptaculum Chyli*.) Here the *Chyle* meets and joins with the *Lympha* sent through the *Lymphatick Ducts* from the inferior Limbs and neighbouring Parts, whereby the *Chyle* is not only farther prepared, but its Ascension is promoted in the *Thoracic Ducts*, whose several Divisions and Inosculation (like the Veins of the Testicles) with its many Valves looking from below upwards, and advantageous Situation between the great Artery and *Vertebre* of the Back together with the *Lymphatick* ducts, discharging their *Lympha* derived from the Lungs and neighbouring Parts of the Thorax, does demonstrate the utmost Art still used in order to its Ascension towards the left Subclavian Vein, where meeting with the reflux Blood of the Superiour Parts, its passes with it through the descending

descending Trunk of the *Vena Cava*, and joins with the reſluent Blood of the inferior Parts in the Right Auricle of the Heart; whence its expelled by its Contraction into the Right Ventricle, when the Heart is in *Diſtole*; but by the *Syſtole* or Contraction of the Heart, it's again driven out thence into the *Arteria Pulmonaris*, thro' whose Extremities, in conjunction with those of the *Vena Pulmonalis*, it paſſes to the Left Auricle and Ventricle of the Heart, from whence it's again expelled in the *Syſtole* (as above) into the *Aorta* or *Arteria Magna*, by whose Branches it's conveyed thro' the whole Field of the Body: The three tricuspid Valves in the Right, and two Mitral Valves in the left Ventricle of the Heart opposing its return into the Veins, and the Semilunary Valves of the *Arteria Pulmonaris* and *Aorta* preventing its Ingreſs into the Ventricles, are ſufficient (when rightly conſidered) to demonſtrate the neceſſity of a Circulation of this grand Fluid called Blood. Thus *Sanguification* is begun, and as we have mentioned the divers Preparations of the Aliment before Chylification, ſo here may be obſerved the various Mixtures and Preparations of Chyle in order to Sanguination.

CHYL *Receptaculum*: See *Receptaculum Chyli*.

CHYLIOSIS, the ſame with Chylification.

CHYMIA, or *Chemia*, is a Reſolution of mix'd Bodies in their Elements; and again, when it can be done, *Co-agulation* or *Redintegration* of the ſame Elements into the Bodies which they conſtituted before: There are two Parts of it, *Solution* and *Co-agulation*; by the Addition of the Arabick Article it is called, *Alchymia*, or *Alkymia*; it is called alſo *Spagyria*, *Hermetica ars*, *ars perfecti Magiſterii*, *ars Segregatoria*, *Separatoria* and *Deſtillatoria*. Blanchard.

CHYMICA, or *Chymicalia*, are Medicines which the Chymiſts prepare, that they may be taken in a leſs or more grateful Quantity. Blanchard.

CHYMISTRY, is variously defined, but the Deſign of the Art is to ſeparate uſefully the purer Parts of any mix'd Body, from the more Groſs and Impure. It ſeems probably to be derived from the Greek Word, *χυμος*, which ſignifies a Juice, or the purer Subſtance of a mix'd Body; though ſome will have it to come from *χέω*, to melt. It is alſo called the *Spagyrick*, *Hermetick*, and *Pyrotechnick Art*, as alſo by ſome *Alchymy*. The Reaſons whereof you may ſee under thoſe Words.

CHYMOSIS, or *Chemoſis*, is a Diſtortion of the Eye-lids, ariſing from an Inflammation; alſo an Inflammation of the *Cornea Tunica* in the Eye. Blanchard.

CHYMUS, the ſame with Chylus.

CHYRONIA, is a great Ulcer, and of different Cure.

CHYRURGERY, or, as 'tis now a-days pronounced and written *Surgery*, is the Third Branch of the Curative Part of Medicine, and teacheth how ſundry Diſeaſes of the Body of Man may be cured by *Manual Operation*. Some divide it into theſe five Parts. 1. *Syntheſis*, a ſetting together of things ſeparate. 2. *Diareſis*, a ſeparating of things that were continued before. 3. *Diorthotiſis*, a correcting of things ſqueezed together, and con-torted. 4. *Exereſis*, a taking away of Superfluities. 5. *Anaplerotiſis*, a reſtoring of that which was deficient.

CICATRISANTIA, are ſuch things as by drying, binding and contracting, fill up Ulcers with Fleſh, and cover them with a Skin. Blanchard.

CICATRICULA, is that little whitish Speck in the Coat of the Yolk of an Egg, in which the firſt Changes towards the Formation of the Chick appear in an impregnated Egg: 'Tis commonly called the *Tredde*. The Chick lodged in the *Cicatricula* is nourished only by the White of the Egg, till 'tis grown of a competent Largeneſs; the Yolk ſeeming to be reſerved by Providence for a more ſtrong and ſolid ſort of Aliment, which is ſitter for the Animal when grown greater.

CICATRIX, *Cicatrices*, Scars or Marks which are left after great Wounds or Ulcers: Some are Simple, others are accompanied with *Cavities*, Diminution or Excreſcence in the Parts affected.

CICATRINING Medicines: See *Cicatrifiantia*.

CILIA and *Supercilia*, are the Eye-brows, hard Cartilaginous Bodies; but *Supercilia* properly the Hair upon the Eye-brows, at the Extremity of the Forehead.

CILIARE Liganentum, or *Proceſſus Ciliaris*, is a Collection of ſmall ſlender Filaments which take their Riſe from the inner Part of the *Tunica Uvea* in the Eye, and thence run towards the Prominent Part of the Chryſtalline Humour, which they compaſs in and connect to the Uvea: Its uſe is to help, contract, or dilate the Figure of the Chryſtalline Humour, and to draw it farther from, or bring it nearer to the Uvea, according as occaſion ſerves.

CINCTURE, in Architecture, is that part which makes the middle of a Pillar; 'tis *Conge* in French; the Greeks called it *ἀμφοῦρος*, becauſe that Part of the Pillar taking as it were, a Riſe, ſeems to fly from the Baſis: It is no more than the Rings of Ferrils formerly uſed to preſerve Wooden Pillars from ſplitting, and which they afterwards imitated in Stone Work.

CINEFACTION, with ſome Chymiſts is uſed for Calcination.

CINERITIA, or *Subſtantia Corticalis*, is the External Subſtance of the *Cerebrum*; it is Soft, Glandulous, and of an Aſhy Colour. Blanchard. See *Cortical*.

CINNABAR, is a Mixture of Sulphur and Quick-ſilver ſublimed together, and is either Natural, when this Mixture is made in the Earth by Means of the Subterranean Heat, and then 'tis called *Native Cinnabar*: Or elſe, 'tis *Artificial*, which is thus made: The Sulphur is melted in a great Earthen Pan, and then is put into it by Degrees, thrice its Weight of Mercury, and the Mixture is ſtirred about till all the Quick-ſilver diſappears. After this the Mixture is cooled and powdered, and then ſublimed in Pots with an open Fire, a hard red Maſs will be raiſed, ſhaped like Needles. 'Tis browniſh when in the Lump, but being powdered finely, is of a very high red, and is called *Vermillion*. The chief Deſign of this Operation is to make the Mercury Portable; which 'tis not ſafely, when in its natural Form, becauſe of its great Weight and Fluidity.

Cinnabar is revived into Mercury, by mixing with it in Powder, three times as much Quicklime, and diſtilling in a Glaſs Retort, into a Receiver filled with Water, by Degrees of Fire; the Quick-ſilver will be found at the Bottom of the Receiver. You may receive Quick-ſilver alſo by mixing an equal

qual Quantity of Filings of Iron with the *Cinnabar*; and distilling as before.

CINNABAR of *Antimony*, is thus made: Fill a Retort half full of equal Parts of Powder of Antimony and Sublimate Corrosive; and setting the Vessel in Sand, proceed at first as in the making of *Butter of Antimony*, which will also this way be made. But when, the Fire being encreased, you find red Vapours begin to arise, fit on another Receiver, but without luting the Junctures, and raise the Fire by degrees till the Retort be red hot, in which State it must be kept three or four Hours. Then the Vessels being left to cool, break the Retort, and you will find, if the Operation succeed (which now and then it will not) the *Cinnabar* sublimed and adhering to the Neck of the Retort. 'Tis accounted a good Medicine for Epileptick and Cephalick Distempers.

CION, *Columella*, *Gargareen*, *Gurgulio*, *Uva*, *Uvula*, *Uvigena*, *Uviger*, *Epiglottis*, *Sublinguim*, is the Cover of the Wind-pipe; it hangs betwixt the two Glandules, called *Amygdalæ*, above the Chink of the *Larynx*, and is a Process from a Substance, as one would think, Glandulous, Spungy, and red; which *Columbus* is of Opinion, arises from the Tunick of the Mouth, redoubled in that Place. But *Riolan* says, it proceeds from some Muscles which are terminated there. It is of a Figure roundly oblong, in the upper Part thicker, and ending acutely. Its use is to temperate the Coldness of the Air, and hinder the Drink from falling upon the Nostrils: Sometimes this *Uvula* sticks out too far, from the Humours that fall upon it, which cannot return by the *Lymphatick Vessels*, whence proceeds the falling of the *Uvula*, which we call *Roof of the Mouth*. *Blanchard*.

The *Uvula* is moved by two Pair of Muscles, the *Pterigopharyngeus Externus*, and *Internus*; (which see) and the former of these draws the *Uvula* backwards, and the latter plucks it forwards, because of the Pulley through which its Tendon passes, and which alters the Direction of its Motion; both which Motions are necessary for Deglutition, for the Articulation of the Voice, as well as to hinder any Drink, &c. from going into the Nostrils.

CIRCLE, is a Plane Figure bounded with one only Line, and to which all the Right Lines that can be drawn from a Point in the Middle of it are equal to one another. And it may very well be supposed to be made thus; If you imagine the Line *AB* fastned at one End to the Point at *A*, but yet so as to be moveable on *A* as a Center, till the End *B* arrive at the Place where it began; the Line *AB* in its Motion describes a Figure, called a Circle, and the Point *B*, at the same time, describes a Curve Line, called the Circumference of a Circle.

From which *Genesis* 'tis plain, That all Right Lines drawn from the Point *A* (which is called the Center) to the Circumference, must be of equal length, or be equal to one another. And these Lines are called *Radius*, and by some *Semi-Diameter*.

The Line *DT* passing through the Center, and terminated at each End by the Circumference, is called the *Diameter*, and its half the *Semi-Diameter* or *Radius*.

These *Diameters* are all equal to one another, and do divide the Circle into two equal Parts which are called *Semicircles*.

Any Part of the Circumference of a Circle is called an *Ark*, which *Ark* is the Measure of any Angle, whose Vertex or Angular Point is at the Centre of that Circle.

Every Circle is supposed to be divided into 36 equal Parts, which Parts are called *Degrees*; of these a *Semicircle* contains 180, and a *Quarter* of a Circle 90, which is called a *Quadrant*, as *CT*.

To find the Superficial Content of any Circle, see *Area* and *Polygon*; where the Ground of the Practice is demonstrated. And since 'tis there proved from *Archimedes*, that a Circle is equal to a *Rectangle Triangle*, one of whose Sides is the *Radius*, and the other the *Periphery* (or a Line equal to it.) Let the *Radius* be called $\frac{1}{2}d$ (supposing *d* to be the Diameter) and whatever the unknown Ratio of the *Periphery* be to the Diameter, let it be expressed by *r*: Then will the *Periphery* be *r d*; and conse-

consequently the Perpendicular rd being multiplied by half a Radius, that is, by $\frac{1}{2}d$, the Product will be $\frac{1}{2}rd = \text{Area of the Circle}$ (because of the Triangle.)

From which way of Notation may it be presently proved, That Circles are to one another as the Squares of their Diameters.

For let the Diameter of one Circle be d , and of the other D ; then their Areas will be $\frac{1}{4}rd$ and $\frac{1}{4}rDD$, where $\frac{1}{4}r$ being a common Efficient or Multiplier, alters not the Ratio; for no doubt $\frac{1}{4}rd : \frac{1}{4}rDD :: d : DD$. Q. E. D.

Proposition I.

The Parts of any two Chords cutting each other in a Circle, are Reciprocally Proportional.

That is, $ae : eb :: ec : ed$.

— Draw ba and cd .

Demonstration.

1. The Triangles aeb and ced are similar, because the Angles at e are equal, and $a = c$, because in the same Segment; therefore the Sides about the equal Angles are Proportional, that is, $ae : ab :: ec : ed$. Q. E. D.

Coroll. 1. Hence, if two Chords cut each other, the Product made by the Multiplication of the Parts of one Chord, is always equal to the Product of the Parts of the other:

That is, the \square of the Extremes $aed = \square$ of the mean Terms bec .

Coroll. 2. If one Chord (ad) be a Diameter, and the other (bc) cut it Perpendicularly; then is be , or its equal ec , a mean Proportional between the Parts of the Diameter ae and ed .

For if you imagine the Lines ab and bd to be drawn, the Triangles x and y will be similar, and therefore $ae : eb :: eb : ed$. And then the

$$\square aed = \square eb.$$

And this may be called the General Property of the Circle arising from the Nature of the Curve.

And if you call the Diameter of the Circle $2r$ (because the Radius is $= r$) and consider it as the Axis of a Conick Section; the Part ae in the Figure, will be the Abscissa or intercepted Ax proper to the Ordinate be , wherefore calling, as is usual, the Abscissa x , and the Ordinate y , this general Property of the Circle will be thus expressed $2yx - xx = yy$; for ae being x , ad must be $2r - x$; and that multiplied by x , gives $2rx - xx$ which must be equal to $\square ba = yy$.

Proposition II.

If two Lines (as af and ae) from a Point (a) without a Circle, be draw to its Circumference within (as to e and f) the Rectangles made by those Lines and their External Parts shall be equal.

That is, $\square eab = \square fac$. Or those Lines are to each other reciprocal in a Proportion of their External Parts, $ie, ae : af :: ac : ab$.

Draw bf and ec : Then are the Triangles $eaec$ and $abfec$ equiangular, for the $\angle f = \angle e$ being in the same Segment, and a is common.

Therefore $ac : ac :: af : ab$, and then alternately $ac : af :: ac : ab$.

Therefore $ac \times ab (= eab) = fa \times ac (= fac)$ Q. E. D.

Problem I.

To divide the Circumference of a Circle into any number of Parts not above 10.

Suppose the Circle $ABCD$ were to be divided.

1. The Diameter AC divides the Circle into two equal Parts.
2. The Radius AE being made the Chord, AB is the Side of the Hexagon inscribed by 15 *e*.
4. *Eucl.* Therefore.
3. The Line BD is the Side of an Equilateral Triangle.
4. And AF the Side of a Square inscribed.
5. With the Distance HF describe the Ark $F I$; the Right Line FI is the Side of a Pentagon inscribed. 10 *e*. 13. *Eucl.*
6. The Line $BH = DH$ is the Side of the Heptagon.

7. The Line AK (which is the Chord of half the Ark AF) is the Side of an Octagon inscribed.
8. The Line DL (which is $\frac{1}{3}$ of the Arch BAD) is the Side of a Nonagon.
9. The Line $E I$ is the Side of a Decagon.

Problem II.

To divide the Circumference of a Circle into any number of equal Parts.

Upon the Diameter AB (of the given Circle) make an Equilateral Triangle ABD , and divide the Diameter AB into as many equal Parts as you design there shall be Sides of the Polygon to be inscribed, or as the Circle is to be divided into; and omitting two, *e.g.* from B toward A , draw thro' the beginning of the third from D , a Right Line, to the opposite Concave Circumference, and thence another Right-Line to the end of the Diameter B .

Thus, *e.g.* to Divide the Circumference into three equal Parts, Divide the Diameter AB into three equal Parts; and then omitting two of them through the beginning of the third, or thro' $B 2$ draw the Right Line $D 3$; and from 3 the Line $3 B$, which last will be the Side of the Triangle to be inscribed; so $4 B$ will be the Side of a Square, $B 5$ the Side of a Pentagon, $B 7$ of an Heptagon, &c.

The Plane of any Circle may be considered as made up of an infinite number of Concentrical Peripheries, encreasing from the Center in Arithmetical Proportion; wherefore a Rank of such Peripheries will be to a like Number equal to the greatest, as 1 to 2. Wherefore the Area of a Circle is to the Surface of a Cylinder, whose Height is equal to the Radius, and its Base that Circle, as 1 to 2. And consequently, if the Height of the Cylinder had been equal to the Diameter of the Circle (which is the case of the Cylinder circumscribing a Sphere) the Curve Surface of the Cylinder would be equal to 4 times the Base of it (*i.e.* the Surface of a Sphere is quadruple to the Area of one of its great Circle: for the Surface of the Sphere is equal to the Curved Surface of such a Cylinder; as is proved elsewhere. See Cylinder.

The Proportion of the Periphery of a Circle to its Diameter is less than $3\frac{1}{7}$, and greater than $3\frac{1}{8}$ to 1.

The Area of any Circle to the Square of its Dia.

Diameter :: is as $\frac{1}{2}$ of the Periphery to the said Diameter, as is proved under *Cylinder*.

The Area of any Circle is incomensurable to the Square of the Diameter; and so, is also the Periphery to the Diameter: See *Sturmius's Mathes. Euclear. Prop. 43*.

CIRCLE Equant, in the *Ptolemaick Astronomy*, is a Circle describ'd on the Center of the *Equant*; its chief use is to find the Variation of the first Inequality.

CIRCLE of perpetual Apparition, is one of the lesser Circles parallel to the *Equator*, being describ'd by any Point of the Celestial Sphere which toucheth the Northern Point of the *Horizon*, and carried about with the Diurnal Motion. All the Stars that are included within this Circle never set, but are always visible above the *Horizon*: And the

CIRCLE of perpetual Occultation, is another Circle at a like distance from the *Equator*, and contains all those Stars which never appear in our Hemisphere. But the Stars situated between these Circles incessantly rise and set at certain times.

CIRCLES of Altitude: See *Almicanters*.

CIRCLE of Declination on the Globe; So some Writers call the Meridians on which the Declination or Distance from the *Equator* of any Planet or Star is accounted.

CIRCLES of Longitude, on the Globe, are great Circles passing thro' the Star and the Pole of the *Ecliptick*, where they determine the Star's Longitude, reckon'd from the beginning of *Aries*. On these Circles are accounted the Latitudes of the Stars.

CIRCLES of Position, are Circles passing by the common Intersections of the *Horizon* and *Meridian*, and thro' any Degree of the *Ecliptick*, or the Center of any Star, or other Point in the *Heavens*; and are used for the finding out the Situation or Position of any Star, &c.

CIRCUITY of Action (in Law) signifies a longer course of proceeding than is needful, to recover the thing sued for.

CIRCULAR Numbers, or *Spherical ones*, according to some, are such whose Powers terminate in the Root themselves.

As for Instance, 5 and 6, all whose Powers do end in 5 and 6, as the Square of 5 is 25, the Square of 6 is 36, &c.

CIRCULATE, Circulation, in Chymistry, signifies the giving a Motion to Liquors contained in a double Vessel (that is, when the Necks of two Vessels are excellently well luted one into another) excited by Fire and causing the Vapours to ascend and descend to and fro; which Operation is intended either to subtilize the Liquors, or else to open some hard Body that is mingled with them. The circulating Vessel is sometimes called a *Pelicans*, or a blind *Alambick*.

CIRCULATION of the Blood, is that Motion of it which is produced by the continual Reciprocal of the Pulse; whereby there is a constant Expulsion of the Blood from the Heart into the Arteries, and as constant and continual an Influx of Blood into it out of the *Cava*; and seeing the *Vena Cava*, from whence the Supply comes, is never drawn dry; nor on the other Hand, the Arteries which receive the Blood from the Heart continually, are unduly swell'd with it; it must necessarily follow (as our great *Harvey* first plainly proved) that this Motion proceeds circularly, and that the Blood is continually driven out of the

Heart into the Arteries, and out of these into the Parts to be nourish'd; from whence it is reformed by the Capillary Veins, which carry it into the larger, and these into the *Cava*, from whence it returns to the Heart again. The Reasons enforcing the Necessity of a Circulation of the Blood are these.

1. The great Quantity of Blood that is driven out of the Heart into the Arteries at every Pulse. For tho' the Ancients who knew not this Circulation; imagin'd, that only a drop or two was expell'd by every *systole*, which they were necessitated to suppose, to avoid the great Distention that the Arteries must be liable to, if any considerable Quantity issued into them; yet it is certain and demonstrable, that there must needs an Ounce, or more, be driven into them each time: For (taking it for granted, that there is no other way for any Liquor to pass from the Stomach to the Kidneys but thro' the Heart, along with the Blood) seeing if some Men at some times drink three Pints of Drink, they shall piss it out again in half an Hour, yea more of *Tunbridge Water* in that space: And seeing, Secondly, that there is commonly as much Blood as Serum, that flows to the Kidneys (the Blood returning back by the Emulgent Veins) it is clear, that by the two Emulgents (which are none of the largest Arteries) there must pass in half an Hour 6 Pounds of Liquor, all which must come from the Heart; and how much more then may we conceive to be driven thro' all the other Arteries that run thro' the whole Body? This is most accurately evinced by Dr. *Fouler's* Experiment, which is this; "I cut *Asper's* (says he) both the *Cervical Arteries* in a large Dog, and at the same time thro' an Hole made in the left side of his Breast over-against the Heart, I compressed the Trunk of the *Aorta* below the Heart with my Finger, to hinder any Blood from descending by it; and, lastly, I took care also to straiten the *Brachial Arteries* under the *Axilla*, by which means almost all the Blood was driven out of the Heart thro' the *Cervicals* (besides that which was sent into the *Vertebrales*) and which is wonderful to be related, within the twentieth part of an Hour the whole Mass issued out; so that it is not to be denied, but that all passes thro' the Heart in that space. And tho' it may be granted, that amidst such Wounds and Tortures the Heart does beat somewhat quicker than at other times; yea the same thing is partly evident from Wounds in the Limbs when some notable Artery is cut asunder; for 'tis strange in how small a time a Man will bleed to Death even at that one great Artery: Yet we may give a guess how much Blood is sent out of every Pulse, even from ordinary opening of one Vein in the Arm, from whence a notable quantity of Blood will issue in a short time, how much then may we suppose would flow out of all the Veins, if they were open'd at one time? Seeing then 'tis evident so great such a quantity of Blood is expell'd out of the Heart at every *Systole*, and that for all that the Arteries are not unduly distended, nor any part swell'd by it, neither yet the *Cava* and other Veins emptied; 'tis certain that the Blood that is driven into the Arteries flows back to the Heart by the Veins in a constant Circulation.

2. A second Argument to prove it, may be taken from the Valves in the Veins, which are so framed that Blood may freely flow thro' them out of the lesser Veins into the greater (and so into the

Cava) but not on the contrary, out of the greater into the less. Yea, if one blow into the *Cava* thro' a Pipe, there will no Wind pass into the smaller Veins; but on the contrary, if you blow up the lesser Veins, the Wind will readily pass to the larger, and so to the *Cava*.

3. And lastly, the same thing is most clear by the Ligature in Blood-letting: For whether you let Blood in the Arm or Foot, you always tie the Fillet above where you intend to make the Orifice, and then the Vein below the Ligature will presently fill and grow tumid, but above it will fall and almost disappear; which must needs be from hence, for that the Blood being driven along the Arteries towards the extrem parts, returns by the Veins, and ascends upwards, which coming to the Ligature, and being stop'd there, swells the Vein below the Ligature, and spurts out as soon as the Orifice is made; but when the Fillet is loos'd again, the Blood flows no longer out thereat, but holds on its wonted Channel, the Vein and the Orifice closes up again.

Having sufficiently demonstrated the Circulation of the Blood, we will shew two things farther; *First*, How the Blood passes out of the Arteries into the Veins; and, *Secondly*, in what time it may be supposed to pass thro' the Heart in its ordinary Circulation.

As to the *first*, it was the Opinion of *Riolanus*, that the Blood circulated only thro' the larger Vessels, by Anastomosis or Inoculation of the Veins with the Arteries; and that that which run into the smaller, was all spent on the Nutrition of the Parts. But it is clear, that there must be a Circulation even in the smallest, from the great quantity of Blood that will flow out of the least Artery in the Hand or Foot when it is cut; which it were very absurd to imagine to be all spent on the nourishment of the respective Parts. Now there are but two ways whereby the Blood can be supposed to pass out of the Arteries into the Veins, *viz.* either by the former's being continued to, or opening into the latter by Inoculation, or else by the Capillary Arteries letting out their Blood into the Pores of the Substance of the Parts, on whose Nutrition part is spent, and the Remainder imbibed by the gaping Mouths of the Capillary Veins. That it is necessary to admit of this latter way, is evident, because if part of the Arterial Blood did not issue into the Substance of the Parts, they could not be nourish'd by it; for while it is in the Vessels, it may add Warmth indeed to the Parts thro' which it flows, but cannot nourish them, seeing even the Vessels themselves are not nourish'd by that Stream of Blood that glides along their Cavity, but by Capillaries running thro' their Coats; and if the Blood be driven into the Substance of the Parts, and that in a greater quantity than suffices for their Nourishment (as was just now shewn that it is) what is superfluous must needs enter the Mouths of the Capillary Veins, from which it goes forward to the larger, and so to the Heart: But seeing this way of transfusing the Blood thro' the Substance of the Parts, has seem'd to some not to answer to that hasty Circulation of it as above demonstrated; they have thought it necessary also to admit of the former way, namely, Anastomoses, by which the Veins are continued to the Arteries, and that not only in their larger Branches (as that notable one of the Splenick Artery with the Splenick Vein) but also in their smaller Twigs in the extreme

Parts. But we must consider, that in a living Body the solid Parts are infinitely more porous and permeable than in a dead; so that tho' the Anatomists find their Substance so dense and close, as to make it seem almost impossible they should permit so quick a passage to the Blood thro' them, yet they should rather believe it, than suppose such Anastomoses as they cannot discover (tho' it were not difficult to find them out if they had an Existence;) for abating the single one of the Splenick Artery with the *Ramus Splenicus* of the *Porta* (and perhaps some of the Arteria with the *Vena Pulmonaris* in the Lungs) none of the latest most accurate Anatomists have been able to find out any. And as for that mentioned, it seems rather to be of an Artery with an Artery (such as are frequent in several Parts of the Body, as are also of one Vein with another) than of an Artery with a Vein; for the *Porta* from which this *Ramus* is propagated, is generally reputed rather an Artery than a Vein.

And, *Secondly*, as to the Space of Time in which the whole Mass of Blood may ordinarily circulate thro' the Heart, it is probably much shorter than many have imagin'd. For supposing that the Heart makes 2000 Pulses an Hour (which is the least Number any spoke of, and some have told twice as many) and that at every Pulse there is expelled an Ounce of Blood (which we may well suppose, seeing the Ventricles are wide enough to contain 2 Ounces; and that it is probable also, both that they are filled near full in the *Diastole*, and that they are near, if not quite emptied by the strong Constriction of the Heart in the *Systole*) seeing the whole Mass usually exceeds not four and twenty Pound, it will be circulated six or seven times over thro' the Heart in the Space of an Hour. And by so much the oftner, by how much the Blood comes short of the supposed Quantity, or the Pulse either naturally, or by a Fever, Spirituous Liquors, or violent Motion is rendred more frequent. By which quick Motion the Blood it self is kept from Coagulation and Putrefaction, and the Parts are cherish'd with vital Heat, which Heat of the Parts is much according to the Slowness or Rapidity of the Circulation: So when we sit still, and the Pulse is slow or rare, we grow cold; but when upon running, or any other violent Exercise the Pulse becomes more frequent and quick, we become hot.

CIRCULATORIUM, is a Glass Vessel, wherein the Liquor infused by its ascending and descending, rolls about as it were in a Circle: There are several sorts of these Vessels, but two especially of moment and use, that called *Pelicanus*, and the other *Diora*: Which see; as also *Double Vessel*.

CIRCULUS, is a round Instrument made of Iron, used by Chymists for the cutting off the Necks of Glass Vessels; which is perform'd thus; The Instrument being heated is apply'd to the Glass Vessel, and is there continued till it grow hot; then with some drops of cold Water, or a cold Blast upon it, it flies in pieces. This way they cut off the Necks of Retorts or Cucurbits.

CIRCUMAGENTES Musculi, are certain oblique Muscles of the Eyes, so called from their helping to wind and turn the Eyes round about.

CIRCUMAMBIENT: See *Ambient*.

CIRCUMFERENCE, is the outermost bounding Line of any Plane Figure, but it more properly belongs to the Perimeter of a Circle; as is apparent

parent from the Genesis of a Circle. See Circle.

CIRCUMFERENTER, and Instrument used in Surveying, being the same with the *Theodolite*: Which see.

CIRCUMFLEX *Accent*, in Grammar, is composed both of the *Acute* and the *Grave*, and it's expressed thus (A).

CIRCUMGYRATION, is the wheeling Motion of any Body round a Center.

CIRCUM-POLAR Stars, are such Stars as being pretty near our *North Pole*, do move round it, and in our *Latitude* never set, or go below the *Horizon*.

A TABLE of Circum-Polar Stars.

N. B. □ stands for 4 Stars in Charles's Wain.

The Use of this Table.

1. For the Hour of the Night.

In a *North Widow* (or any convenient Place) hang up a fine String with a weighty Plummet, and placing your Eye at some distance (backward) mark when any Star in the Table comes to your String, so that it cut both it and the *Pole-Star* together; then from that Star's *Right Ascension* (in the Table) take the *Right Ascension* of the Sun (adding 24 Hours to the Star's (if need be) the Remainder is the exact Time of the Night.

N. B. The Stars mark'd with *W.* in the last Column, come under the Pole after they have been in the Vertical of the *Pole-Star*, when they are *West* of the Pole.

2. To find a true Meridian.

Place a second Line and Plummet behind the former (which was for the Hour) and having by the former observed when any Star in the Table comes to a Perpendicular with the *Pole-Star*, then count (by a Pendulum Clock or Watch) the difference in Time expressed in the second Column, and belonging to the Star you observe; then at the Moment when the Account is up, bring the two Strings and the Star all in a Right-Line, and then your two Strings are in the *Meridian*.

The two last Columns serve for the same use.

For when any of these Stars are under the *Pole-Star*, making the two Strings cut both the *Pole-Star* and the other; these two Strings hang so far out of the *Meridian Line*, as is the *Azimuth* expressed in the Table; which *Azimuth* is shewn to be *East* or *West*, as in the last Column.

N. B. There are 3 Stars in the Table, which being under the *Pole-Star*, are insensibly near the *Meridian*, viz. *Cassiopeia's Hip*, *Cor Caroli*, and *Alioth*; so that when they are under the *Pole-Star*, a *Meridian* may be found (very near) by one Thread.

Observe also, That there is just four Hours (wanting only one Second) between the coming of *Cor Caroli* and the 24th Star of *Draco* (in *Tycho's Catalogue*) under the *Pole-Star*.

CIRCUMSCRIBED; in Geometry a Figure is said to be *Circumscribed*, when either the Angles, Sides or Planes of the outward Figure, touch all the Angles of the Figure that is inscribed.

CIRCUMSCRIPTION, in Natural Philosophy, is the Termination or certain Bounds or Limits of any Natural Body. They make it either *Internal*, which belongs to the Essence and Quantity of every Body, whereby it hath a certain determinate Extension, Bounds and Figure: Or *External*, which they call also *Local*, because it is referred to the Place within which any Body is confined; for a Body is said to be *Circumscribed Locally*, or to be in a Place *Circumscriptively*, when it hath a certain and determinate *Ubi* or Place; in respect of the *Circum-Ambient* Bodies.

CIRCUMVALLATION, or the *Line of Circumvallation*, in Fortification, is a Trench bordered with a Parapet, dug round about the Besieger's Camp, within Cannon-shot of the Place, to hinder the Relief of the Besieged, and to stop Deserters: It is usually flank'd at the Distance of a Musket-shot with *Redoubts* and other small Works, or with Field Forts raised upon the most eminent Posts: Care must be taken never to draw a *Line of Circumvallation* at the Bottom of a rising Ground, lest the Enemy, having seized on the Station, inould plant Cannon there, and by that Means command the Line. This Line is usually about seven Foot deep, and twelve broad.

CIRRI, in Botany, are those fine Strings or Hairs by which some Plants fasten themselves in order to their Support in their creeping, as Ivy, &c.

CIRSOCELE, is a Swelling of the preparing Vessels about the Testicles, so that they sometimes look like a Third Testicle. *Blanchard.*

CIRCOS or *Varix*, is a Dilatation and Swelling of the Veins, crooking or winding, and arising in one or more Parts of the Body, insomuch as the Veins threaten a Rupture. *Blanchard.*

CISSOID, the Name of a Curve Line invented by *Diocles*, and thus produced or generated.

Let there be two Diameters of a Circle *A B* and *C D* cutting one another at Right Angles.

From *B* take equal Arks, as *Be* and *Bf* or *BE* and *BF*; and then from *e* or *E*, &c. erect the

Perpendiculars *eg* or *Eg*. Then draw the Transverse Lines *Df* and *DF*, &c. cutting those Perpendiculars in *H* and *b*, &c. by which Means you may find as many Points as you please in those Perpendiculars, through which to draw the Curve *D b A b B b* (which may be continued below the Circle if you please.) And this is called the *Cissoid*.

A Way to describe which Curve Organically the Second Figure represents.

Where two Rulers being fastened at *C* and *D*, and moveable upon those Points, intersect one another, as at *O*, or in *B*; and then a Square, as *LGE*, being so placed that *GE* and *LB* are coincident; as also the three Points *O*, *B* and *E*, if the two Rulers be moved upwards, so then the intersecting Point *O* begins to ascend, and the Square at the same time moves upwards also, with its upper Leg *LG* always parallel to *CD*, the Intersection of the Point *H*, or Angle of the Square with the Rule *FD* shall, in its Ascent, describe the Curve *BHD*, which is the true *Cissoid*.

Proposition.

If from any Point of the Diameter *CD* (See Fig. I. above) as from *G*, you draw a Perpendicular, as *GE*, through the Cissoid, the Lines *CG*, *GE*, *GD* and *GH* will be continually proportionable.

Demonstration.

The Lines *GE* and *IF* being Right Sines, and also *GD* and *IC* being versed Sines of equal Arks, will be equal; wherefore because of the Circle, *DI* : *IF* (i.e. *CG* : *GE*) : : *IF* : *IC*; i.e. *GE* : *GD*. But by Similar Triangles, *DG* : *GH* : : *DI* : *IF* (that is, as *CG* : *GE*;) so is *CG*, *GE* : : *GE*, *GD* : : *GD*, *GH*; that is, those Lines are all in continual Proportion. *Q. E. D.*

How by the Help of his Curve to find two mean Proportionals; see *Sturm. Math. Emuleus*, Prop. 21. of Book 2. and *Conf. 1.*

CITADEL, is a Fort of 4, 5 or 6 Bastions, built somewhere near a City, that it may command it in Case of a Rebellion; so that the City is not fortify'd on that Part against the Citadel, tho' the Citadel is against the City. The most usual Form

Form for *Citadels* is that of a Pentagon, a Square being too weak, and an Hexagon too big.

CITTA, or *Pica*, is a depraved Appetite, when People long for those things which are not fit to be, nor never are eat, as Lime, Coals, Shells, Cloth, Hides, Sand, *etc.* *Blanchard.*

CIVIL-DAY: See *Day*.

CIVIL-LAW, is properly the peculiar Law of each State, Country or City: But what we usually mean by the *Civil-Law*, is a Body of Laws composed out of the best of the Roman and *Grecian* Laws, and which was in the main received and observed throughout all the Roman Dominions for above Twelve Hundred Years. The Romans took the first Grounds of this Law from the Twelve Tables, which were Abridgements of the Laws of *Solon* at *Athens*, and of other Cities in *Greece*, famous for Knowledge and Wisdom, to which they added their own ancient Customs of the City of *Rome*. These written Laws were subject to various Interpretations, whence Controversies arising, they were determined by the Judgment of the Learned; and these Determinations were what they first called *Jus Civile*, after their several Cases were composed, which, lest the People should make them at pleasure, were fixed certain and solemn; and this Part of their Law they called *Actiones Juris*, *Cases at Law*: And by the bye, the Romans had also their *Plebiscita*, which were Laws made by the Commons without the Authority of the Senate. The *Jus Honorarium*, which was an Edict of some particular Magistrate; the *Senatus Consultum*, which was an Ordinance made by the sole Authority of the Senate; and the *Principalis Constitutio*, which was Enacted by the Prince or Emperor. These Laws grew by degrees to a vast number of Volumes; and therefore the Emperor *Justinian* commanded his Chancellor *Tribonian*, with the Assistance of the other Eminent Lawyers of that Time, to reduce it to a perfect Body. *Suidas*, and some others reflect on *Tribonian's* Learning and Integrity in this great Work; but no one can excuse his Haste and want of Care, for he did that in Three Years time, which the Emperor faith (in the Constitutions) he could not have imagin'd would be effected in less than Ten. For this Law had now been in practice above 1000 Years, and the Volumes of it were swelled to the prodigious Number of 2000, which 'twas impossible for *Tribonian* to read over in that time, much less to compare and digest them well. However this Body of Law is called the *Digests* or *Pandects*.

This Body of the *Civil-Law* is divided into three Volumes, which are still remaining; viz. the *Pandects* or *Digests*, the *Code*, and the *Institutes*: Which see. Afterwards to these were added the *Authenticks*, or *Constitutions* of *Justinian*, called also *Novellæ*: Which see, also under the Word *Authenticks*.

CIVIL-YEAR, is the Legal Year, or Annual Account of Time, which every Government appoints to be used within its own Dominions; and 'tis so called in contradistinction to the *Natural Year*, which is measured exactly by the Revolution of the Heavenly Bodies.

CLAMEA *admittenda in Trinere Attornatum*, is a Writ whereby the King commands the Justices in *Eyre* to admit of one's Claim by Attorney that is employed in the King's Service, and cannot come in his own Person.

CLAMPS, in a Ship, are those thick Timbers which lie fore and aft, under the Beams of the first *Orlope*, bearing them up at either End; and are the same that the *Risings* are to the Deck.

CLARETUM, amongst the foreign Writers of Pharmacy, is an Aromatick Wine, impregnated with an Infusion, and sweetned with Sugar; it is otherwise called *Vinum Hippocraticum*, *Hippocras Wine*; also *medicated Wine*: It is so called because it's percolated and purified by a Wine Sack or Bag, through which it is drained from its Dregs. And this Bag is called *Manica Hippocratis*.

CLARIFICATION, is the way to make Juices or thick Decoctions become clearer and finer, which is done three ways; by letting the Dregs subside of themselves, by Fermentation, or by the Addition of Vinegar, White of an Egg, or Milk, *etc.* either to precipitate the Dregs to the Bottom, or gather them in a Skum.

CLARICATIO, so the *Civilians* call *Aresto facto super bonis mercatorum alienigenorum*: Which see.

CLARION, a bearing in Heraldry of the following Figure; Ruby 3 *Clarions* *Topaz*, being the Arms of the Earl of *Bath*, by the Name of *Greenwile*. *Guillim* takes these *Clarions* to be a kind of old fashioned Trumpet; but others think they rather represent the Rudder of a Ship; or as some say, the Rest for a Lance.

CLASPERS, the twisted Ligaments or Threads with which certain Herbs or Shrubs, such as *Briony* and *Vines* takes hold of Trees or Plants that grow about them.

These *Claspers* are of a Compound Nature, between that of a Root and a Trunk. Their Use is sometimes for Support only, as in the *Claspers* of *Vines*, *Briony*, &c. whose Branches being long, slender and fragile, would fall by their own and their Fruits Weight; but these *Claspers* taking hold of any thing which is at Hand (which they do by a Natural Circumvolution which they have, those of *Briony* have a Retrograde Motion about every third Circle in the Form of a double Clasp, so that if they miss one way, they may catch the other). Sometimes the Use of *Claspers* is also for Supply, as in the Trunk Roots of *Ivy*; which being a Plant that mounts very high, and being of a closer and more compact Substance than that of *Vines*, the Sap would not be sufficiently supplied to the upper Sprouts, unless these assisted the Mother Root; but these serve also for Support too. Sometimes they serve for *Stabiliment*, *Propagation*, and *Shade*; for the first of these serve the *Claspers* of Cucumbers; for the second, those, or rather the Trunk Roots of *Chamæmil*; and for all three, the Trunk Roots of *Strawberries*, which mightily seem to delight in Shade.

CLAUDENT Muscles, otherwise called *Semicircular*, are those that shut the Eye-lids; being placed between the *Inner Membrane* of that Part, and the *Fleshy Membrane*. These two Muscles being contracted, shut up the Eye, the greater drawing down the upper Eye-lid, and the less pulling up the lower, which falls down again through its own Gravity, and the Relaxation of its Fibres.

CLAVICULÆ, or *Channel Bones*, are two little ones which are situated at the Basis of the Neck above the Breast, on each Side one: They

are

are pretty long and small, and at one End are joined to the Production of the *Scapule*, called *Acromion*, by a peculiar Articulation, which they call *Synchondrosis*; at the other End they are joined to the upper Part of the *Sternum*, by an Articulation which they call *Arthrodia*. They are in the Shape of a long (J) for the Passage of the Vessels which pass under them; and to facilitate the Motion of the Arms: Their Use is to sustain the *Scapule*, to which the Arms are articulated; and because the Pectoral Muscle which pulls the Arm across the Breast, is inserted near the upper End of the Shoulder-Bone; if the *Clavicule* did not keep the *Scapule* to which the Head of the *Humerus* is always joined at an equal Distance from the *Sternum*, the upper Part of the Arm only, and not the Hand, must have been pulled forwards.

CLAVUS, is a Pain in a small Part of the Head, commonly above the Eye in the Eye-brow, and seems as if that Part of the Head were bored through with a little *Augur* or Whimble. Dr. Sydenham calls such a Pain in the Top of the Head of Hysterical Persons, *Clavus Hystericus*.

CLAUSUM Fregit, signifies as much as an Action of Trespass; and is so called, because in the Writ such a one is summoned to answer, *Quare clausum fregit?* that is, Why he did such a Trespass?

CLAYES or *Wales*, a Term in Fortification: See *Hurdles*.

CLEAR Vision: See *Vision*.

CLEAT, is a Piece of Wood fastened to the Yard-Arm of a Ship, to keep the Ropes from slipping off the Yard.

CLECHE, a Term in Heraldry for any Ordinary being pierced through with the same Figure, as here. He beareth *Gules*, a *Saltier Cleche*, that is, one pierced through with another.

CLEIDION, the same with *Clavicula*.

CLEPSYDRA, an Instrument anciently used, especially among the *Egyptians*, to measure Time, by the running of Water out of one Vessel into another: First invented by *Scipio Mansica*, or at least thought first by him to *Rome*; for *Pierius* in his *Hieroglyphicks* tells us, The Priests of *Acania*, a Town beyond the River *Nile* in *Egypt*, did use every Day to pour Water into a Vessel, by the dropping of which through a small Hole, they measured Time.

There were many kinds of them, but all had this in common, that the Water ran gently thro' a narrow Passage from one Vessel into another; and in the lower was a Piece of Cork or light Wood, which as the Vessel filled, rose up by degrees, and so shewed the Hour.

Plutarch observes one Inconvenience in these *Water-Cocks*, i. e. that the Air, according to its different Temperature, as to Heat, Cold, Density or Rarity, had an Influence on the running of the Water, so that it must measure Time unequally. And another greater there was, which a good while was unheeded, viz. that the Water always ran slower out, according as its Quantity and Pressure in the Vessel abated; to remedy this, the *Orontes* invented a *Clepsydra* in the Form of a small Ship floating on the Water, and which em-

ptied it self by Means of a Syphon, placed in the Middle of it; but which way the Hours by this Means were made equal, I cannot find, the Descriptions given of the thing being very obscure.

Some of these *Clepsydræ* were so made, as that without changing the Dial, the Hours were sometimes longer, and sometimes shorter, by Means of an Inequality in the Index, or Hand, and which *Vitruvius* says, depended on the Management of the Water: for in the long Days they made the Hole narrower, and so the Water ran proportionably slower; and in the Winter, when the Days were short, the Hole was made larger, which made the Water flow the faster, and so the Index turned round also the faster.

CLERICO admittendo, is a Writ directed to the Bishop, for the admitting of a Clerk to a Benefice upon a *ne admittas*, tried and found for the Party that procureth the Writ.

CLERICO capto per Statum Mercatorum, &c. is a Writ directed to the Bishop, for the Delivery of a Clerk out of Prison, that is in Custody upon the Breach of a Statute Merchant.

CLERICO convicto commissio Ecclesie in defectu Ordinarii deliberando, &c. is a Writ for the Delivery of a Clerk to his Ordinary that formerly was convicted of Felony, by reason his Ordinary did not challenge him according to the Privileges of a Clerk.

CLERICO infra Sacros Ordines constitutio non elegendo in Officium, is a Writ directed to the Bishops, &c. that have thrust a Bailiwick or Beadleship upon one in Holy Orders, charging them to release him again.

CLERK Controulor of the King's House (whereof there be two) is an Officer in Court, that hath Place and Seat in the *Counting-house*, and Authority to allow or disallow the Charges or Demands of Pursuivants, and Messengers of the *Green-Cloth*, Purveyors or the like: He hath also the oversight and controuling of all Defaults, Defects and Miscarriages of any of the Inferiour Officers; and sits in the *Counting-House* with the Superiour Officers, viz. the Lord Steward, Treasurer, Controulor and Cofferor, either for correcting or bettering things out of Order, with several other Matters.

CLERK of the Acts, is an Officer of the Navy, who receives and enters the Commissions and Warrants of the Lord-Admiral, and registers the Acts and Orders of the Commissioners of the Navy.

CLERK of Assize, is he that writeth all things judicially done by the Justices of Assize in their Circuits.

CLERK of the Check, is an Officer in Court, so called, because he hath the Check and Controulment of the Yeomen of the Guard, and all other ordinary Yeomen or Ushers belonging either to the King, or Queen, or Prince, either giving leave, or allowing their Absences or Defects, in Attendance, or diminishing their Wages for the same.

CLERK of the Crown, is a Clerk or Officer in the King's Bench, whose Business is to read, frame and record all Indictments against Traitors, Felons and other Offenders there arraigned upon any publick Crime. He is otherwise called *Clerk of the Crown-Office*, or *Clerk of the Crown in the King's Bench*.

CLERK of the Crown in Chancery, is an Officer there, that by himself or his Deputy, is continually

ally to attend the Lord-Chancellor, or Lord-Keeper, for special Matters of State, by Commission or the like, either immediately from his Majesty, or by Order of his Council, as well ordinary as extraordinary: Also all general Pardons upon Grants of them at the King's Coronation, or at a Parliament, the Writs of Parliament, with the Names of Knights and Burgeſſes, are returned into this Office. He hath alſo the making of ſpecial Pardons, and Writs of Execution upon Bonds of *Statute Staple* forfeited.

CLERK of the *Errors*, in the Court of Common-Pleas, does tranſcribe and certify into the King's-Bench, the Tenor of the Records of the Cauſe or Action, upon which the Writ of Error (made by the *Cuſtor*) is brought there to be judged and determined.

CLERK of the *Errors* in the King's-Bench, does likewiſe tranſcribe and certify the Records of ſuch Cauſes in that Court into the *Exchequer*, if the Cauſe or Action were by Bill.

CLERK of the *Errors* in the *Exchequer*, does tranſcribe the Records certified thither out of the King's-Bench, and prepares them for Judgment in the Court of *Exchequer*, to be given by the Juſtice of the Common-Pleas and Barons there.

CLERK of the *Eſſoigns*, is an Officer belonging to the Court of *Common-Pleas*, who only keepeth the *Eſſoign-Roll*, and hath for entering every *Eſſoign* Six-pence, and for every *Exception* to bar the *Eſſoign*, in Caſe where the Party hath omitted his Time, Six-pence. He hath alſo the providing of Parchment, and cutting it into Rolls, and making the Number upon them, and Delivery out of all the Rolls to every Officer, and receiving them again when they be written.

CLERK of the *Eſtreats*, belongs to the *Exchequer*, and every Term receiveth the *Eſtreats* out of the Lord Treſurer's Remembrancer's Office, and writeth them out to be levied for the King: He alſo maketh Schedules of ſuch Sums *eſtreated* as are to be diſcharged.

CLERK of the *Hamper*, or *Hanaper*, or Warden of the *Hamper*, is an Officer in the Chancery, whoſe Buſineſs is to receive all Money due to the King's Majesty for the Seals of Charters, Patents, Commiſſions and Writs; as alſo Fees due to the Officers for Enrolling and Examining the ſame. He is obliged to attend on the Lord Chancellor or the Lord Keeper daily in Term time, and at all times of Sealing.

CLERK of the *Juries*, or *Curata Writs*, is an Officer belonging to the Court of Common-Pleas, which maketh out the Writs called *Habeas Corpora*, and *Diſtringus*, for the Appearance of the Jury either in Court or at Aſſizes, after that the Jury or Pannel is returned upon the *venire facias*.

CLERK of the King's Great Wardrobe, is an Officer of the King's Houſe, that keepeth an Account or Inventory in Writing of all things belonging to the King's Wardrobe.

CLERK of the King's Silver, is an Officer belonging to the Common-Pleas, to whom every Fine is brought, after it has been with the *Cuſtos Brevium*, and by whom the Effect of the Writ of Covenant is entered into a Paper-Book, and according to that Note, all the Fines of that Term are alſo Recorded in the Rolls of the Court.

CLERK of the Market, is an Officer of the King's Houſe, whoſe Duty is to take Charge of the King's Meaſures, and to keep the Standards of

them; that is, Examples of all the Meaſures that ought to be through the Land.

CLERK *Maſhal* of the King's Houſe, ſeems to be an Officer that attends the Maſhal in his Court, and Recordeth all his Proceedings.

CLERK of the *Nibils* or *Nibils*, is an Officer in the *Exchequer*, that maketh a Roll of all ſuch Sums as are nibiled by the Sheriff upon their *Eſtreats of Green Wax*, and delivereth the ſame into the Lord Treſurer's Remembrancer's Office, to have Execution done upon them for the King.

CLERK of the *Outlawries*, is an Officer belonging to the Court of *Common-Pleas*, being a Deputy to the King's Attorney-General, for making out the Writs of *Capias ut legatum* after Outlawry; and the King's Attorney's Name is to every one of thoſe Writs. And whereas Seven-pence is paid for the Seal of every other Writ betwixt Party and Party, there is but a Penny paid for the Seal of this, becauſe it goes out of the King's Suit.

CLERK of the *Parliament*, is he that recordeth all things done in the High Court of Parliament, and engroſſeth them fairly into Parchment Rolls, for their better keeping to Poſterity. Of theſe there be two, one of the Higher, the other of the Lower, or Houſe of Commons.

CLERK of the *Peace*, is an Officer belonging to the *ſeſſions* of the Peace; his Duty is at the *ſeſſions* to read the Indictments, to enroll the Acts, and draw the Proceſs, to enroll Proclamations of Rates for Servant's Wages, to enroll the Diſcharge of Apprentices, to keep the Counterpart of the Indenture of Armour, &c. alſo to certify in the King's-Bench, Tranſcripts of Indictments, Outlawries, Attainders and Convictions had before the Juſtices of the Peace within the time limited by Statute.

CLERK of the *Pell*, belongs to the *Exchequer*, whoſe Buſineſs it is to enter Teller's Bills into a Parchment-Roll, called *Pellis receptorum*, and alſo to make another Roll of Payment, called *Pellis exitum* wherein he ſetteth down by what Warrant the Money was paid.

CLERK of the *Petty Bag*, is an Officer in Chancery, whereof there are three, and the Maſter of the Rolls their Chief: Their Office is to Record the Return of all Inquiſitions out of every Shire, all Liveries granted in the Court of Wards, all *Oſter les marnes*, to make all Patents of Cuſtomers, Gaugers, Controulers and Aulnagers, Summons of the Nobility, Clergy and Burgeſſes to the Parliament; Commiſſions directed to Knights and others of every Shire for ſeiſing of Subſidies; Writs for Nomination of Collectors for the Fifteenth, and all Traverſes upon any Office, Bill, or otherwiſe, and to receive the Money due to the King for the ſame.

CLERK of the *Pipe*, belongs to the *Exchequer*, who having all Accounts and Debts due to the King, delivered and drawn out of the Remembrancer's Office, chargeth them down into the great Roll; who alſo writeth Summons to the Sheriff to levy the ſaid Debts upon the Goods and Chattels of the ſaid Debtors; and if they have no Goods, then doth he draw them down to the Lord Treſurer's Remembrancer, to write *Eſtreats* againſt their Lands.

CLERK of the *Pleas*, is an Officer in the *Exchequer*, in whoſe Office the Officers of the Court upon ſpecial Privileges belonging to them, ought to ſue, or be ſued upon any Action.

CLERK of the Privy-Seal (whereof there be four) that attendeth the *Lord-Keeper of the Privy-Seal*; or if there be none such; upon the Principal Secretary, writing or making out all things that be sent by Warrant from the Signet to the *Privy-Seal*, and are to be pass'd to the *Great-Seal*; as also to make out *Privy-Seals* upon any special occasion of his Majesty's Affairs; as for Loan of Money, and such like.

CLERK of the Sewers, is an Officer belonging to the Commissioners of the *Sewers*, writing all things that they do by vertue of their Commission: See *Sewers*.

CLERK of the Signet, is an Officer continually attending upon his Majesty's Principal Secretary, who always hath Custody of the *Privy-Signet*, as well for Sealing his Majesty's Private Letters, as also such Grants as pass his Majesty's Hand by Bills signed. Of these there be four that attend in their course, and have their Diet at the Secretary's Table.

CLERK of the Treasury, belongs to the *Common-Pleas*, and hath the charge of keeping the Records of *Nisi prius*, hath the Fees due for all Searches, and hath the certifying of all Records into the *King's-Bench*, when a Writ of Error is brought, and maketh out all Writs of *Superfedeas de non molestendo*, which are granted for the Defendants, while the Writ of Error hangeth. Also he maketh all Exemplifications of Records being in the Treasury.

CLERK of the Warrants, is an Officer belonging to the Court of *Common-Pleas*, which entrench all Warrants of Attorney for Plaintiff and Defendant, and enrolieth all Deeds of Indentures of Bargain and Sale, which are acknowledged in Court, or before any Judges out of the Court.

CLEW, of the Sail of a Ship, is the lower Corner of it which reaches down to that Earing, where the *Tackles* and *Sheets* are fastned; so that when a Sail is made goaring, or sloping by degrees, she is said to have a great *Clew*: And a Ship is said to spread a great *Clew*, when she hath a very long Yard, and so hath much Canvase in her Sails.

CLEW-GARNET, is a Rope fastned to the *Clew* of the Sail, and from thence runs in a Block seized to the middle of the *Main* and *Fore-yard*; its Use is to hale up the *Clew* of the Sail close to the middle of the Yard, in order to its being furled.

CLEW-LINE, is the same to the *Top-sails*, *Top-gallant-sails*, and *Sprit-sails*, that the *Clew-garnet* is to the *Main-sail* and *Fore-sail*, and has the very same use. In a gust of Wind, when a *Top-sail* is to be taken in, first hale home the *Lee Clew-Line*, and then the Sail will be taken in the easier.

CLIFF or *Cleff*, a Term in Musick, signifying a certain Mark from the Position whereof the proper Places of all other Notes in any Song or Lesson are understood, by proving the said Notes from thence according to the Scale of the *Ganutt*; wherein are contained three Septenaries of Letters, viz. G, A, B, C, D, E, F; which seven Letters of the Alphabet set at the beginning of every Rule and Space represents as many *Cliffs*; But of these four are only used, and generally placed at the beginning of the Staves of every Lesson, either Vocal or Instrumental.

The First is called *F-a-ut Cliff*, and appropriated only to the *Bass* or lowest Part.

The Second is *C-fol-fa-ut Cliff*, peculiar to the inner Parts, as the *Tenor* and *Counter-Tenor*.

The Third is *G-fol-re-ut Cliff*, which is only set for the *Treble* or highest Part.

The Fourth is *B-Cliff*, or *B-fa-b-mi Cliff*, which is proper to all Parts, and serves for the *Flattening* and *Sharpening* of Notes.

CLIMACTERICAL Years, are certain observable Years; which are supposed to be attended with some grand Mutation of Life or Fortune; as the 7th Year, the 21st, (made up of three times seven) the 49th (made of 7 times 7) the 63d, (being 9 times 7) and the 81st, (which is 9 times 9) which two last are called the *Grand Climactericks*. *Aulus Gellius* saith, This Whim came from the *Chaldeans* first, and 'tis probable *Pythagoras* had it from them, who used to talk much of the Efficacy of the Number 7, with which he was mightily in love.

CLIMATE, is a Space on the Terrestrial Globe comprehended between two Circles parallel to the Equator, so that from the beginning of the *Climare* to that of another next to it, there is half an Hours difference in the longest *Summer-day*. Each *Climare* also is divided into two half *Climates* by a parallel Circle, which half *Climare* is call'd a *Parallel*; wherefore these *Parels* must differ from one another $\frac{1}{2}$ of an Hour in the longest Days.

CLINCH (of a Cable) is that part of it which is bended about the Ring of the Anchor, and then seiz'd or made fast.

CLINCHING, is a kind of slight Calking used at Sea, in a Prospect of foul Weather, about the Ports; which is, to drive a little *Oakum* into their Seams, that the Water may not come in at them.

CLINOIDES, are four Processes in the inside of the *Os Splenoides*, forming a Cavity called *Cella Turfca*, in the middle of that Bone, in which lies the *Glandula Pituitaria*.

CLITORIS, is a Part in the *Pudendum Muliebre* seated before; 'tis a long round Body naturally about the bigness of the *Uvula*: It lies within the Skin, nor doth any part of it appear outwardly, but just its Extremity; which is covered with a folding of the Skin made by the union of the *Nymphæ*, and is called its *Preputium*. The Substance of it consists of two spongy Bodies like those of the *Penis*. They rise at two different places, in the lower Part of the *Os Pubis*, and approaching on to the Body of the *Clitoris*, whose Extremity, which is of an exquisite Sense, is called its *Glans*. The two spongy Bodies before they unite are called by some the *Gruæ Clitoridis*, and they are twice as long as the Body of the *Clitoris*. It hath two Muscles arising from the Protuberance of the *Ischium*, and are inserted in its spongy Bodies; they are called *Erefores Clitoridis*, because they have the same Use as the *Erefores Penis*. The *Clitoris* hath Veins and Arteries from the Hemorrhoidal Vessels and the *Pudenda*, and Nerves from the Intercostal Pair.

CLOATHED, the Seamen say a Mast is cloathed, when the Sail is so long as to reach down to the Gratings of the Hatches, so that no Wind can blow below the Sail; and they say a Ship spreads much Cloth, when she hath broad Sails.

CLOCKS and *Clock-work*: How to calculate all the Numbers and Proportions for any Movement, &c. see under *Watch-work*.

CLOSE, in Musick: See *Cadence*.

CLOSE, when any Bird is drawn in a Coat of Arms with its Wings close down about it (*i. e.* not displayed) and in a standing posture, they Blazon it by this word *Close*; but if it be *Flying* they call it *Volant*.

CLOSETT, a Term in Heraldry, signifying the half of a Barr, and the Barr ought to contain one fifth part of the Escutcheon, as the *Fesse* doth the third: See *Fesse*.

CLOUDS, are a Congeries of (chiefly) watery Particles, drawn or sent out of the Earth, in Vapour; which, when these Particles are very nearly placed to one another, appear dense and thick; but when they are more remote, are clear and bright, and sometimes almost transparent.

It hath been frequently Matter of dispute amongst Naturalists, how these clouds are suspended in a Medium which must be lighter specifically than themselves. But 'tis easy to conceive that the Parts which compose Clouds are so many little Bubbles, having a watery Skin over a little Sphere of fluid Matter lighter than Air, and therefore may easily, like the Bubbles of Soap and Water which the Children blow up with a little Pipe, be supported by the Air: but whenever they are broken by the violent Agitation of Winds, or are driven against the sides of Hills, &c. they must change their form of Bubbles and fall down in Rain: See the word *Vapour*.

Mr. Boyle saith, An excellent Astronomer assured him, That tho' he had many times accurately measured the Height of the Clouds, yet he could never find any (even white ones) to be $\frac{1}{2}$ of a Mile high, and few did exceed $\frac{1}{3}$ of a Mile.

CLOYED; the Seamen say, when any thing is got into the Touch-hole of a Great Gun, so that they cannot with a *Priming-Iron* make way for the Powder to be put in to prime her, they say the Touch-hole is cloyed; wherefore when Guns are nailed, &c. they say they are cloyed.

CLYDON, is a Fluctuation of the Ventricle.

CLYPEAL Cartilage: See *Thyroides*

CLYPEI-FORMIS, a sort of Comets resembling a Shield: See *Discus*.

CLYSMA, the same with *Clyster*.

CLYSSUS, among some Chymists, is a long Digestion and Union of Oily Spirits (especially Mineral ones) together, in order to make a Composition or accurate Mixture of them. Sometimes 'tis taken for an Extraction and Union of the more subtle Parts of any Plant, *Vid. Rosinck, Chym. Lib. 3, Sect. 2. Schroder. Lib. 3, c. 17.* Sometimes for a Medicine made of the most active and energetical Parts of any Ingredients.

COACERVATE Vacuum: See *Vacuum*.

COACH, the Council-Chamber on board a Flag-ship.

COAGULATE, signifies in Chymistry to give Consistence to Liquors by evaporating some part of them over the Fire, or else by mixing Liquors together, which are of different Natures, to effect the same thing; by either of which, and many other ways a Coagulation may be effected.

COALITION, is the gathering together and uniting into sensible Masses the minute Corpuscles which compose any Concrete or Natural Body. *Calescence* is commonly taken for the same.

COAMINGS, aboard a Ship, are those Planks or that Frame which raises up the *Hatches* higher than the rest of the Deck, in which Loop-holes for *Muskets* to shoot out at are usually made, in order

to clear the Deck of the Enemy when a Ship is Boarded.

COASTING, is that Part of Navigation where the Places assign'd are not far distant, so that a Ship may Sail in sight of Land, or within Soundings between them.

For the Performance of which there is only required good Knowledge of the Land, the Use of the Compass, and Lead or *Sounding-Line*; such are the Voyages on the Narrow or *British Seas*, between *England, Holland and France*, also all about the *Baltick Seas*, and those in the *Mediterranean* are little else.

COAT, by Anatomists, is taken for a Membranous Cover of any part of the Body; as the Coats of the Eye, Nerves, Arteries, &c.

COATS, in a Ship, are pieces of tarr'd Canvas which are put about the Masts at the Partners; they are also put about the Pumps at the Decks, that no Water may go down there; and these are also used at the Rudders's Head.

COCYGIS OS, is a Cartilaginous kind of Bone joined to the Extremity of the *Os Sacrum*; it is composed of 3 or 4 Bones, of which the lower is still less than the upper, till the last end in a small Cartilage, and it resembles a little Tail turn'd inwards: Its Use is to sustain the *Rectum Intestinum*; it yields to the pressure of the *Fetus* in Women in Travail, and therefore Midwives use to thrust it backwards; but sometimes they do it so rudely and violently, that it occasions very great Pain, several bad Effects. It's called *Os Coccygis*, and because it is in shape something like a *Cuckow's Bill*; its Bones are spongy and soft, and have neither Process nor Cavity, for the Spinal Marrow descends no farther than the bottom of the *Os Sacrum*, which terminates in the first Bone of the *Os Coccygis*.

COCYX, the same with the *Coccygis Os*: Which see.

COCHLEA, is a Cavity of the inner part of the Ear, so called from its Windings and Turnings, for it has 3 or 4 Rings which mutually succeed one another; it is girt about with a very soft and thin Membrane: See *Ear*.

COCKPIT, in a Man of War, is a place on the lower Floor or Deck abaft the main Capstan, lying between the Platform or Orlop and the Steward's Room, where are Subdivisions or Partitions for the Purser, the Surgeon, and his Mates.

COCK-SWAIN or *Cock/on*, is an Officer aboard a Man of War who hath the care of the Barge or Shallop, and all things belonging to it, to be always ready with his Boat's Gang or Crew, and to Man the Boat on all occasions: He sits in the Stern of the Boat and Steers; and he hath a Whistle to call and to encourage his Men.

CONCOCTION or *Digestion*, is the Fermentation of the smallest Particles which our Nourishment consists of, that they may be made fit and proper for the Nourishment and Increase of a living Body; the first Concoction is made in the Stomach by a kind of Ferment, as most suppose, which partly remains there, from the Relicks of the former Meats, and partly flows thither from the *Celiac Arteries*: The second is made in the Guts by the Gall and *Pancreatic Juice*; the third is in the Glandules of the *Mesentery* from the *Lymphæ* or Water which mixes it self with the *Chyle*: the fourth is in the Lungs, from the mixing the Air in some measure with the Blood there: The fifth is in the Vessels and Bowels, as in the Spleen, Liver, Testicles, &c.

The Roman Silver Denarius was $7\frac{1}{2}$ d.
 The Roman Gold Denarius's were double in weight.
 The Roman Brazen As weighed $\frac{1}{2}$ Ounce; valued
 $\frac{3}{4}$ Farth. $\frac{1}{10}$.
 The Assarium was $\frac{1}{5}$ of the As.
 Quadrans $\frac{1}{4}$ part.
 The Mirre was $\frac{1}{3}$ of the As, or about $\frac{2}{5}$ of our Far-
 thing.

Sestertius (mark'd thus IIS) was 2 Asses, and $\frac{1}{2}$ of
 the As, in Value 7 Farthings and $\frac{1}{10}$ of a Far-
 thing.
 Denarius (mark'd thus, X) was 10 times the As,
 and therefore was of our Money 7 Pence 3 Far-
 things.
 Sestertium was 8 l. 1 s. 5 d. 2 f.

An Account of the Hebrew Coins from Mr. Jeak's Arithmetick.

		l. s. d.								
Money	Silver	(a) Shekel, of the Sanctuary, in { Weight $\frac{1}{2}$ Oz. Troy Value to Sterling Money }	00	02	06					
		(b) King's Shekel, half the Sanctuary Shekel, called Bekah	00	01	03					
		(c) Third Part of the Shekel	00	00	10					
		(d) Zuz, Fourth Part of the Shekel	00	00	07 $\frac{1}{2}$					
		(e) Gerah, Agurab, Keshitab	00	00	01 $\frac{1}{2}$					
	Gold	(f) Zabab Golden Siculus or Shekel	each $\frac{1}{2}$ Oz. Troy, in Value 12 Silver Shekels of the Sanctuary }	01	10	00				
		(g) Adarkon Dracmon, or Darcon					each half so much	00	15	00
		Sums of Money	(b) Maneh, or Mina, or a Pound, valuable in {	Gold 100 Shekels 25 Oz. Troy Silver 60 Shekels 30 Oz. Troy }	75	00	00			
								(i) Chicbar or Talent { 3000 Shekels in Weight 123 lb. Troy }	valuable in { Gold 4500 Silver 375 }	00

(a) This piece of Coin is often mentioned in Sacred Writ, and looks like the Standard of all the rest. On the one Side was shew'd the Vessel in which the Manna was, inscribed in this Perigraph Shekel Israel; on the other Side the Rod of Aaron that budded, with this Inscription, Jerusalem Kod-shaf, in English, The Holy Jerusalem, called Shekel from Shakal to weigh: For Money, at the first, seems to be a Merchandise, exchanged or given for other Commodities, as Gen. 23. 16. after the Chaldees called Silgha, and commonly with the Hebrews, Kesheph, i.e. Silver; and being put absolutely, rendered a Silverling or Piece of Silver, by Expofitors, as usually as a Shekel, when the Quality is not mentioned, is taken for a Silver Shekel.

(b) First mentioned, Gen. 24. 22. paid by all as a Yearly Tribute, Exodus 30. 13, 15. 2 Chron. 24. 6, 9. towards the Repair of the Tabernacle first, and after of the Temple. Between this and the Sanctuary Shekel some mentioned a third sort of Shekel, called the Common Shekel, valued at 20 d. of our Money, of which I find nothing but uncertainty.

(c) In Nehem. 10. 32. noted as a Yearly Tribute given to the Jews by a Civil Decree to the Second Temple.

(d) 1 Sam. 9. 8. spoken of and equal to the old Attick Dram and Roman Penny, as several say, and by some called Zuz, Zuzza, Zur and Zuzra.

(e) Agurab, render'd Gerah by the Chaldee Paraphrase, and also Megna or Megha in that Tongue; by the Arabians, Mega; Greeks, Obolus; and in English, a Piece of Silver, 1 Sam. 2. 36. called also in the Hebrew, Keshitab, because Signed with the Image of a Lamb; see Gen. 33. 19. Jobna 24. 32. Twenty of these made a Shekel, Exod. 30. 13.

(f) The Zabab, and Golden Shekel in Rider's Dictionary undervalued at 15 s. for tho' Hunt in his Handmaid to Arithmetick out of Breerwood de Nummis, mentioneth the Weight but two Attick Drams, yet he valueth it at 30 Shill. Alsted in his Encyclo-

pædia of Arithmetick makes it 4 Drams, which accounted $\frac{1}{2}$ Ounce Troy, must yield double the Value of 15 Shill. And most Authors agree that the Gold Shekel was equal in Weight with the Silver Shekel, so the Difference must be only in the Value of the Metal. Some to keep up the Credit of differing Authors, conceive there were two sorts of Golden Shekels as well as Silver, the one double to the other.

(g) These Golden Adarkons and Drackmons seem to be Persian, or Coins of some other Nations, and Current, not Coined in Judea, nor read of till after the Captivity; for tho' the Word be used 1 Chron. 29. 7. yet both Books of the Chronicles, as most take it, were penn'd by Ezra after his return from Babylon, in whose Book mention is made thereof, as in Ezra 2. 69. and 8. 27, etc. in Greek called Drachme, and in English render'd Drams. Alsted, in his Encyclopædia of Arithmetick, makes the Value equal to a Ducat of Hungary: But Hunt, who throughout his Book hath much lost himself in valuing 2 Attick Drams in the Zabab at 30 sb. and 2 Attick Drams in the Adarkon (which he saith is the Weight thereof) at 15 s.

(b) The Maneh in Gold, by comparing 1 King. 10. 17. with 2 Chron. 9. 16. is found to be 100 Shekels, which Buxtorf and others understand not of the Holy but the Royal Shekel. The Maneh in Ezek. 45. 12. seems to be 60 Shekels, and hereto several agree, but some think it was now encreased 19 Shekels more than of old, and call it the new Maneh, valued nevertheless with most after the Holy Shekel, in Silver at 7 l. 10 s. Buxtorf tells us also of a Maneh of 25 Holy Shekels. The Assembly's Annotations on Ezek. 45. 12. make 3 sorts of Manehs, viz. Common 15, the King's 20, and the Holy 25 Shekels; but the Word Maneh is Singular and not Plural in the Hebrew Text there, as noting all those Divisions to make but one Maneh.

(i) The *Chibar*, by some wrote *Kiebar*, and commonly translated *Talent*, contained 3000 *Shekels*, as may be collected from *Exodus* 38. 25, 26. where the Silver collected is expressed to be 100 *Talents*, and 1775 *Shekels*, v.g. and the Persons that paid it at half a *Shekel* a Piece, v. 26. numbered to be 603550, whereof the Half is 301775, which divided by 3000, the *Shekels* in one *Talent*, makes 100 *Talents*, and leaves the odd *Shekels* remaining 30) 1775 (100

3 000

The *Talent* thus valued after the *Holy Shekels*, makes the number of *Talents* mentioned in some Texts of Scripture, especially 1 *Chron.* 22. and 29 *Chapters*, amount to such Maffy Sums, that some think the *Talents* are to be reckoned at the Rate of the other *Shekel*; and others, not improbably, that the *Jews* had a Piece of Money or Plate of Gold of small Value (as may be observed anciently in *Homer Iliad lib.* 23.) called a *Talent*. And *Fuller* in his *Pisgab sight of Palestine*, Book 3. P. 356, 357. shews whereon such an Opinion may be strengthened; and that the *Talent* mentioned in some Scriptures may be rather this than the other.

The Account both of the Hebrew Weight and Money, with their Value in Sterling-Money and Troy-Weight, is Contrasted into the following Table.

Hebrew Gold and Weights.

Chibar or Talent	I	Month.
Maneh or Pound	Old New	I
	60 50	New Old Zabab.
Zabab or Shekel	3000	60 50 I Adark.
Adarkon or Dram	6000	120 100 2 I
Troy-Weight	125 l.	2 1/2 1 1/3 1/2 Oz. 1/2 Oz.
Sterling-Money	4500	90 l. 75 l. 11 l. 10 s. 15 s.

Hebrew Silver and Weights.

Chibar or Talent.	I	Month
Maneh or Pound.	Old New	I
Shekel	3000	60 50
Bekah	6000	120 100
Third Part.	9000	180 150
Fourth Part, Zuzim or Drams.	12000	240 200
Gerahs.	60000	1200 1000
Troy-Weight.	125 l.	2 1/2 1 1/3 1/2 Oz. 1/2 Oz.

The Roman *Libra*, called also *As*, and by Translators commonly rendered a *Pound*, was divided into 12 *Ounces*, and for every Number of *Ounces* under 12, a proper Name used; as,

Denex	11
Dexians and Decunx	10
Drodans	9
** Bes, Bessis, and of Old Des	8
Septunx	7
Semis, Semissis, Semissus, Sella, and Simbella	6
Quincunx	5
Triens	4
Quadrams, and Triunx	3
Sextans	2
Uncia	1

Malines, P. 24. of his *Lex Mercatoria*, divides *Pounds*, which he calls the Old *Pound* of the Romans, into

64	Dinariis.
128	Quinariis.
256	Septertis.
640	Asses.
1280	Semilibella's.
2560	Teruncios.

A Reason is wanting why *Legat* makes the Roman *Libra* of 12 Oz. but 10 1/2 Oz. Troy, since if he reckon by the Number of Grains (the Original of Weights) at 5760 Grains of Assize in the *Pound* Troy; it can be but 10 Oz. just; for 10 times 6912, the Grains in a Roman *Pound*, and 12 times 5760 are equal: But if he count the *Pound* Troy at 7580 Grains, according to the Statute at 32 Grains of Wheat to a Penny-Weight, the *Troy Pound* will be 13 1/2 Oz. Roman.

** Bes

** *Beis*, is the Mark Weight, two Thirds of the Pound, *Malines*, P. 24. aforesaid, makes the *Beis* or Old Mark of the Romans to be divided into

- 16 Loos, or Tetradrans.
- 23 $\frac{1}{2}$ Tridrans.
- 32 Didrans.
- 64 Drans.
- 96 Obolos, or Treobolus.
- 128 Triobulos.
- 384 Obolos.
- 768 Miobolos.
- 3840 Moments.

b. *Semiuncia*, or the Half Ounce, is sometimes called *Assarion* and *Assarius*; and by *Alsted*, *Lotho*, answering to a German Weight of that Name.

c. *Duella*, being double the Weight of the *Sextula*, is sometimes called *Bina Sextule*.

d. *Sicilicum*, or *Silicus*, and by Abreviation *Siclus*, is $\frac{1}{4}$ of an Ounce.

e. *Sextula*, used promiscuously with *Sextans* and understood, by import of the Name, to be the Sixth Part.

f. *Denarius*, a Penny Weight, the seventh Part of the Ounce, whether used to Weigh any thing

but Money as the other Divisions thereof, somewhat questionable, see among the Money, *Alsted* compares the *Drachmal Denarius* to the German Weight *Quintlein*.

g. *Quinar*, was half the Penny Weight, and a Piece of Money set afterward among the Roman Coins.

*, Between the *Quinar* and *Scruple* some mention a Weight called *Termiffis*, containing 32 Grains, being the 18th Part of an Ounce.

h. *Quadrane*, here, is $\frac{1}{4}$ of the Penny Weight; and so called *Quadrans Denarii*, to distinguish it from *Quadrans Librae*, which was 3 Ounces.

i. *Sextans*, called *Sextans Denarii* to difference it from *Sextans Librae*, was the sixth Part of the Penny-Weight, and sometimes called *Sextula*.

k. *Obolus*, or half a *Scruple*, called sometimes *Simplium*, weigheth 12 Grains. If there be another *Obolus*, as some say, which was the Third Part of a *Quinar*, it seems to be a Piece of Coin, and must weigh 12 $\frac{1}{2}$ Grains, and so is all one with the *Sextans*, according to the *Tabulary Divisions*; yet this sort of *Obolus* they make to contain but 10 Grains.

Between the *Obolus* and the *Siliqua* some mention a *Cerates*, which they say contains 6 Grains, and so is $\frac{1}{2}$ the *Obolus*, or $\frac{1}{4}$ of the *Scruple*.

The Brass Unica, misprinted in Rider, at $\frac{1}{12}$ Affis; for $\frac{1}{12}$ Part of three Farthings, cannot be $\frac{1}{12}$ of our Penny, counting 4 Cees to a Farthing as they do.

So also is As, as ob. q. for ob. qa. for As being the 10th Part of the Denarius, must be 3 Farthings, 10 times 3 making 30 Farthings, which is $7 \frac{1}{2}$ d. the Value of the Denarius. To the Brass As was the Silver Libella equal in Value.

Obolus, being $\frac{1}{24}$ of the Roman Penny, is called by Celsus, Sextans.

Sestertius, English'd a Sestertian, was $\frac{1}{4}$ of the Roman Penny, and being of the Masculine Gender, was differenced from the other being of the Neuter Gender, and in Numbring by these Sestertians, these 3 Rules are to be observed.

1. If the Numeral Noun agree in Case, Gender and Number with the Sestertian, it signifieth barely just so much as was pronounced, as Decem Sestertii is 10 Sestertians.

2. If the Numeral Noun of another Case be

joined with the Genitive Case Plural of Sestertius, it noteth so many Thousands, as Decem Sestertium (for Sestertiorum) is Ten Thousand Sestertians.

3. If an Adverb be put without any Numeral joined, as Decies, Viginti, &c. or joyned with Sestertium the Genitive Case Plural, there is understood by it so many Hundred Thousand, as Decies Sestertium is Ten Hundred Thousand Sestertians, Alitè delivers it thus;

From 1 Sestertian to 1000 in the Masculine Gender, as Unus Sestertius, Decem Sestertii, &c. is 1 Sestertian, 10 Sestertians, &c.

From 1000 to 100000 in the Neuter Gender and Plural Number, as Singula Sestertia 1000 Sestertians, Bina Sestertia, 20 Sestertians, &c.

From 100000 upward, all expressed adverbially and in the Genitive Plural, as Semel Sestertium 100000, Decies Sestertium 1000000, &c.

Victorinus was so called, because stamped with the Image of *Victory*; and *Quinarus*, because equal in Value to 5 Brass *Asses*, or half the *Denarius*.

Bigatus, some call *Quadratus*, had the Print of a Cart or Chariot on it, and was of Value equal with *Denarius*.

Denarius, q. d. *Dena æris*, because it containeth 10 *Asses*, rendred a Penny. Mar. 18. 28. and 22. 19. at the Old Rate was $\frac{1}{2}$ of an Ounce, and at the new $\frac{1}{4}$, and at this Rate all the other Coins are valued in the Table. This is sometimes called the *Drachmal Denary* for Distinction sake. Some make 3 sorts of Pence, the heavier weigheth $1\frac{1}{2}$ *Attick Dram*, the Mean of one *Dram*, and the least lighter than 1 *Dram* by $\frac{1}{2}$ of an Ounce, or thereabouts. Some say one was $\frac{1}{8}$ of the *Roman Unica*, the Mean $\frac{1}{4}$, and the Lighter $\frac{1}{8}$. *Budeus* makes the *Attick Dram* and *Roman Penny* of the same Weight and Worth, wherewith most agree, and accordingly each in the foregoing Tables are valued at $7\frac{1}{2}$ d. after 5 Shillings the Ounce.

The Golden *Denarius* mentioned in *Holyoke* at 2 s. $4\frac{1}{2}$ d. *Sterling*, I have omitted, as not satisfied in the Weight, nor certain of such a Coin.

The Golden *Amient* seems the Eldest and Great-

est, a Piece Coined by the *Consuls*, therefore called *Consularis*, weighed $2\frac{1}{2}$ Drams.

The *Imperatorius*, or Piece of the Emperor's Coin 2 Drams.

The *Drachmal* 1 Dram, and the *Triens* of the *Imperatorius*.

After *Constantine* removed his Seat to *Bizantium*, now called *Constantinople*, a City after his own Name, we read of *Follis* in *Eusebius*, a Brass Piece, as *Lampridius*, or of Iron, as *Eustatius* saith, so called because it representeth a Leaf, in Latin *Folium*, and was $\frac{1}{2}$ of the Silver simple *Siliqua*.

The Silver *Siliqua* or *Ceratum* was double: The Simple $\frac{1}{2}$ of the *Millierifum*, value 5 d. The Great called *Cerates*, 1 *Dram* equal to the Penny $7\frac{1}{2}$ d.

Milliarifum, weighed 2 Drams.

Constantine's Piece of Gold was called *Romanus Solidus*, at the Proportion of 7 s. 5 d. for a *Dram* of Gold must weigh $1\frac{1}{2}$ Dram.

These continued current till *Valentinian*, who made his Coin somewhat heavier.

Valentinian's Piece of Gold by some is called *Sextula*. and being valued at 10 s. *Sterling*, must weigh $1\frac{1}{2}$ Dram.

Of which the { *Semissis*
{ *Tremissis*, or *Triens* } being { $\frac{1}{2}$ } was { $\frac{1}{4}$ } of a *Dram*.
{ *Scruple*.

Sportula, say some, was a Lawyer's Fee, or an Alms distributed by Princes among the People. See *Selden's History of Tythes*, Chap. 4. P 37, 38.

Accounts of Exchange of Money at several Places.

2. 11. *Aleppo*, the Exchange is made by *Sultanes* of 120 *Aspers*, or *Dollars* of 80 *Aspers*, every *Asper* 10 *Marcherines*.

3. 1. *Alexandria*, they account by *Ducats*, either *Ducat* de *Pargo*, of 120 *Mails*, *Ducat* of *Venice* of 40 *Mails*, or *Italian Ducat* of 35 *Mails*.

1. 7. *Ancona*, Exchange is made on the *Ducat* of 21 *Gros* (which is in *Specie* 23 *Gros*) which *Ducat* also is 14 *Carlina*, and every *Carlina* 6 *Bollidini*; so in the *Ducat* of 84 *Bollidini*.

1. 4. *Aragon*, the *Rial* or *Ryal* of the Plate is 23 *Dinero's* (*Hunt* saith 13) and the *Ducat* is 12 *Ryals*, whereon they make Exchange; and they account by *Pounds* of 20 s. and 12 d. And the *Ducat* of 12 *Ryals*, every *Ryal* of 1 s. or 12 d.

1. 8. *Artois*, and in several other Places they Account and Exchange by *Pounds* or *Livres*, *Tournois* of 20 *Stivers*, or 40 Pence *Flemish*, whereof 6 called *Guilders* or *Florins* makes the *Pound Flemish* in all the 17 Provinces of the Netherlands; which *Pound* is divided into 20 s. and every *Shilling* into 12 d. &c.

Some reckon by the *Pound Paris*, which is but 20 Pence, whereof 12 make 1 *Pound Flemish*,

but their Accounts, as also the Finances of the Princes, are kept by *Pounds Tournois*, and both *Pounds* divided in 20 s. and every *Shilling* into 12 Pence, admitting also the Subdivisions of *Obolo's*, *Maille*, *Heller*, *Hallnick*, *Corte*, *Mites*, *Points*, *Engevin*, *Poot*, and such like *Copper Monies*.

Alsted mentions the *Florin* in *Germany* to be 15 *Batz*, every *Batz* 2 *Albes*, every *Albe* 8 *Oboli* or *Nummos*: so shall the *Florin* be 30 *Albes* or 240 *Oboli*.

1. 4. *Augusta* or *Ausburgh*, Accounts on the *Dollar* Coined at 65 *Creutzers*, risen since to 72. Exchange is made on the imaginary Rate of 65 *Creutzers*.

A *Creutzer* is sometimes called a *Schreikenborger*, and in Latin *Crucigerus* and *Cruciatas*, being Pieces stamped with a Cross: Their *Gros* make 12 *Creutzers*; their *Lyon Piece* half a *Creutzer*. They have their *Snubourgh*, *Blaphart* or *Bohemico's* of 3 and $\frac{1}{2}$ *Creutzers*. The *Rix* or *Rycks Doler* is 30 *Albes* of 8 d. every *Albe*, or 72 *Creutzers* every *Dollar* as before. See the following Table, and afterwards in *Germany*.

Dollar	Gros.	Batz.	Albes.	Creutzers.	Lyon.	Pence.	Black-pennies.
	6	18	30	72	144	240	288
		3	5	17	24	40	48
		Batz.	12	4	8	13 $\frac{1}{2}$	16
			Albes.	2 $\frac{1}{2}$	4 $\frac{1}{2}$	8	9 $\frac{1}{2}$

Dollar.	1 1/2	2 1/2	12	24	72	240	
Angl's.			12	24	6	20	
Bohemico.			2	6	3	10	
Creutzer.					3	10	

1. 7. *Bologna*, they account by *Piastra* or *Pounds* (called also *Piaftri*) each containing 20 *Bolognese*; and exchange on the Ducat of 4 *Piaftri*.

1. 8. *Brabant*, and in most Places of the *Low Countries* Monies are accounted by the *Pound Flemish*, containing 20 s. *Flemish*, and every Shillings 12 d. or *Deniers*, called single *Stivers*, two of which make one double *Stiver*. See *Flanders*.

1. 4. *Breslaw*, they reckon by Marks of 32 Grofs of 12 *Hellers* to the Grofs; and exchange by 30 *Florins*, to have at *Norrenburgh* 32 *Florins*, and at *Vienna* 34 *Florins*.

1. 7. *Calabria*, Exchanges are made by the *Naples* Ducat of 10 *Carlini*.

1. 14. *Castile*, Exchanges are made on the Ducat of 375 *Marvedies*, which they call in the Bill of Exchange *Ducados d'oro*, or *de Peso*: to be paid out of the Bank is better by 6 or 8 *pro Militar*. See *Spain*.

1. 14. *Catalonia*, as at *Aragon*.

1. 4. { *Cleves*, } both Accounts and Exchanges
1. 4. { *Collen*, } are made by Dollars of 72 *Creutzers*.

Their Guilders is	Marks, Morkens. White Pennies		Shillings, or Stivers.

Five single *Stivers* are current in several Places of the *Low Countries* for six Pence Sterling; Or-

kens in some Places are called Duyts; Mites in some Places of *Flanders* are called Cortes, Engcuni, Points, Pites, Poots.

1. 7. *Florence*, they account by Crowns of 20 s. 12 d. to the Shilling; and exchange by a Ducat called *Lugo*, or *scripto in Banco*. A Florin there is 24 Quatrini.

1. 3. *France* generally they use Livres, Sols, and Deniers, and commonly account by them, as the *English* by Pounds, Shillings and Pence; but by an Edict made 1577, their Accounts are to be kept in French Crowns of 60 Sols to the Crown, or 3 Livres, that is, Pounds *Tournois*; and Exchange is made thereupon, unless for some Places in *Italy*, where they exchange for number, to have so many Ducats for so many Crowns of the Sum, not in *specie*, but imaginary, yet repeating the Value or Par. See further in the Table and Notes thereupon.

	Livres.	Sols.	Liarts.	Doubles.	Deniers.
French Crown	3	60	240	360	720
A	Livre.	20	8	120	240
B	Sols.		4	6	12
C	Liart.			1½	3
D	Double.				2
E					

There are also Petit Deniers and Mailles, but not considerable. A. This Crown here to make exchange by is equivalent to the Silver Coins of *Lewis* 13th and 14th, called *Lewis*, and imaginary, and not to be accounted for the French Gold Crown, which is a real Coin and of great Value now, being worth about 8 s. *Sterling*. The Account and Exchange agreed in reality 10 Sols then, and yea commonly reckoned for an *English* Shilling. Of this Gold Crown was the Cardecue a Quarter, and so valued in *Sterling* Money at 18 d. and should be wrote *Quartid escue*, *Escue* being French for a Crown.

B and C, the Livres (or Pounds, sometimes called Franks) and Sols (wrote sometimes Souls) derived from the Latin, *Solidus*, as *Livre* from *Libra*, are different. Those commonly used are called *Tournois*; and valued with *Sterling* Money as above. Of the Sols Barrois 14 make 20 Sols *Tournois*. The Sols *Mausais* is 2 Sols *Tournois*: The Sols *Paris* is 1½ Sols *Tournois*. The Sols *Bourdelois* is half the Sols *Paris*, and so accordingly is the Livre to be accounted.

D and E; neither the Liarts nor Doubles, though both Copper Coins, are used in common Accounts.

1. 4. *Frankfort*, their Guilder or Florin by which they reckon is 60 Creutzers divided by 20 s. and every Shilling in 12 Hellers according to the Pound. But they exchange by the Dollar of 65 Creutzers, payable in the two Yearly Fairs or Marts, one the Week before *Easter*, and the other all the Month of *September*.

1. 7. *Genoa*, all Accounts and Exchanges are made by Crowns of 60 s. divided into 20 s. and every Shilling into 12 Pence.

1. 4. *Germany*, every Batz, by which generally they keep Accounts, is 4 Creutzers: They exchange on the Dollar, imaginary at 65 Creutzers, and so coined, as was noted before at *Augusta*, though risen to 72 in Value.

They have Pieces of 3, 6, and 12 Creutzers, and by them and their Batz they value their own and *Exotic* Coins; as the *Hungarian* Ducat is 27 Batz; the Gold Guilder is 18 Batz; the *Poltz* Guilder or Dollar is 15 Batz; *Teflon* 5 Batz, &c.

A Guilder was the Name the ancient *Romans* gave to an Ounce, and 8 Ounces made a Mark, and 12 Ounces of Guilders a Pound; and there were coined Pieces called *Nunni Dragmi* or *Grosfen*, the 8th Part of a Dollar. Anno 1520 was the Gold Guilder coined for a general Coin, and valued in *Holland* at 28 Stivers, but now in *specie* at double the Price: Nevertheless Corn brought from *Poland* and the *East Countries*, is bought and sold by the same at the old Value of 28 Stivers.

Angelices was the sixth Part of a Dollar, making 3 Batz or 12 Creutzers. These Angelici becoming Tribute Pennies were alloyed, and so becoming made worse, did obtain the Name of Batz or Bats (sometimes wrote Batfes) *quasi* Bafe: And in *Thuringia* they are called *Gulielmi*, and in *Bohemia*, *Bohemici*, whereof they have also 12 Pieces dividedly for for 12 Pence, which Penny is 2 Hellers in Account all over *Germany*.

2. 6. *Goa*, their common Account is by their ordinary Silver Coin a *Pardaune Xeraphin*, having the Image of St. *Sebastian* on one Side, and 3 or 4 Arrows bound together at the other, which is worth 3 Testons, or 300 Res of *Portugal*, but varieth as the Exchange riseth or falleth; and accordingly their other Coins and Accounts, of which some are imaginary and some real. They have also some good and some bad Monies; for 4 good *Tanga's* or 5 bad *Tanga's* are reckoned to value 1 *Pardaune Xeraphin*, and 1 *Tanga* is 75 *Basarves*. Of these *Basarves* 375 make 1 *Pardaune Xeraphin*, and 15 good *Basarves* are valued with 18 bad, which are made of bad Tin. By these other Country Coins are rated, as the *Larin* of *Persia* is worth 105, and 108 *Basarves*, as the Exchange goes. A *Pardaune* of *Larins*, is 5 *Larins*, and the Crowns of *Venice* or *Turkey* are almost worth 2 *Pardaune Xeraphins*. They have also a *Pagoda*, or Gold Crown, on which is the Figure of their *Idol*, worth about 8 *Tanga's*; and Gold Crowns of St. *Thomas* with his Image on them, esteemed at 7 or 8 *Tanga's*.

1. 1. *Hamborough*, their Dollar was first coined at 31 Shillings *Lups*, and many Years current for 33, is now haunched to 54 s. *Lups*, of 3 white Penny, and every Shilling is 12 d. and every Penny 2 Hellers. They account by Marks of 16 s. *Lubish*, and 12 d. to the Shilling; but exchange for *London* upon the Pound *Sterling*, and for other Places on the Rix Dollar of 33 s. now by them inhaunched to 54 s. *Lubish*, or so many Stivers *Flemish*.

1. 8. *Henault*, as *Antois*.

1. 4. *Hungaria*, account by Guilders of 10 Shillings, of 33 d. to the Shilling; and exchange on the Ducat and Rix-Dollar, worth 8 Shillings, formerly but 7 s. 6 d.

1. 6. *Ireland*, they, as the *English*, account by Pounds of 20 Shillings *Sterling*, and Pence of 12 to the Shilling; only their *Harper*, valued in *England* but 9 d. was with them counted 1 s. so as their Pound is but ¾ of ours, or 15 s. *Sterling*; and thereon Exchanges are made.

1. 4. *Leipsick*, as *Bresla*.

1. 10. *Lisbon*: See *Portugal*.

1. 8. *Low Countries*, generally as before at *Brabant*.

1. 2. *London*, Exchanges are generally made for *Germany* and the *Low Countries* on the Pound *Sterling*; for *France* on the French Crown of 60 Sols *Tournois*; for *Italy*, *Spain* and other Places on the Ducat, Dollar or Florin, according to the Custom of the Place.

1. 7. *Luca*,

17. *Luca*, for divers Places in *Italy*, and *Lyons* in *France*, Exchanges are made on the Ducat.

1. 3. *Lyons*, as before in *France*.

1. 14. *Madrid*: See *Spain*.

1. 7. *Milan*, Accounts are kept by Ducats Imperial, divided by 20 s. and 12 d. to the Shilling, and Exchanges made on the same, accounting 80 s. to the Ducat Imperial; but they buy by a Ducat current of 120 s.

1. 7. *Naples*, they account by Ducats, Taries and Grains. The Ducat is 10 Carlini or 5 Taries, for the Tary is 2 Carlini or Royals; and hereupon Exchanges are made for most Places of *Italy*; but for *Lyons* they exchange by Number, as 125 Ducats for 100 Crowns.

1. 5. *Norembourgh*, the Exchange is made on the Dollar of 65 Creutzers, and many times on the Guilder of *Florin*, of 60 Creutzers, which they also divide into 20 s. and every Shilling into 12 d. to keep Accounts by; and some say the Creutzer is 4 d. every Penny is 2 Hellers, and 5 d. is called a *Fynfer* or 5 Pennick.

1. 7. *Palermo*, the Ducat is 13 Taries, 1 Tary 2 Carlini, 5 Ryals of *Spain* are 6 Taries. They account by Ounces of 30 Taries, to 20 Grains every Tary, and every Grain 6 Piccolie. And their Exchanges are made upon *Florins* of 6 Taries or Tarii.

1. 3. *Paris*, as before in *France*.

1. 9. *Poland*, they account by Marks, and exchange on the Dollar, and also on the *Florin* of 48 s. The Mark is one Third Part of it.

1. 4. *Pomerania*, they divide their Money as in the Next Table following, account by Marks of 16 Snudens, and Exchange upon the Rix-Dollar of 32 s. or 2 Marks Snudens, so called to distinguish them from Marks-Lups and Shillings-Lups.

	Marks-Lups.		Shillings.		Pence.		Hellers.
	Snudens.	Shillings.	Snudens.	Shillings.	Snudens.	Shillings.	
Rix-Dollar.	2	16	32	384	768		
Mark-Lups.	Mark.	8	16	192	384		
	Snudens.	Shilling-	2	24	84		
	Lups.	Shilling-	21	24			
		Snudens.	Penny	2			

1. 10. *Portugal*, they account by *Milrais*, Ducats or *Crufado's*, &c. as in the Table following, and exchange by the same Ducat of 400 Raies.

	Ducats, or Crufado's.		Teffons.		Rials.		Vintaines, or Half Rial.		Raies.
	Ducat.	Teffton.	Rial.	Half Rial.	Rial.	Half Rial.	Rial.	Half Rial.	
Mill-Raies.	2½	10	25	50	1000				
	Ducat.	4	10	20	400				
	Crufado.	Teffton.	2½	5	100				
		Rial.	2	4	40				
		Vintaine, or	20						
		Half Rial.							

Of these Ducats, Rials (or Royals) and Raies (wrote also Reas, Reyse and Rés) are most in use for Account. They have *Tefftons* also of 4 *Vintaines*; 40 Raies are commonly accounted for six Pence *Sterling*, and so accordingly were the other Coins valued till the late Advance, whereby the *Teffton* of 100 Raies were stamped and made current for 120 Raies, and so rated at 1 s. 6 d. *Sterling*, when before but 1 s. 3 d.

1. 7. *Puglia*, as *Calabria*.

1. 9. *Riga*, they buy by Dollars or *Florins Polish* of 18 Farthings, whereof 11 make 10 Dollars,

but they exchange upon the Rix-Dollar.

1. 3. *Roan*, as before in *France*.

1. 7. *Roan* Accounts and Exchanges are performed by Ducats *di Camori*, of 13 July or *Guilt*, every Ducat, which they divide into 20 s. and every Shilling into 12 d.

1. 11. } *Ruffia*, they have small Coin of 11 Oz.

2. 10. } Penny Weight fine, called *Dengen*, whereof 320 Pieces weigh but a Mark of 8 Oz. They exchange upon the Dollar of *Germany*; but for *London* upon their Rubble, which is valued as a double Ducat, formerly accounted to a Mark *Sterling*, or 13 s. 4 d.

1. 14. *Saragossa*, as *Arragon*.

1. 12. *Scotland*, they account by Pounds, Shillings and Pence as in *England*, but one Pound *Scotch* is but 20 d. *English*. Their Mark is 13½ s. *Scotch*, current in *England* at 13½ d. Their Noble or half Mark with them 6½ s. with 5 6½ d. their half Noble and third Part of their Noble proportionably. They have also Turnoners, Pence and Half-pence; and base Money of Bodles, Achifons, Babees, Placks, &c. accounting 6 Bodles to 1 d. *Sterling*, or 12 d. *Scotch*; 4 Bodles to 1 *Achifon*, 3 to 1 *Babee*, and 2 to 1 *Plack*; but they exchange upon their Mark.

1. 14. *Spain*, as in *Madrid*, *Sevil*, and other Places their Accounts are kept by *Malvedies*, or *Marvedies* (wrote also *Merveides* and *Meravides*) whereof 375 are esteemed to make a Ducat of 11 Rials, tho' really every Rial is 34 *Marvedies*, and so maketh but 374, as in the Table following; and so others keep Accounts accordingly. Exchange is made on this imaginary Ducat of 375 *Marvedies*, to be paid in Bank with 5 on the 1000, which is the Salary of the Banker; or without the Bank to be paid without the same.

	Pieces of Eight.		Rials.		Quartillo's.		Marveides.		Carnado's.
	Piece of Eight.	Rial.	Quartillo.	Marveid	Piece of Eight.	Rial.	Quartillo.	Marveid	
Ducat.	1½	11	44	374	2244				
	Piece of Eight.	8	32	272	1632				
		Rial.	4	34	204				
			Quartillo.	8½	51				
				Marveid	6				

A Rial is about 6½ d. *Sterling*.

1. 4. *Straßborough* or *Strausburgh*, they have *Blapharts*, *Grofs*, *Behemico's*, all current for 3 Creutzers apiece, 1 Creutzer at 2 d. one Penny at 2 Hellers, and 1 Heller at 2 Orthings.

1. 15. *Sweden*, they reckon by Marks, whereof 8 make a Dollar, whereupon they exchange: And 2 Marks make a Clipping of 9 Stivers.

1. 4. *Tirol*, the Dollar is 72 Creutzers, and the Creutzer 5 Fynfers or Hellers.

2. 11. *Tripoli*, as *Aleppo*.

1. 14. *Valentia*, as *Arragon*.

1. 7. *Venice*, Thirty Bats make 1 *Souldey*, and 20 *Souldeys* 1 *Livre* of *Venice*. Their Gold Ducat is valued equal to 40 Maides of *Alexandria*. They have also Copper Money, 1 *Seffini* make 2 *Quatrini*, and 1 *Quatrino*, 4 *Bagatini*, and so 3 *Quatrini*, or 12 *Bagatini* make an Half-penny *Sterling*, or thereabouts.

They account by Pounds *Flemish* of 10 Ducats of 20 Shillings, and divide the Ducat into 24 *Grofs*, and the Shilling into 12 d. and also by the Ducat 124 s. called *Ducato di Banco*, or *Current*, and thereupon Exchanges are made.

1. 7. *Verona*, their Accounts are kept by 20 s. and 12 d. to the Shillings; and they exchange upon the Ducat of 93 s.

1. 4. *Vienna*, both Accounts and Exchanges are kept and made by *Guilders* or *Florins* of 8 s. a piece, 30 d. to the Shilling; and 2 Hellers to the Penny.

They esteem the Rix-Dollars at 8 s. and the Ducat at 12 s.

1. 4. *Ulm*, they reckon by Pounds of 20 s. and 12 Hellers to the Shilling; and exchange on the Dollar of 60 Creutzers.

COITION, is a Word sometimes used for that mutual Attraction or Tendency towards each other, which is found between Iron and the Magnet.

COLATURE, is that, which after boiling or infusion of any Ingredients, is percolated or strained through a Sieve or Cloth; or through Hippocrates's Sleeve, as the Chymists speak.

COLCOTHAR, is the dry Substance red as Blood which remains after Distillation of Vitriol, commonly called *Caput Mortuum*; though when Vitriol is calcined a good while in a strong Fire, it will turn red, and is also called *Colcothar*.

COLD, is one of those Qualities of Bodies which they call *Primary*, and is nothing but the arriving of the minute and insensible Parts of any Body at such a State, as that they are more slowly or faintly agitated than those of our Fingers or other Organs of Feeling; for from this Effect we pronounce any Body to be cold.

Mr. Hobbs thought the Cause of Cold to be only a Wind taking the condensed or frozen Body.

Whether Cold be barely a Privation of Heat, or rather a stop put to that violent tumultuary Motion of the insensible Particles of Bodies, as the Cartesians assert; or whether Cold be introduced by the Entrance of adventitious Particles actually cold themselves, and therefore called *Frigorifick Particles*, according to the Opinion of the Learned and Ingenious Gassendus, is a Controversy not so easy to be determined as at first Sight it may appear. For though the considerable Encrease of the Dimensions of the same Quantity of Water when turned into Ice, and the prodigious Force of Freezing, by which Water may be made to lift up vast Weights, and to break to Pieces some of the strongest Bodies that are; and also since it is true, that a brisk, nay a furious Agitation of the small Parts of a

Mixture may be produced, and yet on the Con-
flict the Mixture shall become not only not Hot, but sensibly and considerably Cold; though, I say, these seem to bid very fair for a Proof of Gassendus's Opinion; yet, on the other Hand, 'tis certain, that a bare Privation of Motion will produce, or rather occasion, Effects as considerable as any of those of Cold, as the Excellent Mr. Boyle largely shews in his Dialogue about the Positive or Privative Nature of Cold: And also, if it should be ask'd how the Frigorifick Particles themselves become cold? What degree of Gravity or Levity they have? What kind of Structure in them is proper to produce such an Effect? Whether such a Structure be destructible or mutable, or not? Whether these Frigorifick Particles be primitive Bodies or not? And whether there was not Cold in the World till they were produced; If these or such like Queries were made about the Nature and Circumstances of the Frigorifick Particles, it would, I believe, puzzle the Maintainers of the Opinion of Gassendus to give satisfactory Answers to them and therefore the Decision of this Point must be suspended further.

Mr. Boyle found, that though Water usually expands it self in Freezing, yet 'tis always first contracted or condensed; and that Spirit of Wine, common exprest Oils, and Chymical Oil of Anniseeds it self, will be notably condensed when exposed to an intense Degree of Cold. And he found that no other Liquor but Water, or one in which there are store of Watry Particles, will ever be expanded by Cold. The Reason of which perhaps may be, that Water contains more Air in its Pores than other Fluids; and 'tis not improbable, that from the Coalescence of many of the Aereal Particles into one during the Action of Freezing

Freezing, their Spring may by that Means be encreased, and so they may from those numerous and large Bubbles we observe in Ice, which occasions it to be specifically lighter than Water.

The Expansion of Water in Freezing is about $\frac{1}{10}$ Part of the Space more than it before took up.

The *Expansive Force of Cold* is so great, that if the Barrel of a Gun be filled with Water, and then have its Muzzle and Touch-hole well stop'd, the Water within the Barrel, when either by Natural Cold or a Freezing Mixture it is turned into Ice, will break the Barrel in several Places, as Mr. Boyle and many others have tried.

That noble Philosopher contriv'd several Experiments to estimate or measure the Quantity of this *Expansive Force*, which were made with a Brass Cylinder of two or three Inches in Diameter, into whose Cavity was put a Bladder filled with Water, and strongly tyed about the Neck, and over it was put a Wooden Plug, to stop up the upper Orifice of the Cylinder; and on the Plug was put a broad flat Board, on which was laid as much Weight as one time amounted to above an Hundred Pound, another time an Hundred and Twenty Pounds, and another time to two Hundred fifty four Pounds; and yet in all the Experiments, when the Water in the Bladder was turned into Ice, it expanded so as to raise up all this Weight very conspicuously, as appeared by a Circle designedly made on the Wooden Plug.

He tells us also, That by mingling together three Saline Bodies, each of them purified by the Fire, tho' there did arise a very great Commotion, Hissing and Explosion, yet a very considerable Degree of Cold was thereby produced: And tho' he was under an Obligation of not discovering what these Ingredients were, yet he gives a *Succedaneum* to that Experiment, by telling us, that by putting good Salt of Tarter into Spirit of Vinegar, there was a Struggle, Commotion and Hissing produced, and yet instead of Heat, as is usual in such Cases, a very sensible Degree of Cold was produced.

Sylivious also acquaints us with a Method of producing Cold, by mingling Spirit of Virriol with another Saline Spirit.

If in 3 or 4 times its weight of Water, you put about half a pound of *Sal Almoniac* powdered, and stir it about to hasten the Dissolution, so great a Degree of Cold will, even in the Heat of Summer be produced, as is very surprizing; for if you nimbly shake it, or stir it about, it will produce actual Ice on the outside of the Glafs, if you purposely wet it with Water. This Noble Experiment Mr. Boyle first made, and thereby plainly proved the Mechanical Producibleness of the Quality of Cold; and the Experiment may be of great Use to cool Wine, &c. in the hot Months, or in such Places where no good Cellarage is to be had. The *Sal Armoniac*, by evaporating the Water from it, may be recovered again, and will serve many times for the same Experiment.

That Honourable Virtuoso found also, that by shaking Gunpowder in 4 or 5 times its Weight of common Water, a considerable sensible Coldness would be produced.

The Learned Dr. *Stare* produces a considerable Experiment (in *Philos. Trans. N. 150.*) whereby a considerable Degree of Cold is made with a very great Ebullition, as in the former Experiment it

is produced without any. The Experiment is only to pour into any strong Acid (he used mostly Spirit of Verdigrease) a Quantity of the Volatile Spirit of Human Blood; by which Means he tells us, that he produced so much Cold, as that the Spirit of Wine in an immersed Thermoscope, descended within half an Inch of the Freezing Point even in Summer. And this he thinks, very ingeniously, may serve to Explain the Phænomenon of the Cold fits in Agues.

And since, if into this Mixture he poured a small Quantity of Oil of Sulphur, the Matter would immediately grow sensibly Warm, he not improbably suggests, that something like this may occasion the coming of the Hot-fit afterwards, when the Animal Spirits come to be mixed with the Blood more copiously, than at first in an Ague Fit they can be.

Neither our *Senses* nor common *Weather-Glasses*, can enable us to make an accurate Judgment of the Degree of Cold.

For as to our *Senses*, the Organs of Feeling are in a continual State of Mutability, and that (in general) appears Cold to us, which hath its Parts less moved than those of our Hands or Bodies; and therefore if one Hand be very Cold, and the other moderately Warm, the same Water, for instance, will appear Warm to the Cold, and Cold to the Warm Hand.

As to *Common Weather-Glasses*, some Part of the Liquor being contiguous to the open Air, the Weight and Pressure of the Atmosphere hath so great an Effect on them, that their rising and falling depends more on that than on Heat and Cold, and therefore they will often mis-inform us,

The Coldness of Places doth not solely nor principally depend on their nearness to the Poles.

For *Martinus*, in his *Atlas Chinesis*, saith, that in *China*, whose Latitude is no where above 42 Degrees, the Rivers for four Months together (*viz.* from the Middle of November till the Beginning of March) are so Frozen up, that laden Waggon do safely pass on the Ice; and that the Ships and Vessels are all Frozen up; and what is most remarkable, is, the Frost is usually the Result but of one Day's time, though it require many to thaw it again.

A Dutch Master of a Ship, that went within a Degree of the Pole, found the Sea open, and the Weather tolerable enough.

COLDNESS Potential: See *Potential Coldness*.

COLICK, is a Vehement Pain in the Abdomen or lower Belly, and takes its Name from the Part chiefly affected, *viz.* the Gut Colon, which is stretch'd, prick'd and corroded by Winds or Excrementitious Humours, either remaining within its Cavity, or fix'd to its very Coat.

COLLAR of a Ship, is a Rope fastned about her Beak-head, unto which the Dead-man's Eye is seized that holds her Main Stay. There is also a *Collar* or *Garland* about the Main-Mast Head, which is a Rope wound about there to save the Shrouds from galling.

COLLATERAL Assurance, is a Bond that is made over and beside the Deed it self, for the performance of Covenants between Man and Man.

COLLATION, in a Logical Sense, is the same as a comparing of one thing well with another; but now-a-days 'tis used for an Handsome Treat or Entertainment.

COLLATIONE *facta uni post mortem alterius*, is a Writ directed to the Justices of the *Common-Pleas*, commanding them to direct their Writ to a Bishop, for the admitting a Clerk in the Place of another presented by the King, who during the Suit between the King and the Bishop's Clerk, is departed this Life. For Judgment once pass'd for the King's Clerk, and he dying before admittance, the King may bestow his Presentation to another.

COLLATIONE *Heremiticæ*, is a Writ whereby the King conferreth the keeping of an *Hermitage* upon a Clerk.

COLLICIE, are the joining of the *Puncta Lachrymalia* into one Passage on both Sides, which derive the Humour of the Eye-lids into the Cavity of the Nostrils; the Holes that are made in the very Tops of the Eye-brows descend in little Channels, they spread themselves into a larger Channel, and are continued to the Tunick of the Nostrils. The same Holes or Openings in Hares, Calves, Rabbits, are not found in the very Eye-brows, but a little more Inward; and most of all in Birds, where they are larger than in any other Creatures; the *Membrane* which separates the Holes here is very short. *Blanchard.*

COLLIQUANS *Febris*, is one of the Nature of ordinary burning *Fevers*, but by its excessive Heat they say it suddenly melts the Fat, Flesh and Substance of the solid Parts of the Patient's Body; nay sometimes dissolves the very Blood in the *Veins*, as some tell you, and dischargeth the same by insensible Transpiration, as Sweat, Urine, or Stool, &c.

COLLIQUATION, or *melting of Metals*: Thus we say, Silver and Lead being melted or Colliquated together over a strong Fire, will mingle *per minima*, that is, unite thoroughly together.

COLLISION, is the striking of one hard Body against another.

COLLUSION, in Common-Law, is a deceitful Argument or Compact between two or more, for the one Party to bring an Action against another for some evil Purpose, as to defraud a Third Person of his Right, &c.

COLLUTIO, is a washing of the Mouth; as when 'tis done to clean or fasten bad or loose Teeth, or free the Gums from Ulcers, &c.

COLLYRIUM, is an oblong or round *Tablet* or *Trochisk*, used formerly in Distempers of the Eyes, and was then called by the *Arabian* Name of *Seif* or *Sief*. It was dissolved in a convenient *Vehicle*, that it might conveniently be applied; and from hence any Medicines, in a Liquid Form, designed to cure Diseases in the Eyes, are called *Collyrium*.

COLOBOMA, is the growing together of either Lips or Eye-lids, or the adhering of the Ears to the Head preternaturally, &c.

COLON, is the second of the great Guts, arising from the *Cæcum Intestinum* in the Right Flank, and adheres to the Right Kidney; thence it tends up unto the Liver, and sometimes is annexed to the Gall-Bladder, which dies it of a Yellowish Clay-colour; thence it goes on transversely under the Bottom of the Stomach, and on the Left Hand is fastned to the Spleen; after which it is fastned to the Left Kidney, winding and turning very obliquely there, but afterwards it descends almost in a Right Line. It is the widest and largest of all the Guts, and is usually about 8 or 9 Hands

Breadths long; it abounds with small Cells, or little Cavities every where: It hath a Valve to hinder any thing from returning from the great Guts into the small.

COLON, is a Point in Grammar mark'd thus, (:) and shews a Sentence to be perfect or entire, but yet the Sense depending or continuing on; as in this of *Seneca*, *Ante omnia necesse est, seipsum estimare: Quia fere plus nobis videtur posse, quam possumus.*

COLOUR, may be considered two ways. 1. As it is a Quality residing in the Body that is said to be so and so coloured, or which doth modify the Light after such and such a manner: Or, 2. As more properly the Light it self, which so modified strikes upon the Organ of Sight, and produces that Sensation which we call Colour.

The *Peripateticks* asserit *Colours* to be real Qualities, and inherent in the coloured Bodies, and suppose that Light doth only discover them, but not any way Effect their Production.

Plato thought Colour to be a kind of Flame consisting of most minute Particles, very congruous to the Pores of the Eye, and darted against it from the Object. And some Moderns will have Colour to be a kind of internal Light of the more lucid Parts of the Object darkened, and consequently altered by the various Mixtures of the less Luminous Parts.

Others, as did some of the ancient Atomists, maintain Colour not to be a lucid Stream, but a Corporeal Effluvium issuing out of the coloured Body.

Others account for all Colours out of the various Mixture of Light and Darknes: and the Chymists sometimes will have it arise from the Sulphur, and sometimes from the Salt that is in Bodies; and some also from the third Hypostatick Principle, *Mercury*.

The *Cartesians*, who make the Sensation of Light to be the Impulse made on the Eye by certain solid, but very minute Globules, easily permeating the Pores of the Air and Diaphanous Bodies: These, I say, derive Colour from the various Proportion of the direct Progress or Motion of these Globules, to their Circumrotation or Motion round their own Centres; by which Means they are qualified to strike the Optick Nerve after distinct and divers Manners, and so do produce the Perception of various Colours.

Dr. Hook, in his *Micrographia* says, The Phantasm of Colour is caused by the Sensation of the oblique or uneven Pulse of Light; and that this is capable of no more Varieties than two, which arise from the two Sides of the oblique Pulse; so that there is in reality but two simple Colours, Yellow and Blue; from the Mixture of which, and a due Proportion of Black and White (that is, Darknes and Light) all Colours may be produced.

The incomparable *Sir Is. Newton* found by two Experiments on Prisms, that there is a great Difformity in the Rays of Light, and that hereby the Origin of Colours may be unfolded. The Doctrine therefore of Colours, according to his Notion and Experiments, are contained in the following Propositions.

1. As the Rays of Light differ in degrees of Refrangibility, so they also differ in their Disposition to exhibit this or that particular Colour.

Colours are not *Qualifications* of Light, derived from Refractions or Reflections of Natural Bodies (as 'tis generally believed) but *Original* and *Connate Properties*, which in divers Rays are divers. Some Rays are disposed to exhibit a red Colour, and no other; some a Yellow, and no other; some a Green, and no other; and so of the rest. Nor are there only Rays proper and particular to the more eminent Colours, but even to all their intermediate Gradations.

2. To the same Degree of Refrangibility, ever belongs the same Colour, and to the same Colour ever belongs the same Degree of Refrangibility. The *least Refrangible Rays* are all disposed to exhibit a Red Colour, and contrarily those Rays which are disposed to exhibit a Red Colour, are all the *least Refrangible*; so the *most Refrangible Rays* are all disposed to exhibit a deep Violet Colour; and contrarily, those that are apt to exhibit such a Violet Colour, are all the *most Refrangible*: And so all the intermediate Colours in a continued Series belong to intermediate Degrees of Refrangibility. And this Analogy 'twixt Colours and Refrangibility, is very precise and strict; the Rays always either exactly agreeing in both, or proportionably disagreeing in both.

3. The Species of Colour, and Degree of Refrangibility proper to any particular sort of Rays is not mutable by Refraction, nor by Reflection from Natural Bodies, nor any other Cause that could be yet observed when any one sort of Rays hath been well parted from those of other kinds, it afterwards obstinately retained its Colour, notwithstanding all Endeavours to change it. Though refracted with Prisms, and reflected with Bodies, which in Day-light were of other Colours; having also intercepted it with the coloured Film of Air interceding two compressed Plates of Glass; transmitting it thro' other coloured Mediums, and thro' Mediums irradiated with other sorts of Rays, and diversly terminated it, and yet could never produce any new Colour out of it. It would by contracting or dilating become more brisk or faint, and by the loss of many Rays, in some Cases, very obscure and dark; but could never be seen to change in *specie*.

4. Yet seeming Transmutation of Colours may be made where there is any Mixture of divers sorts of Rays; for in such Mixtures the *Component Colours* appear not, but by their mutual alloying each other, constitute a middling Colour; and therefore, if by Refraction, or any other of the *aforesaid Causes*, the difform Rays, latent in such a Mixture, be separated, there shall emerge Colours different from the Colour of the Composition: Which Colours are not new generated, but only made apparant by being parted; for if they be again entirely mix'd and blended together, they will again compose that Colour which they did before separation. And for the same Reason Transmutation made by the conveneing of divers Colours are not real; for when the difform Rays are again severed, they will exhibit the very same Colours which they did before they entered the Composition; as you see Blue and Yellow Powders, when finely mix'd, appear to the naked Eye Green; and yet the Colours of the component Corpuscles are not thereby really transmuted, but only blended, for when view'd with a good Microscope, they still appear Blue and Yellow interspersedly.

5. There are therefore two sorts of Colours, the one Original and Simple, the other compounded

of these. The Original and Primary Colours are Red, Yellow, Green, Blue, and a Violet Purple, together with Orange, Indico, and an indefinite variety of intermediate Gradations.

6. The same Colours in *Specie* with these Primary ones may be also produced by Composition; for a mixture of Yellow and Blue makes Green; of Red and Yellow makes Orange; of Orange and Yellowish Green makes Yellow: And in general, if any two Colours be mixed, which in the Series of those generated by the Prism, are not too far distant one from another, they, by their mutual alloy, compound that Colour which in the said Series appeareth in the Mid-way between them; but those which are situated at too great a distance, do not so, Orange and Indico produce not the intermediate Green, nor Scarlet and Green the intermediate Yellow.

7. But the most surprizing and wonderful Composition was that of *Whiteness*. There is no one sort of Rays alone which can exhibit this: 'Tis ever compounded, and to its Composition are requisite all the *aforesaid Primary Colours* mixed in a due Proportion; for all the Colours of the Prism being made to converge, and thereby to be again mixed as they were in the Light before it was incident upon the Prism, will produce Light intirely and perfectly White, and not at all sensibly differing from a *direct Light of the Sun*, unless when the Glasses are not sufficiently clear.

8. Hence therefore it comes to pass, that *Whiteness* is the usual Colour of Light; for Light is a confused aggregate of Rays indued with all sorts of Colours, as they are promiscuously darted from the various Parts of Luminous Bodies. And of such a confused Aggregate is generated *Whiteness*, if there be a due Proportion of the Ingredients; but if any one predominate, the Light must incline to that Colour, as it happens in the Blue Flame of Brimstone; the Yellow Flame of a Candle; and the various Colours of the fixed Stars.

9. These things considered, the Manner how Colours are produced by the Prism is evident: For the Rays constituting the incident Light, since those that differ in Colour proportionably differ in Refrangibility, they, by their unequal Refractions, must be severed and dispersed into an oblong Form, in an orderly Succession from the least refracted Scarlet to the most refracted Violet. And for the same Reason it is, that Objects, when look'd upon through a Prism, appear coloured: For the difform Rays, by their unequal Refractions, are made to diverge towards several Parts of the Retina, and there express the Images of things coloured, as they do the Sun's Image upon a Wall. And by this Inequality of Refractions they become not only coloured, but also very confused and indistinct.

10. Why the Colours of the Rainbow appear in falling drops of Rain, is also from hence evident; for those drops which refract the Rays disposed to appear Purple in greatest quantity to the Spectator's Eye, refract the Rays of other sorts so much less, as to make them pass beside it; and such are the Drops on the Inside of the Primary Bow, and on the Outside of the Secondary or exterior one: So these Drops which refract in greatest Plenty the Rays, apt to appear Red towards the Spectator's Eye, reflect those of other sorts so much more as to make them pass beside it; and such are the Drops on the Exterior Part of the Primary, and Interior Part of the Secondary Bow.

11. The odd Phænomenon of an Infusion of *Lignum Nephriticum*, *Leaf-Gold*, *Fragments of Coloured Glass*, and some other transparently Coloured Bodies appearing in one Position of one Colour, and of another in another, are on these Grounds no longer Riddles; for those are Substances apt to reflect one sort of Light, and transmit another, as may be seen in a dark Room, by illuminating them with similar or uncompounded Light: For then they appear of that Colour only with which they are illuminated, but yet in one Position more vivid and luminous than in another, accordingly as they are disposed more or less to reflect to transmit the incident Colour.

12. From whence also is manifest the Reason of an unexpected Experiment, which Dr. *Hook* in his *Micrography* relates to have made with two Wedge-like transparent Vessels, filled the one with a Red, the other with a Blew Liquor; namely, that tho' they were severally transparent enough, yet both together became opaque; for if one transmitted only Red, and the other only Blue, no Rays could pass through both.

13. That the Colours of all natural Bodies have no other Origin than this, that they are variously qualified to reflect one sort of Light in greater plenty than another. And this was experimented in a dark Room, by illuminating those Bodies with uncompounded Light of divers Colours; for by that means any Body may be made to appear of any Colour: They have there no appropriate Colour, but ever appear of the Colour of the Light cast upon them, but yet with this Difference, that they are more brisk and vivid in the Light of their own Day-light Colour. *Minium* appeareth there of any Colour indifferently with which 'tis illustrated, but yet most luminous in Red; and so *Bise* appeareth indifferently of any Colour with which 'tis illustrated, but yet most luminous in Blue; and therefore *Minium* reflecteth Rays of any Colour, but most copiously those indeed with Red; and consequently, when illustrated with Day-light, that is, with all sorts of Rays promiscuously blended, those qualified with Red shall abound most in the reflected Light, and by their Prevalence cause it to appear of that Colour: And for the same Reason *Bise* reflecting Blue most copiously, shall appear Blue by the excess of those Rays in its reflected Light; and the like of other Bodies. And that this is the entire and adequate Cause of their Colours is manifest, because they have no Power to change or alter in the Colours of any sort of Rays incident apart, but put on all Colours indifferently with which they are enlightened.

These things being so, it can be no longer disputed, whether there be Colours in the Dark? Nor whether they be the Qualities of the Objects we see? nor, perhaps, whether Light be a Body? For since Colours are the Qualities of Light, having its Rays for their entire and immediate Subject, how can we think those Rays Qualities also, unless one Quality may be the Subject of and sustain another, which in effect is to call it Substance? We should not know Bodies from Substances, were it not for their sensible Qualities; and the Principal of those being now found due to something else, we have as good Reason to believe that to be a Substance also.

Thus far went this wonderful Man, as long since as the Year 1675, as you may see more at large in

the *Philosoph. Transact. N.* And as himself acquaints us (with his usual Modesty) in his excellent Treatise of *Opticks* just now published, and come to my Hands while this Part is composing at the Press, where the Reader will meet with ample Satisfaction as to all Parts of the admirable Doctrine of Light and Colours. And that the World may see that the Account he so long ago Published of this Theory was both intelligible and certainly true, I have subjoined the subsequent Experiments which came to my Hands a Year ago, and are inserted here also at the desire of their Author, the ingenious Mr. *John Perks* of Old Swinford in *Worcestershire*.

An Abstract of Sir *Is. Newton's* Doctrine concerning Light and Colours.

1. Light consists of an infinite number of Rays Right-lined and Parallel, but of different Degrees of Refrangibility when meeting with a different Medium.

2. Each Ray according to its degree of Refrangibility, when so refracted, appears to the Eye of a different Colour.

3. The least Refrangible Rays appear of a deep Scarlet, the most Refrangible appear of a Violent Blue, the intermediate proceeding from Scarlet to Yellowish, than to light Green, and so to Blue.

4. The Colours arising from the different Refrangibility of Light, are not only the more noted Colours of Red, Yellow, Green, Blue, but also all the intermediate Degrees of Red to Yellow, of Yellow to Green, &c. differing as the Degrees of sound from Grave to Acute, in which there are not only the Notes of common Denomination, but also indefinite intermediate Degrees of Sounds, which are distinct different Sounds as the other.

5. Whiteness (such as the Sun's Light appears) containing all these Degrees of Refrangibility, is consequently made up of all the above-mentioned Colours.

6. Simple or Homogeneous Colours are such as are produced by Homogeneous Lights or Rays, that have the same Degree of Refrangibility, and mix'd Colours are such as are produced by Rays of different Refrangibility.

7. Rays of the same Refrangibility produce the same Colour, which Colour is not alterable by repeated Refractions, only made more strong or faint as the Rays are united or scattered.

8. All Bodies appear of this or that Colour according as the Surfaces are adapted to reflect only the Rays of such a Colour, or (at least) in more plenty than the rest.

Experiments for Confirmation of the foregoing Doctrine.

Experiment I.

The great Experiment on which Sir *Is. Newton* grounds his Doctrine (and which he calls *Experimentum Crucis*) is after this manner; *BE* and *FG* are two Boards about 4 or 5 Yards distance, having in each of them a little round Hole at *D* and *H*, about $\frac{1}{4}$ of an Inch Diameter; *ABC* is a Prism exposed to the Sun, *IKL* is another Prism, whose Side *IK* is near parallel to the Side *BC* of the other, and receiving the Rays *DH*, refracts them to fall on a Paper *nm*.

The Colours will fall from *H* to *O* on the Board *FG*: Let one only Colour (suppose Blue) fall on the Hole *H*, and it will be refracted by the Prism

IKL to fall (suppose) at *M*; then move the Glas *ABC* about its Ax, so as to bring another Colour (suppose the Red at *O*) to the Hole *H*, and it will by the Glas *IKL* be refracted not to *M*, but another Place (suppose *N*) some distance from the other, and in like manner will each Colour be refracted to fall on a different Place, tho' the Glas *IKL* be held unmoved. This Experiment proves the different Refrangibility of the Rays of Light, and that different Colours do thence arise.

For the Holes *D* and *H* being fix'd, and also the Glas *IKL*, 'tis plain, that the Rays have a like Incidence on the Glas *IKL*, but the different Places where they fall on the Paper, as *M*, *N*, &c. shew a different Refraction in the Glas *IKL*; and the Eye discovers a different Colour, according to the different Places on which the Rays fall, which demonstrates the fundamental Doctrine of the Theory.

Sir *I. Newton* directs this to be done in a dark Room, where (no doubt) all will appear more exact and lively. My Trial (for want of Conveniences) was in an open Room, but it succeeded well enough to satisfy me of the Truth.

He observes, that the Oblong Image of Colours *HO* will be about 5 times its Breadth, which also shews the different Refrangibility of the Rays, which otherwise would be near round as the Hole *D* is.

Experiment II.

Being in a convenient Room, where the Sun shines thro' a Hole or open Casement, turn your Back towards the Sun, and hold the one End of the Prism so to your Eye, that the Sun may shine on the other End; then move it so about its Ax, that the Colours may appear somewhere on the Wall; find the Colours with your Eye looking thro' the other End of the Glas, and there will appear a Spot of perfect Light.

The Reason of this Appearance is this; The parallel Rays *DE* meeting with the Glas at *E*, and again with the Air at *F*, are separated by these two Refractions, the least Refrangible appear Red at *r*, and the most Refrangible appear Blue at *b*, with the intermediate Colours between. These Colours being view'd by the Eye at *E*, the Rays come back (near) the same way they went, and are therefore in like manner united at the Eye, as they were in their Incidence from the Sun, and consequently

have the same Appearance (White) as the Light itself. The Place where the Spot of Light appears to the Eye is at *G*, where the Rays would have

fallen had they not been intercepted, and of a Bigness according to what Light falls on the Glas, whereas the Coloured Image *b y r* will appear four or five times longer, by reason of the scattering of the differently refracted Ray.

Experiment III.

ABC is the Prism, upon one of whose Sides is put a Past-board or thick Paper *AB*, or the like, with a little round Hole at *E*, which being exposed to the Sun's Rays *DE*, they are refracted and carried (in Colours) towards *HL*.

HI is a Lens (or a common Magnifying Glas) broad enough to receive all the coloured Rays; where they being made to converge by the Glas, they will be united in *O*, the Focus of the Glas.

Hold a Piece of Paper *KL* in the Focus, where all the Colours are united, and the little Spot at *O* will be perfect Light or Whiteness: But if the Paper *KL* be held farther or nearer off (as at *M* or *N*) the Colours will appear. If any Colours be intercepted, as at *P*, the Light near *O* will not be clear White, but inclining to the remaining Colours. If the Blue be wanting, the White will be somewhat Reddish or Flesh-colour, and if the Red be wanting, the White will incline to be something Bluish: And if only one Colour be let come to the Lens, that Colour, without Alteration, will be transferr'd to the Paper *KL*.

This Experiment shews, (1.) That all the Colours being united make Light or Whiteness. (2.) That if any Original Colour be wanting, the White will not be pure. (3.) That a Simple Colour is not alterable by farther Refractions, which also will appear if another Prism be put at O.

Experiment IV.

Let $ABGH$ be a Piece of fine Silk of a lively Scarlet Colour, whose Edges AB and GH are freight, parallel and smooth; let $CDEF$ be a

another Piece of Violet Blue Silk, like and equal to the other. Let them be placed, as in the Figure, on some black Cloth or Door, with their Edges in a straight Line: View them through a Prism at about two or three Yards distance: The Ax of the Prism being Parallel to the Position of the Silks: So will the blue Piece CF appear lower than the other (*viz.*) as in $cdef$. The Reason of which appearance is, that Blue is more Refrangible than Red.

This will more fully appear, if instead of the Blue Silk CF , there be let fall in the Place of CF , the Blue Rays from another Prism (the other Colours being intercepted by a Paper with a Square Hole for the Blue to pass through.) If the Silk AB and the blue Square CF be view'd thro' a Prism (as before) the Blue will appear far below, as at KL , this being a more perfect Blue than any Silk can be of.

Experiment V.

Let MN be the black Cover of a Book, Paper coloured Black, or the like; upon which lay in a

freight Line five or six little Squares of White Paper, about the Bigness and at the Distance as in the Figure, first Column: View these through a Prism, so as that the Row of little Squares have its one End towards you, or be in a Plain perpendicular to the Ax of the Prism, and about two Foot distance from the Glass; so will you see a Stream of Colours proceeding from every Square towards the next nearer you, the Colours arising out of each white Square. Move these Squares near to one another, or put others between them, as in the second Column (still keeping them in a straight Line) and you will see as they come near, that the Colours mixing one with another will alter, approaching nearer to White till the Squares touch, and then all the Colours being perfectly mix'd they produce Whiteness, and appear as in the third Column, a white Line, only tag'd with Red at the Top and Blue at the Bottom, there being no other Colours coming from above to mix with the uppermost Red, nor any Colours below the Blue at Bottom for it to mix with. If you turn the Paper MN aside a little from its Perpendicularity to the Glass, the third Column, which before appeared White, will all appear in Colours arising out of the White, and Streaming towards you, being always in a Plain Perpendicular to the Axis of the Prism.

From this Experiment and the foregoing Doctrine we have the Reason why a Sheet of white Paper, or the like, appears coloured only at the Edges, for there only the Colours want others to mix with them: In the Middle, taking any Point the several Colours from so many other Points meet there as make White. For Instance,

Let rr be any little Particle in the Middle of the white Surface, whose other Colours streaming towards B , leave the Particle rr itself Red, as the Squares will do in the last Experiment. The Yellow of the Particle yy , the Green of the Particle gg , the Blue of the Particle bb do all meet on the Particle rr , which is Red.

(For if bb were a white Particle, and all black about it, its blue Colour would be seen upon rr ; and if gg were another, its Blue would be below rr , and its Green upon it, &c.) and so there being a Concurrence of all the Colours that make up White, it consequently appears White. The same is to be said of any other Particle lying so far from the Edges as to have other Particles between to transmit their Colours.

If a Square Paper be held so straight before you that the two Side Edges be in a plain Perpendicular to the Axis of the Glass, they will be White, and no Colours appear but at the Top and Bottom, the Streaming of the Colours being in such a perpendicular Plain, as may be observed by looking at any white Spot through the Glass, and then turning it a little obliquely to the Horizon, or one End higher than the other.

So in the Position of the Glass DE (see the following Fig.) the white spot ascends its Colours towards b , and in the Position FG the Colours stream from a to c . If a black Spot, as A , upon a Paper be view'd through the Prism, the Top will have Green and Blue upon it, and under the lower Part will appear Red and Yellow;

the Reason of which is, that the Blue comes from the White above it, and appears on the

Black, there being no other Colours to mix with it: The Red appears under the Spot, because the black Spot transmits no other Colours to mix with the Red.

Experiment IV.

Hold the Prism so to the Sun, as that thee Colours may appear upon a large plain Wall, as at *AB*; turn the Prism swiftly about it Axis, so as that the Colours may move swiftly up and down, as from *B* to *C*.

So will there appear no Colour distinct, but a faint white Streak between *B* and *C*, which so appears, because by the swiftness of the Motion the several Colours are confounded and mixed, and therefore appear White. Then move the Glass in such manner, that the Colours may move sideways and swiftly from *B* to *D*, in which Case the Colours will not disappear, but make a sort of List of several Colours, because they are not mix'd to make Whiteness, but each Colour keep in its own Line.

Experiment VII.

In a dark Room, having a little Hole for the Sun's Rays to come in, apply the Prism to the Hole, so as that the Colours may appear on a Wall. Hold a Quantity of Smalt, or Powder-Blue, or blue Silk in the Colour severally, and it will appear clear of the Colour of the Rays that fall on it, (*viz.*) Red while the Red Light falls upon it, and Yellow when the Yellow Light falls on it:

but of all the Colours 'twill most strongly reflect the Blue, the Surface being most disposed to reflect those Rays, &c.

Then view a Quantity of Vermilion, or a little Piece of Scarlet Silk in the Blue Light, and 'twill appear Blue, and Green in the Green Light; but of all the Colours, 'twill most strongly reflect the Scarlet Rays, and appear deepest of that Colour. This Experiment confirms the 8th Proposition, That Bodies appear of the Colour of those Rays that are most plentifully reflected from the Body to the Eye. Thus far Mr. Perks.

I can now only give you some of the Propositions of Sir *Is. Newton's* excellent Book of *Opticks*, relating to the Doctrine of *Light* and *Colours*, with something from him by way of Proof and Illustration in the most Eminent and Material Points.

Prop. I.

Lights which differ in Colour, differ also in Degrees of Refrangibility.

Prop. II.

The Light of the Sun consists of Rays different-ly Refrangible.

Prop. III.

The Sun's Light consists of Rays differing in Reflexibility; and those Rays are more Reflexible which are more Refrangible than others.

This, which seems to be a surprising Property of Light not before Discovered, he proves in his 9th and 10th Experiments of the First Book; where 'tis evident, that the Rays within a Prism, and refracted by its Base at their going out into Air, being by the Revolution of the Prism round its Axis made so oblique to the Base, as thereby to begin to be totally reflected by it: Then he shews that these Rays became first of all totally reflected, which before at equal Incidences with the rest had suffered the greatest Refraction; and the same thing he found to happen also when the Reflection was made by the common Base of two Prisms placed together as to make a Parallelopiped, as in the 10th Experiment.

Prop. IV. Probl. I.

To separate from one another the Homogeneous Rays of compound Light.

Prop. V.

Homogeneous Light is refracted regularly, without any Dilation, Splitting or Shattering of the Rays; and the confused Vision of Objects seen through refracted Bodies by Heterogeneous Light, arises from the different Refrangibility of several sorts of Rays.

This he proves in his 5th, 12th, 13th and 14th Experiments; from whence it appears, that the cross Position of a second Prism to refract the Light of the Sun which came to it from a former Prism, placed at the small Hole of a darkened Room, did not at all dilate the Image or Coloured Spectrum as to Breadth, nor increase its Dimensions that way: As also, that Homogeneous Light, refracted by a Prism, did not exhibit an oblong coloured Image, as Heterogeneous Light doth, but that a round

round Spot of it was by the Prism refracted exactly in the same Figure, and of the same Colour it was before the new Refraction; and moreover, that Flies and such like small Objects placed in Homogeneous Light, and viewed through a Prism, were not thereby at all rendered confused and indistinct as to appearance, whereas if placed in Heterogeneous Light, and viewed after the same manner, they seemed egregiously confused.

BOOK II. Prop. I.

The *Phænomena* of Colours in reflected or refracted Light are not caused by new Modifications of the Light variously impressed, according to the various Terminations of the Light and Shadow.

For by this 10th *Experiment*, Book I. 'tis evident that the Sun's Light being transmitted into a dark Room through the parallel Surface of two Prisms fastened together in the Form of a Parallelopiped, became totally of one Colour (either uniformly Yellow or Red) at its emerging out of the Prism: In the Production of which Colour the Confine of Shadows (he shews) can have nothing to do, because the Light changes from White to Yellow, Orange and Red successively, without any alteration of the Confine of Shadow: At both Edges of the emerging Light where the contrary Confines of Shadow ought to produce different Effects, the Colour is one and the same, whether it be White, Yellow, Orange or Red; and in the Middle of the emerging Light where there is no Confine of Shadow at all, the Colour is the very same as at the Edges, the whole Light at its Entrance being of one uniform Colour, whether White, Yellow, Orange or Red, and going on thence perpetually without any change of Colour, such as the Confine of Shadow is vulgarly supposed to work in its refracted Light at its Emergence.

Neither can these Colours arise from any new Modifications of the Light by Refractions, because they change successively from White to Yellow, Orange or Red, while the Refractions remain the same; and also because the Refractions are made contrary ways by parallel Surfaces, which destroy one another's Effects.

He shews also in *Experiment* the First of this 2d Book, That by applying an Iron Wire, or such like Body, to a proper Part of a very large Prism, posited about 20 Feet from the Hole of a darkned Room, you may so intercept the Rays at their Entrance, as to take away any one Colour (which you please) either wholly or in Part, out of the Spectrum or coloured Image, and leave the rest remaining; which shews that all Colours have an Indifference to any Confines of Shadow, and therefore the Differences of these one from another don't arise from the different Confines of Shadow, whereby the Light is variously modell'd, as hath hitherto been the Opinion of Philosophers. Again, a Lens being placed about 8 Feet from the Prism at the Hole, had a Paper placed in its Focus, which, when it was situate perpendicular to the Light, appeared of its own colour White, but when very much oblique appear'd Yellow and Red when inclined one way, and Blue, when turned another, and yet here the Confines of Light and Shadow, and the Refractions of the Prism remained in all Cases the same. And the reason of the Phenomenon (he shews) is this, That the

Paper in one Posture being more oblique to the more refrangible Rays than to the less, is more strongly illuminated by the latter than by the former; and therefore the less refrangible Rays are predominant in the reflected Light, and wherever they are so, they tinge the Light with Yellow or Red; as when the Paper being placed in the contrary way, and in an oblique Posture, the more refrangible Rays become Predominant; and they always tinge the Light with Blues and Violet Colours.

Prop. II.

All Homogeneous Light hath its proper Colour answering to its degree of Refrangibility; and that Colour cannot be changed by Reflections and Refractions.

This is plain by Experiment, for after he had separated the several sorts of Rays one from another (as he shews how to do in the *Experiments* belonging to the 4th *Propos.* of his First Book) and by that means got a quantity of Homogeneous Light; this Spot of Homogeneous Light was afterwards incapable of being changed by either Refraction or Reflection, and all Bodies placed in that Homogeneous Light still appear'd of its Colour, however different their own proper Colours were from that. From whence he concludes, That if the Sun's Light consisted but of one sort of Rays, there would be but one Colour in the whole World; nor would it be possible to produce any new Colour by Reflections and Refractions; and consequently all the variety of Colours depend upon the Composition of Light.

Prop. III. Problem

To define the Refrangibility of the several sorts of Homogeneous Light answering to the several Colours.

In this the Author is very curious and Exact, shewing the Laws of the Refractions out of Glais into Air, whence by the 3 Axioms of his first Book, the Laws of Refractions out of Air into Glais are easily derived. And finding by Experiment, that when Light goes out of Air thro' several contiguous refracting Mediums (as thro' Water and Glais) and thence goes out again into Air, whether the refracting Surfaces be parallel or inclined to one another; that Light, as often as by contrary Refractions 'tis so corrected, as that it emergeth in Lines parallel to those in which it was incident, continues ever after to be White: But if the emergent Rays be inclined to the Incident, the whiteness of the emerging Light, will by degrees, in passing on from the Place of Emergence, become tinged in its Edges with Colours. He thinks he can gather two Theorems (which he there gives) and by which the Refractions of the Rays of every sort, made out of any Medium into Air, are known by having the Refraction of the Rays of one sort; and also the Refraction out of one Medium into another, may be had as often as you have the Refractions out of them both into any third Medium. And these Theorems, if admitted into Opticks, would give a scope to treat that Subject voluminously after a new manner, not only by teaching those things which tend to the Perfection of Vision, but also by determining, Mathematically, all kinds of *Phænomena* of Colours which could be produced by Refraction.

Prop. IV.

Colours may be produced by Composition, which shall be like the Colours of Homogeneous Light, as to the Appearance of Colour, but not as to the Immutability of it; and the Constitution of Light, and those Colours, by how much more they are compounded, by so much are they less full and intense; and by too much Composition they may be diluted and weakened, till they cease. There may also Colours be produced by Composition, which are not fully like any of the Colours of Homogeneous Light.

Prop. V.

Whiteness, and all Grey Colours between White and Black, may be compounded of other Colours; and the Whiteness of the Sun's Light is compounded of all the primary Colours, mixed in a due Proportion.

This he proves by many Experiments, and in particular by this: That a Lens being placed to receive the colour'd *Spectrum* cast from a Prism at the Hole of a darkened Room, the Light in the Focus of the Lens converged, and there made a bright Spot, which received on a white Paper there, and in a right or normal Position to the Rays, appeared White on the Paper; but if either the Paper be moved towards the Hole, or behind the Focus of the Lens, it will presently begin to appear coloured with the usual Colours of the Prism. Now the Reason of its appearing White at the Focus, was, because there all the Rays were exactly mingled; for if any Colour, suppose the Red or Blue, were by the Interposition of some Body intercepted at the Lens; the Image in the Focus would never appear White, but some how coloured; so that to make Whiteness the Blending or Mixture of the Rays is necessary. And then in

Prop. VI. he proposes this Problem.

In a Mixture of Primary Colours, the Quantity and Quality of each being given, To know the Colour of the Compound.

Prop. VII.

All the Colours in the Universe which are made by Light, and depend not on the Power of Imagination, are either the Colours of Homogeneous Lights, or compounded of such; and that either accurately or very nearly, according to the Rule of the preceding Problem.

For Book II. Prop. I. he shews, That the changes of Colours made by Refractions, do not arise from any new Modifications of the Rays impressed by those Refractions, and by the various Terminations of Light and Shadow, as has been the constant and general Opinion of Philosophers. He has likewise proved, that the several Colours of the Homogeneous Rays do constantly answer to their degrees of Refrangibility (Prop. I. Lib. I. and Prop. II. Lib. II.) and that their degrees of Refrangibility cannot be changed by Refractions and Reflections (Prop. II. Lib. I.) and by consequence, that those Colours are likewise immutable: He has also proved directly by refracting and reflecting Homogeneous Lights apart, that their Colours cannot be changed (Pr. II. L. II.) He has proved also, That when the several sorts of Rays are mix'd, and in crossing pass through the same Space, they do not act so upon one another, so as to change each others colorific Qualities (Exp. X. L. II.) but by mixing their Actions in the *Sensorium* beget

a Sensation differing from what either would do apart; that is, a Sensation of a mean Colour between their proper Colours; and particularly, when by the Concourse and Mixtures of all sorts of Rays a white Colour is produced, the White is a Mixture of all the Colours which the Rays would have apart (Prop. V. Lib. II.) The Rays in that Mixture do not lose or alter their several Colorific Qualities, but by all their various kinds of Actions mix'd in the *Sensorium*, beget a Sensation of a middling Colour between all the Colours, which is Whiteness; for Whiteness is a Mean between all the Colours, having it self indifferently to all, so as with equal Felicity to be tinged with any of them: A Red Powder mixed with a little Blue, or Blue with a little Red, doth not presently lose its Colour; but a White Powder mixed with any Colour, is presently tinged with that Colour, and is equally capable of being tinged with any other Colour whatever: He has likewise shown, that as the Sun's Light is mixed of all sorts of Rays, so its Whiteness is a Mixture of the Colours of all sorts of Rays; those Rays having from the beginning their several colorific Qualities, as well as their several Refrangibilities, and retaining them perpetually unchanged, notwithstanding any Refractions or Reflections they may at any time suffer, and that whenever any sort of the Sun's Rays is by any Means (as by Reflection in *Exper. 9* and *10. Lib. I.*) or by Refraction, as happens in all Refractions, separated from the rest, then they manifest their proper Colours.

These things having been proved, says he, the Sum of all this amounts to the Proposition here to be proved; for if the Sun's Light is mixed of several sorts of Rays, each of which have originally their several Refrangibilities and colorific Qualities; and notwithstanding their Refractions and Reflections, and their various Separations and Mixtures, keep those their original Properties perpetually the same without alteration; then all the Colours in the World must be such as constantly ought to arise from the original colorific Qualities of the Rays, whereof the Lights consist by which those Colours are seen: And therefore, if the Reason of any Colour whatever be required, we have nothing else to do but to consider how the Rays in the Sun's Light have by Reflections or Refractions, or other Causes been parted from one another, or mixed together; or otherwise, to find out what sorts of Rays are in the Light by which that Colour is made, and in what Proportion; and then, by the last Problem, to learn the Colour which ought to arise by mixing those Rays (or their Colours) in that Proportion. After this in

Prop. VIII. and IX.

He shews, how by these discovered Properties of Light, to explain the Colours made by Prisms, and also those of the Rain-bow. And then in

Prop. X.

By the same discovered Properties of Light, he explains the Permanent Colours of Natural Bodies.

Shewing that their Colours arise from hence, that some Natural Bodies reflect some sort of Rays, and others other sorts, more copiously and strongly than the rest: As for Instance, *Minium*, or Red-lead, reflects the least Refrangible, or Red making Rays, most copiously, and thence appears Red.

But

But *Violets* reflect the most Refrangible most copiously, and thence have their proper Colour; and so of other Bodies. Every Body reflects the Rays of its own Colour more copiously than the rest, and from their Excess and Predominance in the reflected Light, hath its Colour.

Then in his Second Book, Part I. and II. he takes into Consideration the *Phenomena* of those Colours which are observed in thin transparent Bodies, making many excellent Observations about their Reflections and Refractions, and discovering many things as wonderful as they are certain. And here he finds new reason to conclude, that the colorifick Dispositions of Rays are also connate with them and immutable; and consequently, that all the Productions and Appearances of Colours in the World are derived not from any Physical Change caused in Light by Refraction or Reflection, but only from the various Mixtures or Separations of Rays, by virtue of their different Refrangibility or Reflexibility; and in this respect the Science of Colours becomes a Speculation as truly Mathematical as any other part of Opticks; that is, as far as they depend on the Nature of Light, and are not Creatures of the Imagination only. And in Part the Third, he discourses again of the permanent Colours of Natural Bodies, and shews the Analogy between them and the Colours of thin transparent Plates; as also shewing their Constitutions, whereby they reflect some Rays more copiously than others: As also about the Colours which arise from the Inflection of the Rays of Light: In all which there is intermixed many excellent Observations and curious Experiments relating to this most copious Subject. See more under Light and Colour, in Vol. II.

Promiscuous Observations and Experiments about Colours.

It's observable, that most transparent Bodies when they are either split, divided, or extended so that they have no sensible thickness upon their Surfaces, exhibit various Colours like those of the Rainbow. Thus is it with *Muscovy* Glass when split into exceeding thin Pieces, and fine Glass when blown at the Flame of a Lamp into Bubbles as thin or thinner than the finest Paper; and so we see it is in those Bubbles which Children make out of a mixture of Soap and Water, and those which arise from the shaking of almost any Chymical Oyle, or Spirit of Wine into very fine Froth.

Mr. Boyle found that one Grain of Cochineal dissolved first into a pretty quantity of Spirit of Urine, and then that Dissolution diluted with Water; would impair a sensible, though but a faint Colour, to fix Glasses of Water, each of which contained 45 Ounces and $\frac{1}{2}$, which amounts to above 125000 times its own Weight: And this shews the very great Divisibility of the Parts of Matter, as well as the Intestine Motion of the Parts of Fluid Bodies.

Dr. Hook in his *Microgr.* seems to think there are but two Original Colours, viz. Red and Blue, which, Page. 64. he defines thus:

Red is an Impression on the Retina, made by an Oblique and confused Pulse of Light, whose strongest Part precedes, and its weakest follows. Blue, an Impression made by an Oblique and confused Pulse of Light, whose

weakest part precedes, and its strongest follows. Out of these two he supposes all other Colours may by mixture, &c. arise.

The Ways by which a Liquor may suddenly change the Colour of another Liquor, or of another Body, Mr. Boyle thinks reducible to such as these.

1. By the Minute Particles of the Adventitious Liquors insinuating themselves into the Pores of the other, and filling them up either perfectly or in part; by which means the Light passing thro', the Liquor will be differently refracted from what it was before, when the Pores of it were only filled with Air, or perhaps some more subtle Fluid.

2. A Liquor may alter the Colour of a Body, by freeing it from those things which hindered it before from appearing in its genuine and proper Colour; as when Water washes off the Filth of ordinary Bodies, and other Lixiviums or Menstruums clear away, or four of the discoloured Rust of Metals, &c.

3. By making a Communion of the Parts of any Body, and that either by really subdividing them and making them less, or else by disjoining and separating such Aggregates or Clusters of Particles which clung together before.

4. Contrary to the last Way, the Colour of a Body may be changed by means of a Liquor's making Coalitions or Aggregates of several Particles, which before lay too scattered and dispersed to exhibit any Colour; and this way the new Colours of Precipitates may be supposed in part to arise.

5. A Liquor may also change the Colour of a Body, by dislocating and changing the Site and Position of the Parts of it: Thus bruised Fruits appear of a different Colour from their Ripe and Natural ones; and several Bodies are of a different Colour when dissolved in a Menstruum from what they had before.

6. The chiefest and most important way of all, as being that which doth contain many others within it, is by associating the Saline Corpuscles or any other sort of the more rigid ones of the Liquor with the Particles of the Body that it is employed to work upon, and by that means must needs alter the Figure, Position, Bigness and Degree of Motion of the Component Particles of that Body.

The Learned Dr. Grew thus sums up the Result of abundance of curious Experiments about the Causes of Vegetable Colours.

1. While the Sulphur and Saline Principles of Plants do only swim together, and are not yet united into one Precipitate, no Colour results from them, but the Contents are rather Limpid; as usually in the Roots and many other Parenchymous Parts.

2. But when they are united, and the Alkalines are predominant, they produce a Green Colour.

3. When the Sulphur and Alkaline are more equal, they make a Tawny.

4. When the Sulphur, Acid and Alkaline are nearly equal, they produce a Yellow.

5. When the Sulphur is predominant, and the Acid and Alkaline equal, it makes a Blue: But;

6. When the Sulphur and Acid are predominant to the Alkaline, it produces a *Purple*.

7. When the Sulphur is predominant to the Alkaline Principle, and the Acid to them both, it produces a *Scarlet*: But,

8. When the Acid is predominant to the Alkaline, and the Sulphur to them both, a *Blood-Red*; which is the highest and most Sulphurous Colour in Nature, *Anatom. of Plants*, P. 276, 277.

Experiments of the sudden Change of Colours.

1. Into a strong Solution of Sublimate in common Water (the Quantity, a Spoonful or two) drop 5 or 6 Drops of good Spirit of Urine (or almost any Volatile Spirit) and the Mixture will presently appear White; which Whiteness may immediately be destroyed by pouring in a little good *Aqua Fortis*. The Tribe of *Urnous Salts* are distinguished by producing this white Colour.

2. Drop a large Drop of Syrup of Violets on White Paper, it will spread and exhibit a tolerable blue Colour; then if you drop upon it any Acid Spirit or Stygian Liquor, as suppose a Drop of Spirit of Vitriol, 'twill immediately turn into a fine Red; whereas a Drop of Spirit of Urine or any Volatile Spirit would have turned into a lovely Green; as also will a Drop of the Solution of Copper in Spirit of Urine, though it be of a deep Blue it self. *Note*, To make the Experiment appear the better, 'tis best to stir about or mingle the Liquors with the Tip of your Finger.

3. The Essential Oil of Anniseeds in cold Weather coagulates and turns Whitish; yet if on this Whitish Ointment, spread on White Paper, you let fall but a Drop or two of good Oil of Vitriol, a Heat and Smoak will arise, and a Blood-red Colour will be produced.

4. The *Adiaphorous* Spirit of Box mingled with a Solution of Mercury in *Aqua Fortis*, made first a deep Yellow, and then in a Minute or two turned a deeply Red; and being digested a Day or two, let fall a white *Precipitate*. *Mr. Boyle*.

5. An Infusion of an Handful of sliced *Lignum Nephriticum* in 4 Pound of Spring Water all Night, will give the Liquor that is poured off into a clear Glass Vial a Colour almost like that of Gold, provided you hold up the Vial between your Eye and the Light; but when you hold it from the Light, so that your Eye be between the Light and it, it will appear of a deep and lovely Blue Colour; which fine Blue Colour a few Drops of any Acid Liquor will immediately make disappear, and about as many of Oil of Tartar per Deliquium or any such fix'd Alkalizate Liquor will again restore.

6. Every one knows, that red Rose-Leaves held a while in the Smoak of Sulphur will turn pale; and yet if you infuse old discoloured Rose-Leaves that have been long dried in a Glass of Water, it will scarce impart any Colour to the Liquor; but on the dropping a due Quantity of the Spirit of Sulphur, the Liquor will turn into a lovely Red.

7. Tincture of Red Rose-Leaves drawn with Water and a little Oil of Vitriol was put into a clear Vial about half full of fair Water, in such a Proportion as that the Mixture was very red, but yet transparent; then into it was dropt leisurely a little Spirit of Urine, and the Mixture being shaken, exhibited a fine Greenish Blue.

8. If into a Spoonful of the Infusion of Pow-

der of Logwood in Water, which will be Red, you drop two or three Drops of Spirit of Urine, it will produce a lovely Purple; but if the Water which drew the Tincture from the Logwood, had been impregnated with Spirit of Salt, the Drops of Spirit of Urine, instead of Purple, would have produced a Yellow Colour.

9. Three or four Drops of Oil of Tartar per Deliquium drop'd into a Spoonful or two of clear Solution of Sublimate in common Water, though the Liquors are both Colourless, will in a trice produce a deep Yellow Colour; which, by dropping in four or five Drops of Oil or strong Spirit of Vitriol, may be as soon destroyed and made to vanish; and by putting in more of the Oil of Tartar, recovered again, &c. The Tribe of Lixivate Salts are known and distinguished by this Test, that they will all produce this Yellow Colour, when mix'd duly with a Solution of Sublimate.

10. Dissolve Filings of Copper in good Spirit of Fermented Urine, the Solution will be deeply Blue; but if into a Spoonful of this you drop 2 or 3 Drops of Oil of Vitriol, the Ceruleous Colour will immediately vanish, and the Liquor become clear as Rock-Water.

11. If three times its Weight of Oil of Vitriol be in a Glass Retort placed in Sand, drawn off from a Quantity of good Quick-silver, it will leave a Calx as white as Snow; which yet as soon as ever common Water is poured on it, turns into one of the brightest and loveliest Yellow Colours in the World.

12. Dissolve Camphire in Oil of Vitriol, and it will impart a deep and almost opake Red on the Menstruum, though it self be White, and the Menstruum, if good, clear and transparent. And if into the Solution you pour a little Water, the Red Colour will vanish in a trice, the Menstruum grow pale, and the Camphire be recovered again in its pristine Form.

A CATALOGUE of the Simple Colours.

1. *Spanish White*, made of Chalk and Alum, burnt together.
2. *Lapis Armenius*, supposed to be the same with the common *Blue Bice*.
3. *Ultramarina*, made of the bluest *Lapis Lazuli*, which is freest from Gold Veins by Calcination.
4. *Smalt*, made of Zaffer and Pot ashes calcin'd together in a Glass Furnace.
5. *Lirmose*, supposed to be the Juice of a Plant.
6. *Indico*, by some said to be a kind of Mud adhering to the Froth about Reeds in India. Others say it is a Plant like *Rosemary*, called *Intil*, growing in *Cambria*, which is gathered and dried, then wetted with fair Water, and beaten to a Mud; this Operation being repeated, it is dried and fitted for use.
7. *Indian Ink*, whose Comparison is supposed to be burnt Rice.
8. *Cerus* or *Pyrmiridium*, is the Rust of Lead made by a Vaporous Calcination.
9. *Masticot*, is a kind of improper Calx of Tin.
10. *Gambodia*, or *Gutta Gambæ*, is supposed to be the inspissated Juice of a Plant that comes from the Indies.
11. *Oker*, a sort of Natural Earth.
12. *Orpiment*, a fat inflammable Mineral, justly ranked

ranked amongst *Poisons* for its extream Corrosive Quality.

13. *Umber*, a native Earth.

14. *Red-Lead*, made of Litharge or burnt Lead, by a Reverberatory Calcination, or of *Ceruss* put on a Platter over the Fire, which must be continually stirred till it has acquired a Red-Lead Colour.

15. *Burnt Oker*, is the common Yellow *Oker* burnt in open Fire.

16. *Cinnabar* or *Vermillion*, there are two sorts, Native, or the *Minium* of the Ancients, which is a Mineral that yields *Quick-silver*, whereof, and of *Sulphur*, it chiefly consists. It is found in the Mines of *Itria*.

The *Falsitious Cinnabar* is that which we now use; and is made by a Sublimation of *Mercury* and *Sulphur*.

17. *Carmin*, made of *Cochineal*.

18. *Lake*, is made of *Flocks* dyed, or Shavings of *Scarlet-Clork*, or of the *Cochineal Insest*, or else of *Kermes-Berries*, their Tincture being extracted with a Lee of *Pot-ashes*, and then precipitated with a Solution of *Rock-Allum*. After the same manner a *Lake* may be made of a Plant or Plover. There is also another sort of *Lake* made of *Gunn-Lac*, by extracting its Tincture with *Urine*.

19. *Sarguis Draconis*, is the Gum of a Tree which looks like dried Blood; 'tis brought out of several Places in the *East-Indies*.

20. *Earth Reddle*, or *Ruddle*, found in many Places of *England*.

21. *Lamb-black*, made of Soot of *Rosin* or *Pitch*, burnt in Places built on purpose for it, that keep in the Smoke.

COLUMN, in the Art Military, is the long File or Row of Troops, or of Baggage of an Army in its Match. To march in a *Column*, is to march a great Depth, or in a long File, instead of making a large Front. An Army marches in one two, three, or more *Columns*, according as the Ground will allow, and the General sees expedient.

COLUMN, in Architecture, is properly that round long Cylinder or Part of a Pillar which is called the *Shaft*, *Trunk*, *Fust*, the *Scapus*, *Vivo*, *Tige*, &c. containing the Body of it from Spire to the Base, or from the *Astragal* of the Base to the Capital.

COLUMNÆ Cordis, are the Muscles and Tendons by which the Heart is contracted and dilated.

COLURES, are two great Circles imagined to pass through the Poles of the World, one of them through the Equinoctial Points *Aries* and *Libra*, and the other through the Solstitial Points *Cancer* and *Capricorn*, these are called the *Equinoctial* and *Solstitial Colures*. And these divide the *Ecliptick* into four equal Parts or Quarters, which are denominated accordingly: And the Points where these pass through are called the *four Cardinal Points*.

COLPUS, the same with *Sinus*.

COLUMELIA, the same with *Cion*.

COLUMMA Nasi, is the Fleishy Part of the Nose, prominent in the Middle near the upper Lip.

COLUMMA Oris, the same with *Coin*.

COLUMN, in Architecture, taken in the largest Sense, is a sort of Pillar of a round Form, which

serves to support or adorn a Building consisting of a Base, a Shaft or Shank (which is properly the *column*) and a Capital. *Columns* are different according to the several Orders of Architecture.

The *Tuscan* being the shortest and most simple, is seven Models long, comprehending its Base and Capital, and diminished a fourth Part of its Diameter.

The *Doric* ought to be Seven and a Half, or Eight Diameters long; and its Base and Capital are somewhat more beautify'd with Mouldings.

The *Ionick Column* is nine Diameters long, and hath its Capital set off with *Voluta's* or curl'd Scrolls, differing in that respect from others as well as in its Base, which is peculiar thereto.

The *Corinthian* is the Richest of all, having two Rows of Leaves for the Ornament of its Capitals with Stalks or Stems, from whence shoot forth small *Voluta's*. Its Length is Ten Diameters.

The *Composit Column* is likewise Ten Diameters long, and its Capital is made like that of the *Corinthian*, with the Angular *Voluta's* or the *Ionick*.

COMA *Somnolentum*, is a deep Sleep, less than a Lethargy, without a Fever, wherein the Patient being awakened, answers to any Question propounded to him, but falls into a profound Sleep again, with his Mouth open and his under Jaw fallen, more like to one dead than alive. *Blanchard*.

COMA *Vigil*, waking Drowsiness, is a Disease wherein the Patients are continually inclined to Sleep but scarce can Sleep, being affected with a great Drowsiness in the Head, a Stupidity in all the Senses and Faculties, and many times with a *Delirium* too.

COMB, in a Ship, is a small Piece of Timber set under the lower Part of the *Beak-head* near the Middle; it hath two Holes in it, and supplies to the *Fore-Tacks* what the *Chiefs-Trees* do to the Main ones, that is, to bring the Tacks aboard.

COMBATANT, the Herald's Word for two Lions born in a Coat of Arms in a Fighting Posture, Rampant, and their Faces towards each other.

COMBINATION, is the Art of finding how many different Ways a certain given Number of things may be varied, or taken one and one, two and two, three and three, &c. See Vol. II.

COMBUST, a Term in Astronomy, when a Planet is not above 8 Degrees and 30 Minutes distant from the Sun, either before or after him; he is said then to be *Combust*, or in *Combustion*.

COMETS, are what are commonly called *Blazing-Stars*. The Ancients, especially *Aristotle* and his Followers, supposed them to be Meteors or Exhalations set on Fire in the highest Region of the Air: The Modern Astronomers have found them to be above the Orbit of the Moon, but yet to descend so low as to move in the Regions of the Planets: It is not improbable but that they may be a sort of very Eccentric Planets, and move Periodically about the Sun.

Mr. *Arout*, a French Gentleman, was the first as I can find, who pretended to predict what would be the future Motion of a Comet; which he did for one that appeared Jan. 1664, and sent Copies of them to the Secretary of the Royal Society, Jan. 2. 1664, *New Style*. He also did the same for a second Comet, which appeared the Year following.

Hevelius, in his *Prodromus Cometicus*, saith, he is almost positive no Account can be given of the *Phænomena of Comets*, without supposing the Annual Motion of the Earth.

Measuring the *Comet* in the Year 1664, he found it to be distant from the Earth above 5000 Semi-Diameters of the same; and that its true Diameter was then 25600 *German Miles*, which is 3 times as long as the Diameter of the Earth.

He supposes all of them to move round the *Sun* as their Center, and to be a kind of Spurious Planets.

Their Train or *Coma* he takes to be occasioned by the Beams of the *Sun* falling on the Head of the *Comet*, and passing through the same Reflected and Refracted.

Afterwards, in 1668, he published his *Cometographia*, wherein he supposes, that the Trajectory of a *Comet* is nearly Rectilinear, or that they always move in a straight Line.

Yet he supposes also a Motion impressed, and an Inclination of the *Comet's* Disk to the *Sun*, as two Causes why *Comets* may sometimes deviate from a straight Course, especially about the Beginning and End of their Appearance.

He observes, That this Line is something near that of a *Parabola* sometimes, but never is the Ark of any Circle: Also that there is in *Comets* a Libratory Motion, like that in the *Moon*.

The famous *Sr. Isaac Newton*, in his excellent *Principia Philos. Mathem.* hath a large Discourse of *Comets*, p. 473, &c. where he proves.

1. That they are above the *Moon*, and in the Region of the Planets, because they have no Diurnal Parallax, but an Annual one: For those *Comets* which move forward according to the Order of the Signs, are all at their Exit or Disappearance, slower in their Motion than they were before, or (Retrograde) if the Earth be between them and the *Sun*; but they move swifter than ordinary when they begin to disappear, if the Earth be in opposition to the *Sun*: And on the contrary, if they move contrary to the Succession of the Signs, and have the Earth between them and the *Sun*, then they move more swifter than ordinarily at their Exit; but if the Earth be in opposition, they move slower, and retrograde towards their going off. This chiefly depends on the Motion of the Earth, as it is in the Planets, who, according as the Earth's Motion agrees with, or is contrary to theirs, appears sometimes retrograde, sometimes to move slower, and other times more swiftly.

If the Earth move the same way with the *Comet*, and swifter by its angular Motion round the *Sun* than the *Comet*, the *Comet*, when beheld from the Earth, will appear to be Retrograde.

And if the Earth move slower than it, the Motion of the *Comet* (subducting the Motion of the Earth) will be, to appearance, slower.

But if the Earth move a contrary way to the *Comet*, it will then appear to move swifter than the Earth: All which he illustrates and proves, and shews also a Way from the *Comet's* Parallax to find its distance.

From the Consideration also of the Curvity of the Way of a *Comet*, he concludes, That when they disappear, they are much below the Orb of *Jupiter*; And that in their *Perigeums* and *Periheliums*, they often descend below the Orbits of *Mars* and the inferior Planets.

From the Light also of the apparent *Star* that is in the Head of the *Comet*, he concludes their Vicinity to the *Sun* and Earth; and that they can by no Means be in the Region of the fixed Stars, as some have imagined, for then their Heads could no more be enlightened by the *Sun*, than the Planets are by the fixed Stars.

Considering also the Obscuration of the *Comet* by that thick Fume or Vapour with which its Head is always encompassed, he concludes, That they must often descend down below the Sphere of *Saturn*, as he had before found by their Parallax. The same thing he concludes also by examining into the Cause of the *Coma* or Tail, and then draws these Corollaries.

1. That *Comets* shine by the Light of the *Sun's* Beams reflected from them.

2. That the Heavens are devoid of all Resistance, such as our Air and other Mediums have: For these *Comets* move every way with all the freedom that can be, obliquely, directly, and often against the Course of the Planets, and yet can continue their Motion for a very long while, even so. And therefore the Celestial Regions cannot be filled with Matter like the *Cartesian Vortices*, but must be almost void Spaces.

Next, in *Propos. 40. Book 3.* he proves, That *Comets* move round the *Sun* in Conick Sections, having their *Umbelici* in the Center of the *Sun*; and that by Lines drawn from themselves to the *Sun*, they describe *Area's* proportional to their Times of Revolution, as the other Planets do: And he seems to think them a kind of Planets, and that they revolve in real Elliptical Orbits, though they nearly approach to *Parabola's*. From which Proposition he concludes,

1. That if *Comets* do ever come about again, their Orbits are very Eccentric Ellipses; and that their Periodical Times are to those of the Planets in a Sefqualteral Ratio of the Tranverse Axes; and therefore *Comets* being usually above the Planets, and describing Orbits of longer Axes than they, do really move slower than they; and particularly, that if the Ax of the Orb of a *Comet* were 4 times as long as the Ax of *Saturn's* Orbit, the Time of the Revolution of the *Comet* to that of *Saturn*, would be $4 \times \sqrt{4}$, or 8 to 1; that is, 240 Years.

After this, in several *Lemma's*, he prepares the Way to determine the Species of the Conick Section a *Comet* describes; to find its Place at any intermediate given Time; and to determine the Trajectory from three Observations, which he illustrates by Examples.

Then he proceeds to consider more particularly what the Bodies of *Comets* are, and concludes that they are solid, compact, fix'd and durable, like those of the other Planets. Refuting the old Opinion of their being Meteors or Exhalations from this, That in their Transits, so near the *Sun* as we find they do go, they would be perfectly dissipated, dispersed and destroyed.

The Heat of the *Sun* he had before shewn to be as the Density of the Rays, or reciprocally as the Squares of the Distances of Places from the *Sun*: Wherefore since the Distance of the *Comet* which appeared in the Year 1680, being in its Perihelion December the 8th, was then to the Distance of the Earth from the *Sun* as 6 to 1000 nearly. The *Sun's* Heat in the *Comet* at that time was to his Heat with us at Midsummer as 1000000 to 36, or

28000 to 1; whereas the Heat of boiling Water, as he tried, was but very little more than triple the Heat of our dry Earth exposed to the *Midsummer Sun*; and the Heat of red hot Iron he Conjectures to be about 3 or 4 times as great as that of boiling Water: Wherefore the Heat of the dried Earth or Body of the *Comet* in its *Perihelion*, was near 2000 times as great as that of red hot Iron; and consequently, if the *Comet* had been a Meteor, or an Aggregate of Vapours and Exhalations, the Sun would have rendred it invisible.

The *Comet* therefore acquired so great, so immense a degree of Heat in its *Perihelion*, that it must needs be a long time before it will be cold again; for he computes that a Globe of red hot Iron of the Dimensions of our Earth, would scarce be cool in 50000 Years. If therefore we suppose the *Comet* to cool 100 times as fast as red hot Iron, yet since his Heat was 2000 times greater than that of red hot Iron, if you suppose his Body to be of the same Bigness of our Earth, he will not be cool in a Million of Years.

He observes also, that the Tails of all *Comets* are longest and largest after their passing from the Sun, or just after their *Perihelions*; which shews that the Sun's Heat contributes to the encrease of the Tail: Whence 'tis more than probable, that the Tail of a *Comet* is only a long and very thin Smoak or train of Vapours which the ignited *Nucleus*, or the Head of the *Comet* emits from it. And this Notion he confirms after this, by refuting the two other Opinions about the Origin of the Tail of a *Comet*.

For some will have it to be only the Sun-Beams shining thro' the Head of the *Comet*, as they do, thro' a Crevise into a dark Place, and by that Means come to appear in that Form.

But this Notion he shews will not hold, because the Reason that the Sun-Beams appear thus lucid when his Rays shine thro' an Hole or Chink into a dark Place, is because the Light is reflected from the Particles of Smoak, small Dust, &c. which continually fly to and fro in the Air, and therefore is always more splendid where the Air abounds with the most gross and greatest number of Particles of this Nature. But in a thin and clearer Air, no such Appearance can well be seen; and consequently in the Celestial Regions, where probably there is little or no Matter to reflect, cannot be visible: For Light, as in the Sun-Beams only, is not discernable, but only so far as it is from thence reflected to our Eyes.

Others will have the Tails of *Comets* to be formed by the Refraction of Light as it passes thro' the Head of the *Comet* to the Earth: But this Opinion he thinks prest with many scarce answerable Difficulties; for first, the Tails of *Comets* never appear adorned with various Colours, which yet are usually the inseparable Concomitants of Refraction. Again, the Light of the fix'd Stars and Planets coming to us directly, and transmitted distinctly, plainly shews that the Celestial *Mediums* it passeth thro' have no refracting Power. And as to the Radiation and Twinkling of the fixed Stars, that ought to be attributed rather to a Refraction in our Eyes, or to be occasioned by the tremulous Motion of the Air, because when we look on them thro' a Telescope, there is no such thing. The Tremor of the Air, and of the ascending or descending Vapours, may easily occasion a little

quick successive Distortion of the Rays from so small a Point as the Pupil of one's Eye; but they cannot do so from the much larger Aperture of a Telescope's Object Glass, which is the Reason why there is an apparent twinkling in the former, but not in the latter Case; and the Cessation of the Scintillation in the Latter, is a Demonstration that there is a regular Transmission of the Rays of Light without any sensible Refraction.

Lastly, If the Tails of *Comets* were produced by the Refraction of the Sun's Light shining thro' them towards us, and according to the Figure of the Heavens, were reflected to Parts opposite to the Sun, that Deflection in the same Regions of the Heavens must always be made towards the same Parts: But this, by plain and undoubted Observation, hath been found to be false in Fact, and therefore this account cannot be the true one.

That the Tails or Beards of *Comets* do arise from the *Nucleus* or Head, and ascend towards the Regions opposite to the Sun, is confirmed by the Laws which they observe; as, that lying in the Planes of the Orbits of *Comets* which pass thro' the Sun, they deviate from the Opposition of the Sun always towards those Parts, which their Heads, as they move forward, leave in those Orbits: That to a Spectator placed in these Planes, they appear in Parts directly opposite to the Sun; but that if the Spectator deviate a little from these Planes, their Deviation will become sensible, and every Day appear greater and greater: That, the Deviation, all things consider'd, is less where the Tail is oblique to the Orbit of the *Comet*; as also when the Head of the *Comet* approaches nearer to the Sun, especially if the Angle of the Deviation be observed near the Head of the *Comet*; besides that those Tails which do not deviate appear straight, but those that do, appear Curved: That the Curvature is greater where the Deviation is greater, and more sensible where the Tail is of the greater length; for in short ones it is hardly observable: That the Angle of Deviation is less near the Head of the *Comet*, and greater near the opposite Extreme, and therefore that the Tail turns its Convex Parts towards the Place from which the Deviation is made, and which are in a Right Line drawn from the Sun thro' the Head of the *Comet*, and produced infinitely: And that those Tails which are larger and longer, and which shine brightest, are more splendid towards their Convex Sides, and are better defined, or more distinctly terminated there, than on their Concave Sides.

Wherefore the Phenomena of the Tails of *Comets* depend upon the Motion of their Heads, and not upon that Region of the Heavens in which the Head is seen, and therefore do by no means arise from Refraction in the Heavens, but have their Matter supplied from the Head.

For, as in our Air, the Smoak of any kindled Body ascends upright if the Body be at rest, but obliquely if it have a Lateral Motion any way: So in the Heavens, where Bodies gravitate towards the Sun, Smoak and Vapours ought to ascend up from the Sun, and that in a Right Line, if the Smoaking Body be at rest, or obliquely, if it move any way laterally, and by its progressive Motion doth always desert those Spaces from whence the Superior Parts of the Vapours had ascended: And this Obliquity will be less where the Ascent of the Vapours is more swift, viz. near the Sun, and near the

the smoking Body. From the Diversity of this Oblivity the Column of the ascending Vapour will be incurved; and because the Vapour in the Precedent Side of the Column, is something newer or more recent than the other, it will therefore be a little more dense, and consequently more copiously reflect the Light, and be defined or terminated more distinctly than the other Side.

That there may arise from the Atmosphere of *Comets*, Vapours enough to take up such immense Spaces, may be understood from the Rarity of our Air: For Air, near the Surface of our Earth, takes up a Space 850 times as large as Water of the same weight with it; and therefore a Column of Air of 850 Foot high, weighs no more than one of Water of but one Foot high, if they have both the same Base. But a Column of Air of the height of the whole Atmosphere, weighs no more than a Column of Water of about 33 Feet high, and of the same Base; and therefore if from this whole Column of Air you subtract the lower Part as far as the Height of 850 Foot, the remaining Column will weigh equal to a Column of Water of 32 Foot; from whence (by that Hypothesis which is now confirm'd by many Experiments) it may be fairly concluded, that the Compression of the Air is as the Weight of the incumbent Atmosphere; and that Gravity is reciprocally as the Square of the Distance of Places from the Center of the Earth. I found by Circulation, saith he, (the Ground of which he gives in *Prop. 22. Lib. 2.*) that Air, at the Distance of our Earth's Surface, of only one Semi-diameter of the Earth, is more rare than it is with us in a Ratio much exceeding that which all the Space below the Orb of *Saturn* bears to the Diameter of a Globe of only one Inch in length. And therefore a Globe of our Air of only one Inch in Diameter, if it had but the same degree of Rarity which our Air hath at the Distance of 4000 Miles, or of the Earth's Semi-diameter from us, would more than fill all the Regions of the Planets, as far as the Sphere of *Saturn*, and much farther. Wherefore since Air, as you go higher, will still grow immensely rare, and that the *Coma* or Atmosphere of a *Comet*, counted from its Center is about 10 times higher than the Superficies of the Nucleus, the Tail of it ascending much higher, must needs be exceedingly rare.

And tho', because of the great Crassitude of the Atmosphere of *Comets*, and the great Gravitation of Bodies towards the Sun, and the Gravitation of the Particles of Air and Vapour towards one another, it may be that the Air in these Celestial Spaces, and in the Tails of *Comets* may not be rarified quite so much, yet 'tis plain by this Computation, that a very little Quantity of Air and Vapours will suffice to solve all the Phenomena of the Tails of *Comets*.

For the very great Rarity of the Tails of *Comets* may be concluded by the fix'd Stars so plainly appearing thro' them, as we find they do. The Atmosphere of our Earth shining with the Sun's Light, tho' perhaps its Thickness be but a few Miles, yet quite extinguishes all the Light of the fixed Stars, and obscures the Moon it self; whereas the immense Thickness of the Tail of a *Comet*, illustrated as our Atmosphere is by the Rays of the Sun, will permit the smallest fix'd Stars to be seen thro' it without any Diminution of their Brightness.

And the Tails of most *Comets* have no greater Splendor than the Sun-beams exhibit when reflected from a Stream of Motes, Dust, &c. in a darken'd Room, of but one or two Inches in Thickness.

At what time the Vapour ascends from the Head to the Extremity of the Tail, may be almost discovered by drawing only a Right Line from the End of the Tail to the Sun, and then noting the Place where that Right Line cuts the Trajectory: For the Vapour in the Extremity of the Tail, if it ascend in a Right Line from the Sun, will begin its ascent at the time when the Head of the *Comet* is in the Place of Intersection.

But indeed the Vapour doth not ascend in a Right Line from the Sun, but by retaining the Motion of the *Comet* which it had before its Ascent, and compounding it with the Motion of its Ascent, it ascends obliquely; wherefore it will be a truer Solution of the Problem, to suppose the Right Line which intersects the Orbit to be parallel to the Length of the Tail, or rather (because of the Curvilinear Motion of the *Comets*) that it diverge from the Line of the Tail. By this means I found that the Vapour which was in the Extremity of the Tail, Jan. 25. began to ascend from the Head before December 11. and therefore had taken up more than 45 Days in its Ascent: But all that long Tail which appeared December 10. ascended in the space of those two Days, which were then just past since its *Perihelion*; wherefore the Vapour at the Beginning, when the *Comet* was near the Sun, ascended prodigiously swift, and afterwards continued to ascend with a Motion retarded by the Gravity of the Particles, and by that Ascent encreaseth the Length of the Tail: But the Tail, as long as it appeared, consisted almost all of that Vapour which ascended from the Time of the *Perihelion*; and the Vapour which first ascended and composed the Bounds of the Tail, did not vanish till it was both too far off the Sun to be illuminated by him, and off us to be visible. Hence also the Tails of *Comets* which are shorter, do not ascend with a quick and continual Motion from the Head, and then presently vanish and disappear; but are permanent Columns of Vapours and Exhalations, gathered from the Head by a very gentle Motion, and in a great space of Time; which yet by participating of that Motion of their Heads which they had at the Beginning, they continue easily to move along with their Heads thro' the Celestial Regions. And from hence it may again be concluded, That the Heavens are filled with no Matter that hath any Power of Remittance or Resistance in it; since only the Planets and *Comets* themselves, but even such very rare Bodies as the Tails of *Comets*, can both move there very freely and swiftly, and also continue that Motion for a vast while together.

This excellent Author supposes the Ascent of Vapours into the Tails of *Comets*, to be caused by the Rarefaction of the Matter in the Atmosphere at the Time of the *Perihelion*. Smoak, saith he, in a Chimney ascends up by the Impulse of the Air in which it swims or floats: And Air, rarify'd by Heat, ascends by the Diminution of its Specifick Gravity, taking the Smoak, and carrying it up along with it. Why should not the Tail of a *Comet* be, after the same manner, supposed to be raised by the Sun? for the Sun-Beams do not agitate any Mediums which they pass through, but only by Reflection and

and Refraction. The reflecting Particles being made warm by this Action, do warm the Æther, with which they are compounded. This Æther (or whatever you will call it) being rarified by the Heat communicated to it, and having its Specifick Gravity by which it descendeth toward the Sun before, now diminished by this Rarefaction, ascends and carries along with it those reflecting Particles of which the Tail of a *Comet* is composed.

To the Ascent of these Vapours, it conduces that they are carried by a circular Motion round the Sun, and consequently endeavour to recede from the Sun, while the Atmosphere of the Sun, and the Matters of the Heavens, doth either really rest, or else being moved with no other Motion than what they have from the Sun's Circumrotation, are moved very slowly. These are the Causes of the Ascent of Vapours into the Tails of *Comets*, when they are within the Confines of the Sun, where their Orbits are more curved, and where *Comets* being within the denser, and therefore heavier Atmosphere of the Sun, have their Tails of the greatest Length. For the Tails which are now produced by preserving their own Motion, and at the same time gravitating towards the Sun, will move about him in Ellipses like their Heads, and by that Motion will always accompany and freely adhere to their Head: For the Gravity of the Vapours towards the Sun, will no more cause the Tails of the *Comets* to forsake their Heads, and to fall down towards the Sun, than the Gravity of the Heads can make them fall off from their Tails. But their common Gravity they would either fall down to the Sun together, or be together retarded in their Ascent: and therefore this Gravity doth by no means hinder, but that the Heads and Tails of *Comets* may receive and retain any Position to one another, which either the above-mentioned Causes, or any other may produce.

These Tails therefore which are thus produced in the *Perihelions* of *Comets*, will go off along with their Heads into remotely distant Regions, and from thence, either with the *Comets* themselves, return again to us after a long series of Years; or rather being there rarified vanish quite away by little and little: For afterwards in the descent of their Heads towards the Sun, some little short Tails ought gradually and slowly to be produced from the Heads, which afterwards in the *Perihelions* of such *Comets* descend down into the Sun's Atmosphere, must needs be immensely encreased; for the Vapours in those free Spaces will continually be rarified and dilated, whence it comes to pass, that the Extremity of the Tail is always much broader than the End next to the Head of the *Comet*.

And it appears agreeable enough to reason, to suppose, that those Vapours which are thus dilated, rarified and diffused throughout all the Celestial Regions, may by little and little by their own proper Gravity, be attracted down to the Planets, and become intermingled with their Atmospheres. For as to the Constitution of this Earth of ours, it is necessarily required that there should be Seas, that from them vast quantities of Vapours being raised, by the Heat of the Sun, they may either gather into Clouds, and then fall down in Rain to moisten and nourish the whole Earth, and to render it Fertile; or else (as some Philosophers think with good Reason) being condensed by the cold Tops

of Mountains and Hills, run down from thence, and form Springs, Fountains and Rivers; so for the Conservation of the Seas and Moisture of the Planets, *Comets* seem necessarily requisite: from whose condensed Exhalations and Vapours all that Moisture which is consumed in Vegetations and Putrefactions, and turned into dry Earth, may by degrees, be continually re-supplied and recruited: For all Vegetables do entirely grow and encrease from Liquors, and then, as to their greatest Part, do turn by Putrefaction into dry Earth, and a Slime perpetually is precipitated to the Bottom of putrifying Liquors. From hence the Quantity or Bulk of dry Earth must continually increase, and the Liquors or Moisture of our Globe continually decrease, and at last be quite evaporated and lost, if they had not as continual a Supply from some Part or other of the Universe. And I do also suspect (saith our Author) that that Spirit which is the finest, subtlest, and best Part of our Air, and which is necessarily requisite to the Life and Being of all things, comes chiefly from *Comets*.

The Atmosphere of *Comets*, as they descend towards the Sun, are sensibly diminished by their running out to afford Matter to produce the Tail, and (certainly in that Part which looks towards the Sun) do grow more narrow and contracted; but after this, as the *Comets* recede from the Sun, when they do not so much run out into the Tail, they are enlarged, if *Hewelius* hath rightly observed the Phenomena. But they appear least of all when the Heads of the *Comets*, having been so exceedingly heated by the Sun (in the *Comet's* *Perihelia*) blaze out into those vastly great and bright shining Tails, and when the Nuclei being perhaps covered with a black thick Smoak, are covered by the lower Parts of the Atmosphere: for all Smoak is greater and more black and thick when the Heat is very great.

Thus the Head of that *Comet* of which we have been speaking, at equal Distances from the Sun and the Earth, appeared more obscure after the *Perihelion* than before. For in December it appeared but like a Star of the 3d Magnitude, whereas in November it was like one of the First or Second.

He concludes therefore, that *Comets* are a kind of Planets moving round the Sun in very excentric Orbits; and as those Planets which are nearest the Sun, and revolve about him in lesser Orbits, are lesser than others, so he supposes those *Comets*, which in their *Perihelion* come very near the Sun, are less than others, and revolve in lesser Orbits.

If a *Comet* in its descent to, or ascent from the Sun, approach near to a Planet as it passes by, and its Plain be different from that in which the Planets move: By its attractive Power it will, agreeably to the universal Law of Gravitation of Bodies, draw it from the Plain in which it before moved, and so cause it afterward to move to a new one, inclined to the former, but passing thro' the Sun as the former did.

Hence 'tis possible, That though the Planets originally revolved in the same common Plain, yet by the subsequent Attraction of *Comets*, their Plains may be inclined to one another and different, as 'tis certain, de facto, they now are.

Dr. Gregory, in his *Astronomical Phys. & Geometrica Lib. 5.* shews, That the ancient Astronomers and Philosophers believed *Comets* to be very Eccentric

central Planets revolving round the Sun ; and that it was the Peripatetick School which brought up the Notion of their being nothing but Meteors and below the Moon.

Cassini observed of the *Comet* which appeared in the Year 1680, that it was but 22 or 23 Degrees from the Sun, and yet to us appeared to have half its Globe illuminated, or not to be either *falcated* or *gibbous* ; which also was observed of the *Comet* in the Month of *April*, 1665 ; and from thence he concludes justly, that those *Comets* were at that time not only higher than the Moon, but also than the Sun himself ; because *Mercury* and *Venus* at that distance from the Sun do never appear full but when they are so.

The same Person thinks it is too rash in the Modern Philosophers to condemn as false and ridiculous, the Notion that hath been long received of the bad Prefages of *comets* ; for he saith, If the Tail of a *Comet* should be intermingled with our Atmosphere, or if the Matter of it should, by its Gravity, fall down upon our Earth, it may induce changes in our Air, that may be very sensible among Animal and Vegetible Bodies. *Astron.* p. 408.

And p. 412. he shews the Way of determining the Way and apparent Place of a *Comet*. And p. 418. from four observed Places of a *Comet* to determine its Trajectory, if it were Rectilineal ; and at p. 421. he gives the Method of determining the true Trajectory of a *Comet*. At p. 446. he shews how to find the Position of the Bodies of a *Comet's* Orbit, and when the *Comet* will be in them ; and p. 447. to find the Inclination of the Plane of this *Comet's* Orbit to that of the Ecliptick. And after this he shews how to correct the Trajectory, and to determine the Heliocentrick and Geocentrick Place of the *Comet* in the Trajectory, determined by the Method before given, for any given Time ; as also to make necessary Tables for readily finding the Places of *Comets*. From p. 448. to 460.

The Famous *James Bernoulli* in his *Systema Cometarum*, An. 1682, supposes, That there is some primary Planet revolving round the Sun in the Space of 4 Years and 157 Days, and at the Distance from him of 2583 Semi-diameters of the *Magnus Orbis* : The primary Planet he supposes either from his vast Distance or Smallness not to be visible to us, but however, to have, at various distances from him, several Satellites moving round him (though none descending so low as the Orbit of *Saturn* ;) and that these becoming visible to us when they are in their *Perigeum*, are what we call *Comets*.

COMITATU *ex Castro Commissio*, is a Writ whereby the Charge of a County, together with the keeping of a Castle, is committed to the Sheriff.

COMITATU *Commissio*, is a Writ or Commission, whereby the Sheriff is authoris'd to take upon him the Command of the County.

COMITIALIS *Morbus*, the same with *Epilepsia*.

COMMA, is one of the Points or Stops used in Writing, and is thus mark'd (,) and is the least in Power of them all, implying only a small Rest or little Pause, without breaking off the Sentence.

COMMA, in Musick, is the Ninth Part of a Tone, or the Interval whereby a Semi-tone or a perfect Tone exceeds the Imperfect. This Term is used only in Theoretical Musick, to shew the exact Proportion between Concords.

COMMANDING Ground, in Fortification, is such as overlooks any Post or strong Place : Of this they reckon 3 sorts ; 1. *A Front Commanding Ground*, which is an Height opposit to the Face of the Post which plays upon its Front. 2. *A Reverse Commanding Ground*, which is an Eminence that can play upon the Back of any Place or Post. 3. *An Enfilade Commanding Ground*, or *Curtain Commanding Ground*, which is an high Place that can with its Shot scour all the Length of a strait Line.

COMMENDAM, is a Benefice that being void, is commended to the Care of some sufficient Clerk, to be supplied till it may conveniently be provided of a Minister. He to whom the Church is commended hath the Fruits and Profits thereof only for a certain time, and the Nature of the Church is not changed thereby, but is as a thing deposited in the Hands of him to whom it is commended who hath nothing but the Custody thereof which may be revoked. When a Parson is made a Bishop, there is a *Cession* of his Benefice by the Promotion ; but the King may give him a Power to hold it in *Commendam*.

COMMENSURABLE *Magnitudes*, are such as are measured by one and the same common Measure ; as *A* and *B* by *C* ;

<i>A</i>	— — — — — —
<i>B</i>	— — — — — —
<i>C</i>	— — — — — —

for *C* repeated 6 times, measures *A* ; and repeated 3 times, measures *B* ; therefore *A* and *B* are said to be *Commensurable*. Def. 1, 2, *Eucl.* 10. c. 6. *Euclid*.

COMMENSURABLE Numbers, whether Integers or Fractions, are such as have some other Number which will measure or divide them without any Remainder : Thus 6 and 8, $\frac{8}{5}$ and $\frac{3}{4}$ are respectively *Commensurable Numbers*.

COMMENSURABLE in Power : Right Lines are said to be *Commensurable in Power*, when their Squares are measured by one and the same Space or Superficies. Def. 3. c. 10. *Eucl*.

COMMENSURABLE *Surds*, are such *Surds* as being reduced to their least Terms, become true Figurative Quantities of their kind ; and are therefore as a Rational Quantity to a Rational.

COMMUNITION, is a dividing of a thing into very small Parts or Particles.

COMMISSARY : In an Army there are two sorts of Commissaries, 1. The *Commissary General of the Musters*, or *Muster-master General*, who takes an Account of the Strength of every Regiment, reviews them, sees that the Horse be well mounted, and all Men well armed and accounted. 2. The *Commissary General of Provisions*, who hath the Charge of furnishing the Army with all things of that kind.

COMMISSURES, a Word used frequently by Mr. Boyle and others for the small Pores of any Body, or the little Clefts, Cavities or Interstices which are between the Particles of any Body ; especially when the Particles are broadish and flatish, and lie contiguous to one another, like very thin Plates.

COMMON *Axis*, in *Opricks* : See *Axis*.

COMMON Divisor, is that Number which exactly divides any two other Numbers, without leaving any Remainder.

COMMON-PLEAS, is the King's Court now held in *Westminster-Hall*: all Civil Causes, both Real and Personal are, or were, in former times, try'd in this Court according to the strict Law of the Realm. The Chief Judge of that Court is called *The Lord Chief Justice of the Common-Pleas*, assisted with three or four Associates, which are created by Letters Patents from the King, and as it were installed or placed upon the Bench by the Lord Chancellor and Lord Chief Justice of the Court. *Forrescue*, cap. 51. The rest of the Officers belonging to this Court are the *Custos Brevisium*, three Protonotaries, one Chirographer, fourteen Filicers, four Exigenters, Clerk of the Warrants, Clerk of the Juries, or *Jurata Writs*; Clerk of the King's Silver, Clerk of the Treasury, Clerk of the Escoyons, Clerk of the Outlawries; whose distinct Functions see in their proper places.

COMMON Ray, in *Opticks*, is a Right Line drawn from the Point of Concourse of the two Optical Axes through the Middle of the Right Line which passes by the Center of the Pupil of the Eye.

COMMON Receptacle, in Anatomy, is a certain Vessel, so termed, because it receives both the *Chyle* and *Lympha* promiscuously, though some falsely call it the *Receptacle* of the *Chyle* in particular.

Common Section of two Planes: See *Section*.

COMMON Sensory, the common Perception of all Sensations, or that which receives the Images of sensible things, or the Impression made by the Objects upon the Nerves, and according to these Implies determines the Appetite and exerts other Animal Actions.

COMMUNI Custodia, was a Writ that lay for that Lord, whose Tenant, holding by Knight-service, dies, and leaves his eldest Son under Age, against a Stranger that entrench the Land, and obtaineth the Ward of the Body: But now is become of no use.

COMMUNIA Placita non tenenda in Scaccaria, is a Writ directed to the *Treasurer* and *Barons of the Exchequer*, forbidding them to hold Plea between two Common Persons in that Court, where neither of them belong to it.

COMPARATIVE Degree, in Grammar, is when an Adjective hath joined to its natural and ordinary Signification the Word *more*, either actually or implied; as *more wise*, or *worse*, that is, *more bad*.

COMPARISON, in Grammar, is the Variation of the Sense of an Adjective, as to Degree; as *good*, *better*, *best*, are the three Degrees of Comparison of that word.

COMPARTIMENT, is a regular orderly disposition of agreeable Figures all round any Picture, Map, Draught, &c. for its better Ornament.

COMPASS, in Navigation, is a Circle divided into four Quadrants, representing the four Cardinal Winds, or Principal Points, *East*, *West*, *North*, and *South*; and each Quarter subdivided into eight other equal Parts, making in all 32 *Rhumbs* or *Points*.

This thus graduated Circle being drawn on a Chard, or Past-board, hath a toucht Needle or Wire placed under it, and in its Center a Brass little Cell or a Conical Hollow, by which means it

hangs horizontally on an erect Pin, and keeps its Lilly or North-Point always towards the *North*; by which means the Man at Helm, or Steersman knows how to keep the Ship to her Course.

This Instrument, though it be subject to Accident, and always to Variation, is yet of vast use in Navigation; as also in Surveying, Dialling, and many other Parts of the *Mathematicks*.

The Learned Dr. Wallis conjectures, That the Compass was invented by an *Englishman*, because the word *Compass* is used in many parts of *England* for a Circle.

COMPASS Dials, are small ones fitted in Boxes for the Pocket, and shew the Hour of the Day by the Direction of the Needle; which shews how to place them right, by turning the Dial about till the Cock or Stile stand directly over the Needle, and point up to the Northward; but these can never be very exact, because of the Variation of the Needle itself.

COMPASS of Proportion, is an Instrument to divide Lines and Circles into proportional Parts at one opening of the Compasses, and is very much used in reducing or enlarging of Maps or Draughts. The French sometimes call a *Settor* by this Name the *Compass of Proportion*.

COMPERTORIUM, a Judicial Inquest in the Civil-Law, made by Delegates or Commissioners to find out, or relate the Truth of a Cause.

COMPLEMENT of any Ark of a Circle, or of any Angle, is what it wants of a Quadrant or 90 Degrees.

COMPLEMENT of the Course, in Navigation, is the Number of Points the Course wants of 90 Degrees, or eight Points, viz. of a Quarter of the Compass.

COMPLEMENT of the Curtain, in Fortification, is that part of the Curtain which (being wanting) is the *Demigorge*.

COMPLEMENT of the Line of Defence, is the Remainder of the Line of Defence after you have taken away the Angle of the Flank.

COMPLEMENTS in a Parallelogram, are the two lesser Parallelograms C and M, which are made by drawing two Right Lines parallel to each side of the Figure, through a given Point in the Diagonal.

Proposition.

In every Parallelogram the Complements C and M are equal : For $Z + C + O = R + M + X$, as making up on each side the great Triangle, made = by the Diagonal ; of which $Z = R$ and $O = X$ (because the Diagonal makes them so) wherefore the remaining Parallelogram $C = M$. *Q. E. D.*

COMPLEX Terms, in Logick, are such as are compounded of simple or single ones ; which they call *Incomplex Terms*.

COMPLEX, or *Complicated Diseases* : See *Complication*.

COMPLEXUS, a Muscle of the Head, serving to move it backwards. It is also called *Trigeminum*, because it hath plainly a three-fold Beginning, and seems to be compounded of 3 Muscles ; one Beginning is from the tranverse Processes of the fourth and fifth *Vertebrae* of the Thorax : The Second from the first and second of those *Vertebrae* ; and the Third from the Spine of the 7th *Vertebra* of the Neck : After, in their Ascent, they all unite together, and are inserted into the *Occiput*, sometimes by one, and sometimes by a threefold Tendon.

COMPLICATION of Diseases, is when divers Distempers seize on the Body at the same time, especially if they depend one upon another.

COMPOSITA, or *Compound Medicines*, are Medicines made up of any Simple Medicines ; as certain Waters, Syrups, Electuaries, Opiates, Trochisks, Ointments, Plasters, &c.

COMPOSITE Order, in Architecture, which is also called *Italic* and *Roman*, because it was the Invention of the Ancient Romans, is so called, because it is composed of the other four Orders, viz. *Tuscan*, *Dorick*, *Ionick*, and *Corinthian* ; the first is composed only of the *Ionick* and *Corinthian*.

COMPOSITON, in Painting, is used in the same Sense with *Invention* or *Design* ; See *Design*. There is also a certain Method of Demonstration in Mathematicks call'd by this Name of,

COMPOSITION, which is the Reverse of the Analytical Method, or of *Resolution* : It proceeds upon Principles in themselves self-evident, on *Definitions*, *Postulates*, and *Axioms*, and a previously demonstrated Series of Propositions, step by step, till it give you a clear knowledge of the thing to be demonstrated. This is what they call the *Synthetical Method*, and is used by *Euclid* in his *Elements*.

COMPOSITION of Motion, is the Composition of the several Directions or Declivities of Motion, whether equable or unequable.

If any Point be supposed to move or flow (for this Speculation gives an Illustration of the Do-

ctrine of *Fluxions*) according to one and the same Direction ; whether it move equably or not, whether it be accelerated or retarded in any Proportion whatsoever, it will still keep the same Right Line, only the *Celerity* will be changed, and will be increased or diminished according to the Forces, with which it is impelled.

Nay, if the Motion be so compounded as that the Directions be made one quite contrary to the other, as one suppose directly downward, the other upward, &c. yet still the Line of Motion will be the same.

But if the Compounding Motions are not according to the same Line of Direction, but such as do intersect each other, then the Compound Motion will not be according to the Line of Direction of either of the former, but in a different one from them both ; and this either straight or crooked, according as the Directions and Celerities shall require.

If two Compounding Motions be each of them equable (or every where equally swift) whether the Celerity of those Compound Motions be each to other equal or unequal, yet the Line of the Compound Motion will still be a straight Line ; and this, though the Motion be neither at Right Angles one to another, nor equally swift, nor (each to it self) equable, if they be at least but *Similar*, that is, if they be both accelerated and retarded alike.

Thus, for instance, if the Point a be impelled by a double impulse of equal force, both upwards towards b , and also forwards towards d , 'tis plain, that when it is gone forwards as far as ee , it must of necessity be gone upwards as far ef ; and if the Motions were both equable, it would always go on in the Diagonal ac .

Nay, if the Motions be unequal as to Celerity, so as, v. gr. it move twice as fast upward as forward, &c. yet still it must go on in the Diagonal ac , because the Triangles ae , ae , ec , &c. and ad will still be *Similar*, being as the Motions are : But if the Motions be *Dissimilar*, then the Compound Motion must be a *Curve*.

And this Consideration of the Composition of Motions is of great use in Mechanics. See *Diston's Law of Motion*.

COMPOSITION of Proportion, the comparing the Sum of the Antecedent and Consequent with the Consequent in two equal Ratio's, as suppose 4. 8 :: 3. 6. they say by Composition of Proportion, 12. 8 :: as 9. to 6. But,

There is, as *Dr. Wallis* well distinguishes it in his *Algebra* (*Engl. Ed.* p. 85.) a great difference between Composition of Proportion by Addition, and by Multiplication ; the Instance above is of

Com-

Composition by addition; but if it had been 4×8 it would have been Composition by Multiplication. In one word, Composition of Proportion by Addition, is by Addition of the *Indices* of the *Ratio's*, but by Multiplication, it is when the *Ratio's* are multiplied into one another. See more of this Matter under the Word *Proportion*.

COMPOSSIBLE, is an old barbarous Word used to signify such things as are capable of existing together, whereas such as cannot exist together are called *impossible things*.

COMPOUND Interest, are those which some Number may measure besides Unity; as 15, which is measured by five and three.

COMPOUND Quantities, in Algebra, are such as are connected together by the Signs $+$ and $-$, and are expressed by the same Letters than one, or else by the same Letters unqually repeated; thus, $a + b = c$, and $b b - b$ are Compound Quantities.

CONPOUNDED, Composite, or Aggregated Flower of a Plant, is by the Botanists accounted such an one as consists of many little Flowers concurring together to make up one whole one, each of which hath its *Style* and *Stamina*, and adhering Seed, and are all contain'd within one and the same *Calyx* or *Perianthium*. This Composite Flower distinguishes a large Genus of Plants, which our Accurate Botanist, Mr. Ray, divides as follows:

Herbs of Compounded or Aggregated Flowers are,

1. Such as have a plain Leav'd Flower naturally, and for the most part full, and having their whole Body Milky (*i. e.* on cutting or cropping yielding a Milky Juice) and these have [their Seeds.

1. Pappous or Winged, *i. e.* having a little Lannugo adhering to each Seed, by which the Wind can carry it easily from place to place: Such as the *Lactuca*, *Tragopogon*, *Scorzonera*, *Dens Leonis*, *Hieracium*, and the *Pilosella*.

2. Such as the solid Seed without any Pappous or Down upon them; as the *Eringium*, *Luteum*, *Cichorium*, *Lampfana*.

2. Such as have a Discous Flower, that is, one composed of many short, thick, compressed, small *Flosculi* (which some by mistake call *Stamina*) set together so as to make one flat or hollowish Superficies: And these also either are such as have their Seeds,

Pappous, as the *Tussilago*, *Petasites*, *Carlina*, *Helianthemum*, *Doronicum*, *Conyza*, *Asier*, *vinga Aurea*, *Jacobaea*, *Stachys Citrini*, *Jacea*, *Senecio*, *Eupatorium Avicennae*, *Cacalia Valgaris*, *Gnaphalium Maritimum*, and *Monspeliensium*.

Such whose Seeds are Solid and not Pappous, as the *Corymbiferous Herbs*; which see under that Word.

COMPULSION, is when in an Agent capable of Volition, the Beginning or Continuation of any Action is contrary to the Preference of his Mind.

COMPUTO, is a Writ so called of the Effect, because it compelleth a Bailiff, Receiver, or Cham-

berlain to yield up his Accounts: It lieth also for Executors of Executors; and against the Guardian in Socage, for Waste made in the Minority of the Heir.

CONARIUM, or the *Glandula Pinealis*, is a part of the Brain hanging in a small Cavity called the *Anus* in the hinder part of the third Ventricle of the Brain, and leading into the fourth; it is so called from being of the Shape of a Pine Cone. *Des Cartes* supposed this Glandule to be the Seat of the Rational Soul; but its Substance being the same with the rest of the Brain, its probable it serves for the same Use.

CONATUS *Recedendi ab Axe motus*, is the Endeavour which any Body moved circularly hath to recede or fly off from the Center or Axis of its Motion.

CONCATENATION of Causes, is a Term sometimes used to express, that an Effect is the Result of a long Chain of Causes depending upon or linked one to another.

CONCAVE and Concavity, signifies the Hollowness of any thing: See *Convexity*.

CONCAVE Glasses, are such as are ground hollow, and are usually of a Spherical Figure, though they may be of any other; as *Parabolical*, &c.

All Objects seen through Concave Glasses appear erect and diminished or lessened.

What the Virtual Focus of a Concave Glass is, see under that Term.

The confused Appearance of a Point through any Concave Glass proceeds from the too great Divergence of those Rays which fell on the Eye; wherefore, because the more remote the Eye is from the Glass, the less will the Rays Diverge; therefore the farther the Eye is from a Concave Glass, the more distinct will be the Appearance of any Object thro' it, tho' the more faint.

The Apparent Place of Objects seen through Concaves, is always brought nearer to the Eye; which is the Reason why they help Short-sighted Persons, or such as can see only nigh Objects distinctly.

For a Rule to fit a Concave Glass to the Eye of such a Person, let him observe nicely the Distance at which he can read Letters, or see Objects distinctly; which suppose to be at 12 Foot, then will a Concave Glass, whose Virtual Focus is a Foot distant from it, make that Person see distant Objects distinctly.

The farther the Eye is removed from any Concave Glass the less the Object appears, and a lesser Area of it is seen; and when the Glass is exactly in the Middle between the Eye and the Object, the Object will appear the most diminished, that that Distance between the Eye and Object will allow of.

CONCENTRATION, according to Dr. Grew, is the highest Degree of Mixture, and is when two or more Atoms or Particles of the Mixture do touch by Reception and Intrusion of one into the other: And this he takes to be the Case of all fixed Bodies which are without Taste or Smell, whose Constitution is so firm, that till the Particles are as it were unprim'd from each other, they cannot affect either of those Senses.

CONCENTRICK Figures, are such as have the same common Center.

CONCEPTIO, a Grammatical Figure: See *Syllepsis*.

with all their Octaves : *Imperfect Conords* are the Third and Sixth with their Octaves. The *Imperfect* have yet another *Distinction*, viz. the Greater and Lesser Third, as also the Greater and Lesser Sixth. Some reckon the *Unison* among the *Concords*, but others will not admit it into the Number of the Intervals.

CONCRETE, is the Subject in which any Qualities inhere : See *Abstract*.

CONCRETE, in Natural Philosophy and Chymistry, signifies a Body made up of different Principles, and therefore is of much the same signification as the Word *Mix'd* : Thus *Soap* is a *Fatitious Concrete*, or a Body mix'd together by Art ; and *Antimony* is a *Natural Concrete*, or a mix'd Body compounded in the Bowels of the Earth.

CONCRETE, is also used in Logick in Contradistinction to the Word *Abstract*, v. gr. when we consider any Quality, as Whiteness, inhering in any Subject, as suppose in *Snow*, if we say the *Snow is White*, then we speak of Whiteness in the *Concrete* ; but if we consider Whiteness by it self as a Quality that may be in Paper, in Ivory and in other things as well as *Snow*, we are then said to consider or to take it the *Abstract*.

CONCRETE Numbers, are those which are applied to express or denote any particular Subject, as 2 Men, 3 Pounds, $\frac{3}{4}$ of a Shilling, &c. whereas if nothing be connected with the Number, 'tis taken abstractly or universally : This 3 signifies only an Aggregate of 3 Unities, let those Unities be Men, Pounds, or what you please.

CONCRETION, is the uniting together of several small Particles of a Natural Body into sensible Masses or *Concrete*, whereby it becomes so and so figured and determined, and is indued with such and such Properties.

CONCURRING, or *Congruent Figures*, in Geometry, are such as being laid one upon another, will exactly meet and cover one another ; and therefore 'tis a received Axiom in reference to Plane or Superficial Figures, *Quod quæ sibi mutuo congruunt sunt equalia* ; i. e. Those Figures which will exactly cover one another are equal.

CONE or *Conn*, in the Sea Phrase, is to guide or conduct a Ship in her right Course : He that Conns stands aloft with a Compass before him, and gives the Word of Direction to the Man at Helm how to Steer.

If the Ship go before the Wind ; or as they call it, *betwixt the Sheets*, then the word is, *Star-board*, or *Port the Helm* (according to the Conder, would have the Helm put to the Right or Left Side of the Ship) and then the Ship will always go the contrary way. If he says, *Helm a Mid-ship*, he would have the Ship go right before the Wind, or directly between her two Sheets. If the Ship Sail by a Wind, or on a Quarter Wind, the Word is, *A-loof ! Keep your Luff ! Fall not off ! Veer no more ! Keep her to ! Touch the Wind ! Have a care of the Lee-Latch !* All which Expressions are of the same import, and only imply, that the Steersman should keep the Ship near the Wind. On the contrary, if he would have her Sail more large, or more before the Wind, the Word is, *Ease the Helm ! No near ! Hear up !* But if he cries *Steady !* It means no more than *Keep her from going in and out*, or *Making Yaws* (as they call it) howsoever the Sails, whether large by a Wind ; and when he would have her go just as she doth, he cries, *Keep her thus ! Thus, &c.*

CONDENSANTIA : See *Incrustantia*.

CONDENSATION of any Natural Body, is when it takes up less Space, or is confined within less Dimensions than it was before.

CONDITIONAL Propositions, are such as have two parts bound together by the Conditional Particle (*if*) of which the first, where the Condition lies, is called the *Antecedent*, and the other the *Consequence* : Thus, *If the Soul be Spiritual, it is Immortal*, is a Conditional Proposition, wherein *If the Soul be Spiritual*, is the *Antecedent* ; *it is Immortal*, is the *Consequent*.

CONDYLL, are the Joints and Knuckles of the Fingers.

CONDYLOMIA, is the knitting or jointing of the Joints of an Animal Body : Also a certain Tumour in the little Skin of the Fundament ; an hard and callous Swelling growing from black Humours that Flow thicker, and rather troublesome than painful. Sometimes also it is accompanied with an Inflammation. *Blanchard*.

CONE, is a solid Figure, whose Base is a Circle, and is produced by the Revolution of the Plane of a Right-angled Triangle round the Perpendicular Leg ; which Leg (or *Axis*) if it be equal to the Base, the Solid produced is an *Acute-angled Cone* (as 2.) if it be less, it is an *Acute-angled Cone* ; but when greater, an *Obtuse-angled Cone*.

A Cone is said also to be Right as to the Position of its Axis in respect to the Horizon; i. e. when its Axis be not so, 'tis called an *Oblique Cone*. A Cone is called *Scalenous*, when one Side of it is longer than the other, as S.

The solid Content of a Cone is found by multiplying the Area of its Base by $\frac{1}{3}$ of its perpendicular Height.

For a Cone is but a Pyramid of infinite Sides, and a Pyramid is equal to $\frac{1}{3}$ of its circumscribing Prism, and a Prism is but a Cylinder, having an infinite Number of Sides; therefore a Cone is equal to $\frac{1}{3}$ of a Cylinder circumscribing it. 7. c. 12. Euclid.

See also the Demonstration under Proportion of Solids.

How to find the External Surface of a Cone, see under the Word Pyramid.

If a Cylinder, Sphere and Cone have the same Base and Altitude, the Cone is the Difference of the Cylinder above the sphere; and Cylinder, Sphere and Cone, are as 3, 2 and 1. See Cylinder.

CONE of Rays, in Opticks, are all those Rays which fall from any Point, as suppose B, in any Ob-

ject, on whose Surface of any Glass, as GLS, having Vertex in B, and the Glass for its Base; such is the Cone GLSB.

CONFECTIONS, a Composition of Powders, Gums, Sugar, Honey, Syrups, &c. made up into one Substance; and it is two-fold, either dry, as *Loxenges*, &c. or moist, as *Preserves*, *Conerves*, and all sorts of *Amidoses*. Blanchard.

CONFISCATE, in Law, signifies to be forfeited to the Publick Fisque or King's Treasury: For among the Romans the Emperor's Treasure was kept in Hampers or Baskets, which, in Latin, is *Fiscus*. Now if a Man be Indicted for Feloniously stealing the Goods of another, tho' in truth they are the proper Goods of the Person Indicted, yet if, when the Goods are brought in Court against him, as the Manner is, he shall then *Disclaim* them, he doth by this *Disclaimure* lose the Goods, although he be afterwards acquitted of the Felony, and they shall be *Confiscated* to the King; but it is otherwise if he does not Disclaim them. The same

Law is where Goods are found in the Felon's Possession, which he disavows, and afterwards is attained of other Goods, and not of them, there the Goods which he disavows are *Confiscated* to the King; but had he been attained of the same Goods, they should have been said to be *Forfeited*, and not *Confiscated*, notwithstanding the Disavowment. So if an Appeal of Robbery be brought, and the Plaintiff leaves out some of his Goods, he shall not be received to enlarge his Appeal; and forasmuch as there's none to have the Goods so left out, the King shall have them as *Confiscate*, according to the old Rule, *Quod non capit Christus, capit Fiscus*.

CONFUSED Vision: See Vision.

CONGE, a Term in Architecture: See Apophyge.

CONGEALE, in Chymistry, is to let some Matter that is melted fix or grow into a Consistency; as when a Metal is left to cool, which hath been melted in a Crucible; or when Wax, Fat, Butter, or the like, are taken from the Fire and set to cool, they say, 'tis let *Congeal*.

CONGLOBATE, a Word used for such of the Glands in an Animal Body as are smooth in their Surface, and seem to be made up of one continued Substance: They serve to separate the Lympha from the Arterious Blood, and to return it by the Lympheducts, either into the Chyliferous or Sanguiferous Vessels, though some think the Glands of the Mesentary, and Breasts of Lactescent Women serve to separate true Chyle.

CONGLOMERATE Glands, are such in an Animal Body as are uneven in the Surface, and are made up, as it were, of many lesser Glands. Their Use in the Body is to separate several sorts of Juices from the Blood, and also to Elaborate and alter them, and by proper Ducts to convey them to their appropriate Receptacles and Cavities. Thus the *Parotides* and Maxillary Glands separate and bring the Saliva into the Mouth by their proper Ducts.

CONGREGATION, according to Dr. Grew, is the least Degree of Mixture; in which the Parts of the Mixt are *inconsistent*, and do touch each other but in a Point; and he saith, he hath many Arguments to induce him to believe, that the Atoms or Particles of all Fluids, as such, do touch one another only after that Manner.

CONGRUITY, by the Naturalists is esteemed a Relative Property to a Fluid Body, whereby any Part of it is readily united with any other Part, either of it self, or of any other Similar Fluid or Solid Body. And *Incongruity* is a Property by which it is hindered from uniting with any Solid or Fluid Body dissimilar to it.

CONGRUITY of Geometrical Figures: See Concurring.

CONICK Sessions: See Sessions.

CONJERIES, is the joining or collection together of many Bodies or Particles in Mass or Lump.

CONIFEROUS Plants, whether Trees, Shrubs or Herbs, are such as bear a Squammose Scaly Fruit, of a Woody Substance, and of a kind of Conical Figure, in which Cone are many Seeds, and when they are ripe, the several Cells or Partitions in the Cone gape or open, and the Seed drops out: Of this kind are the Scotch Firs, Male and Female, and the Pine, which in our Gardens is called

called the *Scotch Firr*, the common Alder, and the Beech Tree.

CONJUNCTIVA Tunica, the same with *Adnata*.

CONJUGATE Diameter, is the shortest Axis or Diameter in an Ellipsis.

CONJUGATE of the *Hyperbola*, is a Line drawn parallel to the *Ordinates*, and thro' the Center or middle Point of the *Transverse Axis*; and is always a middle Proportion between the *Parameter* (or *Latus Rectum*) and the *Latus Transversum*. This Line also is sometimes called the *Second Axis* or *Diameter*.

CONJUGATION of a Verb, in Grammar, is varying or forming it by Mood, Tense and Person.

CONJUNCTION, in Astronomy, is the meeting of the Stars or Planets in the same Degree of the Zodiac; and is either *Apparent* or *True*.

CONJUNCTION *Apparent*, is when the Right Line that is supposed to be drawn thro' the Centers of the two Planets, does not pass thro' the Center of the Earth.

CONJUNCTION *True*, is when that Right Line being prolonged, passes also thro' the Center of the Earth.

CONJUNCTION, in Grammar, is an undecidable Word, which is used to connect or join Words and Sentences together.

CONNIVENTES Glandule, are those Wrinkles which are found in the Inside of the *Intestinum Ileum* and *Jejunum*. For the inner Tunick of the Guts being longer than the Middle or the Outward, it doth frequently, and in many Places wrinkle or bag out, by which Means the Passages for the Contents become strait'ned, and consequently the Matter descends thro' the Guts more slowly, so that the *Lacteals* have the more time to imbibe Chyle.

CONOID, is a Solid produced by the Circumvolution of any Section of the *Cone* about its *Ax*, and may be either a

CONOID *Epileptical*, when made by an *Ellipsis*, and then is more commonly called a *Spheroid*; and if the Revolution be made round the *Latus Transversum*, it forms an oblong *Spheroid*; but if round the *Conjugate Axis*, a *Prolate* or *Oblate one*: Such is the Figure of our Globe, and of the other Planets.

CONOID *Hyperbolical*, when made by an *Hyperbola*.

CONOID *Parabolical*, when it is produced by the Section called a *Parabola* turning about its *Ax*.

CONOIDES, the same *Conarium*.

CONSCRIBED, the same with *Circumscribed*: Which see.

CONSECTARY, is a Deduction or a Consequence drawn from a preceding Proposition, and is the same with *Corollary*.

CONSENT (in Medicine) is the depending of one Distemper upon another: Thus a Difficulty of Breathing is said to proceed by *Consent* from a *Pleurisy*, and in that Case does not require a particular Cure, because it ceases as soon as the Disease on which it depends is removed; or the mutual Sympathy or Correspondency betwixt the Parts of the Body, which is usually said to be occasioned.

1. By the Likeness or Similitude of their Kind, as when one Nerve is affected with the Hurt of another.
2. By the Similitude of their Office or Function, as when the Intercoastal Muscles suffer

by an Inflammation of the Diaphragm. 3. By a Communication of Vessels, for which Reason a Fit of the Stone in the Kidneys is frequently attended with Vomiting. 4. By the Contiguity or Neighbourhood of the Parts, as when the Inflammation of the Pleura is communicated to the *Lungs*: But the two former may be reduced to the two latter, which are the only real Causes of a *Consent* or Sympathy betwixt the Parts of the Body.

CONSEQUENCE or *Consequentia*, a Term in Astronomy: See *Antecedence*.

CONSEQUENT, in Mathematicks, is the latter of two Terms of Proportion, as if the Proportion were of *A* to *B*, *B* is said to be the *Consequent*.

CONSERVA, a *Conserve*, is a Composition of Flowers or Herbs beat together, to every Pound whereof, if they be dry, are added three Pounds of Sugar; if moister two Pounds, so that they may be kept several Years. *Blanchard*.

CONSISTENT Bodies, so Mr. Boyle calls such as we usually stile solid or firm ones, and he means such whose Parts are firmly and consistently united together, so that they do not slide over one another's Surfaces, as easily as the Parts of Fluid Bodies do.

CONSOLE, is a kind of Bracket or Shoulder-ing-Piece in Building, which hath a Projecture, and serves to support a Cornice, or to bear up Figures, Butts, Vessels, and other Ornaments of the like Nature.

CONSOLIDATING Remedies, are those things which cleansing with a moderate Heat and Force, by taking Corruption out of Wounds, and preserving the Temperature of the Parts, cause the Nourishment to be fitly apply'd to the Part afflicted. *Blanchard*.

CONSOLIDATION, is a Word used by Physicians and Surgeons for the uniting strongly together the Fractures of broken Bones, or the Lips of a Wound; then they say the Parts begin to consolidate or join together in one entire Piece, as they were before the *Fracture* or the *Solution of Continuity*.

CONSONANCE, in Musick, is the Agreement of two Sounds, the one *Grave*, the other *Acute*, which are compounded together by such a Proportion of each, as shall prove agreeable to the Ear. A *Unison* is the First *Consonance*, an *Eight* is the Second, the *Fifth* is the Third, and then follows the *Fourth*, and the *Third* and *Sixths*, major and minor. There are other *Consonances*, which are the Doubles or other Repetitions of the former. There can be but Seven or Eight *Simple Consonances*; the *Perfect* ones are the *Unison*, the *Eight* and the *Fifth*, with their Correspondents.

CONSPIRATIONE, is a Writ that lies against Conspirators.

CONSTABLE, is a Word variously used in our Common-Law: First, for the *Constable of England*, who is also called *Marshal*; his Office consisteth in the Care of the common Peace of the Land in Deeds of Arms and Matters of War. The Court of the *Constable* and *Marshal* determineth Contracts touching Deeds of Arms out of the Realm, and handling things concerning War within the Realm, as Combats, Blazons of Armory, &c. But he may not deal with Battel in Appeals, nor, generally, with any other thing that may be tried by the Laws of the Land. Out of his Magistracy were drawn these lower *Constables* which

we call *Constables of Hundreds and Franchises*, and first ordained by the Statute of *Winchester*, which appointed for the Conservation of Peace and View of Armour two *Constables* in every Hundred and Franchise: And these be now *High Constables*, because continuance of Time and increase of People and Offences, hath again, under these, made others in every Town called *Petit Constables*, which are in like Nature, but of inferior Authority to the other. Besides these there be Officers of particular Places called by this Name, as *Constable of the Tower*, *Constable of the Exchequer*, *Constable of Dover Castle*, &c.

CONSTAT, is a sort of Certificate made by the Clerk of the Pipe and Auditors of the *Exchequer*, at the Request of any Person who intends to plead in that Court for the Discharge of any thing.

CONSTELLATION, or *Asterism*, is a Company of fixed Stars, imagined to represent the Image of something, and commonly called by the Name of that Thing: There are 21 Northern and 12 Southern ones.

CONSTIPATION, is when the Parts of any Body acquire a closer Texture than what they had before.

CONSTITUTIONIS *Basilick*: See *Basilick Constitutions*.

CONSTRUCTION, is the crouding the Parts of any Body close together in order to Condensation.

CONSTRUCTOR *Labiorum*, *Sphincter* & *Orbicularis Labiorum*, a Muscle which environs the Lips with Orbicular Fibres, and when it acts it purles them up; wherefore some Name it *Osculatorius*.

CONSTRICTORES *Alarum Nasi ac Depressores Labii Superioris*: These Muscles arise from the fourth Bone of the upper Jaw, immediately above the Gums of the *Dentes Incisorii*, and ascending, are soon inferted to the Roots of the *Ale Nasi* and superior Parts of the upper Lip; they draw the upper Lip and *Ale* downwards.

CONSTRUCTION of Equations, in Algebra, is the contriving such Lines and Figures as shall demonstrate the Equation, Canon or Theorem to be true Geometrically. And this is often of great Use to solve and illustrate Algebraical Equations: And the Manner of it you will see in the following Rules, which shew you how to resolve Simple Equations into Proportionals, and to build a Geometrical Construction thereupon.

1. Thus if $\frac{ab}{c} = x$, then $c : b :: a : x$; by 12. e. 6. *Euclid*.

Or if $\frac{aa}{b} = x$, then $b : a :: a : x$.

Or if $\frac{ab+ag}{b+i} = x$, then $b+i : b+g :: a : x$.

Or if $\frac{ab+ag}{b+i} = x$, then $b-i : b+g :: a : x$.

2. If $\frac{ab+mn}{r-s} = x$, the Construction and So-

lution will be more difficult, because no Letter in the Numerator is taken twice; but that it may be so, and that (*a*) (for Instance) may be twice us'd, make, as $a : n :: m : a$ to a Fourth Proportional, which call *p*; then $nm = ap$, and consequently, $\frac{ab+ap}{r+s} = x$; wherefore, by Rule 1, $r+s : b+p :: a : x$.

Or if this Equation were proposed, $\frac{ab+m}{r-s} = x$,

first find a mean Proportional between *a* and *b*, which suppose to be *p*; also another mean Proportional between *m* and *n*, which let be *q*; then the Equation will stand thus, $\frac{pp+qq}{r-s} = x$.

Let therefore a Right-angular Triangle be made, wherein the Perpendicular $AP = p$, and the Base $AB = q$; therefore shall $PB^2 = pp + qq$, which, since according to the Equation it is to be divided by $r-s$, make, as $r-s : PB (= \sqrt{pp+qq}) ::$

PB : to a Third Proportional, and that shall be *x* sought.

3. In this Equation $\frac{ab-mn}{c+d} = y$.

First, Make, as $a : m :: n : p$, a Fourth Proportional;

portional; then will $\frac{ab - ap}{c + d} = y$, and consequently (as in *Case 3.*) $c + d : b - p :: a : y$.

Or you might (as in *Case 2.*) have found a mean Proportional between a and b , as also between m and n , which being called (as there) p and q , the Equation would have stood thus, $\frac{p \cdot p - q \cdot q}{c + d} = y$: Then having taken $AB = p$, and on it, as a Diameter, drawn a Semicircle, and applying in $BC = q$, the Square of AC will be $= pp - qq$; which, since it is to be divided by $c + d$, make, as $c + d : AC :: AC : y$, the Quantity sought.

4. Let this Equation $\frac{a a b c}{f f g} = z$ be proposed :

First, Find out (p) a Third Proportional to f and a , then $fp = aa$; the Equation will stand thus, $\frac{f p b c}{f f g} = z$, that is, $\frac{p b c}{f g} = z$.

Secondly, Find a Fourth Proportional (q) to f , p and b , saying, as $f : p :: b : q$; then will $f q = p b$, and consequently the Equation will stand thus, $\frac{f q}{g} = z$, that is, $\frac{q}{g} = z$; and therefore (as Rule 1.) $g : q :: c : z$, sought.

5. If this Equation $\frac{h k k}{m m} = z$ were proposed,

First, Find a Fourth Proportional to m , b and k , which let it be p ; therefore $p m = b k$, and consequently the Equation will stand thus, $\frac{p m k}{m m} = x = \frac{p k}{m}$; therefore $m : p :: k : x$, sought.

Construction of all the Three Forms of *Quadratic Equations*, according to Mr. *Oughtred's* Method of Solution.

Draw two Concentrick Circles, as in the Figure, and let the Diameter of the Greater be called S , and the Diameter of the Lesser be D .

Which Letters S and D do represent the Sum and Difference of the Roots found, as H and d do the Half Sum and Half Difference.

Since therefore his Theorem is, that $SS - DD = 4R$, let \sqrt{R} be made a Tangent to the lesser Circle, and a Right Sine in the Greater, and draw the Hypotenuse H , and call the Base of the Triangle d .

Then will $HH - dd = R$, (viz. $\frac{1}{4}SS \rightarrow \frac{1}{4}DD = R$;) wherefore $HH = R + dd$, and therefore $H = \sqrt{R+dd}$: Thus H , if required, is found: Or if H had been given, and d required; now since $HH - R = dd$, therefore $\sqrt{HH - R} = d$.

And having thus found H and D , then $H + d$ ($= O p$) = the greater Root a ; and $H - D$ ($= p n$) = the lesser Root e , which will be Affirmative or Negative according to the Form of the Equation.

CONSTRUCTION of *Quadratics* after another
Method, in Imitation of *Des Cartes*.

In the First Form, which is $ax + d = R$,
Let $FC = a$, the Laffer of the Two Roots, and
 DF or $DT = \frac{1}{2}d$, i. e. Half the Co-efficient.

Then will $BC = d + a$, and consequently
 $\square BCF = \square TC$, by 36 e. 3 *Euclid*.
 That is, $aa + da = R$.

In the Second Form, which is $aa - da = R$, Make $BC = a$, the Greater of the two Roots, and DF or $DT = \frac{1}{2}d$ (Half the Co-efficient;) Then will $\square BCF = \square TC$ (by 36e. 3) or $aa - ad = R$.

In the Third Form, which is $Sa - aaR$,
Let $FB = S$, and CB or $FK = a$ (the Greater
Root;) Then will FC or $KB = S - a$.

But by 36.e. 3. Encl. $\square GBK$ or $KFC = \square BH$ or FL ;
That is, $Sa - aa = R$.

But if KB be supposed equal to a (the lesser Root) Then will $KF = S - a$ and

But $\square KFG \equiv \square FL$, that is, $Sa \vdash a a \equiv R$,
by 36. e. 3. *Euc.*

The Three Forms of *Quadratics* may also be constructed another Way after the following Manner, which agrees very well with *Hartot's* Method of Solution by completing the Square.

Thus ; Suppose $a a + d a = R$:

Thus; Suppose $a a + a d = R$:
 Draw a Line, at pleasure, and on it set the Coefficient d , and bisect it: At any End of it erect perpendicularly a Right Line equal to the \sqrt{R} . Then, with the Distance between the Top of the Line and the Middle of d , describe a Circle, which will give you a , as you see; for then \sqrt{R} will be a mean Proportional, and $a a + a d = R R$, by 14. e. 6. *Euclid*.

And here 'tis plain, that if to R , the known or absolute Number, you add the Square of Half the Co-efficient, or of $\frac{1}{2}d$, 'twill give you the Square of H , or of $\frac{1}{2}d + a$; from the Root of which, at last taking $\frac{1}{2}d$, there will remain a , the Lesser of the two Roots sought.

In the Second Form, where $aa - dd = R$. Let xx be supposed $= d$; Then will $xy = a - d$; and consequently (all things being constructed as before) $aa - dd = R$ (by 14. e. 6. *Euch.*) And here, as before, $Qd - dR = HH$, which is equal to $Qd + xr$; to the Square Root of which adding dy you have xx or $py = a$.

As to the Third Form, viz. $Sa - a\bar{a} = R$,

where the Co-efficient is the Sum of the Roots; on S , as a Diameter, draw the Circle apb ; then apply, in a Line equal to the Square Root of R , the absolute Number perpendicularly as before; and then will $S - a \cdot \sqrt{R} : R :: \sqrt{R} : R \cdot a$; (for since $S =$ to the Sum of the Roots, if either be a , the other must be $S - a$) and therefore $Sa - aa = R$.

CONSTRUCTION of Cubick and Biquadratic Equations in Algebra.

This, I believe, was first done by *Des Cartes*, who (in the Third Book of his excellent *Geometry*) hath given us a Method for the constructing and finding the true Roots of all Equations, not exceeding four Dimensions, by means of a Parabola and a Circle; which Method was indeed not perfect, because it would not construct any Equations but such as had their Second Term first taken away. However, because it was that which gave the first Rise to *Baker's* excellent Rule, and to whatever Improvements have been since made in it, it's proper to give you an Account of it in the first Place.

When the Second Term is wanting, *Des Cartes* reduces all Cubick Equations to this Form, $Z^3 + apz, aaq = 0$; and Biquadratics to this, $z^{4*} + apz, aaq, aaar = 0$; where a stands for the *Latus Rectum* or *Parameter* of any given *Parabola*, and is supposed equal to 1, that its Power may produce no Trouble in Operation: By which Means the former Equations will stand thus, $Z^3 + pz, q = 0$, and $Z^{4*} + pzz, qz, r = 0$.

Let then any *Parabola*, as *FAG*, be supposed to be described, whose *Axis* is *ACDKL*, and its *Parameter* $1 = a$, make *AC* equal to $\frac{1}{2}a$, so that the *Point C* will always be within the *Parabola*: Then take in the *Axis* (downwards from *C*, if *P* have a *Negative Sign*, but upwards in the *Axis* produced when it hath a *Positive one*) *CD* $=$ to $\frac{1}{2}p$. Then from the *Point D* (or *C*, if the *Quantity p* be wanting in the Equation) erect a *Perpendicular* to the *Axis*, as *DE*, and make it equal to $\frac{1}{2}q$; which *DE* must be on the *Right-hand*, if it have a *Negative Sign*, but on the *Left* if it be $+q$. After which, describing a *Circle* on the *Center E* with the *Radius EA*, it will (if the Equation be

only a Cubick one) cut the Parabola in as many Points as the Equation hath true Roots; and the Affirmative ones will be Ordinates or Perpendiculars let fall from thence to the Axis on the Right-hand; and the Negative Roots Perpendiculars let fall on the Left-hand of the Axis.

But if the Equation be a Biquadratic one, the fourth Term being there, and having a positive Sign, then from A take $AR = r$, and produce $AS = c$ or 1. Make RS the Diameter of a Circle, and at A erect HA perpendicularly; I say, the other Circle must pass through H , and its Radius

will be EH : But if r have a Negative Sign, there must yet another Circle be drawn on the Diameter AE , in which AI must be applied equal to AH , and that will find the Point I , through which the intersecting Circle must pass, and whose Radius will be IE , and Center E ; which Circle may cut the Parabola in 1, 2, 3 or 4 Points, from

whence perpendicularly let fall to the Axis, will be all the Roots, whether Affirmative or Negative; the former of which will be on the same Side with the Center E when 'tis $+q$, and on the other Side the Axis when 'tis $-q$.

The Demonstration of all which he thus very easily gives us: If the Ordinate GK , by this Construction found, be called Z , then the Abscissa AK will be ZZ , because the Ordinate is a mean Proportional between the Parameter (here 1) and the Abscissa (by the first Property of the Parabola;) wherefore, if from AK you take $AC = \frac{1}{2}$, and also $CD = \frac{1}{2}p$, you will find, by that Means, the Remainder DK or EM , which, in this Notation, will be $ZZ - \frac{1}{2}p + \frac{1}{2}$ (See Figure the First) whose Square will be $Z^4 - ZZp - ZZ + \frac{1}{4}pp + \frac{1}{4}p + \frac{1}{4}$. And because, by the Construction, DE or $KM = \frac{1}{2}q$, the Whole GM will be $= Z + \frac{1}{2}q$, and its Square will be $ZZ + qZ + \frac{1}{4}qq$. Add then this and the former Square of EM together, and you will have the Square of the Radius EG , $Z^4 - ZZp + qZ + \frac{1}{4}pp + \frac{1}{4}qq + \frac{1}{4}p + \frac{1}{4}$ (by 47 *e. Euclid.*) which Radius, or its equal EH , may be expressed another way, if we consider that $ED = \frac{1}{2}q$, and $AD = \frac{1}{2}p + \frac{1}{2}$, for then the Hypothenuse EA will be $\sqrt{\frac{1}{4}qq + \frac{1}{4}pp + \frac{1}{4}p + \frac{1}{4}}$. Wherefore, since AH is a mean Proportional between $AS = 1$, and $AR = r$, it must itself be noted by \sqrt{r} ; Also since EAH is a Right Angle, the Square of EH is the Sum of the Squares of HA and EA , that is, \square of HE or $EG = \frac{1}{4}qq + \frac{1}{4}pp + \frac{1}{4}p + \frac{1}{4} + r$; which last Quantity being equal to $Z^4 - ZZp + qZ + \frac{1}{4}pp + \frac{1}{4}qq + \frac{1}{4}p + \frac{1}{4} = \square EG$, as was proved before: If you compare them together, you will find this Equation to arise $Z^4 = \frac{1}{4} + pZZ - qZ + r$; whence 'tis plain IK is the true Root. Q. E. D.

Thus far went *Des Cartes* in this Matter; but he considering only the Axis of the Parabola, and not thinking of what might be done by the other Diameters, could not construct any Equations, but from which he had first ejected the Second Term. But our *Baker* took the Diameters or Parallels to the Ax also into Consideration, and by that Means did exceedingly perfect and improve this Construction of *Des Cartes*, and made it universal for all Equations not exceeding four Dimensions, without any previous Reduction of them, or taking any of the Terms.

And his Method is this, as you may find in his *Clavis Geometrica*.

Taking any Parabola, let the Parameter or Latus Rectum be called $1 = L$, (that so the Power of L may create no Trouble) and its Vertex a ; then, at Right Angles to the Axis, inscribe $RA = \frac{1}{2}p$, (for half the second Term in the Equation) and then shall its Point A be the Vertex of the Diameter AD , to be drawn parallel to the Axis; so that the Distance of this Diameter from the Axis is always $\frac{1}{2}$ of p , or $\frac{1}{2}$ of pL (for L is $=$ but to 1;) and consequently, when $p = 0$, or when the second Term is wanting (as in *Des Cartes* his Construction) AD will be in the Axis, and the Points R , a and A all co-incident. Next in this Diameter AD , he determines the Point D by the Length of AD , and then erects in D a Perpendicular to DA , as DH , whose Length he determines also, and by that Means finds H the Center of the Circle, which is to intersect or touch the Parabola:

And this he performs by what he calls his *Central Rule*; viz.

$$1. \frac{L}{2} + \frac{p p}{8L} + \frac{q}{2L} = b = AD; \text{ And,}$$

$$2. \frac{p}{4} + \frac{p p p}{6LL} + \frac{p q}{4LL} + \frac{r}{2LL} = d = DH.$$

Which two Rules are demonstrated in his Book and here, under the Word *Central Rule*, which see; and because $L = 1$, they may be contracted thus,

$$1. \frac{1}{2} + \frac{p p}{8} + \frac{q}{2} = B = AD.$$

$$2. \frac{p}{4} + \frac{p p p}{6} + \frac{p q}{4} + \frac{1}{2} r = d = DH.$$

And you must observe, That in the Former of these Rules $+$ signifies downwards from the Point A , and $-$ upwards from it; and in the latter Rule $+$ signifies towards the Left Hand, as $-$ doth towards the Right; So according as the Affirmative or Negative Roots prevail, H will be on the Left or Right Hand of D .

And in both Parts if $p q$ or r be $= 0$, the Member where it is found will vanish and become also $= 0$.

As to the Signs of the Quantities in his Rule, he makes p always retain the Sign it hath in the Equation, but q always puts on a contrary one to what it had there: r is always with a positive Sign, except when $p r$ have contrary Signs in the Equation, and then r will always have a Negative Sign in the Rule.

Having thus, by his *Central Rule*, found H the Center of the Circle, the next Work is to determine the Radius; and if the Equation be no higher than a Cubick, HA is always the Radius; but if it

be a Biquadratick, then supposing $-S$, or that the Fifth Term (or absolute Number) be a Negative Quantity, take in the Line AH produc'd both Ways if there be Occasion $AI = L$ above, and $AK = S$; and making IK a Diameter, describe the Semi-circle KL , and erect at the Point A the Line AL perpendicularly; which therefore will be a mean Proportional between AK and AI : May, the Circle must pass through L , and HL will be the Radius.

But if it be $+S$, you must draw another Diameter HA , and therein fit in or apply $AZ = to LA$ before found (for now the Square of AL is to be taken from HA , as in the former Case it was to be added to it) which will find the Point Z through which the Circle must pass, and the Radius will be HZ , which Circle being drawn, it will cut the Parabola in 4, 3, 2 or 1, or in no Point; and according to the Number of such Intersections, will the real Roots of the Equation be found, which will be always so many Perpendiculars from those Points to AD , as e. gr. NO on the Left Hand, MO on the Right, &c. Of which, if there be no p or Second Term, and also it be $-r$, then on the Left Hand are the Positive Roots, and the Negative ones on the Right Hand: But if the Second Term be there, and with a Negative Sign, as $-p$, then NO on the Left Hand are Affirmative, and the others MO on the Right Negative; but if it be $+p$, 'tis on the contrary; NO Negative, and MO Positive.

The Demonstration of all which is very easy to one that hath considered the Demonstration above given from *Des Cartes*, on which this entirely depends; taking into Consideration also the Property of the Parabola, which *Baker* had from Mr. *Seade* of *Maperton*, that *The Latus Rectum*: Is to the Sum of any two Ordinates :: As their Difference, Is to the Difference of the Abscisse.

CONSTRUCTION, in Geometry, is the drawing of such Lines as are previously necessary for the making any Demonstration appear the more plain and undeniable; and this Construction is always of such things as are well known and sought before.

CONSTRUCTION, in Grammar, is the natural, just and regular placing and disposing of Words in a Discourse, so as to make proper and intelligible Sense.

CONSULTATION, is a Writ whereby a Cause being formerly removed by Prohibition from the Ecclesiastical Court, or Court Christian, to the King's Court, is returned thither again; for the Judges of the King's Court, if, upon comparing the Libel with the Suggestion of the Party, they do find the Suggestion false, or not proved, and therefore the Cause to be wrongfully called from the Court Christian, then, upon this Consultation or Deliberation, they decree it to be returned again; whereupon the Writ in this Case obtained is called a Consultation.

CONSUMPTION, in general, signifies a Defect of Nourishment, or the consuming, wasting or decaying of the Body; and particularly of the Muscular Flesh: 'Tis frequently attended with a *Hætic* Fever, and is divided into several Kinds according to the Variety of its Cause, and the Parts it principally affects, as a *Scorbutick Consumption*, a *Consumption of the Lungs*, &c.

CONTACT, is when one Line, Plane or Body is made to touch another, and the Parts that do thus touch are called the Points or Places of *Contact*.

CONTAGION, the communicating or transferring of a Disease from one Body to another, by certain Steams or Effluvia transmitted from the Body of the Sick Person. Some Diseases are *Contagious* by immediate contact or touch, as the Madness of a Dog, which is communicated by Biting; and the Venom of the *French-Pox*, which is transmitted from the infected Person in the Act of Copulation; sometimes the *Contagion* is propagated by infected Cloaths, as in the Itch and Leprosy: And there are some *Contagions* that are transmitted through the Air to a considerable Distance, as the Plague and other Pestilential Distempers; in which Case the Air is said to be *Contagious*; that is, full of *Contagious* Particles or *Effluvia*.

CONTEMPLATION, is the preserving of the *Idea* which is brought into the Mind for some time actually in view.

CONTENEMENT, seems to be Free-hold-Land which lies next a Man's Tenement or Dwelling-House, that is, in his own Occupation.

CONTENT, in *Solid Geometry*, is the Measure of any Solid Figure, viz. in Cubick Inches or Feet, &c.

CONTIGUITY, is only the Surface of one Body's touching that of another. But *Continuity* is the immediate Union of the Parts which compose any Natural Body, so that one cannot tell where one begins, and another ends.

CONTIGUOUS

Angles, in *Geometry*, are such as have one Leg common to each Angle, and are otherwise called *Adjoining Angles*. Thus, the Angles *a* and *d* are called *Contiguous Angles*, but *b* and *c* *Opposite or Vertical*: See *Angle*.

CONTINENT, in *Geography*, is a great Extent of Land, which comprehends several Regions and Kingdoms, and which is not interrupted or separated by Seas.

CONTINENT Cause of a Distemper, is that on which the Disease depends so immediately, that it continues so long as that remains, and no longer. Thus a Stone sticking in the *Ureters*, is the *Continent Cause* of a Suppression of Urine.

CONTINENT Fever, is that which performs its Course without either Intermision or Remission.

CONTINGENT, is a Casual Event, which may or may not happen to come to pass: 'Tis sometimes also in *Mathematicks* used for the Word *Tangent*.

CONTINGENT Line, in *Dialling*, is supposed to arise from the Intersection of the Plane of the Dial with the Plane of the Equinoctial; and consequently in this Line the Hour Lines of the Dial and the Hour Circles intersect each other. This Line is always at Right Angles with the Subtilar Line.

CONTINGENT Line, the same with *Tangent Line*.

CONTINUAL Claim, is a *Claim* made from Time to Time within every Year and Day, to Land or other Thing, which, in some respect, we cannot attain without Danger.

CONTINUAL Fever, is that which sometimes remits or abates, but never perfectly intermits; that is, the sick Person is sometimes better, but never perfectly free from the *Fever*.

CONTINUAL Proportion, *Arithmetical* and *Geometrical*: See *Progression*.

CONTINUANDO, is a Word used in Law, when the Plaintiff would recover Damages for several Trespasses in the same Action: For in one Action of Trespass they may recover Damages for divers Trespasses, laying the first with a *Continuando* to the whole Time, and in this Form;

CONTINUANDO Transgressionem predictam, &c. à predicto die, &c. usque talem diem; to including the last Trespass.

CONTINUED Quantity or a *Continuum*, is that whose Parts are inseparably joined and united together, so that you cannot distinguish where one begins and another ends: See *Discrete Quantity*.

CONTINUED Zocle: See *Zocle*.

CONTRABANDED Goods, are such as are prohibited by Act of Parliament or Proclamation to be imported into, or exported out of this into other Nations.

CONTRACT, is a Covenant or Agreement, with a valuable or lawful Cause or Consideration; or else one thing must be given for another, which is called *Quid pro quo*; as if I sell my Horse for Money, or Covenant to make you a Lease of my Mannor in Consideration of so much Money; these are *Good Contracts*, because one thing is given for another: But if a Man make Promise to me that I shall have Twenty Shillings, and that he will be Debtor to me thereof; and after I ask the Twenty Shillings, and he will not deliver it; yet I shall never have an Action to recover, because the Promise was no *Contract*, but a bare Promise, and *ex nudo Pacto non oritur Actio*: But if any thing were given for the Twenty Shillings, though it be but the Value of a Penny, then had it been a *Good Contract*.

CONTRACTILE, is a Word used by some Physicians to express such Muscles, and other Parts of the Body, as are usually contracted.

CONTRADICTORY Propositions, in *Logick*, are either such as consist of an Universal and Particular, of which one Affirms, and the other Denies, as thus; *All Right lined Triangles have the Sum of their Angles equal to two Right ones; some Right lined Triangles have not the Sum of their Angles equal to two Right ones*; or else they are both Singular and Particular, one Affirming, the other Denying the same Thing, as the *Circle is Squarable, the Circle is not Squarable*.

CONTRA-Fissura, or *Counter-Fissure*, is a Fissure on one Side of the Head, occasioned by a Blow or Fall upon the other.

CONTRA Formam Collationis, is a Writ that lies where a Man hath given Lands in perpetual Alms to any Religious House, Hospital, &c. For if they Alien the Lands, then the Donor or his Heirs may recover them by this Writ, but not of the Alien, although he be Tenant; tho' in all other Actions, where a Man demands Free-hold, the Writ shall be brought against the Tenant.

CONTRA Formam Feoffamenti, is a Writ that lies for the Heir of a Tenant infeofed of certain Lands

Lands or Tenements by Charter of *Feesment* of a Lord, to make certain Services and Suits to his Court, and is afterwards disfreind for more than is contained in the said Charter: This Writ lies not for the Plaintiff, who claims to purchase from the first *Feeoffee*, but for the Heir to the first *Feeoffee*.

CONTRA-Indications, are divers Considerations in a Disease that dissuade a Physician from using such a Remedy, when other Things induce him to it.

CONTRAMANDATIO Placiti, in Law, seems to signify a Respite, or giving the Defendant further Time to answer; or an Imparance, or Countermanning what was formerly ordered.

CONTRA Mure, in Fortification, is a little Wall built before another Partition Wall to strengthen it, so that it may receive no Damage from the adjacent Buildings.

CONTRARY Propositions, in Logick, are two universal Enunciations, of which one Affirms, and the other Denies; as *all Squares are Parallelograms*; *no Squares are Parallelograms*.

CONTRATE Wheel, is that Wheel in Pocket-Watches and others which is next to the Crown-Wheel, whose Teeth and Hoop lie contrary to those of other Wheels, whence it hath its Name.

CONTRAVALLATION, or *The Line of Contravallation*, in Fortification, is a Trench guarded with a Parapet, and usually cut round about a Place by the Besiegers, to secure themselves on that Side, and to stop the Sallies of the Garrison; 'tis without Musket-Shot of the Town; so that the Army forming a Siege, lies between the Lines of *Circumvallation* and *Contravallation*.

CONTRE-Queue d'ironde, a Term in Fortification, the same with the *Counter-Swallow's Tail*, which see.

CONTRIBUTIOE Facienda, is a Writ that lieth where more are bound to one Thing, and but one is put to the Burden: As if Joint-Tenants, or Tenants in Common hold a Mill, *pro indiviso*, and are equally to take the Profits thereof; the Mill falling to Decay, and one or more of them refusing to contribute towards the Reparation, the rest shall have this Writ to compel them.

CONTROLLER, is an Officer who keeps a Roll of all other Officers Accounts; and in *England* we have divers Officers of this Name, as *Controller of the King's House*, *Controller of the Navy*, *Controller of the Customs*, *Controller of Callis*, *Controller of the Mint*, *Controller of the Hamper*, who takes all Things sealed in Leather Bags from the *Clerk of the Hamper*; and *Controller of the Pipe*, who writes Summons to the Sheriffs to levy the Debts of the Pipe.

CONTUSION of a Bone, is the bruising of a Bone by some hard and blunt Thing, that though it outwardly appear Whole, yet inwardly it is really Injured and out of Order.

CONVENTIO, is a Word used frequently both in Ancient and Modern Pleadings at Law.

CONVENTION, is a Writ that lieth for any Covenant in Writing not performed. *Fitz-Herbert* calls it a *Writ of Covenant*: *Nat. Brev. Fol. 145.*

CONVERGING, or *Convergent Rays*, in *Opticks*, are those Rays which going from divers Points of the Object, incline towards one another, till at last they meet and cross, and then become

Diverging Rays. Thus the Rays *AB* and *CB* do Converge till they come to the Point *B*, and then they Diverge and run off from each other in the Lines *BE*, *BF*.

CONVERSE: In Mathematics one Proposition is called the *Converse* of another, when after a Conclusion is drawn from something supposed in the *Converse* Proposition, that Conclusion is supposed; and then that which in the other was supposed, is now drawn as a Conclusion from it. Thus; as when two Right Lines are supposed to be parallel; and another crosses them, 'tis demonstrable that the Alternate Angles are equal; so 'tis equally true Conversely, that if the Alternate Angles are equal, the Lines which are crossed must be parallel.

CONVERSION of Equations, in *Algebra*, is thus; if the Quantity sought, or any Part or Degree of it be in Fractions, let all be reduced to one common Denomination (by Multiplication of the Whole, by the Denomination of the Fractional Part) and then omitting the Denominators, continue the Equation in the Numerators only. Thus, suppose $a - b = \frac{aa + cc}{d} + b + b$; multiply all

by *d*, and it will stand thus, $da - db = aa + cc + db + db$. 'Tis called by *Vieta*, *Isomeria*.

CONVERSION of Propositions, in Logick, is the changing of the Subject into the Place of the Predicate, and the Predicate into the Place of the Subject, and yet always retaining the same Quantity of both Propositions; as, Every Right-lined Triangle hath the Sum of its Angles equal to two Right ones; every Right-lined Figure that hath the Sum of its Angles equal to two Right ones, is a Triangle.

CONVEXITY, signifies any Protuberancy or swelling out of any thing; as Glasses are said to be *Convex*, when they are thicker in the Middle than at the Edges; or rather, when their Surface rises up regularly (so *Vitellio* defines it) above the Plane of the Base; as they are *Concave*, when the Surface sinks down regularly, or with a regular Curvity below it; so that the same Thing may be, and often is, *Concave* within, and *Convex* without.

Here follow some Properties of *Convex Glasses*.

1. If an Object be in the Focus of a *Convex* Glass, and the Eye on the other Side the Glass, the Object will appear erect and distinct.

2. If any Object be in the Focus of a *Convex* Glass, and the Eye in the opposite Focus on the other Side, it will appear under the same Angle, as if

if the Eye were in the Place of the Glass; and consequently the Distance being double in that Position of the Eye and Object, it will appear thro' the Glass magnified under an Angle almost double of what it would appear to the naked Eye; but the Eye can see no more of its Area than the Breadth of the Glass will permit.

Mr. *Molyneux*, in his *Diotrica Nova*, shews how to determine the visible Area of an Object in the Focus of a *Convex Glass* from the Distance of the Object, and of the Eye from the Glass, and the Glass's Breadth. P. 126. Prop. 34.

3. If an Object be farther from a *Convex Glass* than the Focus, and the Eye on the other Side be nearer than the distinct Base of the Glass, it will see the Object erect but confus'd; and it will be most confus'd when the Eye is placed in the distinct Base.

4. But if the Object being placed as before, the Eye be farther from the Glass than a distinct Base, it begins to see the Object *Inverted*, and at a due Distance distinct.

5. If the Object be nearer than the Focus, it will appear erect and distinct to an Eye placed on the other Side the Glass, at any Distance within the Eye's Power to discern it.

CONVICT, in the Common Law, is he that is found guilty of an Offence by the Verdict of a Jury: But *Crompton* says, that *Conviction* is either when a Man is Out-lawed, or appeareth and confesseth, or else is found Guilty by the Inquest.

CONVOCAION, is commonly taken for the General Assembly of the Clergy, to consult of Ecclesiastical Matters in Parliament; and as there are two Houses of Parliament, so there are two Places called *Convocation Houses*; the one called *The Higher*, where the Archbishop and Bishops sit severally by themselves; the other, *The Lower Convocation House*, where all the rest of the Clergy sit. An English *Convocation* or *Synod*, as it now stands for the Province of *Canterbury*, consists of a *President* (the Lord Archbishop) and 24 Bishops, 22 Deans, 53 Archdeacons, 24 Proctors of Chapters, 44 Proctors for the Diocesan Clergy, (2 for each Diocese) and one *Præcentor*. *Cowell's Interpreter*.

CONVOLUTION, is a winding or turning Motion, which is proper to the Trunks of some Plants; as the *Convolvulus* or *Bindweeds*, and to the Claspers of Vines and of *Briony*; and Dr. *Grew* thinks that all those Plants whose Roots are twisted, have such a *Convolution*; and he assigns two great Efficient Causes of this winding Motion, the *Sun* and the *Moon*: Methinks 'twere worth the while, as 'tis very easy, to try whether there be any such *Convolution* or not in the Trunks of Plants, which may easily be done, as he hints, by tying a little Bit of Paper to any of the Branches which are exactly *South*, *North*, &c. and then seeing whether it will change its Position or not, in respect of the Point of the Compass.

CONVOLVULUS: See *Iliac Passon*.

CONUS Fuserius, is a sort of Crucible made

to melt Iron or any other Metal. *Blanchard*.

CONUSANCE, the same with *Cognisance*.

CONUSANT, in the Common Law, signifies Knowing or Understanding; as if the Son be *Conusant*, and agrees to the Feoffment. *Cook* upon *Littleton*. Fol. 159. b.

CONVULSION, is a Motion whereby the Nerves, Muscles and Members are contracted or remitted against the Will, or without it, as in the *Cramp*, *Epilepsy*, &c. *Blanchard*.

CONVULSIVE Motions, are sudden and swift Concussions or Shakings that cease and return alternately.

COOK-Room, in a Ship, is variously seated in some, and generally in great Ships it is in the Fore-Castle; in some other Ships it is seated in the *Hatch-way*, upon the first *Orlope*; and for Ships of War (which are termed Men of War) it might most properly be there, in regard of Danger by Fire; and the freer Use of the Guns that lie in the Fore-Castle, especially if this *Cook-Room* (as some conceive) may be contrived to be moveable, and so in a Fight be struck down into the Hold of the Ship. But after all, I cannot apprehend how it can be otherwise placed than in the Fore-Castle in great Ships, by reason of the Multitude of Men, which require, necessarily, the dressing of much Meat, and as necessarily a large and private Room to dress it in.

COPERCENERS, or *Parceners*, in Common Law, are such as have equal Portions in the Inheritance of their Ancestors; and as *Littleton* in the Beginning of his Third Book, saith, *Parceners* be either by Law or by Custom; *Parceners by Law* are the Issue Female which (no Heir-Male being) come in Equality to the Lands of their Ancestors. *Parceners by Custom*, are those that by Custom of the Country challenge equal Part in such Lands; as in *Kenil*, by the Custom called *Gavel-kind*. This, amongst the *Feudists*, is called *Adequatio*.

COPERNICAN System, the same with the most Ancient or Pythagorean System of the World, which *Copernicus* revived; and it is since improved, and now generally adhered to by Astronomers, and is as follows.

1. The Sun is supposed to be placed in the Middle, very near the Center of Gravity of the entire System, in the common Focus of every one of the Planetary Orbits.

Next to him *Mercury*, in about three Months Time, describes his *Ellipsis*, and that so near, that we on the Earth rarely obtain a distinct View of him.

Next to *Mercury* is the *Elliptick Orbit* of *Venus*, whose Period is 7 Months $\frac{1}{2}$; and next to *Venus*, our Earth with its Attendant the *Moon* perform a joint Course, and measure out the Annual Period.

Next to the *Earth*, *Mars* alone, without any visible Guard or Satellite accompanying him, revolves about the same Center in about two Years Time.

Next to *Mars*, tho' at a mighty Distance from him, the largest of the Planets, *Jupiter*, with his four remarkable Satellites, takes his Round in 12 Years.

And Lastly, *Saturn* with his five little *Moons* about him, according to *Cassini*, describes in 30 Years time, the farthest and most remote Orbit; and compleats the intire Planetary *Chorus*, as the Figure represents.

Besides the Planets, whose Orbits are not very different from Circles, there are another *Species* of Bodies which are called *Comets*, revolving about the *Sun* in such *Ellipsis*, as may pass almost for *Parabola's*, they are so exceeding Eccentricall; but as regularly retaining their several Periods and Orbits as the Planets themselves, of which see *Comets*.

COPHOSIS, is a Deafness in the Ears. *Blanchard*.

COPIA Libelli deliberando, is a Writ that lieth, in Case when a Man cannot get the *Copy* of a Libel at the Hands of a Judge Ecclesiastical.

COPOS, is a Weariness of the Body, when the *Muscles*, or their *Fibres* rather, are loaden and obstructed with such viscous Humours, that they are rendred unfit for Motion. *Blanchard*.

COPPEL, or *Coppie*: See *Cuppel*.

COPROCRITICA, are Medicines which purge away the Excrement in the Guts. *Blanchard*.

COPULA, in *Logick*, is the Verb that connects any two Terms in an Affirmative or Negative Proposition; as God is Good, where (*is*) is the *Copula*. Riches alone make not a Man Happy, where (*make*) is the *Copula*.

COPULATIVE Propositions, are those that include several Subjects or several Attributes joyn'd together by an Affirmative or Negative Conjunction;

on; that is to say, *and* (not) or (*neither*;) For (*neither*) does the same thing as (*and*) in these sorts of Propositions, for that (*neither*) signifies (*and*) with a Negative, which falls upon the Verb, and not upon the Union of the two Words which it joins; as if I should say, *That Knowledge and Riches don't make a Man happy*: Here I unite Knowledge and Riches, affirming of both that they don't make a Man happy.

COPY-hold, is a Tenure for which the Tenant hath nothing to shew but the Copy of the Rolls made by the Steward of the Lord's Court; for the Steward as he doth inroll and make Remembrances of all other things done in the Lords Court; so he doth also of such Tenants as he admitteth into the Court, to any parcel of Land or Tenement belonging to the Mannor; and the Transcript of this is called *The Copy of the Court Roll*, which is all the Tenant taketh from him, and keeps as his own Evidence: This Tenure is call'd *A Base Tenure*, because it holdeth at the Will of the Lord: It is wont to be called *Tenure in Villanage* by some, who also say, that *Copy-hold* is but a new Name, yet it is not simply at the Will of the Lord, but according to the Custom of the Mannor: So that if a *Copy-holder* break not the Custom of the Mannor, and thereby forfeit his Tenure, he seemeth not so much to stand at the Lord's Curtesie for his Right, that he may be displaced hand over head at his pleasure. These Customs of Mannors be infinite, varying in one Point or other almost in every several Mannor.

First, Some *Copy-holds* are *fineable* at Will, and some *certain*: That which is *fineable* at Will, the Lord

Lord taketh at his Pleasure, but if it exceed two Years Revenue, the *Chancery*, *King's-Bench*, *Common-Pleas*, or *Exchequer*, may reduce them to Reason. That which is *certain*, is a kind of Inheritance, and called in many places *customary*, because the Tenant dying, and the *Hold* being void, the next of Blood, paying the customary Fine (as 2s. for an Acre, or such like) may not be denied his Admission.

Secondly, Some Copy-holders have, by Custom, the Wood growing upon their own Land, which by Law they could not have.

Thirdly, Copy-holders, some be such as hold by the *Verge* in ancient *Demesne*; and although they hold by Copy, yet are in Account a kind of *Free-holders*, for if such a one commit Felony, the King hath *Annum, Diem et Vestium*, as in the Case of *Free-hold*. Some other hold by *Common Tenure*, called *Meer Copy-hold*, and they committing Felony, their Land escheateth to the Lord of the Mannor.

COR, the Heart, is a fleshy *fibrous* Substance made up of several *Muscles* and *Tendons*; it has two *Auricles* or *Ears*, and as many *Ventricles*: the *Vena Cava*, or great Vein, is fasten'd to the Right *Auricle*, and the *Pulmonary Vein* to the Left; the *Pulmonary Artery* is join'd to the Right *Ventricle*, and the great *Artery* to the Left. It is clothed with a little *Membranous Bag*, called the *Pericardium*, wherewith it is joyned to the *Mediastinum*, and the *Diaphragm*; its Basis is upwards, and Point downwards, and it is placed in the Middle of the Chest amongst the Lobes of the Lungs. Its Use is to receive and disperse the Blood to all Parts in the Body. The Base of the Heart is environed round with a *Plexus* of Veins and Arteries.

Our Excellent Dr. *Lower* was the first that gave us the true Mechanical Structure of the Heart, and a very good rational Account of its Action: He explains the *Systole* of the Heart, by the natural Method of muscular Contraction; but in order to account for its *Diastole*, he hath recourse to a certain unaccountable Motion of *Restitution*, which seems not to be so well grounded.

The Heart being a single Muscle without an Antagonist, appears to be of the *Sphindler* kind; and *Borellus* in his *Oeconomia Animalis*, computes the Motive Power of a Man's Heart to be more than that of a Weight of 3000 lb. The Obstacles to the Motion of the Blood through the Arteries, he judges equivalent to 18000 lb. i. e. 6 times as much as the Power of the Heart: He estimates the Power of the *Elastick Coat* of the Arteries at 45000 lb. whose Adventitious Help to move the Blood being deducted, he leaves the Heart with a force, but of 3000 lb. to surmount a Resistance of 155000 lb. that is, with one to move 45; and this mighty Power in the Heart he ascribes to the Force of Percussion. Dr. *Drake*, in his Discourse of the Motion of the Heart in *Phil. Transact.* N. 280, supposes that Respiration hath a great Influence to assist it; and that even the *Systole* or *Constriction* of the Heart is occasioned in some measure by the help of the *Diaphragm* and *Intercostal Muscles*, by whose Means the Blood hath a Passage opened for it into the Lungs, which denied, would be an Invincible Obstacle: And he thinks also that the *Systole* is furthered by the Situation and Capacity of the Blood-Vessels of the Lungs, in the several Times of the Elevation and Depression of the Ribs; for by this Means a Passage is opened to the Blood to flow from the Right Ventricle of the Heart to

the Left thro' the Lungs, to which it could not otherwise pass; and the Opposition which the Blood contained in that Ventricle, must otherwise have made to its *Constriction*, is taken off. And thus the Dr. with great probability, supposes the *Systole* of the Heart to be much facilitated by the Action of the *Thorax*: But he saith, that neither the *Diaphragm* nor *Intercostal Muscles* can contribute any thing towards the *Diastole*, the Cause of which, be it what it will, must be equal to that of the Heart, the *Intercostal Muscles*, and the *Diaphragm*, to all which it acts as an *Antagonist*, dilating the Heart, as they constrict or close it. The Dr. thinks such a Power or Cause is not to be found any where in an Animal Body, and therefore it must be sought without it; and he concludes that this Cause is the Weight of the incumbent Atmosphere pressing upon the *Thorax* and other parts of the Body, which he proves from Mr. *Boyle's* Experiments upon Animals in *Vacuo*, where, as soon as the Pressure of the Incumbent Atmosphere is removed, the *Intercostal Muscles* and *Diaphragm* are contracted, and the Ribs elevated in an Instant, and can't by any Power of the Will be made to subside, till the Air is let in again to bear them forcibly down: And, as in the Elevation of the *Galle*, the Blood is in a manner solicited by the Passage now opened for it to flow into the Lungs; so in the Depression of them by the Subsidence of the Lungs, and the Contraction of the Blood Vessels (both which are consequent thereupon) the Blood is forcibly driven, as it were by an Embolus, through the *Pulmonary Vein* into the Left Ventricle of the Heart; and that, together with the general Compression of the whole Body, by the Weight of the Atmosphere, which surrounds, and gravitates upon the whole Surface of it, is that Power which causes the Blood to mount in the Veins, after the force impress'd upon it by the Heart is broken and spent, and which is sufficient to force the Heart from its Natural State to Dilatation. And thus by the Contraction of the Heart (the proper Action of all Muscles) and its Dilatation again this way, is the Circulation of the Blood set forward and kept going on.

COR, is by the *Botanists* used to signify the inward soft pithy and spongy part of any Tree or Plant, which they call also *Medulla* and *Materia Arboris*.

COR Caroli, an extraneostellated Star in the Northern Hemisphere, situated between the *Coma Barentis*, and *Ursa major*, so called in Honour of King Charles.

COR Hydra, a fix'd Star of the first Magnitude in the Constellation of *Hydra*; its Longitude is 142 deg. 49 min. Latitude 20 deg. 23 min.

COR Leonis: See *Regulus* or *Basilius*.

CORACORRACHIALIS, or *Coracobrachialis*, is a Muscle so called from its Origination and Insertion: It arises partly fleshy, and partly tendinous, from the Extremity of the *Processus Coracoides Scapulae*, and in its Descent it becomes larger, strictly adhering to the Internal Tendon its beginning of the *Biceps*; and parts from it near its Tendinous Insertion at the Middle of the Internal Part of the *Os Humeri*: Thro' this Muscle passes a large Nerve, wherefore by some it is called *Perforatus*. When at rest, the Arm is moved upwards, and turned somewhat obliquely outwards.

CORACOHYOIDES, are Muscles which proceed from the Process of the Shoulder-bone, call'd

Coracoides, and go on as far as the Bone *Hyoides*; their Use is to move obliquely downward.

CORACOIDES, is the Process of the Shoulder-blade, in form of a Beak.

CORAM non Judice, is a Term in the Common Law, when a Cause is brought into a Court wherein the Judges have no Jurisdiction.

CORBEILS, in Fortification, are little Baskets about a Foot and a half high, eight Inches broad at the bottom, twelve at the Top; which being filled with Earth, are frequently set one against another upon the Parapet, or elsewhere, leaving certain Port-holes, from whence to fire upon the Enemy under Cover, without being seen by them.

CORD, in Geometry: See *Chord*.

CORDAGE at Sea, signifies in general all the Ropes belonging to the Rigging of a Ship.

CORDIALIA, are Medicines which are commonly thought to strengthen the Heart; but they only put the Blood into a fine gentle Fermentation, which corroborates and facilitates the Motion of the Heart. *Blanchard*.

CORDON, in Fortification, is a Row of Stones made round on the outside, and set between the Wall and the Fortrefs which lies in *Talu*, or a Slope, and the Parapet which stands perpendicular after such a manner, that this Difference may not be offensive to the Sight; so that those *Cordons* serve only as Ornaments ranging round about the Place; neither are they used but in Fortifications made of Mason's Work, the void Space being filled up with pointed Stakes in those that are raised with Earth.

CORDS, in Musick, properly signifies the Strings of a Harp, Violin, Lute, or any other Musical Instrument: But the Term is also applied to denote the Sounds which proceed from such Instruments, even from those that have no Strings.

CORINTHIAN Order of Architecture, is so called from *Corinth*, the Place of its Invention. It observes the same Measure with the *Ionick*, and the Difference between them is chiefly in the *Capital*. See *Order and Column*.

Vitruvius makes the Height of the *Capital* to be two Modules, and this he divides into seven parts, of which the first is for the *Abacus*, and the other six downwards are for the Ornament.

CORNACHINE Powder, the same with what is sometimes called the *Earl of Warwick's Powder*, and by Foreign Writers frequently *Pulvis de tribus*; it is a purging Powder made of equal parts of *Antimonium Diaphoreticum*, *Diagridum*, and *Cream of Tartar*.

CORNEA Luna: See *Luna Cornea*.

CORNEA Oculi Tunica, which is also called *Sclerotes*, and *Dura*, the hard Tunick, proceeds from a Tunick in the Brain called *Dura Meninx*; it is pellucid forwards, that it may transmit the visible Species: Its Sides are covered with the *Albugineous Tunick*; inwardly it contains the *Aqueous Humour*.

CORNICHE, or as we pronounce it, *Cornish*, in Architecture, is the third and highest part of the *Entablature*, and is commonly used to signify the uppermost Ornament of any Wainscot, &c. In reference to the *Pillar*, 'tis different according to the different Orders of Architecture. In the *Tuscan* 'tis without Ornaments, and this *Pillar* of all others hath the least Mouldings. The *Doric*

is adorn'd with *Dentils* like the *Ionick*, and which sometimes hath its Mouldings cut into it. The *Corinthian* *Pillar* hath of all others the most Mouldings, and those very often cut with *Modillions*, and sometimes *Dentils*. The *Composite* hath its *Dentils* and its Mouldings cut, with its Channels or Chamferings under its *Plafond*.

CORNICULARIS Processus: See *Ancyroides*.

CORNICULATE Plants and Herbs, are such as after each Flower produce many distinct and horned Seed-pods; which Seed-vessels are called *Silique*: This kind is called also *Multisiliquous*; such as the *Sedum* or *Sempervivum*, *Telephium*, *Sedum Stellatum*, *Juncus Floridus*, *Helleborus Niger*, *Fra-xinella*, *Aconitum* (or *Napellus*) *Aquilegia*, *Delphinium*, *Peonia*, *Caltha Palustris*, *Althea Lutea*, &c.

CORNISH Ring of a Gun, is the next from the Muzzle Ring backwards: See *Ordinance*.

CORNUA Uteri, are two lateral parts of the Womb in some Brutes, as Cows, Harts, Sheep, Goats, &c. yet some Authors have attributed the same parts to a Woman's Womb from something which imitates them there; for at the Sides of the Bottom of the Womb, there is a sort of *Protuberance* on both Sides, where the *Vasa Deferentia* are inserted; yet a Woman's Womb is rarely *Bipartite*, as it is in Brutes.

CORODIO Habendo, is a Writ whereby to exact a *Corody* of an Abby, or Religious House.

CORODY Habendo, in Common-Law, signifies a Sum of Money, or Allowance of Meat, Drink, and Cloathing, due to the King from an Abby, or other House of Religion, whereof he is Founder, towards the reasonable Sustainance of such a one of his Servants, being put to his *Pension*, as he thinketh good to bestow it on. And the Difference between a *Corody* and a *Pension* seems to be, That a *Corody* is allowed towards the Maintenance of any of the King's Servants that liveth in an Abby: a *Pension* is given to one of the King's Chaplains, for his better Maintenance in the King's Service, until he may be better provided of a Benefice. It appears in *West. 2. Cap. 25*. That an Assize shall lie for a *Corody*; and in others, That *Corodies* belonged sometimes to Bishops from Monasteries; and also, That a *Corody* may be due to a common Person, by Grant from one to another; or of common Right, to him that is a Founder of a Religious House, not holden in *Franc-Almoine*, for that Tenure was discharged of all *Corodies* in it self. And a *Corody* is said to be either certain or uncertain, and that it may be for Life, for Years in Tail, or in Fee.

COROLLARY or Consequary, is an useful Consequence drawn from something which hath been already advanced or demonstrated; as if from this, viz. That a Triangle which has two equal sides, has also two Angles equal; you should draw this Consequence, That a Triangle which has the three Sides equal, has also its three Angles equal.

CORONA, in Architecture, is properly the flat and most advanced part of the Cornice, called by the French *Larmier*, and by us the *Drip*, because it defends the rest of the Work from Wind and Weather; but it is often taken by *Vitruvius* for the whole Cornice.

Corona, or the Flat-Crown, is also a particular Member in the *Doric* Gate, made by so extraordinary an Enlargement of the *Larmier* or *Drip*, that it hath six times more breadth than Projection. This sort of *Corona* is nowhere found amongst

mongst the Ancients, except only in the Writings of *Viruvius*.

CORONA Borealis, or the Northern Garland, a Constellation in the Northern Hemisphere, consisting of about 20 Stars.

CORONA Meridionalis, a Southern Constellation consisting of 13 Stars.

CORONALE: See *Frontis*.

CORONALIS Sutura, is a Cleft in the Head made like a Comb, and joins as if the Teeth of two Saws were closely compacted into one another: It is placed in the upper Part of the Skull from one Temple to another, and is circumscrib'd with the Bones of the Forehead, and that particularly called *Bregma*; in the Middle whereof the *Suture*, styled *Sagittalis*, is terminated.

CORONARIA Vasa, are the Veins and Arteries which surround the Heart to nourish it: They arise out of the *Aorta* before it comes out of the *Pericardium*; they encompass the *Basis* of the Heart like a Garland; in their Circuit send down divers Twigs length-ways of the Heart, and when they have encompassed the *Basis* and meet, they inosculate with one another, but not with the *Veins*.

CORONATORE Eligendo, is a Writ which, after the Death or Discharge of any *Coroner*, is directed to the Sheriff out of the *Chancery*, to call together the Free-holders of the County for the Choice of another *Coroner*; and to certify into the *Chancery* both the Election and Name of the Party elected, and to give him his Oath.

CORONE, is an Acute Process of the lower Jaw-bone, from its Likeness to the Beak of a Raven called *Rostriformis*, in the Form of a Beak.

CORONER, is an ancient Officer of this Land, so called, because he dealeth wholly for the King and Crown: There be four of them commonly in every County, and they are chosen by the Free-holders of the same upon Writ, and not by Patent. His Office especially concerneth Pleas of the Crown. There be also certain special *Coroners* within divers Liberties, as well as those ordinary Officers in every County; as the *Coroner of the Verge*, which is a certain Compass about the King's Court: And there are certain Charters belonging to Colleges and other Corporations, whereby they are licensed to appoint their *Coroner* within their own Precincts.

CORPORA Cavernosa Penis (by *D'Graaf* called *Nervosa*, and by others *Nervæ Spongiosa*) are two *Capsula* or oblong *Folliculi*, fenced every where without with a thick Membrane: They spring with two distinct Originals from the lower Side of the *Ossa Pubis*, whence stretching forwards, they meet one another, leaving an Intertice before their Conjunction, in which the *Urethra* is conveyed: Where they leave the *Ossa Pubis* they are each covered with a Membrane, and afterwards joined to each other by the Intervention of a *Septum Intermedium*, which, the nearer it comes to the Glans, is the more diminished.

CORPORA Olivaria: See *Olivaria Corpora*.

CORPORA Pyramidalia, are Protuberances of the under Part of the Brain; they are in Length of about an Inch.

CORPORA Striata, are Protuberances upon the *Crura Medullæ Oblongatæ*.

CORPORAL, is an inferior Officer in a Foot Company, who hath charge over one of the Divisions; places and relieves Centinels, and keeps good Order in the *Corps de Garde*: He receives the Word

of the Inferior Rounds that pass by his *Corps de Garde*.

CORPORATION, is a Body Politick authorised by the King's Charter, being of Capacity to take and grant, having a Common Seal, &c. These are constituted either by Prescription, by Letters Patent, or by Act of Parliament, and are either *Spiritual* or *Temporal*.

CORPOREITY, the School Term for the Nature of a Body.

CORPS de Garde, is a Post in an Army sometimes under Covert, sometimes in the open Air, to receive a Number of Men who are relieved from time to time to watch in their Turns for the Security of some more considerable Post; and it often also is taken for the Men thus watching, who are called the *Corps de Garde*.

CORPUS cum Causa, is a Writ issuing out of the *Chancery*, to remove both the Body and the Record touching the Cause of any Man lying in Execution upon a Judgment for Debt, into the *King's Bench*, &c. there to lie till he have satisfied the Judgment.

CORPUS Callosum, is the upper Part or Covering of a Space made by the joining together of the Right and Left Side of the internal Substance of the Brain. This Space forms the three Ventricles or *Fornamen Ovale*, and its Bottom is the Internal Substance of the two Sides of the *Cerebrum* gather'd as it were into two Bundles, and are called the *Crura* of the *Medulla Oblongata*.

CORPUS Glandulosum, the same with the *Prostata*.

CORPUSCLES, in Natural Philosophy, signify the Minute Parts, or Particles, or Physical Atoms of a Body; and by this Word is not meant *Elementary Parts*, nor the *Hypothetical Principles* of the Chymists, but such Particles; whether of a simple or compounded Nature, whose Parts will not be dissolved, disjoined, or dissipated by ordinary Degrees of Heat.

And that way of Philosophizing which endeavours to explain things, and to give an Account of the *Phænomena* of Nature by the Motion, Figure, Rest, Position, &c. of Corpuscles or Minute Particles of Matter, is by the Honourable Mr. Boyle called very properly the

CORPUSCULAR Philosophy; which was so very Ancient, that both before *Epicurus* and *Democritus*, and even before *Leucippus* taught in Greece, there was a *Phænician* Philosopher that explained Natural *Phænomena* by the Motions and Affections of the Minute *Corpuscles* of Matter, as very old Writers inform us: and therefore this kind of Philosophy should rather be called *Phænician* than *Epicurean*.

The chief Principles of the *Mechanical Hypothesis* or *Corpuscular Philosophy*, Mr. Boyle sums up in these Particulars:

1. They suppose that there is but one Catholick or Universal Matter, which is an extended, impenetrable and divisible Substance common to all Bodies, and capable of all Forms.

2. That this Matter, in order to form the vast Variety of Natural Bodies, must have Motion in some or all its designable Parts; and that this Motion was given to Matter by God the Creator of all things, and has all manner of Directions and Tendencies.

3. Matter must also actually be divided into Parts, and each of these Primitive Particles, Frag-

ments or Atoms of Matter must have its proper Magnitude or Size, as also its peculiar Figure and Shape.

4. They suppose also, that these differently siz'd and shap'd Particles may have as different *Orders* and *Positions, Situations* or *Postures*, from whence great Variety may arise in the Composition of Bodies.

CORRECTOR of the *Staple*, is a Clerk belonging to the *Staple* that Writeth and Recordeth the Bargains of Merchants made there.

CORRIDOR, in Fortification, is the *Covert-way* lying round about the whole Compass of the Fortifications of a Place, between the Outside of the Moat and the Pallisado's.

CORROSIBILITY, is the Power of being corroded, eaten or dissolved by any *Corrosive Menstruum* or Liquor; and the Honourable Mr. Boyle reckons these Qualifications necessary to render any Body *Corrosible*:

1. That it be furnished with Pores of such a Bigness and Figure, that the *Corpuscles* of the *Menstruum* or *Solvent* may enter them, and yet not be much agitated in them, without also giving brisk Knocks or Shakes to the solid Parts which constitute the Pores or Cavities: For sometimes, though the Pores of a Body may be large enough to let in some gross *Corpuscles*, yet if these, for want of Solidity or Rigidity, are too flexible, or are of an *Incongruous Figure* to those Pores, a Dissolution may not ensue; as it happens when pure Spirit of Wine is in the cold put upon Salt of Tartar; or when *Aqua Fortis* is put upon powdered Sulphur.

2. That its consistent *Corpuscles* be of such a Bulk and Solidity as doth not incapacitate them from being disjoined by the Action of the insinuating *Corpuscles* of the *Menstruum*.

3. That the Cohesion of the Parts of the *Corrodible* Body be not so strict, as that they are not separable by the Action of the Dissolvent.

CORROSIO *Chymica*, is a Dissolution of mixed Bodies by *Corrosive Menstruums*.

CORROSIVE *Medicine*, is one that has a Power of Corroding, as Lime, *Lapis Infernalis*, and other Canteries.

CORROSIVENESS, is the Quality that some Liquors which are called *Menstruums*, have of dissolving or corroding Bodies.

And the Attributes or Qualifications which seem proper to render any Liquor *Corrosive*, Mr. Boyle, in his Mechanical Original of this Quality, reckons to be such as these:

1. That the *Menstruum* or dissolving Liquour consist of, or abound with such Particles as are not too big to get in at the Pores or Commissures of the Body to be dissolved; nor yet so small, as readily to pass through them, as the Rays of Light do through Glass; nor must they be unable, by reason of their great Slenderness and Flexibility, to disjoin the Parts they invade.

2. That these *Corpuscles* be of a Shape fitting to insinuate themselves more or less into the Commissures or Pores of the Body, in order to dissociate its solid Parts.

3. That these Particles have also a competent degree of *Solidity*, in order to disjoin the Particles of the Body to be dissolved: And this Solidity differs much from the Bulk of the *Corpuscles* mentioned in the first Requisite; for one thing may be much more solid than another, tho' it have, as to Bulk,

the same Dimensions: Thus the Stalk of a Plant may be as big as a small Iron or a Steel Rod, but the Latter is much silder than the Former.

4. That the Particles of the *Menstruum* be Agile, and advantaged for Motion, in respect of their Shape, or their Smallness, or their Fitness, to have their Action befriended by the Pressure of the Atmosphere, which may help to drive them into the Pores of Bodies, or by the Agitation which these intruding Particles may be fitted to receive in those Pores by the Transcurion of some subtle *Aethereal* Matter.

CORRODENTIA: *Corroding* things, are things which eat up and consume Excremental Flesh with their sharp *Partioles*. Blanchard.

CORRUGANT *Muscles*, according to some, are those that help to knit the Brows when one frowns; but they seem to be only a Part of the *Frontal Muscles* that have their Fibres running in this Place somewhat obliquely.

CORRUGATOR *Supercilii*, is by some Anatomists reckoned as a Muscle of the Eye-brows, helping to knit them when we frown; but it seems to be only a Part of the *Frontal Muscles*, having Fibres in this Place a little oblique.

CORRUPTION, is the Destruction, Extinction, or, at least, the *Cessation*, for a Time, of the proper Mode of Existence of any Natural Body: For whenever any Body loses all, or any of those Accidents which are essentially necessary to the constituting it of such a kind, it is then said to be corrupted or destroyed, and loses its former Denomination, being not now a Body of the Kind it was before. But, as in *Generation*, nothing *Substantial* is produced, so here nothing *Substantial* is lost or destroyed, but only that Modification of the Body which was its Form, and made it be of such a *Species*.

CORTICAL *Part of the Brain*, is the outward Substance of the Brain, full of *Labyrinths* and *Meanders* in the Outside; it is covered with a thin Skin, and is of an Ash-grisly Colour, being, as *Malpighius* saith, only an Heap of little Oval Glands, and full of little Vessels; inwardly the *Medullary Substance* is next to it. Its Use is thought by some to be for the generating Animal Spirits from the Blood, and hence they are conveyed by the *Medullary Substance* to the *Nerves*, and distributed through the whole Body: And the Seat of the Memory and Sleep is placed there by many Anatomists.

CORTIN, in *Fortification*, signifies the Wall or Distance between the Flanks of two Bastions.

CORUSCATION or *Flashing*, is (by the *Cartesians*) an Exhalation spread under a Cloud, which rushing downwards is set on Fire and flasheth.

CORVUS, a Southern Constellation in the Heavens, consisting of seven Stars.

CORYMBUS, in general, signifies the Top of any thing; but among the old Writers about Plants, *Corymbi* were the Bunches or Clusters of Ivy Berries: Some also call the Top of the Stalk of a Plant, when 'tis so subdivided and adorned with Flowers or Fruits that it makes a round Spherical Figure, by this Name *Corymbus*, as the Tops of Leeks, Onions, and of the *Sambucus Aquatica*, &c. and others confound the Word with *Umbella*, which expresses the Flowry Top of such Plants as have their Branches and Flowers spread round into the Form of what our Women now call an *Umbrella*.

But

But among our Modern Botanists it is used for a compounded discous Flower, whose Seeds are not *Pappous*, or do not fly away in Down; such are the Flowers of *Daisies*, *Corn-Marygold*, &c. and therefore the Accurate Botanist Mr. Ray makes one large Genus of Plants to be such as have a compound discous Flower, but without any downy Wings to carry off their Seeds, and these he properly calls

Corymbiferous Plants; and these he distinguishes into,

1. Such as have a Radiate Flower, as the *Flos Solis*, *Calendula*, *Galba*, *Flos Africanus*, *Chrysanthemum*, *Sagetum*, *Butyphalum*, *Pranica*, *Abinthium Umbelliferum*, *Millefolium*, *Bellis Major* & *Minor*, *Parthenium*, *Chamamelum*, &c.

2. Such as have a Naked Flower, as the *Abrotanum Femina*, *Eupatorium Cannabinum femina*, *Cofus Hortorum*, *Ageratum*, *Abinthium*, *Artemisia*, &c.

To which he adds such as he calls

Corymbiferis Affines, i. e. such Plants as seem akin to the *Corymbiferous* Kind, as *Scabiosa*, *Dipsacus*, *Carduus*, *Spherocephalus*, *Eryngium*, &c.

CORYPHE, is the Crown of the Head; also the interior Extremity of the Fingers near the Nails. *Blanchard*.

CORYZA or *Gravedo*, is a Diffusion of a sharp, salt, and thick Humour into the Mouth, Lungs, and Nostrils, from the *Ventricles* of the Brain by the *Olfactory Nerves*; for when it grows thick, it can neither be *Percolated* by the Reins, nor pass from the *Pituitary Glandule* through the *Infundibulum* into the *Veins*, and therefore it distils into the Nostrils by the aforesaid *Nerves*. *Blanchard*.

CO-SECANT, is the Secant of an Arch which is the Complement of another to 90° .

CO-SINE, is the Right Sine of an Arch, which is the Complement of another to 90 Degrees.

COSENAGE, or *Cognations*, is a Writ that lies where the great Grandfather is seized in his Demefne, as of Fee, at the Day of his Death, of certain Lands and Tenements, and dieth, and then a Stranger entreth and abateth; for then shall his Heir have this Writ of *Cosenage*.

COSHERING, in the Feudal Laws; as there were many Privileges inherent by Right and Custom, so were there several then grievous Exactions imposed by the Lords, by a sort of Prerogative or Seigniorial Authority, as to lie and feast themselves and their Followers (called *Coshering*) at their Tenant's Houses.

COSMETICKS, are Medicines which whiten and soften the Skin, or, in general, any thing that helps to promote the External Beauty or good Appearance of the Person that useth it.

COSMICAL, a Term in Astronomy, expressing one of the Poetical Risings of a Star; for a Star is said to *rise Cosmically*, when it rises together with the Sun, or with that Degree of the *Ecliptick* wherein the Sun then abides; and the *Cosmical Setting*, is when a Star sets and goes down in the

West, at the same time as the Sun rises in the East.

COSMOGRAPHY, is a Description of all the several Parts of the visible World, delineating them according to their Number, Positions, Motions, Magnitudes, Figures, and their other Properties. The Two Parts of which are *Astronomy* and *Geography*.

COSSE and *Coffick*, the old Word for *Algebra*.

COST, (in the Plural Number *Cotizes*) a Term in Heraldry, signifying a fourth Part of a *Bend*.

COSTÆ, the Ribs, are those Bones which, with other Parts, makes the *Chest* or *Thorax*; Backward they are connected with the *Vertebre* of the Back; Forward with the *Cartilages* of the Breast Bone: They are Twelve in number on each Side, the Seven upper are called *Costa Vera*, *True*, because their Cartilaginous Ends are received into the *Sinus* of the *Sternum*; the Five lower *Spurious*, because they are shorter and softer; the broader Part of the Rib is called *Palmula*, the straighter towards the *Vertebra*, *Remulus*. The Ribs are crooked like the Segments of Circles, and grow flat and broad as they approach the *Sternum*, but nearer the *Vertebra* they are rounder and thicker, and at those Ends have each a round Head, which being covered with a Cartilage, is received into the *Sinus* in the Body of each *Vertebra*; and at the Neck of each Head there is a small Tubercle, which is also received into the *Sinus* of the Transverse Processes of the *Vertebra*; and as they are thus articulated, the Ribs make an Acute Angle with the lower *Vertebra*. Each one hath a small Canal or *Sinus* running along the under Side, in which lies a Nerve, Vein and Artery: Their Extremities, which are fastened to the *Sternum*, are Cartilaginous, and the *Cartilages* make an Obtuse Angle with the Bony Part of the Rib. These *Cartilages* are harder in Women than Men, that they may the better sustain the Weight of the Breasts.

Dr. Keil observes very well in his *Anatomy*, P. 227. That if the Ribs had been articulated with the Bodies of the *Vertebra* at Right Angles, the Cavities of the Thorax could never have been enlarged in breathing: If each Rib had been a rigid Bone articulated at both Ends to two fix'd Points, the whole Chest had been immoveable. If the Ribs had not been articulated to the Transverse Processes of the *Vertebra*, the *Sternum* could not have been thrust out to that Degree it is now, nor the Cavity of the Thorax increased so much as is requisite in Inspiration; for when the Ribs are pull'd up by the Intercostal Muscles, the Angle which the Cartilages at the *Sternum* make with the Bony Part of the Rib, must be increased, and consequently its Subtense, or the Distance between the *Sternum* and the Transverse Processes, lengthened. Now because the Rib can't move beyond the Transverse Process, on the account of its being articulated with it; therefore the *Sternum* must either be thrust to the other Side, or else outwards: It cannot move to the other Side, because of an equal Pressure upon the same Account there, and therefore 'tis thrust outwards, or the Distance between the *Sternum* and the *Vertebra* is increased: The last Ribs, which do not reach the *Sternum*, and consequently conduce nothing to this Action, are not articulated with the Transverse Processes.

If we suppose the Cavity of the *Thorax* to be half a *Spheroid*, whose *Semi-Axis* is equal to the Height

Height of the *Thorax*, or about 15 Inches, and the Diameter of its greatest Circle 12 Inches, then the Cavity of the *Thorax* will contain about 1130 Cubick Inches; but in an easy Inspiration the *Sternum* is raised $\frac{1}{10}$ of an Inch (as I am assured by an exact Experiment) and therefore on that Account the *Thorax* is enlarged to the Capacity of 1150 Cubick Inches. To this, if we add the Space which the Diaphragm leaves, which is the Segment of a Sphere, whose Diameter is about 15 Inches, and the Solidity of that Segment 183 Inches, we shall have 22 Inches more, if the Diaphragm descends but one Inch; but if it descends an Inch and $\frac{1}{2}$, it then leaves room for 32 Inches of Air more to enter; and if it descends two Inches, the Cavity of the *Thorax* will be increased on the Account of the Motion of the Diaphragm alone to 86 Inches; so that in the least Inspiration which we can fairly suppose, the Lungs are distended with 42 Inches of Air, and sometimes may receive above 70 or 100.

CO-TANGENT, is the *Tangent* of an Arch, which is the Complement of another to 90 Degrees.

COTYLE, the same with *Acetabulum*, is the Cavity of the Huckle Bone, which is appointed to receive the Head of the Thigh Bone.

COTYLEDON, the same with *Cotyle*.

COTYLEDONES, or *Acetabula Uterina*, are Glandules dispersed up and down the utermost Membrane investing the *Fetus*, called *Chorion*, which separate the *Nutritious Juice* from the Womb to nourish the *Fetus*; but this is found only in some Animals; the *Placenta* in the Womb supplies their Place in Women: The gaping meeting of the Veins in the Womb also are called *Cotyledones* and *Acetabula*: These Glandules are so called from the Resemblance they bear to the Leaves of the Herb *Pennywort*, in Latin *Cotyledon*.

COUCHANT, the Term in Heraldry for a Lion born in any Coat of Arms, lying on his Belly, but with his Head erect.

COVENANT, is the Consent of two or more to one thing, to do or give somewhat. *Covenant* is either in *Law* or in *Fact*: A *Covenant in Law*, is that which the Law intendeth to be made, though in Words not to be expressed; as if the Lessee do demise or grant, &c. to the Lessor for a certain Term, the Law intendeth a *Covenant* on the Lessor's Part, that the Lessee shall quietly enjoy his Lease for his Term against all Incumbrances.

Covenant in Fact, is that which is expressly agreed between the Parties. There is also a *Covenant Real*; and a *Covenant merely Personal*; A *Covenant Real* is that whereby a Man tieth himself to pass a thing *Real*, as Lands or Tenements, as a *Covenant* to levy a Fine or Land, &c. A *Covenant merely Personal*, on the other Side, is where a Man covenanteth with another by Deed to build him a House, or any other thing, or to serve him, or to infeof him, &c.

COVENANT is also the Name of a Writ: See *Convoention*.

CO-VERSED *Sine*, is the remaining Part of the Diameter of a Circle, after the Versed Sine is taken from it.

COVERTURE, in Law, is particularly applied to the Estate and Condition of a married Woman, who, by the Laws of our Realm, is *sub potestate viri*, and therefore disabled to make Bargains with any, to the Prejudice of her Self or her

Husband, without his Assent and Privy, or at least without his Allowance and Confirmation; and if the Husband alien the Wife's Lands during the Marriage, she cannot gainsay it during his Life.

COVERT-WAY, in Fortification, is a Space of Ground level with the Field, on the Edge of the Ditch three or four Fathom broad, ranging quite round the Half-Moons and other Works toward the Country: It is otherwise called *Corridor*, and hath a Parapet raised on a Level, together with its *Banquets* and *Glacis*, which from the Height of the Parapet ought to follow the Parapet of the Place till it is insensibly lost in the Field: It hath also a Foot Bank. One of the greatest Difficulties in a Siege is to make a Lodgment on the Covert-way, because usually the Besieged Pallisade it along the Middle, and undermine it on all Sides: This is sometimes called, and that commonly, the *Counter-scarp*, because 'tis on the Edge of it.

COVINE, (in Law) is a deceitful Assent or Agreement between two or more, to the Prejudice of one another.

COUNT, (in Law) signifies as much as the Original Declaration in a Process, though more used in Real than in Personal Actions, as Declaration is more apply'd to Personal than Real.

COUNT-WHEEL, is a Wheel in the striking Part of a Clock, moving round once in 12 or 24 Hours: It is by some called the *Locking Wheel*, because it hath commonly 11 Notches in it at unequal Distances from one another, in order to make the Clock strike 1, 2, 3, 4, &c. 'tis driven round by the *Pinion of Report*.

COUNTER-APPROACHES, in Fortification, are Works made by the Besieged to hinder the Approach of the Enemy; and when they design to attack them in Form.

COUNTER-BATTERY is one raised to play against another.

COUNTER-BREAST-WORK, a Term in Fortification, the same with *Falſe Bray*.

COUNTER-CHANGED, is a Term in Heraldry, when there is a *mutual changing* of the Colours of the Field and Charge in an Escutcheon, by Reason of one or more Lines of Partition. Thus in the Coat of the Famous Chaucer, he beareth *Party per Pale*, *Argent* and *Gules*, a Bend *Counter-changed*, i.e. that Part of the Bend which is in that Side of the Escutcheon which is *Argent*, is *Gules*, and that Part of it which is in the other Side, is *Argent*.

COUNTER-COMPONED, the Herald's Term for a *Bordure*, or any Ordinary which hath two Rows only of *Checkers* of two different Colours; but when it hath three or more, they call it *Checky*.

COUNTER-FORTS, are certain Pillars and Parts of the Walls of a Place, distant from 15 to 20 Foot one from another, which are advanced as much as is possible in the Ground, and join'd to the Height of the *Cordon* by Vaults to support the Way of the Rounds and Part of the Rampart; as also to fortify the Wall, and strengthen the Ground; nevertheless they are not at present much used, except in large Fortifications.

COUNTER-FUGUE, in Musick, is when the *Fugues* proceed contrary to one another.

COUNTER-GUARDS, or *Envelopes*, in Fortification, are large Heaps of Earth in Form of a Parapet, raised above the Moat before the Faces and the Point of the Bastion to preserve them; and then they consist of two Faces, making an Angle Salient, and parallel with the Faces of the Bastion. If they are designed to cover one of the Faces of the Bastion, they are shaped like a Demi-Bastion, with a Parapet on the Face and Capital, but none on the Flank, which must lie open and be exposed to the Fire of the Place; but there are few Places now fortified after this Manner by reason of the excessive Charge it requires.

COUNTERMAND, is where a thing formerly executed, is afterwards, by some Acts or Ceremony, made void by the Party that had first done it.

COUNTER-MARCH, in the Art of War, signifies changing the Face or the Wings of a *Battalion*, and this is done either by *Files* or by *Ranks*.

COUNTER-MARCH by *Files*, is when those Men that are in the Front of the Battalion, go into the *Rear*.

COUNTER-MARCH by *Ranks*, is when the Wings or Flanks of the Battalion change Ground with one another.

COUNTER-MINE, in Fortification, is a Subterraneous Passage made by the Besieged in search of the Enemy's Mine, to give Air thereto, to take away the Powder, or by any other Means to frustrate the Effect of it, though it should even happen to be fired by the Assailants.

COUNTER-PART, a Term in Musick, only denoting one Part to be opposite to another; as the *Bass* is said to be the *Counter-part* of the *Treble*.

COUNTER-PASSANT; when two Lions are born in a Coat of Arms, and one appears to be passing or walking quite the contrary way with the other, the Heralds call it by this Term *Counter-passant*.

COUNTER-PLEA, in Common Law, signifies that which the Demandant alledgeth against a Tenant in Courtsey or in Dower, who prayeth in Aid of the King; or him who hath the Reversion for his better Defence.

COUNTER-POINT, in Musick, is a Term whereby is understood the old Manner of composing Parts, before Notes of different Measure were invented; which was to set Pricks or Points one against another to denote the several Concords; the Length or Measure of which Points was sung according to the Quantity of the Words or Syllables whereto they are apply'd; so that in regard that in composing our Descant we set Note against Note, as the Ancients did Point against Point; the Term *Counter-point* is still retained in these Compositions.

COUNTER-SAILIENT, is when two Beasts are born in a Coat of Arms in a Posture of leaping from each other directly the contrary way.

COUNTERSCARP, in Fortification, is that Side of the Ditch which is next the Camp, or properly the *Talus* that supports the Earth of the *Covert-way*; although by this Term is often understood the *whole Covert-way*, with its *Parapet* and *Glacis*; and so it is to be understood when 'tis said, *The Enemy lodged themselves on the Counterscarp*.

COUNTER Swallow's Tail, is an Out-work in Fortification, in the Form of a single Tenaile, wider next the Place, *i. e.* at the Gorge, than at the

Head, or next the Campaign: The Sides of this *Counter Swallow's Tail* are not so well flank'd from the Place as those of the *true Swallow's Tail*, and therefore 'tis not so good.

COUNTER-TENOR, one of the mean or middle Parts of Musick, so called as it were opposite to the *Tenor*.

COUNTER-TRIPPING; when two Staggs, or other Beasts, are born in a Coat of Arms tripping, *i. e.* in a walking Posture, and the Head of one is to the Tail of the other, the Heralds say they are *Counter-tripping*.

COUNTERS, are Two Parts of a Ship; the *upper Counter* is reckoned from the Gallery to the lower Part of the straight Piece of the *Stern*: The *lower Counter* is between the Transom and lower Part of the Gallery.

COUNTING-HOUSE, in the King's Household: See *Green Cloth*.

COUNTY-COURT, is a Court held every Month by the *Sheriff*, or his Deputy the *Under Sheriff*.

COUPED, is the Herald's Word for any thing in an Escutcheon which is born, cut clear and evenly off, in opposition to its being torn off, which they call *Eraled*: Thus the Arms of *Ulster* which all Barons carry, is a Dexter Hand *Couped* or cut off at the Wrist.

COUPLE Close, a Term in Heraldry, signifying the fourth Part of a *Chevron*: These are never born but in Pairs, except a *Chevron* be between them, saith *Guillem*, but *Bloom* gives us an Instance to the contrary.

COURSE, in Navigation, is that Point of the Compass or Coast of the *Horizon* on which the Ship is to be steered from Place to Place; or rather the Angle between the *Rumb-Line* and the *Meridian*.

COURSES, in a Ship, are her *Main-sail* and *Fore sail*; when the sails under them only without lacing on any Bonnets, they say then she goes under a *Pair of Courses*.

COURT, is a Word that has divers Significations, but in Law 'tis the Place where Justice is judicially administered, of which you find Thirty Two several sorts in *Crompton's Book of Jurisdictions*, well described, and of them most are *Courts of Record*; some be not, and therefore are accounted *Base Courts*, in Comparison of the rest. Besides these, there are also *Courts Christian*, which are so called, because they handle Matters especially appertaining to Christianity; and such as, without good Knowledge in Divinity, cannot be well judged of; and therefore the Judges are Divines, as Archbishops, Bishops, Archdeacons, and the like.

COURT-BARON, is a Court that every Lord of a Mannor hath within his own Precincts: And this Court is twofold; as if a Man having a Mannor in Town, to grant the Inheritance of the Copyholders thereunto belonging to another; this Grantee may keep a Court for the Customary Tenants, and accept Surrenders to the use of others, and make both Admittances and Grants. The other Court is of Free-holders, which is properly called the *Court Baron*, wherein the Suitors, that is, the Free-holders, be Judges, whereas of the other, the Lord or his Steward is Judge.

COURT of Chivalry, or the *Marshal's Court*; the Judges are the *Lord High Constable* and the *Earl Marshal* of England. This Court is the Fountain of Martial Law, and the *Earl Marshal* is not only

all of which may be good *Aperitives*; tho' many assert the giving Filings in Substance, is as good a Way as any.

CROCUS Martis Afringens, Binding Saffron of Steel, is the Filings of Iron deprived of their more Saline Parts, which is done by washing them 5 or 6 times in strong Vinegar, and then calcining them 5 or 6 Hours in a strong Fire in a Pot, or upon a Tile. There are many other ways of preparing this *Astringent Crocus*, but this is a very good one.

CROCUS Metallorum, is a kind of Impure and Opaque Glass of Antimony, of a Liver Colour, whence often called *Hepar*, or Liver of Antimony, made by firing equal Parts of Powder of Antimony, and Salt Petre well mix'd, in an Iron Mortar covered with a Tile. 'Tis kindled by dropping in a Coal of Fire, a great Detonation ensues, which when over, strike the Mortar to make the Matter fall to the Bottom: The shining Part is the *Crocus* or Liver, which must be separated from the Dross, washed and kept for use. Of this usually is made the *Emetick Wine*, or *Vinum Benedictum*, by infusing an Ounce of the *Crocus* powdered, in a Quart of Wine for 24 Hours.

CRONICAL: See *Acronical*.

CROSS, one of the Honourable Ordinaries in Heraldry, containing one fifth of the Field. There is great Variety in its Form, according to the Lines that compose it; but a plain *Cross* is figured thus, by the Name of *Rainsford*. He beareth *Argent*, a *Cross Sable*.

Sometimes there is a Line drawn parallel to the Out-line of the *Cross*, and then the Field is supposed to appear through; this is called a *Cross voided*, and born thus,

He beareth *Argent*, a plain *Cross voided Azure*; and sometimes the *Cross* is couped as well as *voided*.

CROSS-Bar-Shot, is a round Shot or great Bullet, with a Bar of Iron put through it.

CROSS-LETTS, are little plain Crosses, whose Ends also bear the Form of a plain Cross. They are thus Figured, and are frequently born *Fitchee*, that is, pointed at Bottom: *Vid. Fitchee*.

CROSS-Staff, is an Instrument made of Box or Pear-Tree, commonly called the *Fore-staff*, because of taking forward Observations; and may be made also a *Back-staff*, by adding a fourth Vane and Sight. 'Tis used by Seamen to take the Meridian Altitude of the Sun or Stars, in order to find the Latitude; 'Tis also by some used in Surveying, to take *Angles*.

CROSS Jack, in a Ship, is a small Yard slung at the upper End of the Mizzen-Mast under the Top; it hath no *Haliards* nor *Tyes* belonging to it. Its Use is to spread and hale out the Mizzen-Top-Sail Sheets. This is also called the *Cross-Tree-Yard*.

CROSS Piece, is a great Piece of Timber going a-cross the *Bitts* of a Ship, and unto it is the Cable belayed when the rides at Anchor.

CROSS Trees, in a Ship, are 4 Pieces of Timber bolted and set into one another a-cross at the

Head of the Mast: Their Use is to keep and bear the Top-masts up; for the Foot of the Top-mast is always fastened into them. Those who are more nice, call only those two of these Timbers which go athwart Ships, the *Cross Trees*; and then the others they call the *Tressel Trees*.

CROSS Tree Yard, is a Yard standing square just under the Mizzen Top, and to it the Mizzen-Top-fail is fastened below.

CROSSIERS, are four Stars in form of a *Cross*, which serve to shew those that sail in the Southern Hemisphere, the *Antartick Pole*.

CROTAPHICK Artery, so some erroneously call the Tendon of the Muscle called *Crotaphites* or *Temporalis*.

CROTAPHITES: See *Temporalis*.

CROTAPHIUM, a Pain in the Head.

CROTCHET, a Term in *Musick*: See *Notes* and *Time*.

CROWN, in Geometry, signifies a plain Ring included between two concentrick Perimeters, and is generated by the Motion of some Part of a Right Line round a Center, the said moving Part not being contiguous to the Center.

The Area of which will be had, if you multiply its Breadth by the middle Perimeter; for a Series of Terms in Arithmetick Progression being $n \times \frac{a + e}{2}$, i. e. the Sum of the first and last multiplied by $\frac{1}{2}$ the Number of Terms, the middle Element must be $\frac{a + e}{2}$; wherefore that multiply'd by the Breadth or Sum of all the two Terms, will give the Crown.

CROWN-WHEEL, of a Watch, is the upper Wheel next the *Balance*, which, by its Motion, drives it; and this in *Royal Pendulums* is called the *Swing-Wheel*.

CROWN-WORKS, in Fortifications, are certain Bulwarks advanced towards the Field to gain some Hill or rising Ground, being composed of a spacious Gorge, and two Wings that fall on the *Counterscarp* near the Faces of the *Bastion*, so that they are defended by them, and present on the Side of the Field an entire *Bastion* between two *Demi-Bastions*, whose Faces look towards one another. Those Works have also their *Half-Moons*, and are raised only to take up and secure some large Space of Ground, or to defend the Head of a Camp when it is intrenched.

CROWNED Horn-work, is a *Horn-work* with a *Crown-work* before it.

CROW-FEET, in a Ship, are small Lines or Ropes put through the Holes of the *Dead Men's Eyes*, and divided by that Means into 6 or 10, or sometimes more Parts: They are of no use at all, but are there left hanging by the Boat-Swain to make a shew of small Rigging. They are placed at the Bottom of the Back-Stays of the Fore-Top-Mast, Mizzen-Top-Mast, and Gallant-Top-Mast.

There goes also a Rope divided into 2 or 4 Portions from the upper End of the Sprit-Sail-Top-Mast to the Fore-Top-Mast Stay, which they call the *Sprit-Sail Top-Sail Crow-Foot*.

CROWS-FEET, (called also *Callrops* and *Chausse Trapes*) are Irons so made with 4 Points of 2, 3 or 4 Inches long, that which way soever they fall, one Point may be uppermost; the shorter are to strow on Bridges, the longer on the Ground, to gall the Feet of a Body of Horse.

CRUCIBLE, is a Chymical Vessel made of Earth,

Thus, suppose 28 were proposed to be cubed, write it down so that there may be room to write

2 Figures between each Place; as,

If, the *Cube* of 2 or 8, is 8 or 800; then 3 times the Square of 2 (which is 12) multiply'd by 8, gives 96 = 3aab,

which place orderly under the 8, as you

see. Next, 3 times the Square of 8 is 192, and that multiply'd by 2 gives 384 = 3abb, which write also orderly, as you see: And lastly, the *Cube* of 8 is 512, which must be written down so, that the first Figure of it to the Right Hand may stand under 8 in the Root; and then adding all together, you have 21952, the true *Cube* of 28.

If the Number to be *Cubed* had consisted of 3 or more Places, as suppose 285,

You must proceed as before to find the *Cube* of 28; the two first Figures toward the Left-hand, which is 21952; then after that you are to account that Number as the *Cube* of *a*, and go on to find the other Members as follows.

Imagine the next Figure 5 to stand 2 Places farther to the Right-hand, and let that be *b*; and 28 or 280, *a*; proceed therefore thus, 3 times the Square of 28 is 2352, which multiply'd by 5, makes 11760 = 3aab;

write that down therefore as you see: Then say, 3 times the Square of 5 is 75, which multiply'd by 28, gives 2100 = 3bba; write that also down as you see: And lastly, write the *Cube* of 5, which is 125 = bbb, in its proper order, as was shewed above, and then adding all together, the Sum will be 23149125, the *Cube* of 285.

And after the same manner you must proceed on, let the Number to be *cubed* be never so large.

And this Method of the Composition of a *Cube Number*, being well understood, the Extraction of the *Cube Root* will be very easy and intelligible by the following Directions.

Suppose you were to extract the *Cube Root* out of this Number 23149125:

1. Beginning at the Right-hand, make a Prick or Point over the first Figure 5, and then over every third Figure afterwards; as many Points as there are, so many Figures will you have in your Root.

2. Find that *Cubick Number* which is next less than 23 (the first Part of the given *Cube*) which is 8, and place its *Cube Root* 2 in the Quotient; then write down 8 under, and subtract it from 23, and to the Remainder bring down the next *Cube* 149; so will 15149 be the *Resolvend*. And thus have

$$\begin{array}{r} 2 \quad 8 \\ 8 \dots a a a \\ 96 \dots = 3 a a b \\ 384 \dots = 3 a b b \\ 512 \dots \quad b b b \end{array}$$

$$21952 = \text{Cube of } a + b \text{ or of } 28.$$

$$\begin{array}{r} 2 \quad 8 \quad 5 \\ : : : : : \\ 21952 = a a a \\ 11760 = 3 a a b \\ 2100 = 3 b b a \\ \quad b 25 = b b b \\ \hline 23149125 \end{array}$$

$$\begin{array}{r} 23149125 \text{ (28)} \\ 8 \quad a a a \end{array}$$

$$\begin{array}{r} 15249 \text{ Resolvend} \\ 12 = 3 a a \\ 6 = 3 a \end{array}$$

$$126 \text{ Divisor.}$$

you found *a* the first Member of the Root, which is 2 or 200; you must next try to find *b*, (that is) such a Number, as that 3aab, 3abb, and bbb added all together, shall not be greater than 15149 the *Resolvend*, for from that Number it must be subtracted. Since therefore *a* = 2, 3 times *a* will 12, which write down as you see; and multiplying *a* also by 3, it produces 6, which set down under the Former in the order as you see.

Add the two last Numbers together, and they make 126, which is to be called a *Divisor*, and is to divide all the *Resolvend* except the last Figure on the Right-

Hand: Enquire therefore how often you can have 126 in 1514, and though you can have it 9 times and more, yet 9 times will be too much, as you may soon find if you multiply 9, which is *b*, according to the Conditions above mentioned; let therefore the Figure to be placed in the Quotient be 8 = *b*, then, by 8 multiplying 3aa, I find the Product to be 96, which I write down under the *Resolvend* as you see: Also squaring 8, I multiply it by 3a or 6, and the Product, which is 384, I write down also under 96; and then cubing 8, I write 512 under the former Numbers, only one Place more to the Right-hand; and adding all together they make 13952, which subtracted from the *Resolvend* 15149, leaves 1197; to which bringing down the last *Cube* 125, you have 1197125 for a new *Resolvend*: Then for a new *Divisor* tripple *a* or 28, and it makes 84 = 3a, which place under the *Resolvend* one Place backward to the Left-hand: Tripple also the Square of *a* or 28, and the Product 2352 = 3aa write under the last Number 84, a Place yet more backward to the Left-hand, as you see. Add the two last Products together for a new *Divisor*, and write it on the Left-hand of the last *Resolvend*; and since on trial you will find it may be had 5 times in the *Resolvend*, place 5 in the Quotient after 28, then cube 5, and write it under the *Resolvend*: Also square 5, and multiply that Square by 3 times 28, it makes 2100, which write down under 125, only a Place backward to the Left-hand, as you see; then multiply 3 times the Square of 28 by 5, and the Product (which is 11760) subscribe (after the same manner) under 2100. Lastly, add the 3 last found Numbers together, and you will find their Sum to be 1197125, which is exactly the *Resolvend*; and so the Work is over, and 285 the true *Cube Root* of the given Number 23149125.

If the Number be not an exact *Cube*, you must add to the last Remainder as many times 3 Cyphers as you design Decimal Places in the Root, and so proceed as before.

CUBIFORME: See *Cuboides*.

CUBIT, or the *Ulna*, in Anatomy is a long hard Bone with a Cavity in its Middle, and lies on the Inside of the Arm, reaching from the El-

bow to the Wrist; but some make it to consist of two Bones, the one called the *Ulna*, and the other *Radius*.

CUBITÆUS Internus & **externus**, are Muscles of the Wrist, the one serves to bend, the other to extend it.

CUBITÆUS Externus, is one of the Extenders of the Wrist, arising from the External Knob of the *Os humeri*, and is inserted in the upper and external Part of the *Os metacarpi* of the little Finger.

CUBITÆUS Internus, is one of the Benders of the Wrist, springs from the inner Extuberance of the *Os humeri*, and passing along the *Ulna*, ends in the fourth Bone of the *Carpus*, and the *Os metacarpi* of the little Finger.

CUBITAL Muscle: See *Anconens*.

CUBO-Cube, the sixth Power of any Number or Quantity.

CUBOIDES, is the seventh Bone of the *Tarsus* of the Foot; it lies in the same Rank with the *Ossa Cuneiformia*: It is called also *Grandiosum* and *Cubiforme*; behind 'tis joined to the *Os Calcis*, before to the two outer Bones of the *Metatarsus*, and on its inside it is joined to the *Os Cuneiforme*.

CUCULLARIS, and *Trapezius*, is a Muscle of the *Scapula*, so named, because this with its Fellow covering the Back, represents a Cowl. It arises fleshy from the *Os Occipitis*, Tendinous from the *Ligamentum Colli*, and *Apex* of the Spine of the last *Vertebra* of the Neck, and eight superior of the *Thorax*; from which broad Origination becoming Thick and fleshy, it's so inserted to the *Clavicula*, and Tendinous to the *Spina Scapulae*. Each Muscle is Triangular, and both conjointly compose a Lozenge or *Trapezium*, whose large Diameter extends from the *Occiput* to the 15th *Vertebra*; the shorter from near the Extremity of the *Spina Scapulae* on one Side to that of the other. They contain a triple Series of Fibres, the Middle passing directly transverse from the first *Vertebra* of the *Thorax*: Those above descend, and those beneath ascend to their Inferion, whereby the *Scapula* is variously moved according to their Directions, either obliquely upward, directly back, or obliquely down wards.

CUCUPHA, a Medicine for the Head, made of Odoriferous and Cephalick Spices beat to Powder, and stitched between two Pieces of Silk, or else sewed within a Cap, and worn upon the Head against *Catarachs* and other Diseases of the Head. *Blanchard*.

CUCURBITE; so the Chymists call a Glass, Earthen or Copper Body of this Shape, because it something resembles a Gourd. This Vessel, with its *Head*, is most commonly used in Distillations or Rectifications. They call it usually a *Body*.

CUCURBITINI Lumbrici, are broad Worms that breed in the Intestines, like the Seed of a Gourd.

CUCURBITULA, or *Cucurbita*, a *Cupping-Glass*, is a wide hollow Vessel made of Glass or Tin, which is applied to the Body with Scarification or without it, to divert, to drive the Blood into the other Part, or to drive it out: If it be applied without Scarification, it is called *Cucurbita Ceca* and *Ventosa*. *Cupping-Glasses* are applied to the

more fleshy Parts, where the large Vessels and Nerves cannot be hurt. The Drawing, which is performed by these Glasses, is done thus; After the Skin is scarify'd, the Air in the *Cupping-Glasses* is rarify'd and dilated by the Flame of the Tow that is fired within it, which, after it is cooled and condensed, takes up less room than before; so that the External Air pressing upon the Fleth without, forces the Blood into the Glass. There are two sorts of *Cupping-Glasses*, says *Celsus*, one of Brass, and the other of Horn; the Former is open on one Part, and shut on the other; the Latter is equally open on one Part, on the other has a little Hole: Burning Tow is thrown into the Brazen one, and so its Mouth apply'd and forc'd upon the Body till it sticks. That of Horn is apply'd singly by it self, and by a violent sucking at the little Hole, which must presently be stopp'd up close with Wax, it sticks as fast the other; but if either things fail, then a little Cup or Goblet with a streight Mouth may be very fitly apply'd to the same Effect: After it has stuck, if the Skin be scarify'd before with a Pen-knife, it draws out the Blood; if it be whole and entire, it draws out the Flatulent Matter; therefore, where the Matter within is hurtful and offensive, it must be apply'd the former Way; where there is an Inflammation, the Latter. The *Egyptians* at this Day use those of Horn, as appears from *Prosper Alpinus*. *Blanchard*.

Now in England we commonly use *Cupping-Glasses* without Fire, which are evacuated by a small Syringe which works like an Air-Pump; and for Scarification they have an Engine that doth it all at once with great Safety and very little Pain; and this was the Invention of the Ingenious Mr. *Hawksbee* in *Wine-Office Court* in *Fleetstreet*, who makes the best Air-Pumps, and all Pneumatick Engines that ever I saw.

CUDDY, in a first Rate Man of War, is a Place lying between the Quarter-Deck and the Captain Lieutenant's Cabin under the Poop, which is divided into Partitions for the Master and the Secretary's Officers.

CUI ante Divortium, is a Writ that a Woman divorced from her Husband, hath to recover Lands or Tenements from him, to whom her Husband did alienate them during the Marriage, because she could not gainsay it.

CUI in Vita, is a Writ of Entry that a Widow hath against him to whom her Husband aliened her Lands and Tenements in his Life-time; which must contain in it, That during his Life-time she could not withstand it.

CULMIFEROUS Plants, (see *Plants*, N. 23.) are by the *Botanists* accounted such as have a smooth jointed Stalk, and usually hollow; and at each Joint the Stalk is wrap'd about with single, narrow, long, sharp pointed Leaves, and their Seeds are contained in chaffy Husks.

CULMIFEROUS Plants, are of two kinds, either having, 1. a greater, or 2. a smaller Grain or Seed.

CULMIFEROUS Plants, with a greater or larger Seed or Grain, are such as are called *Fru mentaceous* and *Cereales*, because their Seeds are used for Food; as for Bread, Beer, Broth, &c. These they call the *Frumenta*, and are

Spicate,

Earth, and so tempered and baked as to endure the greatest Fire. They are used to melt Metals, to flux Minerals, Oars, &c. and are of this Figure.

A French Crucible.

A German Crucible.

CRUDITY, in Diseases, is when the Blood (as in continued Fevers) is not yet duly fermented and brought to a right Consistence. Crudity of the Stomach, is when Mear, out of a Defect of Nourishment, or some other Cause, is not rightly fermented and turned into Chyle; and it is Threefold, *Apepsia*, *Bradypepsia*, and *Dyspepsia*, of which in their proper Places. *Blanchard*.

CRUOR, Blood: See *Sanguis*. *Helmont* makes a Distinction betwixt *Sanguis* and *Cruor*; the former whereof, he says, is the Blood in the Arteries, the latter, that in the Veins.

CRURA, are the two Heads or Beginnings of the marrowy Substance of the Brain, called *Medulla Oblongata*.

CRURA Medulla Oblongata, the Internal Substance of the two Sides of the *Cerebrum*, gathered together as it were into two Bundles.

CRURAL Artery, by some said to be the Artery of the Thigh, among whose Muscles it divideth it self: It is a Continuation of the *Iliac Artery*, which passing out of the Abdomen, and entering into the Thighs, it loses its former Name, and is called *Cruralis*. Besides some less remarkable Branches, before it come to the Ham, it sends forth the External and Internal Muscle; under the Ham it produces the Two *Poplitea's*, and somewhat lower the *Surales*. Afterwards the Trunk it self is divided into the Branches called *Anterior* and *Posterior*; and the last of these is also subdivided into two smaller Branches which descend to the Foot.

CRURAL Vein; the Blood is conveyed from the lower Extremity of the Body by Six Veins, called, *The greater and smaller Iliaca*, *Muscula*, *Poplitea*, and *Saphena*; which joined together, compose the Trunk of the *Crural Vein*, which ascends to the Groin, and ends in the *Iliaca*.

CRUREUS, or *Femoreus*, is a Muscle of the Leg, so called from its Situation on the Bone of the Thigh, like the *Musculus Branchialis*, on that of the Arm; its Origination is large and fleshy, being continued from between the greater and lesser *Trochanter* of the Thigh Bone forwards to its lower Part; that is, immediately above its Inferior Appendix. Its Fleshy Fibres descend directly, and become perfectly Tendinous a little below the upper Part of the Tendon of the *Rectus*; where it joins with it, and the Tendons of the *Vastus Extremus* and *Internus*, which passes over the external

Part of the *Patella*, (or on each Side of it) and is inserted to a Prominence at the Superior and Fore-Part of the *Tibia*; it helps to extend the *Tibia*.

CRUS, or *Magnus Pes*, is all that Part of the Body which reaches from the Buttocks down to the End of the Toes; and it is divided into the Thigh, Leg and Foot. *Blanchard*.

CRUSTA Laëta, is a Species of *Achor*, Scuit, or crusty Scab, only with this Difference, that an *Achor* infects only the Head, but this not only the Face, but almost the whole Body of an Infant at the time of its first Sucking. *Blanchard*. *Crusta Laëta* turns white, but *Achors* have only one Colour.

CRUSTACEOUS Shell-Fishes, are such as Lobsters, Crabs, Craw-Fishes, &c. which are covered with Shells consisting of several Pieces, and which usually are softer too than those of the *Testaceous Shell-Fishes*, which are all entirely of one Piece, and usually much harder, thicker and stronger than the former; as the Oyster, Scollop, Cockle, &c.

CRUSTULA, is the same as *Echynoma* in the Eye, being a Defect of Blood from the Arteries into the *Tunica Conjunctiva*, occasioned by a Wound, Streak, &c.

CRYMOTES, is a cold shivering Fever, but many Times accompanied with an Inflammation of the inner Parts. *Blanchard*.

CRYSORCHIS, is an absconding of the Testicles in the Belly. *Blanchard*.

CRYSTALLINUS Humor Oculi, called also *Glacialis*, the Crystalline Humour of the Eye, lies immediately next to the Aqueous, within the opening of the *Tunica Uvea*; like a Glass put over a Hole, it collects and refracts the Rays which strike upon it from all Parts: Its Substance is like Glue or the Gum of a Tree, very pellucid, and of a Consistence like melting Wax, which, though it be press'd, does not easily yield and separate. In Men it is shaped like a *Lens* or Convex Glass, which rises thicker in the Middle than at the Edges: This Humour is the least of all three, but is much more solid than any of them; and is clothed with a small Membrane of its own called *Aranæa*, by reason of its Thinness, like to a Spider's Web.

CRYSTALLOIDES Tunica, the same with *Aranæa Tunica*.

CUBATURE, in Geometry, is finding exactly the solid Content of any proposed Body; as the *Quadrature* of a Surface is finding the Area of that Surface. There is a little Book lately written by one *Fantus a Frenchman*, entituled, *De la Cubature de la Sphere*, in which, with great Assurance, he pretends to find Geometrically the Solid Content of any Portion of a Sphere; but how little the Success answers the Boldness of the Title, I leave the Reader to judge.

CUBBRIDGE-HEADS; so sometimes are the *Bulk-Heads* of the *Fore-Castle* and the *Half Decks* called; the one the *Cubbridge-Head before*, the other the *Cubbridge-Head behind*.

CUBE, is a solid Body of six equal Sides, which are all Squares; 'tis one of the five regular Bodies, and its Content is found by multiplying any one Side or Face by the Height: See a Table of the different Weight of a Cubick Inch and Foot of several Bodies under the Word *Weight*.

CUBICAL Artery, by some is said to be a Branch of the *Axillary*.

CUBICK Equations, in *Algebra*, are such whose highest Power consists of three Dimensions, or is a *Cubical Quantity*; as $aaa - 3bba = 2ccc$, where the highest Power of a the unknown Quantity, is a *Cube*.

Our excellent *Harriot* shews the Original of all such kind of Equations, to be either from the continual Multiplication of three Lateral or Simple Equations into one another, after they are first reduced to the Form of Binominals; or else by multiplying a Lateral Equation into a Quadratick; by both which Ways the same Quantity will be produced, as in this Example.

Let $a + b = o$ } by multiplying of which continually, you will produce the following Quantity, viz. $aaa + baa + bca + caa - bda - daa - cda - bcd = o$; which is an Original *Cubick Equation*, as he calls it. And by this Means he shews, That every *Cubick* hath, either Real or Imaginary, three Roots, sometimes all Affirmative, sometimes all Negative, or some Affirmative and some Negative: Of this see more in *Harriot* himself, or in *Dr. Wallis's Algebra*, where he gives a large Account of this Method.

As to the Solution of *Cubick Equations*, though *Harriot*, *Des Cartes*, and others, have given very good Rules, yet no Body hath deduced so easy, natural and demonstrative a Method for it, as the profound *Dr. Wallis* in his *Algebra*, Chap. 46. which he tells us he did in the Year 1647, and is as followeth.

Since *Oughtred* proves, *Ch. 18. Art. 15.* of his *Clavis*; That $Zc = Z + 3\mathcal{A}EZ$, and $Xc = Z - 3\mathcal{A}EX$, they may be reduced thus, $Zc - 3\mathcal{A}EZ = Z$, and $Xc + 3\mathcal{A}EX = Z$: And then he found that $3\mathcal{A}E$ was the triple Rectangle of the two Quantities A and E , whose Sum is Z , and Z the Absolute Number was the Sum of their *Cubes* in the Former, but X the Difference of them, and X the Difference of their *Cubes* in the Latter. And he found also, that all *Cubick Equations* might be reduced to one of these two Forms, for as for these two, $Zc - 3\mathcal{A}EZ = -Z$, and $Xc + 3\mathcal{A}EX = -Xc$, where Z and X are Negative Quantities, they only differ from the Former, in which they are Affirmative, in this, that here X and Z will be Negative Quantities, whereas there they will be Positive.

So that all *Cubick Equations* being reducible to these two Forms, the only Difficulty remaining is this, *Having the Rectangle of two Quantities, with the Sum or Difference of their Cubes, to find the Quantities themselves, and consequently, their Sum and Difference.*

Which is performed by resolving a Quadratick Equation of a solid Root (or one whose Root is a *Cube* or some higher Power.)

For $\frac{\mathcal{A}c}{A} = \frac{\mathcal{A}c}{Ac} = Ec$. $Ac + \frac{\mathcal{A}c}{Ac} = Ac + Ec = Z$, and so $\frac{\mathcal{A}c}{E} = A \frac{\mathcal{A}c}{Ec} = Ac$, and $\frac{\mathcal{A}c}{Ec} + Ec = Ac + Ec = Z$, wherefore (multiplying by Ac or Ec , and then transposing the Terms) $Acc - ZAc = -\mathcal{A}c = Ecc - ZEc$, whose Roots are $\frac{1}{2}Z \pm \sqrt{\frac{1}{4}Z^2 - \mathcal{A}c} = \frac{Ac}{Ec}$

And by the like Process it will be found, that $Ac - \frac{\mathcal{A}c}{Ac} = X = \frac{\mathcal{A}c}{Ec} - Ec$; and consequently, $Acc - XAc = \mathcal{A}c = Ecc + XEc$, whose Roots are $\sqrt{\frac{1}{4}X^2 + \mathcal{A}c} \pm X = \frac{Ac}{Ec}$.

And then will the Sum or Difference of their *Cubick Roots* be $A + E = Z$, and $A - E = X$, the Roots sought in those *Cubick Equations*: That is, $\sqrt{c} + \frac{1}{2}Z + \sqrt{\frac{1}{4}Z^2 - \mathcal{A}c} = A + \sqrt{c}$, $\frac{1}{2}Z - \sqrt{\frac{1}{4}Z^2 - \mathcal{A}c} = A + E = Z$, $\sqrt{c} + \frac{1}{2}X + \sqrt{\frac{1}{4}X^2 + \mathcal{A}c} = A - E = X$.

N. B. If as we said above, the Absolute Quantity be Negative, as $-Z$, or $-X$, the Roots then will be $-A - E = -Z$, and $-A + E = -X$.

How to construct *Cubick Equations* after *Mr. Baker's* Way by the *Parabola*, see *Construction of Equations*.

Mr. Halley (now our Learned Savilian Professor of *Geometry* at *Oxon*) in *Philos. Transact. N. 190.* gives a good Way to extract the Roots of all *Cubick Equations* by the Help of the Tables of Sines.

CUBICAL Number, is that which is produced by the Multiplication of a Square Number by its Root: Thus 64 is a *Cubical Number*, and is made by multiplying 16, the Square of 4, by the Root 4. In *Algebra* the third Power in a Series of Geometrical Proportionals continued, is called a *Cube*, as a is the Root, aa the Square, and aaa the Cube: And All *Cubical Numbers* may be ranged into the Form of *Cubes*, as 8 or 27, whose *Sides* are 2 and 3, and their *Bases* 4 and 9.

Theorem. Every true *Cubical Number* produced from a Binominal Root, consists of these Parts, viz. The *Cubes* of the greater and lesser Parts of the Root, and of 3 times the Square of the greater Part multiplied by the lesser, and of 3 times the Square of the lesser multiplied by the greater.

As is plain from bare Algebraical Multiplication in the following Example.

$$\begin{array}{r} aa + 2ab + bb \\ a + b \\ \hline aaa + 2aab + abb \\ \quad aab + abb + bbb \\ \hline aaa + 3aab + 3abb + bbb \end{array}$$

From whence 'tis very easy to understand both the Composition of any *Cubical Number*, and also the Reason of the Method for extracting the *Cube Root* out of any Number given,

Thus,

Spicate, whose Seed is either,

1. *Larger and more Oblong*, and that easily separated from its Husk by Pounding, or Beating, or Threshing, as *Wheat* (*Triticum*) and *Rye* (*Secale*;) or not so easily parting with its Husk, as *Speltz*, in Latin *Zea*, a sort of Bastard Wheat which grows plentifully in *Italy*, *Germany*, and *France*.

To which they add *Barley* (*Hordeum*) and *Rice* (*Oryza*) which are contained in a thicker Husk than *Wheat* and *Rye*.

2. Whose Seed is close and more round, as *Panick*, which is a Seed much sown in *Germany*, and eaten by the Inhabitants.

Paniculate or *Fubate*, whose Seed is either

More Oblong, as *Avena Oats*; or

Roundish, as *Scordium* and *Milum*.

Paniculate and *Spicate* simul, as the *Indian Maize*.

They reckon also some *Culmiferous Herbs* which are not *Esculent*, or usually eaten by Men; and these also are either

Spicate, as the *Phalaris* (*Canary Grass*) and *Lolium*; or

Paniculate, as the *Lacryma Jobi*.

CULMINATE, is a Word used by Astronomical Writers, to express a Star's or the Sun's being upon the Meridian, or having the greatest Altitude that it can have that Day.

The *Culminating* of any Star, or being on the Meridian, may be found by the Globe thus;

Rectify your Globe and Hour Index, and bring the Star to the Brazen Meridian; then the Index will shew the Time of the Star's *Culminating*.

CULMUS, in Botanicks, is properly the Stalk of Corn or Grass, but of no other Plant, for that is called *Caulis*.

CULVERING, a sort of Ordnance, of which there are the *Extraordinary*, the *Ordinary*, and the *least sized Culvering*.

Culvering Extraordinary has $5\frac{1}{2}$ Inches Bore, 12 Foot long, weighing 4800 Pound Weight; its Load above 12 Pound, carries a Shot $5\frac{1}{2}$ Diameter, weighing 20 Pound Weight.

Culvering Ordinary, is a Size lesser.

Culvering of the least Size, is that whose Diameter is 5 Inches Bore, 12 Foot long, weighing about 4000 l. carries a Shot $3\frac{1}{2}$ Inches $\frac{1}{2}$ Diameter, weighing 14 l. 9 Ounces.

CULVERTAILE, the fastening in of a Ship's *Carlings* into the Beam, is so called.

CUN, or *Cond*, a Sea Term, signifying to direct or guide: To *Cun* a Ship is to direct the Person at Helm how to steer her: See *Cond*.

CUNEIFORME Or, is a Bone so called from the Resemblance which it hath to a Wedge; by the Ancients called *Multiforme*, by reason of the various *Processes* on the Inside and Outside, which renders it rough and unequal: It is situate in the Midst of the *Basis* of the Brain, and is placed under it like a *Basis*, so that it touches upon most of the Bones of the Head and the Upper Jaw. *Blanchard*.

CUNEIFORMIA Ossis, are those Bones of the *Tarsus* of the Foot which are accounted the Fourth, Fifth, and Sixth; and these are so called, because they are large above, and narrow below, like Wedges: They link all three at the Side of one another, having their upper Part Convex, and their

Lower Concave, by which means the Muscles and Tendons in the Sole of the Foot are not hurt when we go. At one End, each hath a *Sinus* receiving *Os Naviculare*, and at the other End they are joined to the three inner Bones of the *Metatarsus*; the inmost of these Bones is the largest, and the middle one the least.

CUNEUS, a Triangular Prism, or a Wedge.

CUPPEL or *Coppel*, an Instrument in Chymistry in the Form of a Dish, made of Ashes well wash'd (to cleanse them from all their Salt) or of Bones thoroughly calcined: Its Use is to try and purify Gold and Silver; which is done by mingling Lead with the Metal, and so exposing it in the *Coppel* to a violent Fire a great while; the Impurities of the Metal will then be carried off in Dross, which Dross is called *Litharge* of either Gold or Silver: 'Tis by the Refiners usually called a *Test*.

CUPPING-GLASSES: See *Cucurbitula*.

CURATIO, is a right Way or Method of finding out by Symptoms and Indications proper Remedies for any Disease, in order to the Recovery of Health. *Blanchard*.

CURCULIO, the same with *Cion*.

CURIA *avisare vult*, is a Deliberation that the Court intends to take upon any Point or Points of a Cause, before Judgment be resolved on.

CURIA *Claustranda*, is a Writ that lieth against him that should fence and close up his Ground, if he refuse or defer to do it.

CURIASSIERS, are Horsemen that wear Armour.

CURSITOR, is an Officer or Clerk belonging to the *Chancery*, that maketh out Original Writs: They are called also *Clerks of the Courts*; and there be of these Twenty four in Number, which have allotted to each of them several Shires, in which they make out such Original Writs, as are by the Subject required, and are a Corporation of themselves.

CURTAIN, in Fortification, is the Front of the the Wall of a fortified Place between two *Bastions*; or the longest straight Line that runs about the Rampart, drawn from one Flank to the other, and bordered with a Parapet five Foot high, behind which the Souldiers stand to fire upon the Covert-way and into the Moat. Besiegers seldom carry on their Attacks against the *Curtain*, because 'tis the best flank'd of any Part.

CURTATION of a Planet, in Astronomy, according to some, is a little Part cut off from the Line of his Interval or Distance from the Sun.

CURTESY of England: See *Courtesy* of England.

CURVATURE, signifies Crookedness.

CURVE, the same with Crooked.

CURVES or *Curvilinear Figures*, are in Geometry, such as are terminated or bounded by *Curved* or *Crooked Lines*: as *Circles* and *Ellipses*; and all *Conick Sections*, *Spherical Triangles*, &c. are *Curves*.

CUSTODE *admittendo*, and *Custode amovendo*, are Writs for the admitting or removing of Guardians.

CUSTODES *Libertatis Angliæ autoritate Parliamenti*, was the Stile wherein Writs and other Judicial Proceedings did run during the late Times of Trouble, viz. from the Murder of King *Charles* the First, till the Usurpation by *Cromwell*, mentioned

tioned and declared traiterous by the *Stat. 12. Car.*
2. *Cap. 3.*

CUSTOM, is (both by Common Lawyers and Civilians, taken to be) a Law or Right not committed to Writing, but established by long use, and by the Consent of our Ancestors hath been, and is daily practised; and 'tis either *General or Particular*: A *General Custom*, is that which is allowed through all *England*. *Particular Custom* is that which belongeth to this or that County, or to this or that Lordship, Town, or City.

CUSTOMS and Services, or *Consuetudinibus et Servitiis*, is a Writ of Right close, which lieth against the Tenant that deforceth his Lord of the Rent or Service due to him: Of this see more at large in the *Old Nat. Brev. Fol. 77.*

CUSTOS Brevium, a Clerk belonging to the Court of *Common-Pleas*, whose Office is to receive and keep all the Writs, and put them upon Files, every Return by it self; and at the End of every Term, to receive of the *Protonotaries* all the Records of the *Nisi prius*, called the *Postea*.

CUSTOS Placitorum Coronæ, seems to be the same with *Custos Rotulorum*.

CUSTOS Rotulorum, is he that hath the Custody of the Rolls, or Records of the Sessions of Peace; and as some say, of the Commissions of Peace it self: He is always a Justice of Peace and *Quorum* in the County where he hath his Office.

CUSTOS Spiritualium, or *Custos of the Spiritualities*, is he that exerciseth Spiritual or Ecclesiastical Jurisdiction in any Diocese during the Vacancy of the See, which, by the Canon-Law, belongs to the Dean and Chapter, but at present with us in *England*, to the Archbishop of the Province by Prescription: Howbeit, divers Deans and Chapters do challenge this by ancient Charters from the Kings of this Land.

CUSTOS Temporalium, the Person to whose Custody a vacant See was committed by the King as Supreme Lord, who as a Steward of the Goods and Profits, was to give account to the *Escheator*, and he into the *Exchequer*: His Trust continued till the Vacancy was supplied by a Successor, who obtained the King's Writ *De Restitutione Temporalium*, which was commonly after Consecration, yet sometimes before.

CUT a Feather; if a Ship hath too broad a Bow, they say she will not *Cut a Feather*: that is, she will not pass through the Water so swiftly as to make it foam or froth.

CUTANEOUS Distempers, such as affect the Skin, as the Itch, or Scab, &c.

CUTANEOUS Glands and Vessels, are such as are placed or terminated in the *Cutis* or Skin.

CUTICLE, *Scarff Skin*, is a Cover of the Skin without Sense, extended outwardly over the whole Skin like a Membrane, full of innumerable small Pores, accommodated to the avoiding of Injuries from Abroad, to the shutting up of the *Cutaneous Vessels*, and to the more accurate perfecting of Tactile Qualities: It is nourished by the Blood; for if it be lost or perished, it comes again, though its Vessels be but little conspicuous. *Blanchard.*

Mr. Luenboeck found by his Microscope, that the *Cuticula* consisted of an infinite Quantity of very small Scales, so minute, that a small Grain of Sand would cover near 200 of them; so that he thinks there are no proper Pores in the Skin, but

that the Moisture comes out under or from between the Scales.

CUTIS, is the Skin of a living Man, but *Pellis* is that which is flead off, and it is the outermost Cover of the whole Body, or a pretty thick Membrane wrought of several Filaments of the Veins and Arteries, Nerves and Nervous Fibres, complicated and interwoven with one another, full of Glandules and Lympheducts, or Vessels that convey away the Vapours and Sweat, abounding with a great Number of Pores here and there, and sensibly perforated in many Places to let in and out, as occasion requires; as at the Mouth, Nostrils, Eyes, Ears, Privities, Fundament, &c. it is thickest of all upon the Head, moderately hard in the Neck and Back, finer in the Face, *Penis*, and outer Skin of the *Scrotum*; thin on the Sides, and thinnest of all on the Lips; in some Places, as the Elbow, Forehead, Soles of the Feet, it sticks very close together. *Blanchard.*

CUTT-BASTION: See *Bastion*.

CUTT-WATER, the Sharpness of the Head of a Ship below the Beak; 'tis so called because it cuts or divides the Water before it comes to the Bow: This is called also the *Knee of the Head*.

CUVETTE, in Fortification, is a deeper Trench about four Fathom broad, which is usually sunk in the Middle of the great dry Ditch till you meet with Water, and serves both to prevent the Besiegers Mining, and also the better to keep off the Enemy.

CYCLE, is a continual Revolution of certain Numbers, which successively go on without any Interruption from the First to the Last, and then return again to the First, and so circulate perpetually. In the Calendar there are three principal Cycles, viz. the *Solar*, the *Lunar*, and the *Cycle of Indiction*.

CYCLE of the Sun, is a Revolution of 28 Years, in which time the same Dominical Letter comes about again in the same Order, and Leap-Years expire, and the 29th Year the *Cycle* begins again: This *Cycle* serves to find the Dominical Letter for any Year past, present, or to come.

To find the Cycle of the Sun.

Rule. To the Year add 9, and divide the Sum by 28, the Remainder is the *Cycle of the Sun*.

Example.

To 1701 add 9, the Sum 1710 divided by 28, the the Residue 2 is the *Cycle of the Sun*.

CYCLE of the Moon, is a Revolution of 19 Years, in which time the New Moons return to the same Days they were on before, and she begins again her Course with the Sun. This was invented by *Meton the Athenian*, and is called the *Golden Number*. That which occasioned probably the pitching upon this Number, was their Observations that the *Lunar Eclipses* happen nearly again on the same Day of the Month 19 Years after the former; of which 'tis easy to give many modern Instances. *Enneadecaterides* is with some the Name of this *Lunar Cycle*.

CYCLE of Indiction, is a Revolution of three *Lustrums* of fifteen Years, after which those who used it began it again. This is more ancient than the precedent ones, and hath nothing to do with

with the Heavenly Motions, being established by Constantine, A. D. 312. Sept. 24. who substituted them in the room of the *Olympiads*: They were so called, according to some Authors, because they denoted the Year that Tribute was to be paid to the Republick. To find this *Indiction*, subtract 312 from the Year given, and divide the Remainder by 15, and omitting the Quotient, what remains is the Year of the *Roman Indiction*.

Example, A. D. 1700

1700 - 312

15) 1388 (92

135

38

8 = *Indiction*.

CYCLISCI, are Surgeons Instruments, where-with they scrape away corrupt Flesh, or the like: they are made in the Form of an Half-Moon.

CYCLOID: If on a Right Line, as *AE*, a Wheel or Circle be imagined to make one entire Revolution, or to move till the Point *A* come to touch the Line again at *E*: The Circle will describe the Line *AE*, equal to its Periphery; and the Point

A will describe a Curve Line *AaFE*, which is called a *Cycloid* or *Trochoid*, and the Space contained within this Curve and the Subtense *AE* is called the *Cycloidal Space*.

From the Consideration of which Genes, 'tis very plain, that the Point *a* which describes the Curve, will every where be distant from *d* the Point of Contact, by such a Part of the Circle as is the Distance of that Point of Contact from *A*, the Beginning of the Line. Thus, when *Ad* is a Fourth Part of the whole Subtense, then will *da* be a Quadrant of the Generating Circle; when *Ac* is half that Line, then the Ark *ac* is a Semi-circle, &c. So likewise at the other End, when the Ark *ac* is an Octant, *eE* will be an Eighth Part of the Line *AE*.

Proposition.

Any Semi-ordinate in the Cycloid (or the Right Line *BF*, or *bF*) is equal to its corresponding

Right Sine in the Generating Circle, (as *BD*, *bd*) together with the Arch of that Sine, *AD*, or *ad*.

This is proved from the Consideration of the Manner of the Generation of the *Cycloid* above delivered: For since the Right Line *CE* is equal to the Semi-circular Ark *ADG*, the Right Line *DF* must be equal to the Quadrantal Ark *AD*; for the several Arks of the moving Circle do every where generate Right Lines equal to themselves; wherefore any Semi-ordinate drawn to the Curve of the *Cycloid* must be compounded of *df* or *DF*, viz. a Right Line equal to the Part of the Ark that hath revolved, and of *bd* and *BD* the Right Sine of that Ark in the Generating Circle. *Q. E. D.*

Corollaries.

1. Hence 'tis plain, that by means of the *Cycloid* a Right Line may most easily be found equal to any given Ark of a Circle, or to its whole Circumference; and consequently the Quadrature of the Circle may Geometrically be had, if this *Cycloid* be a true Geometrical Curve, as indeed it is not.

2. If you suppose *de*, *De*, and *de* to be every where drawn equal to the Right Lines *bd*, *BD*, and *bd*; the Curve Line connecting their Extremities will be an Ellipsis (by a Propos. which you will find under the Word *Elliptical Space*) for the whole Aggregate of all these Right Lines, or the Elliptical Space will be double of the Semi-circular one; i. e. as *Be* is to *BB*; and consequently the Curvilinear Space *AeCDA* will be equal to the Semi-circular Space *ADCA*.

3. *DF* (i. e. *De* + *eF*) = Quadrant *DA*, wherefore since the Whole *BG* = to a Semi-circle, the Remainder *BD* + *FG* must also be equal to a Quadrant; but *BD* = *De* (by Cor. 2.) wherefore *eF* will be equal to *FG*; and the same Way of arguing will always prove *ef* above, equal to *fg* below, wherefore all the Indivisibles in each being equal, the Space *eeAfeF* will be equal to the Space *FGE*. Hence,

4. 'Tis plain, that the *Cycloidal Space* is always triple of the Generating Circle.

For the Rectangle *BCEG* is equal to the whole Circle (because on one Side is the Radius, and the other the Semi-circumference,) that is, is equal to the Semi-ellipsis *AeCDA*; wherefore, if out of it you take the Quadrant of the Ellipsis *BeeCB*, what remains, which is the *Trapezium CeGEC*, must be equal to the other Quadrant of the Ellipsis, or to the Semi-circle. But it was proved in Cor. 3. That the Trilinear Space *FGE* was equal

E e to

to $eeAff$; wherefore the Trilinear Figure AfF ECA must also be equal to the Semi-circle; and consequently the whole Semi-cycloidal Space AfF CA must be equal to three Semi-circles, and therefore the whole Cycloidal Space triple of the Generating Circle. *Q. E. D.*

Otherwise thus;

The Rectangle AE is equal to two Circles, and the Semi-ellipsis $AeCA$ to one, wherefore the remaining Space $AeCEC$ must also be equal to another such Circle, and its lower half to a Semi-circle, as well as its upper one; but in the lower half, the Figure FGE = to the Figure $eeAff$ in the upper half; wherefore counter-change them, and the Space $CEAFA$ must be equal to a Semi-circle, and consequently the Semi-cycloidal Space equal to three Semi-circles. *Q. E. D.*

The following Demonstration of the same Proposition I had from Mr. Humphry Ditton, who is very skilful in Things of this Nature: 'Tis very short and plain, and depends on the Arithmetick of Infinites. Thus,

The Figure is a Semi-cycloid, where the Arks dO , dO , dO , egc , are supposed to be in Arithmetical Proportions, and consequently so will the Lines co , co , CO , egc , which from the Nature of the Cycloid are all equal severally to those Arks: Now these being a Series of Arithmetical Proportions, will be to as many equal to the greatest, as 1 to

2 (by Prop. 2. of Dr. Wallis's *Arith. Infinit.*) wherefore the Space $CdOS$ = $\frac{1}{2}SD$, but $\frac{1}{2}SD$ = to the whole Circle; wherefore the whole Cycloidal Space CdS must be equal to three Semi-circles. *Q. E. D.*

The *Linea Celerrimi Descensus*, as 'tis called, or the Curve which any heavy Body would describe, supposing it to descend with the greatest possible Swiftneſs, is the Ark of a Cycloid. This John Bernoulli, I think, first proposed, as a Problem to be discovered, and it hath often been solved, but very briefly and easily by Mr. John Craig, in *Philos. Transact.* N. 268. In the *Acta Eruditorum Lips.* for May 1690, p. 217. there is a Method of Investigation for this Line by James Bernoulli.

CYEMA, the same with Embryo.

CYGNUS, the Swan, a Constellation in the Northern Hemisphere, consisting of 35 Stars.

CYLINDER, the Hollow within every Piece of Ordnance, is called her Concave Cylinder.

CYLINDER, is a Solid Body, made by the Rotation of a Rectangled Parallelogram about one of its Sides.

1. Since every Cylinder hath a Circle for its Base, it will be very proper to denote its Base

thus, $\frac{1}{2}rdd$ (the Reason of which you have under Circle:.) And then, if the Altitude of the Cylinder be called b (i. e. its height) the Solidity of the Cylinder will be expressed thus, $\frac{1}{2}rddb$.

2. If therefore the Altitudes of any two Cylinders be equal to the Diameters of their Bases, such Cylinders must be to one another, as the Cubes of their Diameters or Altitudes; for here, b the Height being the same with d , the Diameters of the Circle of the Base. If in one Cylinder it be called d , and in the other D , the Solidity of the former will be $\frac{1}{2}rdd$, and of the latter $\frac{1}{2}rDDD$; but doubtless $\frac{1}{2}r$ being a common Efficient or Multiplier: $\frac{1}{2}rdd : \frac{1}{2}rDDD :: ddd : DDD$; that is, the Cylinders are as the Cubes of their Diameters. *Q. E. D.*

3. Every Cylinder is triple of a Cone of the same Base and Height; which see proved in Proposition of Solids.

4. Every Cylinder is to a Sphere inscribed, and of the same Base and Height as 3 to 2.

If the Square and Quadrant with the Diagonal ad , be supposed to revolve round the Axis bd , the Square will generate a Cylinder, the Quadrant an Hemisphere, and the Triangle adb a Cone all of the same Base and Height.

And since Circles are as the Squares of their Diameters, and that the Square of eb (= \square of df) = $\square gb$ (= $\square bd$) + $\square bf$, by 47. e. 1; therefore the Circle described by eb , or its = cd , must be equal to two Circles described by gb , and by bf : Take away then the common Circle, described by bf from both, and there will remain the Circle described by gb = to the Ring described by ef . And thus it will always be, that (v. gr.) the Circle described by km , will be equal to the Annulus or Ring made by the Motion of il ; wherefore all the Rings made by the Revolution of ef, il, egc , must be equal to all the Circles describ'd by the Motion of gb, mk, egc , that is, all the Solid, composed of the Rings made by the Motion of the Parts of the Trilinear Figure $cfbba$, shall be equal to all the Circles generated by the Elements of the Triangle adb : Wherefore since the Cone is $\frac{1}{3}$ of the Cylinder on the same Base and Height, and that the Solid made by the Trilinear $cfbba$, is also another third Part, as being equal to the Cone; the Hemisphere must be $\frac{2}{3}$ of the Cylinder, and consequently, if the Base and Altitude of the Cylinder were equal to the Diameter of the Sphere, the whole Sphere would be $\frac{2}{3}$ of the Cylinder.

Cor. 1. From hence we have the Dimensions of the Sphere and Cylinder, both as to Solidity and Surface; for let d be the Diameter of the Sphere and Cylinder, and $r d$ the Circumference of the Base of the Cylinder; then will the whole Base be $\frac{1}{2} r d d$, (which also is the Area of a great Circle of the Sphere;) and this Base multiply'd by d the Altitude, gives $\frac{1}{2} r d d d$ for the Solidity of the Cylinder; and therefore, by this *Prop.* $\frac{2}{3}$ of that gives the Sphere (*i. e.*) $\frac{2}{3} r d d d =$ Solidity of the Sphere; and that last Quantity divided by $\frac{1}{2} d$ (one Sixth of the Diameter) gives $r d d$ the Surface of the Sphere.

2. Which Surface $r d d$ is manifestly Quadruple of $\frac{1}{2} r d d$, the Area of a great Circle of the Sphere, or the Base of the Cylinder.

3. Wherefore, by multiplying $r d$ (= to the Periphery of the Base of the Cylinder by d the Altitude) you have $r d d$ for the Curve-Surface of the Cylinder; which therefore is equal (taken without its proper Bases) to the Surface of the Sphere; and consequently, adding in the Bases (each of which is $\frac{1}{2} r d d$) the whole Surface of the Cylinder, Bases and all, will be $1 \frac{1}{2} r d d$, that is, to the Surface of the Sphere as 3 to 2.

4. The Square of the Diameter (dd): To the Area of the Circle $\frac{1}{2} r d d$: Is as d : $\frac{1}{2} r d$, (for dd : $\frac{1}{2} r d d$: d : $\frac{1}{2} r d$) that is, as the Diameter to $\frac{1}{2}$ of the Circumference.

5. Because the Solidity of the Cylinder is $\frac{1}{2} r d d d$, therefore the Cone of the same Base and Height will be $\frac{1}{3} r d d d$, which is plainly the Difference between $\frac{1}{2} r d d d$ and $\frac{1}{3} r d d d$, the Solidity of the Cylinder and Sphere; so that the Cone is equal to the Excess of the Cylinder above the Sphere; and the Cone, Sphere and Cylinder are as 3, 2 and 1; so that the Sphere is two Thirds of the Cylinder. See this last proved much shorter under the Word *Indivisibles*.

If you consider a Cylinder, as composed of an infinite Number of Cylindrical Surfaces decreasing (as the Circles of the Base on which they stand) in Arithmetical Progression; if you call the outermost or greatest Surface S , and the Radius of the Base r , the Solidity of the Cylinder will be expressed by $\frac{1}{2} r S$. And it will be diverting to measure a Cylinder by both of these different Ways, in order to see how nearly they will agree.

CYLINDROID, a solid Figure with Elliptical Bases parallel and alike situated.

CYLINDRUS, is a Plaster made oblong, which some Physicians call *Magdaleo*. *Blanchard*.

CYLOSIS: See *Cyllum*.

CYLLUM, signifies a Leg put out of Joint outwardly; also one lame and Crooked.

CYMA, among the Botanists signifies the Top of any Plant or Herb.

CYMATIUM, a Member of Architecture, whereof one Half is Convex, and the other Concave: There are two Sorts of *Cymatiums*, *viz.* one called *Doucires* or *Right Gula*, the most advanced Part of which is Concave; and the other *Talon* or *Reversed Gula*, which hath its most advanced Part Convex, but is hollow below, as the first is above.

CYMBIFORME *Os*: See *Os Naviculare*.

CYNANCHE and *Lynanche*, so called because it is frequently incident to Dogs and Wolves, is an Inflammation of the inner Muscles of the Larynx, accompanied with a Difficulty of Breathing, and a continual Fever. *Blanchard*.

CYNANTHROPIA, is Madness given by a Dog, wherein the Patient flies Light, or any thing that is bright and splendid; fears Water, and trembles at the Sight and Remembrance of it: It proceeds usually from a poisonous Bite, or the like, of some mad Creature, as a Dog, a Wolf, &c. *Blanchard*.

CYNICUS *Spasmus*, the Convulsion of the Muscles of the Mouth, by which the Face is so distorted, that it resembles the Countenance of a grinning Dog.

CYNODES *Orexis*, is a Canine Appetite, or an extreme Hunger join'd with Vomiting or a Looseness: It arises from a too much or a too acid Ferment in the Stomach. *Blanchard*.

CYNODESMUS, is the Band which ties the little Skin of the Yard to the Glands.

CYNODENTES, are those Teeth between the Axle-Teeth and the Grinders, called *Canini*, *Columellares*, and *Oculares*; Eye-Teeth, as we say. *Blanchard*.

CYNOREXIS: See *Cynodes Orexis*.

CYNOSURA, a Constellation consisting of seven Stars; otherwise called *Ursa Minor*, or the *Little Bear*, in the Tail of which is the *Polar Star*.

CYPHER, or *Nought*, thus noted (0), which put before a Figure, signifies nothing (except in Decimal Arithmetick, where it augments, being put before, in the same Proportion as when put after Integers) but after a Figure it increases it by Ten, and so onwards in Decuple Proportion, or by Tens, *ad infinitum*.

CYPHOMA, or *Cyphosis*, Crookedness of the Back.

CYPHOSIS, is the bending of the Vertebres of the Back toward the Back Parts.

CYRTOMA, is a Bunch on the Back, or a Tumor in any other Part.

CYRTOSIS, the same with *Cyrtoma*.

CYSTAROS, is the Gut call'd *Rectum*, the lowermost of all; also the Fundament.

CYSTICA, are Medicines used against Distempers in the Bladder.

CYSTICÆ *Gemelli*, a very small Branch of the *Celiac* Artery dispersed through the Gall-Bladder.

CYSTIS, is the Bladder that holds the Urine or the Gall.

CYSTIS *Choledochus*, the same with *Folliculus felleus*.

CYSTOTOMY, the cutting of a Bladder.

D A M

DACRYODES, are Ulcers which continually send forth Matter. *Blanchard.*

DACTYLE, is the Foot of a *Latin* Verse consisting of three Syllables, whereof the first is long, and the other two short; as *Carmina*.

DACTYLONOMY, is the Art of Numbring on the Fingers.

DADO, a Term in Architecture, by some Writers used for the *Dye*, which is the Part in the Middle of the Pedestal of a Column between its Base and Cornice: 'Tis of a Cubick Form, whence the Name of *Dye* is given to it.

DAILY MOTION of a Planet: See *Diurnal Motion*.

DAMAGE, is generally taken to signify any Hurt or Hindrance that a Man taketh in his Estate; but in Common Law it is Part of that the Jurors be to enquire of, passing for the Plaintiff or Defendant in a Civil Action, be it Personal or Real: For after Verdict given of the principal Cause, they are likewise asked their Consciences (touching Costs, which are the Charges of the Suit, called of the *Civilians*, *Expensa Litis*,) and Damages, which contain the Hindrances that the Plaintiff or Demandant hath suffered, by means of the Wrong done to him by the Defendant or Tenant.

This Word *Damage* (in Law) has two several Significations, the one *Properly* and *Generally*, the other *Strictly* and *Relatively*: *Properly*, as it is in Cases where Damages are founded upon the Statute of 2 H. 4. Cap. 1. and 8 H. 6. Cap. 9. where Costs are included within this Word *Damages*; for *Damage*, in its proper Signification, is said à *Demendo*, when by Diminution a thing becomes worse; and in this Sense, Costs of Suits are *Damages* to the Plaintiff, for by it his Substance is diminished. But when the Plaintiff declares the Wrong done him to the *Damage* of such a Sum, this is to be taken *Relatively*, for the Wrong which is passed before the Writ brought, and are assessed by Reason of the Trespas aforesaid, and cannot extend to the Costs of Suit, which are future, and of another Nature.

DAMAGE CLEERE; *Damna Clericorum* is now assayed by the Tenth Part in the *Common Pleas*, and the Twentieth Part in the *King's Bench* and *Exchequer*, of all *Damages* (exceeding five Marks) recovered either by Verdict, Confession, or Judgment of the Court in all Actions upon the Case, Covenant, Trespas, Battery, false Imprisonment, Dower, and all others wherein *Damages* are uncertain, which the Plaintiff was to pay to the *Prothonotary*, or chief Officer of that Court wherein they are recovered, before he shall have Execution for them. This was Originally only a Gratuity given to the *Prothonotaries*, and their Clerks, for drawing Special Writs and Pleadings, which afterwards grew to a Certainty; but now this is taken away by 17 Car. 2. c. 6. for that it was an unnecessary Charge and Burden upon the King's Subjects.

DAMAGE Feasant, in Common Law, is when Stranger's Beasts are in another Man's Ground without Licence of the Tenant of the Ground, and there do feed, tread, and otherwise spoil the Corn, Grass, Goods, and such like; in which Case the Tenant, whom they *Damage*, may therefore take, distrain, and impound them, as well in the Night as in the Day: But in other Cases, as for Rents and Services, and such like, none may distrain in the Night.

D A V

DAMNATA Terra, is the same with the *Caput Mortuum* of the Chymists, being only the Earth or Mass that remains in the *Retort*, &c. after all the other Principles are forced out by the Fire.

DANCETTE, a Term in Heraldry, when the Out-line of any Bordure or Ordinary is of this Shape, that is, indented in and out very largely, in which only it differs from *Indented*.

There is a bearing of a Bend called double *Dancette*; thus, he beareth *Azure*, a Bend double *Dancette Argent*.

DARKENED Room: See *Obscura Camera*.

DARK Tent, is the Term which some Writers give to a Box made almost like a Desk with Optick Glasses, to take the Prospect of any Building, Fortification, Landskip, &c. This is a Portable *Camera Obscura*, or *Darkened Room*: See the Description under *Obscura Camera*.

DARSIS, is an Excoriation of the Skin. *Blanchard.*

DARTUS, is the second or inner *Tunick* of the common Coats, which immediately cover the Testicles; it arises from the *Membrana Carnosa*, and seems to be Muscular from its Power of contracting and wrinkling it self up; it adheres to the *Tunica Vaginalis* that lies under it by many Membranous Fibres. *Russich* saith, that it hath the *Membrana* also under the *Carnosa Adiposa*.

DASSYMA, is a superficial Inequality of the inner Part of the Eye-lids, accompanied with a Redness. *Blanchard.*

DATA, is the Term in Mathematicks for such Things or Quantities as are supposed to be given or known, in order to find out thereby other Things or Quantities which are unknown or sought for; and *Euclid* uses the Word *Data* (of which he hath a particular Tract) for such Spaces, Lines, and Angles, as are given in Magnitude, or to which we can assign others equal: See *Given*.

DATIVE CASE, is the third Case in the Declension of Nouns, Pronouns, &c. and is so called, because 'tis usually governed by a Verb, which implies something to be given to some Person, and the thing is put in the Accusative Case, and the Person in the *Dative*.

DAVIS's Quadrant, is the common Back-Quadrant: See its Description under the Word *Back-staff*.

DAVIT, a Piece of Timber in a Ship, having a Notch at one End; in which, by a Strap, hangs a Block called the *Fish-Block*: And the Use of this Block is to hale up the Fluke of the Anchor, and to fasten it at the Ship's Bow or Loof. This *Davit* is shiftable from one Side of the Ship to the other, as Occasion serves.

There is a small *Davit* in the Ship's Boat, which is set over her Head with a Shiver, in which is brought the Buoy Rope wherewith to weigh the Anchor; and it is made fast to the Carlings in the Boat's Row.

DAY,

DAY, is either *Natural* or *Artificial*; the former is determined by the Motion of the Sun round the Earth in 24 Hours; the *Artificial* Day is the Time betwixt the Sun's Rising and Setting; to which is opposed *Night*, which is the Time that the Sun is under the Horizon.

The *Natural Day* is also called *Civil*, because it is by divers Nations reckoned divers Ways; the *Babylonians* began to account their Day from the Sun-rising; the *Jews* and *Athenians* from the Sun-setting, whom the *Italians* follow to this Day, beginning their first Hour at Sun-set: The *Egyptians* began at Midnight, as we account our Astronomical Day; but the *Umbri* began at Noon.

The *Natural Day*, beginning at Noon or Midnight, is always equal; but that which is accounted from Sun-rising or setting is unequal; and the *Artificial Day* is every where unequal, but just under the *Equinoctial Line*.

DEAD-MENS-EYES, in a Ship, are a Kind of *Blocks*, having many Holes in them, but no *Shivers*; and through them the *Lanniers* go, which make fast the Shrowds below to the Chains. Sometimes, but rarely, the Main-Srays of a Ship are fet taught by *Dead-Men's-Eyes* and *Lanniers*. The *Crowfeet* always do *reeve* through *Dead-Men's-Eyes*.

DEAD-RECKONING, at Sea, is that Estimation, Judgment, or Conjecture, which the Seamen make of the Place where a Ship is, by keeping an Account of her Way by the *Log*, by knowing the Course they have steered by the Compass, and by rectifying all with Allowance for *Drift*, *Lee*, *Way*, &c. according to the Ship's Trim; so that this Reckoning is without any Observation of the Sun, Moon, and Stars, and is to be rectify'd as often as any good Observation can be had.

DEAD-RISING, a Term in a Ship for that Part of her which lies aft between the Keel and her Floor Timbers, and next adjoining to the Stern-Post under the Bread-Room in a Man of War.

DEAD-WATER, is the Eddy Water just behind the Stern of a Ship; and if a Ship hath a great Eddy follows her Stern, they say *she makes much Dead Water*: This is so called because it doth not pass away so swiftly as the Water running by her Sides doth.

DE BENE ESSE, a Term in Common Law, as when the Defendant's Deposition or Bail is only allowed for the present, but after more full Examination is either to stand or fall.

DEBENTUR, was a Kind of Writing first given in the late Times of the Usurpation to the Soldier, to secure the Payment of his Arrears; 'tis used also in the *Exchequer*; and in the King's House *Debentures* are given usually to the Servants, for the Payment of their Wages, Board-Wages, and the like. The Word is mentioned in the Act of Oblivion, 12 Car. 2. c. 2. and since the late Revolution hath been used in many Acts of Parliament, especially in that which relates to the forfeited Estates in *Ireland*, out of which the Soldier's *Debentures* are appointed to be satisfied, 11 W. 3.

DEBET and *Solet*, is a Writ of Right which hath those Words in it, as formal Words not to be omitted; as if a Man sue for any thing that is now first of all denied, and which hath been enjoyed by himself and his Ancestors before him; as for a Mill, common Pasture, &c. then both *Debet* and *Solet* must be used in the Writ of Right.

DEBILITY, is a Weakness of the Body proceeding from Swooning, Fainting, Hunger, Disease, or otherwise. *Blanchard*.

DEBITO, is a Writ that lieth where a Man ow-

eth Money upon Obligation, or other Bargain for any thing fold unto him.

DEBRUISED, a Term in Heraldry, when a *Pale*, &c. is born upon any Beast in an Escutcheon; for then they say, the Beast is *debruised of the Pale*.

DECAGON, is a plain Figure in Geometry, having 10 Sides and Angles; and if they are all equal to one another, 'tis then called a *Regular Decagon*, and it may be inscribed in a Circle.

Proposition.

The Side of a Regular Decagon is in Power and Length equal to the greatest Segment of an Hexagon, cut according to Extreme and Mean Proportion. 9. e. 13. Euclid.

Let the Line *db*, the Radius or Side of an *Hexagon*, cut into Extrem and Mean Proportion in *e*, (*P. 11. e. 2. Euclid.*) be applied to the Circle in the Point *b*, and then produced till *ba* be the Side of a *Decagon*, or the Chord of 36° .

I say *ba* is equal to *be*, and the $\square ba = be$. Draw *bc*, *ac*, and *dc*.

Demonstration.

The Angle $bca = 36^\circ$, and consequently the equal ones cba and a , each $= 72^\circ$; wherefore dbc must be $= 108^\circ$. Also since $db = bc$, the \angle s d and dcb must be exact $= 36^\circ$. and therefore the whole Angle $acd = 72^\circ$. or the Angle of a Pentagon; wherefore the Δ 's abc and adc are Similar, and consequently $ad : ac :: ac : ab$, that is, $ad : db :: db : ba$; wherefore the whole Line *da* is cut into Extrem and Mean Proportion; and therefore, since *db* is also so divided by the Supposition, the whole Line $da : b d ::$ as the whole Line $db : ba$, but in the same Proportion is bd to be ; wherefore *ba* must be equal to *be*, and the Power of one to the Power of the other.

A Fortification also consisting of 10 Baftions, is sometimes called a *Decagon*.

DECAMP, when an Army raises its Camp, and departs from the Place where it lay before, they say it is *Decamped*.

DECANT; to *Decant* a Liquor, is to pour off the clear Part of it by *Inclination*, as the Chymists speak, that so it may be without any Matter or Sediment; and this Action the Chymists call a *Decantation*.

DECEMTALES: See *Tales*.

DECEPTIONE, is a Writ that lieth against him that deceitfully doth any thing in the Name of another, for one that receiveth Damage or Hurt thereby.

DECIDUOUS, is that which is apt or ready to fall, and is used in reference to the Flowers and Seeds of Plants: Thus the *Botanists* say, in some Plants the *Perianthium* or *Calyx* is *deciduous* with the Flow-

Flower, *i. e.* falls from off the Plant with it; but in others it is not.

DECIES TANTUM, is a Writ which lieth against a Juror which hath taken Money for the giving of his Verdict; called so of the Effect, because it is to recover ten Times so much as he took.

DECIMAL Fraction, is that which hath for its Denominator 1. with a Cypher or Cyphers annexed; as $\frac{6}{10}$, $\frac{46}{100}$, $\frac{46}{1000}$, &c.

Which Denominator, for Brevity and Convenience sake, is most commonly expressed by a Point or a Comma set on the Left-hand of the Numerator; thus, .5 is $\frac{5}{10}$. .46 is $\frac{46}{100}$, and .125 is a Hundred Twenty five Parts of any thing, supposed to be divided into 100 such Parts.

N. B. As Cyphers set on the Right-hand of Integers do increase the Value of them *Decimally*, as 2, 20, 200, &c. so when set on the Left-hand of *Fractions*, they decrease the Value *Decimally*, as .5, .05, .005, &c. but set on the Left-hand of Integers, or on the Right-hand of Fractions, they signify nothing, but only to fill up Places; thus, .5000. or .0005. is but five Units.

1. To reduce any *Vulgar Fraction*, as suppose $\frac{1}{4}$ of a Pound, Shilling, Mile, Yard, Day, Hour, &c. to a *Decimal Fraction* of the same Value, whose Denominator shall be 1000; (I say 1000, for 10 or 100 are not large enough to do it without a Fraction.)

Say, by the *Rule of Three*, As 8 the Denominator of the *Vulgar Fraction* : Is to 5 its Numerator : : So will 1000 the Denominator assigned : Be to a 4th Term, which, by working, you'll find to be .625. and therefore $\frac{5}{8}$, or .625. is a *Decimal* of the same Value with the former Fraction $\frac{5}{8}$.

2. *Addition and Subtraction of Decimals* is performed just as Integers, only Care must be taken about duly placing each Part; as to which be sure to place all the Points one under another, then add or subtract as in common Arithmetick, distinguishing from the Sum or Remainder so many Figures for Decimals, as are the most Decimal Places in any of the given Numbers, as in the following Examples.

In Addition,	.73567	64.58
	.705	97
	.86	.005
	.5	
	2,80067	74.285

In Subtraction, From 35.5
Take 20,98679

Remains 14,51321

From 16.05
Take 10,9999

Remains 5,0501

Multiplication of Decimal Fractions.

General Rule.

'Tis no matter in what Order either Multiplicand or Multiplier stand, only observe, *That there must be just as many Decimal Parts cut off by the separating Point from the Product, as there are Decimals in both Factors*: The Work is just as in Integers.

Example 1. Where one *Decimal* multiplies another.

.365
.22

730
730

.08030

Here the Product is only 8030, but a Cypher is prefix'd to make up the five *Decimal Places*, there being so many in both Factors.

.0006 .464
.5 .9
.00030 .4176

Example 2. Where one Factor is an Integer, the other a *Decimal Fraction*.

4.64 3.65 46.4
9 22 9
417.6 730 417.6
730
80.30

Note, That when a *Decimal Fraction*, or mix'd Number, is to be multiplied by an Unit, with Cyphers annexed thereto, (as 10, 100, 1000, &c.) 'tis only removing the Separatrix so many Places towards the Right-hand in the Multiplicand, as there are Cyphers annexed to the Unit: Thus, if .7652 were to be multiplied by

10 } The Product will be { 7.652
100 } { 76.52
1000 } { 765.2
10000 } { 7652

The Reason of which is, because there can be no more Decimals in the Product, than were in both the Factors; and the Cyphers any where on the Right-hand may be omitted, as being of no Value here.

By *Multiplication*, *Decimals* are reduced to the known Parts of such Integers as they are *Decimals* of, in this manner: Multiply the given *Decimal* by the Number shewing how many known Parts of the next inferior Denomination are equal to that Integer, and pursue this as far as it will go, *v. gr.*

What is the Value of this *Decimal* .8687; that is, .8687 of a Day, or of a Pound Sterling, &c.

.8687 of a Day = 20 h. .8687 of a Pound =
24 (50'. 55". (20 17 s. 4 d. 1 q.

34748 17,3740
17374 12
20,8488 7480
60 3740
50,9280 4,4880
60 4
55,6800 1,9520

To find the Value of any *Decimal* of a Pound of *English Money*, there is this ready Rule in Practice: Suppose it were required to find the Value of .8687 of a Pound; double the first Figure 8, and because 6 (the next Figure) exceeds 5, add the Excess, which is 1, to the former Double, and 'twill make it

it 17; account those for Shillings: Then imagining that 1, by which 6 exceeded 5, to be taken as 10, and to stand before the next Figure 8, it will make 18; from which abate 1, and the Remainder 17 is the Farthings, which make 4d. 1q. so that the Decimal was 17s. 4d. 1q.

Also, 312 of a Pound = 6s. 4d. 3q.

If the Second Figure be just 5, add one to the Shillings, and account the third Figure for the Farthings; if it be less than 5, add nothing to the Shillings, but account it as so many Tens, the third Figure for Farthings.

Division of Decimal Fractions.

General Rule.

Work in all Cases, as in Division of Integers, but only observe, that there be just as many Decimal Places (and no more) in the Divisor and Quotient together, as there were in the Dividend.

22)8,030(3,65	22)8,030(3,65	22)8,030(3,65
66	66	66
143	143	143
132	132	132
110	110	110
110	110	110
0	0	0

In *Decimal Division* there are Nine Cases, all performed by the General Rule with a few Directions, as followeth.

1. To divide a whole Number by a greater whole Number;

To the Dividend add Cyphers at Pleasure, and the Quotient will be all Decimal Parts, according to the Number of Cyphers added:

Thus, if 22 were to be divided by 365.

$$365)22,0000(602,87c.$$

2190

1000

730

270

2. To divide a lesser whole Number by a greater mix'd Number;

Add as many Cyphers to the Dividend, as (at least) there are Places in the Divisor:

$$\text{Thus, } 3,65)22,0000(6,02$$

Here, because there are four Decimal Places in the Dividend (by the annexed Cyphers) and but two in the Divisor, there must be two in the Quotient.

3. To divide a whole Number by a Decimal Fraction, annex (at least) as many Cyphers to the Dividend, as there are Places in the Divisor:

$$\text{Thus, } 3,65)22,0000(6,02$$

Here, there being three Places of Decimals in the Divisor, and but three in the Dividend, there can be none in the Quotient.

4. To divide a mix'd by a whole Number:

$$22)8,030(3,65$$

Here, there being no Decimals in the Divisor, but three in the Dividend, there must be three in the Quotient.

5. To divide a mix'd Number by a mix'd Number:

$$22)80,30(3,65$$

Here, the Dividend having two Places of Decimals, and the Divisor one, there must be one in the Quotient.

6. To divide a mix'd Number by a Decimal Fraction, as if 80,30 were to be divided by 3,65, here add three Cyphers to 80,30 the Dividend, because it may have as many or more Decimal Parts than are in the Divisor, and it will stand

$$\text{Thus, } 3,65)80,30000(22,00$$

730

730,87c.

And because the Dividend hath five Places of Decimals, and the Divisor but three, there must be two in the Quotient.

7. To divide a Decimal by a whole Number:

$$22)8030(365$$

Here needs no Cyphers be annexed, because the Dividend is (apparently) bigger than the Divisor; but because the Dividend has four Places in it, and the Divisor none, a Cypher must be prefixed in the Quotient to supply it, and so the true Quotient will be 3,65.

8. To divide a Decimal by a mix'd Number:

$$3,65)8030(22$$

Here, 'tis plain the Quotient must be 22, because there are four Decimals in the Dividend, and but two in the Divisor.

9. To divide one Decimal by another:

$$22)8030(3,65$$

Here 'tis plain by the General Rule. But sometimes Cyphers must be added to the Dividend, as when the Divisor is bigger than the Dividend:

$$\text{Thus, } 3,65)22,0000(6,02$$

Where six Places of Decimals being in the Dividend, and three in the Divisor, three must also be in the Quotient.

Note, That when any Number (either Decimal or Mix'd) is given to be divided by an Unit, with Cyphers annexed thereto (as 10, 100, 1000, &c.) it is only removing the Separatrix in the Dividend so many Places farther toward the Left-hand, as there are Cyphers annex'd to the Unit, prefixing Cyphers to the Dividend to supply the vacant Places (if need be:)

Thus, if 7562 were to be divided

$$\text{By } \left. \begin{array}{l} 10 \\ 100 \\ 1000 \\ 10000 \\ 100000 \end{array} \right\} \text{The Quotient is } \left\{ \begin{array}{l} 756,2 \\ 75,62 \\ 7,562 \\ ,7562 \\ ,07562 \end{array} \right.$$

DECIMIS Sotoendis pro Possessionibus alienigenarum, is a Writ, or Letters-Patents, yet extant in the *Register*, which lay against those that had farm'd the *Priors Aliens* Lands of the Kings, for the Recovery of the Parish to recover his Tythe of them.

DECK of a Ship, is a Planked Floor on which the Guns lie, and the Men walk to and fro. In great Ships there are three Decks, First, Second, and Third, beginning to account from the lowest; and some also have an *Half Deck*, which reaches from the *Main Mast* to the *Stem* of the Ship. There is also a *Quarter-Deck*, which is from the *Steerage* aloft to the Master's Round-House. There is also sometimes a *Spare Deck*, which is the uppermost of all,

all, and is between the *Main Mast* and the *Missen*: This *Deck* is called also the *Orlop*: Which see.

DECLARATION (in Common Law) is a shewing in Writing the Grief and Complaint of the Demandant or Plaintiff, against the Defendant or Tenant; wherein he is supposed to have received some Wrong; And this ought to be plain and certain, both because it impeaches the Defendant, and also compels him to answer thereto.

DECLENSION, of a Disease, is when it recedes from its Height, and the Patient is beyond Danger: See *Acme*.

DECLINATION Apparent, is the Distance of the apparent Place of a Planet from the Equator.

DECLINATION of the Sun, is the Distance of the Parallel to the Equator which the Sun runs in any Day, from the Equator it self: And this Distance (on the Globe) is reckon'd on the *Meridian*; and according as this Distance is towards either of the Poles of the World, 'tis called *North* or *South Declination*.

To find the Sun's greatest *Declination*; you must, by some very large Quadrant, or such like Instrument, take the Sun's greatest Meridian Altitude, and his least at the two Solstices; the Difference between which is the Double of the Sun's greatest Declination, or the Distance of the Tropicks; wherefore half of it is the thing sought.

To find the Sun's or Star's *Declination* by the *Globe* or *Sphere*; bring the Sun's Place, or the Star to the Meridian, and the Degrees from the Equinoctial there reckon'd either *North* or *South*, are the *Declination* at Noon.

To find the *Declination* of the Sun Trigonometrically, having given his greatest *Declination* and Distance from the next Equinoctial Point:

Say, As the *Rad.* is to the *Sine* of the Sun's Distance from the next Equinoctial Point, so is the *Sine* of the Sun's greatest Declination to the *Sine* of the present Declination.

Example: Suppose the Sun's Distance from the next Equinoctial Point to be $30^{\circ}. 00'$. The greatest Declination $23^{\circ}. 30'$.

Then to the *Sine* of $30^{\circ}. 00'$. 9,698970
add the *Sine* of $23^{\circ}. 30'$. 9,600700

And the Sum (less *Rad.*) = *Sine* } 19,299670
of $11^{\circ}. 30'$.

which is the Sun's present *Declination* required.

How to find the *Declination* of a Planet or Star that hath Latitude, see *Newton's Astron. Britan.* p. 10.

In the *Pythagorean* or *Copernican System*, the Sun's *Declination* is express'd by the Complement of his Distance from the Pole, or by the Distance of the Pole from the Horizon of the Disk, and is called the *Reflection*: And the Proportion to find it is this;

As the *Rad.* to the *Sine* of the Distance of the two Poles of the Ecliptick and the Equator:: So is the *Sine* of the Sun's Longitude to the Co-sine of his Distance from the next Pole: The Complement of which last, is the *Reflection*, the Distance of the Sun from the Horizon of the Disk, or his *Declination*.

DECLINATION of the Mariner's Compass, is its Variation from the true Meridian of any Place. How to find this, see in *Variation*.

DECLINATION True, is the Distance of the True Place of a Planet from the Equator.

DECLINATION of a Wall or Plane for Dials, is an Arch of the Horizon, comprehended either between the Plane and the Prime Vertical Circle,

if you account it from the *East* or *West*, or else between the Meridian and the Plane, if you account it from the *North* or *South*.

There are many ways given by Authors, for finding the *Declination* of a Plane; of which, all those that depend on the Magnetic Needle deserve to be suspected upon many Accounts. The common Method also, by finding the Sun's Horizontal Distance from the Pole of the Plane, is subject to many Errors and Difficulties. Mr. *Oughtred's* way, by a Semi-circle drawn on a Square Board, is the plainest and easiest Method that can be well thought on of that Nature; but then there is Difficulty in setting the Pin truly perpendicular, as well as in placing the Board truly Horizontal; and at the same time is required the Sun's *Declination* and *Azimuth* to be had exactly. The very best way therefore that I ever met with for finding the *Declination* of a Plane, is to get, on a large square Piece of Brass or Wood, a Limb accurately divided into 360 Degrees, and (if it can be) every 5 Minutes; on the Center of which moves an Horizontal Dial, purposely made for the Latitude of the Place, and which hath a small Bit of fine Brass fixed on its Meridian Line, like a fiducial Edge, to cut the Degrees in the Limb. The Use of which is very easy; for at any time when the Sun shines, you need only apply that Side of the Square to the Plane where are 60 Degrees on the Limb; and then setting it as nearly as you can horizontally, turn the Dial about, till it shew exactly the true Hour of the Day (which before must be rightly found, and a Watch set to it) and then will the fiducial Edge cut the Degrees of the Plane's *Declination*; and which way to account it will be easily seen, because the Dial pointing true *North* gives you an Idea of all the Points of the Compass.

And this Method will be of great Use to such, whose Business is to make many Dials in or near the same Latitude.

DECLINATORIES, are Boxes fitted with a Compass and Needle, to take the Declination of Walls for Dialling, &c.

DECLINING Erect Dials, how to make; see *Dial in Erect declining Dials*.

DECLINING Erect Planes: See *Erect declining Planes*.

DECLINING { *Inclining* } *Dials*, are those
 { *Reclining* }
whose Planes neither face directly any of the Four Cardinal Points; nor are they either perpendicular or parallel to the Horizon.

For the describing of these Dials; first make an *Erect* one for the given *Declination*, according to the Direction in *Erect Declining Dials*; then let the Height of the Style above the Substyle be the

{ Difference between } the Co-Latitude and
 Sum of
{ *Inclination*,
 Reclination.

DECLINING { *Reclining* } *Planes*: See *Dial Plan*.
 { *Inclining* }

DECLIVIS Musculus: See *Obliquus descendens seu Declivis*.

DECOCTION, is a boiling of some Plants, Roots, Seeds, &c. for Medicinal Use, being the same as *Apozem*: Which see.

DECORTICATION, the peeling or unhusking of Roots, Seeds, Fruits, &c. or the freeing of them from their Barks, Rinds, Husks, or Shells.

DECORUM or Decency, in Architecture, is a suiting of all the Parts and Ornaments of a Building, so as they shall become the Station; as *Vitruvius* shews, when he speaks of adjusting the several Orders

ders to their Natural Affections; and he, as Mr. Evelyn observ'd, would never have placed a *Corinthian Column* at the Entrance into a Prison, nor one of the *Tuscan Order* before the *Portico* of a Church.

DECREPITATION of *Sea Salt*, or of *Sal Gemma*, is a Word used by the Chymists for a kind of Calcination of Salt thus; an earthen unglazed Pot is heated red hot over the Fire, and then an Ounce of Salt is thrown into it, and the Pot is presently covered; a great cracking Noise arises, whence comes the word *Decrepitation*. If more Salt be to be decrepitated, the Pot must be kept still red hot, and you must proceed as at first. The Design of it is to free the Salt from superfluous Moisture, but it renders the Salt so porous and apt to imbibe the Humidity of the Air, that it must always be kept in a Viol well stopp'd, or else the Air will soon moisten it anew.

DECUPELATION, the same with *Decantation*: Which see.

DECUSSION, a Term in Opticks; is the crossing of any two Lines, Rays, &c. when they meet in a Point, and then go on apart from one another.

DECUSSORIUM, is a Surgeon's Instrument, wherewith the *Dura Mater* being highly prested, is accurately adjoined to the Skull, that the Purulent Matter gathered betwixt the Skull and the Skin, called *dura Meninx*, or *Mater*, may be evacuated by a Hole made with a Surgeon's Instrument, called *Trepandum*. Blanchard.

DE DEONERANDA *pro rata Portionis*, is a Writ that lies where a Man is distrained for Rent that ought to have been paid by others proportionably.

DEDIMUS *Potestatem*; is a Writ whereby a Commission is given to a private Man, for the Speeding of some Act appertaining to a Judge; and by the *Civilians* is called *Delegation*.

DEEDS, in Common Law, signify Writings, that contain the Effect of a Contract made between Man and Man: See more in *Fait*.

DEEP *Sea-Line*, is a small Line to Sound with, when a Ship is in very deep Water at Sea; at the End of it is a piece of Lead, called the *Deep-Sea-Lead*, at the Bottom of which is a Coat of white Tallow, to bring up Stones, Gravel, Sand, Shells, or the like from the Bottom, and to know the Differences of the Ground, which having been before discovered by other Observations, and entred in their Books, they guess by their Soundings what Coasts they are upon, though they cannot see Land. If it happens that no Ground come up upon the Tallow, they guess they are upon *Ouzie Ground*, which they discover by sounding again with a Woollen Cloth upon the Lead, whereby this Ground will be brought up.

DE *Essendo quietum de Tolonio*, is a Writ which lieth for them which are by Privilege freed from the Payment of Toll.

DE *Expensis Militum*, is a Writ, commanding the Sheriff to levy so much a Day for the Expences of a Knight of the Shire; and a like Writ to levy Two Shillings a Day for every Citizen and Burgeis, called *De expensis Civium & Burgensium*.

DEFAULT, in Law is a Non-appearance in Court, without sufficient Cause made out.

DEFECTIVE or *Deficient Nouns*, in Grammar, are such as want either a Number, a particular Case, or are *Indeclinable*.

DEFEIZANCE, signifies (in Law) a Condition relating to a Deed, as an Obligation, Recognizance, or Statute, which being performed by the Obligor or Recognizor, the Act is disabled and annulled, as

if it had never been done. The Difference between a *Proviso* or a Condition in Deed, and a *Defeizance*, is this, That a *Proviso* or Condition is annexed or inserted in the Deed or Grant; whereas a *Defeizance* is usually a Deed by it self.

DEFENCES, in Fortification, are all sorts of Works that cover and defend the opposite Posts, as *Flanks*; *Parapets*; *Casemates*; *Fausse-Brays*: 'Tis almost impossible to fix the Miner to the Face of a Bastion till the Defences of the opposite one are ruin'd: i. e. till the Paraper of its Flank is beaten down, and the Cannon in all Parts that can fire upon that Face which is attacked, are dismounted.

DEFENDANT, a Term in Law, is he that sueth in an Action personal, as Tenant is he which is sued in an Action real.

DEFENDEMUS, a word used in Feoffment or Donation, and bindeth the Donor and his Heir to defend the Donee.

DEFENSIVE, or *Defensive Medicines*, in Surgery, are Remedies applied outwardly to prevent an Inflammation, or any other Symptom that seems to threaten any Part, from arriving so far as to that Part.

DEFERENT, in Astronomy, an imaginary Circle or Orb (in the *Ptolemaick System*) which is there supposed, as it were to carry about the Body of the Planet. 'Tis the same with the *Eccentric*. The two Points where the Epicycle intersects the *Deferent*, are called the *Points of the greatest Elongation*.

DEFICIENT Nouns: See *Defectiue*.

DEFICIENT Numbers, are such, whose Parts added together make less than the Integer, whose Parts they be; as Eight, whose Parts being One, Two and Four, make but Seven; likewise the Parts of Sixteen make but Fifteen, and of Forty five make but Thirty three.

DEFILE, in Fortification, is a straight narrow Lane or Passage, through which a Company of Horse or Foot can pass only in File, by making a small Front, so that the Enemy may take an Opportunity to stop their March, and to Charge them with so much the more advantage, in regard that tho' in the Front and Rear cannot reciprocally come to the Relief of one another. Hence to go off File by File is called *Defiling*.

DEFINITION, is an exact Description, explaining the Nature of a thing by Essential Attributes. And there are three things necessary to make a *Definition* good.

1. It must be Universal; i. e. it must contain the whole Thing defined; therefore (as the Author of the *Art of Thinking* would have it) the common *Definition* of Time to be the Measure of Motion, is not good; for Time may be the Measure of Rest as well as Motion.

2. It must be proper, that is, it must agree with the Thing defined.

3. It must be clearer than the Thing defined, that is, it ought to render the *Idea* of it more plain and distinct; and make us as much as may be to understand the Nature of it, and be serviceable to us to give a Reason of its principal Properties, which is that which we ought chiefly to consider in *Definitions*.

DEFLAGRATION, in Chymistry, is the enkindling and burning of, in a Crucible, a Mixture of Salt or some Mineral Body, with a Sulphurous one, in order to make a Purification of the Salt; or a Regulus of the Mineral; of which see *Sal Prunella* and *Regulus of Antimony*.

DEFLECTION, is the Tendency of a Ship from her true Course by the Reason of Currents, &c. which divert her, and turn her out of her right way.

DEFLUVIUM, is a Distemper in Trees, whereby they lose their Bark; 'tis caused by a sharp Humour, that dissolves the Glew whereby the Bark is fastned to the Wood; and sometimes by too much Drought.

DEFLUXION: See *Catarrh*.

DEGLUTITION, Swallowing, is an Animal Action, whereby Meat chaw'd in the Mouth, or any thing more liquid, descends into the Stomach by the Motion and Contraction of the Fibres of the Gullet. *Blanchard*.

DEGRADATION, is a Term in Painting, which expresses the lessening and rendering confused the Appearance of distant Objects in a Landskip, so as they shall appear there as they would to an Eye placed at that distance from them.

DEGREE, is the 360th Part of the Periphery of a Circle, it is sub-divided into 60 Parts, called *Minutes*, and each of them again into 60 Parts more, called *Seconds*, and so into *Thirds*, &c.

DEGREE Parodick: See *Parodical*.

DEGREES of Fire: The Chymists reckon Four Degrees of Fire. The *first* is made by only 2 or 3 Coals, and is the most gentle Heat of all. The *2d*, is with 4 or 5 Coals, or only just to warm the Vessel sensibly, but so that you may endure your Hand upon it for some Time. The *3d* Degree is when there is Heat enough to make a Pot boil that is full of 5 or 6 Quarts of Water. The *4th* Degree is as great a Heat as can be made in a Furnace; but all these must admit of some Variations, according to the Circumstances of the Operations, Furnaces, Vessels, Quantity of Matter, &c.

DEJECTION, the same with *Ejection*; is going to Stool, or an Evacuation of the Excrements by the Peristaltick Motion of the Guts.

DELEGATES, in Law, are Commissioners delegated or appointed by the King's Commission, to sit upon an Appeal to him in the Court of *Chancery*, and is granted in Three Cases; *First*, When a Sentence is given in an Ecclesiastical Cause by the Archbishop, or his Official. *Secondly*, When a Sentence is given in any Ecclesiastical Cause in Places exempt. *Thirdly*, When Sentence is given in any Admiralty in Suits Civil or Marine, by order of the Civil Law.

DELETERIOUS, or *Delatery Medicines*, are such Things or Particles as are of a poisonous Nature.

DELTA, one of the Abatements of Honour in Heraldry, being a Square in the Middle of the Escutcheon. See *Abatements of Honour*.

DELIGATIO, Swathing, is a part of Surgery that concerns the Binding up of Wounds, Ulcers, broken Bones, &c. and it is either Simple or Compound: The Simple is either equal or unequal; the equal is only round, which swathes the affected Member without any Declension to either Side; the unequal is divided into *Ascia* and *Sima*, which at least differ upon the Account of one being greater and the other less; *Ascia* declines little from a Round, but *Sima* much. There are a great many more Distinctions of Swathing, taken from the Likeness of the Parts which are swathed, or from certain Animals and other Things. *Blanchard*.

DELIQUIUM Animæ, Swoning, the same with *Eclipsis*, *Lipobymia*, *Syncope*, *Aphyxia*, *Lipopsychia*, &c.

DELIQUIUM Chymicum, is either a Distillation by the Force of Fire; or a melting of the Calx, which is suspended in moist Cellars, and a Resolution of it into Lixivious Humour; thus when Salt of Tartar, or any such fixed Alkali is set in a Cellar or some such cool Place in an open Vessel, it will run into a Kind of Water, which the Chymists call *Oil of Tartar per Deliquium*.

DELIRIUM, is a Depravation of the Imagination and Judgment, arising from a tumultuary and disorderly Motion of the Animal Spirits, occasioned by a Fever; whereupon the Persons affected speak several absurd and incongruous things. *Blanchard*.

DELPHINUS, the *Dolphin*, a Constellation in the Northern Hemisphere, containing 10 Stars.

DELTOIDES, is the Name of a triangular Muscle, in Form like the *Greek Letter Δ*; it proceeds from the *Clavicula* or Channel-Bone, from the upper Process of the Shoulder-Blade, and from the Process of the same, which is called *Spiniforme*; and being fastned to the Middle of the *Os humeri*, lifts it directly upwards, or somewhat forwards or backwards, according to the Direction of its differing Series or Fibres.

DELUGE, the same with an Inundation or overflowing of the Earth, either in part, or in the whole, by Water. There have been several very notorious Deluges or Floods, whose Memorials are recorded in History; as that of *Ogyges* which overflow'd almost all *Attica*, and that of *Deucalion* which drowned all *Theffaly* in *Greece*; but the most terrible one that ever was, was that which is usually and very properly called the *Universal Deluge*, or *Noah's Flood*, which overflow'd and destroyed the whole Earth, and out of which only *Noah* and those with him in the Ark escaped.

Men have been very solicitous to account for this dismal Judgment Philosophically, and to discover from whence such an amazing Quantity of Water could come as was necessary to cover all our Globe to the Height of 15 Cubits above the highest Hills, for to that Height, *Moses* saith exprelly, *Gen. vii. 20. the Waters prevailed*; and some have made so bold with him, as to deny there were any Mountains at all before the Flood, though he exprelly mentions them as a Standard for the Height of the Water; and others have denied the Universality of the Deluge, though the Text be as plain as Words can deliver, *That all the Hills over the whole Earth were covered*. Others have had recourse to the shifting of the Earth's Center of Gravity, and so will have its Parts all drowned successively: And our famous Theorist, *Dr. Burnet*, makes an Earth as it were on Purpose to be drowned at that time; which being in the Form of an orbicular Crust on the Face of the *Sea* (as we now call it, for he saith there was none before the Deluge) fell down into the Water, and so drowned its Inhabitants.

Now for my own part, I should not at all be in care how to find Water for such a Catastrophe, if that were all that appeared necessary to enquire after; for I could easily believe, that the Great Creator of the World could soon either educe *Subterranean*, bring down *Supercelestial*, or create Waters on purpose for such an Occasion; for nothing can be too hard for Omnipotence to effect; and I dare not make my Understanding a Judge how far it may be expedient for Him to make use of His Almighty Power without Secondary Causes.

But the Matter lies not here, the *S.S.* tells us, That the Waters of the Deluge came from two Funds, the *Great Deep below* and the *Rains above*; to these therefore we must stick, and look no further. Again, when we look into the Internal Parts of the Earth, even to the Greatest Depth Men have ever digg'd or min'd, we find there that the Body of the Terrestrial Globe is composed of *Strata*, Rows or Layers lying one over another, and which appear to every one that observes them to be Sediments of a Flood; besides, in the Bodies of these *Strata*, though never so solid, may even in-
sed

ed within the Solidity of the firmest Flints, Marble, Stone, &c. we find a prodigious variety of the *Exuvia* or Remains of Fishes, such as their Shells, Teeth, &c. as well Marine ones, as those which live in Lakes and Rivers: And from a due Observation of these, and repeated Considerations upon them, it was, that the Learned and Ingenious Dr. Woodward, Professor of Physick in *Gresham College*, founded what he delivers upon this Subject; which therefore is not so much a *Theory*, as necessary Deductions, and unavoidable Consequences drawn from Matter of Fact.

And from hence it is, and hence only, that he deduces the following *Inferences* relating to the *Universal Deluge*, in his *Natural History of the Earth*; which appear to me very reasonable, and are these.

1. That these Marine Bodies, and the other Spoils of Fresh-water Fishes, were born forth of the Sea by the Universal Deluge, and on return of the Water back again from off the Earth, they were left behind at Land.

2. That during the time of the Deluge, whilst the Water was out upon, and covered the Terrestrial Globe, all the *Stone* and *Marble* of the Antediluvian Earth; all the *Metals* in it; all the Mineral Concretions; and in a Word, all Fossils whatever that had before attained any Solidity, were *totally dissolved*; their Constituent Corpuscles were disjoined, and their Cohesion perfectly ceased; and that the said Corpuscles of those solid Fossils, together with the Corpuscles of these which were not before solid, such as Sand, Earth, and the like; as also all Animal Bodies and Parts of Animals Bones, Teeth, Shells; Vegetables and Parts of Vegetables, Trees, Shrubs, Herbs; and, to be short, all Bodies whatsoever that were either upon the Earth, or that constituted the Mass, if not quite down to the Abyss, yet quite down to the greatest Depths we ever dig; all these, he says, were assumed up promiscuously into the Water, and sustained in it, in such manner, that the Water, and Bodies in it, together made up one common Mass.

3. That at length all the Mass that was thus born up in the Water, was again precipitated and subsided toward the Bottom: And that this Subsidence happened generally according to the Laws of Gravity: That Matter, Body, or Bodies which had the greatest Quantity or Degree of Gravity, subsiding first in order, and falling lowest; that which had the next, or a still lesser Degree of Gravity subsiding next after; and so in their several Courses: That which had the least Gravity sinking not down till last of all, but settling at the Surface of the Sediment, and covering all the rest: That the Matter subsiding thus, form'd the *Strata* of Stone, Earth, Marble, Coal, &c. of which *Strata* lying one upon another, the Terrestrial Globe, or at least as much of it as hath ever been displayed to Human view, doth mainly consist.

4. That the *Strata* of Marble, Stone, and of all other solid Matter attained their Solidity, as soon as the Sand or other Matter, whereof they consist, was arrived at the Bottom, and well settled there; and that all those *Strata* which are solid at this Day, have been so ever since that time.

5. That these *Strata* lying thus one on another, were all originally parallel; and they were plain, even and regular, rendering consequently the Surface of the Earth even and spherical; that they were contiguous, and not interrupted or broken as we find them now; and that the whole Mass of the

Water lay then upon them, above them all, and constituted a Fluid Sphere environing round all the Globe.

6. That after some time, by the Force of an Agent seated within the Earth, these *Strata* were broken on all sides the Globe; that they were *dislocated*, and their Situation varied, being elevated in some Places, and depressed in others; and from hence arose all the Mountains, Valleys, and other Inequalities of our present Earth's Surface; all the Caverns and Grotto's, all the Perpendicular and Horizontal Fissures; the Channel of the Sea, all Islands, &c. In one word, the whole Terrestrial Globe was put, by this Disruption and Dislocation of the *Strata*, into the Condition which we now behold it. *Nat. Hist. of the Earth*. Part 2.

And afterward, in Part the 2d. considering farther this Matter of the Universal Deluge, he concludes from his *Observations*;

1. That the *Deluge* of *Noah* was truly *Universal*, and laid the whole Earth under Water, covering all, even the highest Mountains, quite round the Globe.

2. That at the time of the *Deluge*, the Water of the Ocean was first brought out on the Earth, and that it was immediately succeeded by that of the Abyss, which was also brought out on the Surface of the Globe.

3. That upon the Disruption of the *Strata*, and the Elevation of some, and the Depression of others of them, which followed after that Disruption towards the End of the Deluge, this Mass of Water fell back again into the depressed and lowest Parts of the Earth, into Lakes and other Cavities into the *Alveus* or Channel of the Ocean; and through the Fissures whereby this communicates with the Ocean in the Abyss, which it filled till it came to an *Equilibrium* with the Ocean.

4. That the *Deluge* commenced in the *Spring Season*, the Water coming forth upon the Earth in the Month which we call *May*.

5. That the *Deluge* did not happen from an accidental Concurrence of Natural Causes, but that many things were then done, which never could possibly have been done without the Assistance of a *Supernatural Power*: That the said Power acted in this Matter with *Design*, and with the highest *Wisdom*: And that as the System of Nature was then, and is still supported and established, a *Deluge* neither did nor could happen naturally.

The Learned and Ingenious Mr. *Whiston*, now Mathematical Professor of the University of *Cambridge*, in his *New Theory of the Earth*, supposes, and indeed makes it very probable from several surprising Co-incidences (as the exact Correspondence between the *Solar* and *Lunar* Year, supposing, as he doth, that the Earth moved in a Circular Orbit before the *Deluge*: That the Earth at the Time of the *Deluge* should be in its Perihelion, which is indeed the natural Effect of a Comet's passing by at that time, and drawing it from a Circular to an Elliptical Orbit: And also, That the Moon was then in such a Place of its Orbit, as to be equally attracted by the Earth when the Comet passed by; I say, he renders it very probable) that a Comet descending in the Plane of the Ecliptick towards its Perihelion, passed just before the Earth on the first Day of the *Deluge*: The Consequences of which he thinks would be, That this Comet, when it came below the Moon, would raise a prodigious, vast and strong Tide, both in the small Seas, which, according to his Hypothesis, were in the Antediluvian Earth (for he allows no great Ocean there, (as in ours) and also in the Abyss, which was under the upper Crust of the Earth. This Tide he supposes would rise and increase all the time of the approach of the Comet towards the Earth, and would be at its greatest Height when the Comet

was at its least Distance from it. By the Force of which Tide, and also by the Attraction of the Comet, he judges, that the Abyss must put on an Elliptick, or rather exactly Oval Figure, whose Surface being much larger than the former Spherical one, the outward Crust of the Earth incumbent on the Abyss, must needs accommodate itself to that Figure, which yet it could not possibly do while it held solid and conjoined together; and therefore he concludes, that it must of necessity be extended, and at last broken by the violent Force of the said Tide and Attraction, and consequently have innumerable Gaps and Clefts made quite through it, out of which the included Water of the Abyss must issue, and so help to occasion the *Deluge*.

He supposes further, That this Comet in its Descent towards the Sun, passed so close by the Body of the Earth, as to involve it in its Atmosphere and Tail for a good while, and consequently left a vast Quantity of Vapours both expanded and condensed on its Surface; a great Part of which being very much rarify'd after their first Fall, would be soon drawn up into the Air again, and afterwards fall down on the Earth in vast and prodigiously violent Rains; which was the Cause of the *Forty Days* Rain mentioned by *Moses* in his History of the *Deluge*. But the other great Rain, which with this lasted for 150 Days, was caused (he saith) by the Earth's coming a second time into the Tail of the Comet: And from this double coming of the Earth into, first, the Atmosphere, and then the Tail of the Comet, he supposes half the Water of the *Deluge* to be derived, as the other half came from the Abyss; whose Waters he supposes were continued to be brought out from the Pressure of that Water which came from the Comet, which he thinks would press downwards with a mighty Force, and endeavour to sink the outward Crust of the Earth down into the Abyss, and this would force the Subterranean Water up through the Clefts and Fissures before made in the Crust by the Violence of the Tide above-mentioned. And at last, to remove this vast Orb of Waters again, he supposes a mighty Wind to have arisen, which dried up some, and forced the rest down into the Abyss through the Clefts or Fissures by which it came up in a good measure before; only that a good Quantity indeed retired into the *Abvius* of the great Ocean (now first made) and into lesser Seas and *Lakes*, &c. From the Calculation of this Comet he concludes, That the *Deluge* began on the 17th Day of the Second Month from the Autumnal Equinox (or on the 27th Day of *November*, in the *Julian* Style extended backward) in the 2265th Year of the *Julian* Period, and in the 2349th Year before the Christian *Era*. He asserts also, That the Waters of the *Deluge* were still, calm and free from Commotions, Storms, Winds and Tempests of all sorts, during the whole time the Ark was afloat upon them: That at the *Deluge* the Earth was first divided into two vast Continents almost opposite to one another, and separated by a vast Ocean, as it is now; and also, that since the *Deluge*, there neither hath nor will be any great or general Changes in the State of the World, till a Period be put to the present Course of Nature. How he makes out these things, the Reader will find in his *New Theory of the Earth*, which is very well worth the careful Perusal of every Mathematical and Philosophical Reader.

DEMAINE, or *Demesn*, *Dominicum*, is a French Word, otherwise written *Domaine*, and signifieth, as *Hottoman* saith, *Patrimonium Domini*, in *verbis feudalibus*, *verbo Dominicum*, where, by divers Authorities, he proveth those Lands to be *Dominicum*,

which a Man holdeth originally of himself, and those to be *feodum* which he holdeth of a Superior Lord.

In *England* no common Person hath any *Demains* simply underfoot, for all dependeth either mediately or immediately on the Crown; for when a Man in pleading would signify his Land to be his own, he saith, That he is or was seiz'd thereof in his *Demains*, as of Fee, *Lit. lib. 1. C. 1.* whereby he meaneth, That although his Land be to him and his Heirs for ever, yet it is no true *Demaine*, but dependeth upon a Superior Lord, and he holdeth by Service, or Rent in lieu of Service, and by both Service and Rent,

This Word *Demaine* is diversly taken; sometimes more largely, as of Lands and Tenements held for Life, &c. and sometimes more strictly, as for such only as are generally held in Fee. This Word is sometimes used for a Distinction between those Lands that the Lord of the Mannor hath in his own Hands, or in the Hands of his Lessee, demised upon a Rent for Term of Years or Life, and such other Lands appertaining to the said Mannor, which belongeth to the Free or Copy-holders. And the reason why Copy-hold is accounted *Demains*, is, because they that be Tenants to it, are judged in Law to have no other Right, but at the Will of the Lord; so that it is reputed still, after a sort, to be in the Lord's Hands: And yet in common Speech that is ordinarily called *Demeans*, that is, neither Fee nor Copy. Note also, That *Demains* is sometimes used in a more special Signification, and is opposite to *Frank-Fee*: For Example, Those Lands which were in the Possession of *Edward the Confessor*, are called *Ancient Demaine*, and others be called *Frank-Fee*, *Kitchin*, Fol. 58. And the Tenants which hold any of those Lands, be called *Tenants in Ancient Demaine*, the other *Tenants in Frank-Fee*, and also Tenants of the Common Law; the Reason is, because *Tenants in Ancient Demaine* cannot be sued out of the Lord's Court.

DEMI-BASTION, is a kind of Fortification that hath only one Face and one Flank.

DEMI-CANNON *lowest*, the Name of a great Gun; (the ordinary ones are about 6 Inches bore, 5400 lb. Weight; some 10, some 11 Foot long, and carry a Shot of 30 Pound Weight;) it carries point blank 156 Paces; its Charge of Powder is 14 Pound Weight. There are also two Sizes of Demi-Cannon above this, which are something larger, as the

Demi-Cannon Ordinary, which is 6½ Inches Bore, 12 Foot long, weighs 5600 Pounds; its Charge of Powder is 17 Pounds 8 Ounces, carries a Shot 6½ Inches in Diameter, and whose Weight is 32 Pounds, and the Piece shoots point blank 162 Paces.

Demi-Cannon of the largest size, is 6¾ Inches Bore, 12 Foot long, of 6000 Pounds Weight; its Charge is 18 lb. of Powder, and the Piece shoots point blank 180 Paces.

DEMI-CULVERING, a Piece of Ordnance; the common sort of them are 4½ Bore, 2700 lb. Weight, 10 Foot long, carries a Shot of 10 Pounds 11 Ounces, is charged with 7 Pounds 4 Ounces of Powder, and shoots Point blank 175 Paces.

Demi-Culvering of the lowest Size, is 4½ Inches Bore, 10 Foot long, of 2000 lb. Weight; its Charge is 6 Pound 4 Ounces of Powder; it carries a Ball of 4 Inches Diameter, and of 9 Pound Weight, and its level range is 174 Paces.

Demi-Culvering of the Elder sort is 4¾ Inches Bore, 10 Foot long, and ½ of 3000 lb. Weight; its Charge of Powder is 8 lb. and 8 Ounces, the Ball is 4 Inches ½ Diameter, weighs 12 lb. 11 Ounces, and the point blank Shot 178 Paces.

DEMI-

DEMI-DISTANCE of *Polygons*: See *Polygons*.

DEMI-DITON, a Note in Musick, being the same with *Tierce Minor*: See *Monochord*.

DEMI-GORGE, in Fortification, is half the Gorge or Entrance into the Bastion, not taken directly from Angle to Angle where the Bastion joins to the Cortine, but from the Angle of the Flank to the Center of the Bastion, or Angle the two Cortines would make, were they thus protracted to meet in the Bastion.

DEMI-QUAVER, a Note in Musick: See *Notes and Time*.

DEMISE, (in Law) is applied to an Estate either in Fee-simple, Fee-Tail, or for Term of Life, and so it is commonly taken in many Writs: The King's Death is in Law termed *the Demise of the King*.

DEMOCRACY, is a Form of Government where the supreme Power and Authority is lodg'd in the People, and they chuse all Administrators and Officers.

DEMONSTRATION, is a Chain of Arguments depending on one another, and founded primarily on first and self-evident Principles, or plain Propositions established and proved from them, and at last ending in the invincible Proof of the thing to be demonstrated, as the Conclusion.

DEMURRER, (in Common Law) signifies a kind of Pause upon a Point of Difficulty in any Action. In *Chancery* the Defendant *demurs* to the Plaintiff's Bill, averring it to be defective in such and such a Point; and demands the Judgment of the Court thereupon, whether he shall be compell'd to make any further or other Answer thereunto, &c.

DENEB, the same with *Cauda Lucida* or *Lion's Tail*, a Star so called: Which see.

DENIZEN, (in Law) signifies an Alien that is enfranchised by the King's Charter, and in all respects almost to do as the King's Native Subjects do, viz. to purchase and possess Lands, and to be capable of any Office or Dignity; yet it is short of Naturalization, because a Stranger Naturalized may inherit Lands by Descent, which a Man made only a *Denizen* cannot.

DENOMINATIVES, in Logick, are such Terms as take their *Original* and *Name* from others.

DENOMINATOR of a *Fraction*, is the Number below the Line, shewing the Nature and Quality of the Parts which any Integer is supposed to be divided into: Thus in $\frac{6}{8}$ the Denominator shews you, that the Integer is supposed to be divided into 8 Parts or half Quarters; and the Numerator 6 shews, that you take 6 of such Parts, i. e. three Quarters of the Whole.

DENOMINATOR of any *Proportion*, is the Quotient arising from the Division of the *Antecedent* by the *Consequent*: Thus, 6 is the Denominator of the Proportion that 30 hath to 5, because 5) 30 (6. This is also called the *Exponent of the Proportion* or *Ratio*.

DENSE; that Body is said to be *Dense* or Thick, when it hath more of Matter, in proportion to the Space or Room it takes up, than other Bodies have; and the being under these Circumstances is called the

DENSITY of *Bodies*, as that which produces it, is called *Condensation*.

The Density of Water to Air is, as *Sr. If. Newton* states it, as 800, or 850 to 1, allowing the Mercury in the Barascope 30 Inches; though *Mr. Boyle* and some others make it as 1000, to 1; but I judge the former Proportion comes nearest the Truth.

The Density of Quick-silver to Water is as 13 $\frac{1}{2}$ to 1; and when the Quick-silver is extraordinary

good, as 24 to 1 nearly; and consequently the Density of Quick-silver to Air is as 11617 to 1.

Sir Isaac Newton asserts the Density of the Planets *Sol*, *Saturn*, *Jupiter*, and of our Earth, and the *Moon*, to be as 100, 60, 7 $\frac{1}{2}$, 387, and 700, and concludes the Sun to be a little denser than *Jupiter*, and our Earth 7 times more dense than the *Sun*.

DENTARPAGA: See *Forfex*.

DENTIDUCUM: See *Forfex*.

DENTIFRICE, is a Medicine for the whitening, scouring, and fastning the Teeth, and for strengthening the Gums.

DENTILS, in Architecture, is a Member of the *Ionick Cornice*, square and cut out at convenient Distances, which gives it the Form of a Set of Teeth, and the Original of its Name.

DENTITION, is the Time that Children breed Teeth, which is about the seventh Month, or later; and usually the upper Teeth come first, though in some the under; and amongst these the Fore-Teeth first. *Blanchard*.

DEOBSTRUENT Medicines, Remedies that open Obstructions.

DEODAND, a thing devoted or consecrated to God for the Pacification of His Wrath, in case of Misadventure, whereby any Christian Man cometh to a violent End, without the Fault of any Reasonable Creature; as if a Horse should strike his Keeper, and so kill him; in this Case the Horse is to be a *Deodand*, that is, given to God, that is, to be sold, and distributed to the Poor, for an Expiation of that dreadful Event, though effected by an unreasonable Creature.

DEOPPIATIVE, the same with *Deobstruent Medicines*: Which see.

DEPART, a certain Operation in Chymistry is called the *Depart*, because the Particles of Silver are made by it to depart from Gold, when they were before melted together in the same Mass, and could not be separated any other way.

'Tis done by melting the united Metals together in a Crucible with a strong Fire, and while the Matter is in Fusion, casting it into a Vessel of cold Water, the Mixture will be divided into very small Grains, which being collected again, and having *Aqua fortis* poured on them, the *Menstruum* will dissolve the Silver, but leave the Gold at the Bottom in a Powder; which, after the Solution of the Silver is gently poured off, must be washed to sweeten it. This is intended for a kind of Purification of Gold; but all the Particles of the Silver will scarce be separated from it even this way. The only way to purify Gold exactly, is by Antimony: Which see under *Purification*; if you would pursue this

Depart farther, and get your Silver out of the *Aqua fortis*; put then into an Earthen Pan a Plate of Copper, and on it pour 10 or 12 times as much Water as the Quantity of your impregnated *Aqua fortis*; into which put in the *Menstruum* of *Aqua fortis*, and let the Mixture lie still for some Hours, or till you find the Copper-Plate to be covered all about with the Powder or Precipitate of Silver, and that the Water begins to turn Blue; then filtrate the bluish Water, and this is that which is called *Aqua Secunda*. Dry the Powder of Silver, and melt it into an Ingot in a Crucible, with a little Salt Petre. If you steep a Plate of Iron some Hours in this *Aqua Secunda*, you will have another

Depart; for the *Menstruum* will let go the Copper which it had dissolved, and which made it look Blue, to prey upon the Iron, and you will have your Copper in Powder on the Iron-Plate: And if you filtrate this Dissolution, you may get the Iron out of

it, by laying in it a Piece of *Lapis Calaminaris*, the Iron will depart out and fall to the Bottom in a Powder, and the Stone will be dissolved, or at least as much of it as the *Menstruum* can contain. If you again filtrate this Water, and then pour upon it drop by drop the *Liquor of fix'd Nitre*, the *Lapis Calaminaris* will be precipitated to the Bottom: And lastly, if you filtrate this Water as before, and after having evaporated a Part of it, set the rest in a cool Place, you will have Chrystals of Salt Petre which will burn like the ordinary sort. *Note*, That though the Silver, the Copper, and the Iron could not be gotten perfectly out of the *Menstruum*, yet the *Liquor of fix'd Nitre* will precipitate all the *Lapis Calaminaris*, and the remaining Particles of the Silver, Copper and Iron.

DEPARTER, or *Departure* from a Plea or Matter, is where a Man pleads a Plea in bar of an Action, and being replied thereunto, doth in his Rejoinder shew another Matter contrary to his first Plea, that is called a *Departure from his Bar*: It is applied also to a Plaintiff, who in his Replication shews new Matter from his Declaration. So if a Man plead a general Agreement in Bar, and in his Rejoinder alledge a special one, this shall be adjudged a *Departure* in pleading: So in Trespass, if the Defendant will plead a Discent, and the Plaintiff replies, that after this the Defendant infeoffed him; and the Defendant effoins that this Feoffment was upon Condition, for the Breach whereof he entred; this is a *Departure*, for it is new Matter.

DEPARTURE in *despight of the Court*, is when a Tenant or Defendant appears to an Action, and hath a Day over in the same Term, or is called after, though he had no Day given him, so that it be in the same Term: If he do not appear, but make default, it is a *Departure in despight of the Court*, and therefore he shall be condemned.

DEPHLEGMATED, *i. e.* cleared from its Phlegm or Water, is a Term used by the Chymists to expreſs that any Spirit is pure and unmix'd with Water or Phlegm, which to effect, they *rectify* it, as they call it, that is, distil it over again; and when 'tis fully deprived of all Water and Phlegm, or at least as much of it as it can well be, they say such a Spirit is well *dephlegmated*.

DEPILATORY, an external Medicine that takes away the Hair from any Part of the Body.

DEPOSITION, is the Testimony of a Witness set down in Writing by way of Answer to the Interrogatories exhibited in *Chancery*, where such Witness is called a *Deponent*.

DEPOSITION, in the Sense of the Grammarians, is the Termination of the Dimensions of a Latin or Greek Verse, so as to discover whether it be perfect, redundant or deficient; wherefore in this respect they reckon four kinds of Verses; *Acatalectic*, where no Syllable is wanting at the End; *Catalectic*, where a Syllable is wanting at the End; *Brachycatalectic*, where a Foot is wanting at the End; and *Hypercatalectic*, where a Syllable or two are redundant, and this kind is called also *Hypermetros*.

DEPRESSION of Equation: See *Equation*, N^o 3.

DEPRESSION of the Pole; so many Degrees as you fail or travel from the Pole towards the Zenith, you are said to *depress* the Pole, because it becomes (respectively) as much lower or nearer to the Horizon.

DEPRESSOR *vel Deprimens Auricularum*, a Muscle of the Ear, in Beasts serving to depress or let fall the Ear.

DEPRESSOR Labii Inferioris: It's difficult to

determine whether this be one only, or two Muscles, it lying between the *Depressores Labiorum Communis*, possesses that Part of the lower Jaw called the *Chin*, and ascending with a direct and transverse order of the Fibres, is inserted into the nether Lip, in depressing of which it turns it outwards.

DEPRESSOR Labiorum, is a Muscle that arises Fleihy from the lower Edge of the inferior Jaw Bone laterally, and ascends directly to its *Interiores* at the Angle of the Lips: This, with its Partner and the *Quadrati* acting, expreſs a sorrowful Countenance, in drawing down the Corners of the Mouth and Cheeks.

DEPRESSOR Oculi, is a Muscle of the Eye which arises from the profoundest Part of the Orbit, and passes directly to its Insertion to the opposite Part of the Globe of the Eye.

DEPRIMENS, or *Humilis*, one of the straight Muscles which move the Globe of the Eye; its Use is to pull it downwards.

DEPRIVATION, is a bereaving or taking away; as when a Bishop, Parson, Vicar or Prebend is *deprived* or deposed from his Preferment for any Matter in Fact or in Law; as if a Schismatick or meer Lay-man be presented, admitted, instituted and inducted, this is good Cause of *Deprivation*.

DEPTH of a Squadron or Battalion, is the Number of Men that are in a File; which of a Squadron is three, and of a Battalion generally fix; whence it comes that we say a Battalion is drawn up 5 *deep*, or 6 *deep*.

DEPURATION, is the cleansing of any Body from its excrementitious Dregs, or more gross Parts.

DE quibus sur dissei, is a Writ of Entry: See *Fitzb. Nat. Brev. Fol. 191*.

DERAIGNE, or *Dereigns*, (in Law) signifies the Proof of a thing which one denies to be done by himself, and the Adversary affirms it, defeating and confounding the Assertion of his Adversary, and shewing it to be without and against Reason or Probability.

DESCANT, in Musick, signifies the Art of composing in several Parts, and is threefold, *viz.* *Plain*, *Figurate* and *Double*.

Plain Descant, is the Ground-work or Foundation of Musical Composition, and consists altogether in the ordinary placing of many Concords.

Figurate or *Florid Descant*, is that wherein Discords are concern'd, as well (though not so much) as Concords; and may well be termed the Ornament or Rhetorical Part of Musick, in regard that in this are introduced all the Varieties of Points, Figures, Syncopes, Diversities of Measures, and whatsoever else is capable of adorning the Composition.

Double Descant, is when the Parts are so contrived, that the *Treble* may be made the *Bass*, and on the contrary, the *Bass* the *Treble*.

DESCENSION Oblique: See *Oblique Descension*.

DESCENSION Right: See *Right Descension*.

DESCENSORIUM, a Chymical Furnace, in which Substances are distill'd by Descent, or downwards.

DESCENT in Law: *Vid. Discent*.

DESCENTS, in Fortification, signify the Holes, Vaults, and hollow Places made by undermining the Ground, as the *Counterſcarp* or *Covert-way*; so that a **DESCENT** into the Moat or Ditch, is a deep digging into the Earth of the *Covert-way* in Form of a Trench, of which the upper Part is covered with *Madriers* or Clays against Fires, to secure the Passage into the Moat.

DESCENT of heavy Bodies: If a Body descend from *A* by its proper Gravity, it will come to the Center *S* in the same time as another such like Body by its Revolution shall describe the Quadrant *ADE*. *Princ. Phys. Math. Lib. 1. Prop. 38. Cor. 1.*

Wherefore abstracting from the Resistance of the Medium, all Bodies must needs descend equally swift, and come to the Center from the same Height at the same time, as in Fact is found by Experiment true.

An heavy Body let fall from any Height near the Surface of our Earth, descends in a Second of Time $16\frac{1}{2}$ Feet English, or 197 Inches and $\frac{1}{2}$.

Proposition I.

The Velocities of descending heavy Bodies are proportionate to the Times from the Beginning of their Falls. This follows (saith the Learned Capt. Halley, *Philos. Trans. N. 179.*) because the Action of Gravity being continual, in every Space of Time the following Body receives a new Impulse, equal to what it had before in the same Space of Time received from the first Power; *v. gr.* in the first Second of Time a Body hath acquired a Velocity, which in that Time would carry it a certain Distance; suppose 32 Foot, 2 Inches, and there were no new Force, it would continue to descend at that rate with an equable Motion: But in the next Second of Time, the same Power of Gravity continually acting thereon, superadds a new Velocity equal to the Former, so that at the End of two Seconds, the Velocity is double to what it was at the End of the first; and after the same manner may it be proved to be triple at the End of the third Second, and so on; wherefore the Velocities of falling Bodies are proportionate to the times of their Falls. *Q. E. D.*

Proposition II.

The Spaces described by the Fall of a Body, are as the Squares of the Times from the Beginning of the Fall.

Demonstration.

Let *AB* represent the Time of the Fall of a Body, *BC*, perpendicular to *AB* the Velocity acquired at the End of the Fall, and draw the Line *AC*; then divide the Line *AB* representing the Time, into as many equal Parts as you please, as *bb b b*, &c. and from these Points draw the Lines *b c*, *b c*, &c. parallel to *BC*; 'tis manifest, that the several Lines *b c* represent the several Velocities of the falling Body, in such Parts of the Time as *Ab* is of *AB*: It is evident likewise, that the Area *ABC* is the Sum of all the Lines *b c* taken together, which ac-

cording to the Method of Indivisibles, are infinitely many; so that the Area *ABC* represents the Sum of all the Velocities, between none and *BC* supposed infinitely many; which Sum is the Space descended in the Time represented by *AB*. And by

the same Reason the Area's *Abc* will represent the Spaces descended in the Times *Ab*; so that the Spaces descended in the Times *AB*, *Ab*, are as the Area's of the Triangles *ABC*, *Abc*; which, by the 20th of the 6th of Euclid, are as the Squares of their Homologous Sides *AB*, *Ab*, that is to say, the Times; wherefore the Descents of falling Bodies are as the Squares of the Times of their Fall. *Q. E. D.*

Proposition III.

The Velocity which a descending Body acquires in any Space of Time, is double to that wherewith it would have moved the Space descended by an equable Motion in the same time.

Demonstration.

Draw *EC* parallel to *AB*, and *AE* parallel to *BC*, and compleat the Parallelogram *ABCE*; it is evident that the Area thereof may represent the Space, a Body moved equally with the Velocity *BC* would describe in the Time *AB*; and the Triangle *ABC* represents the Space described by the Fall of a Body in the same time *AB* (by the foregoing Proposition.) Now the Triangle *ABC* is half the Parallelogram *ABCE*, and consequently the Space described by the Fall, is half what would have been described by an equal Motion with the Velocity *BC* in the same time; wherefore the Velocity *BC* at the End of the Fall, is double to that Velocity which, in the Time *AB*, would have described the Space fallen, represented by the Triangle *ABC* with an equable Motion. *Q. E. D.*

Proposition IV.

All Bodies, on or near the Surface of the Earth, in their Fall descend so, as at the End of the first Second of Time they have described 16 Feet, one Inch, London Measure, and acquired the Velocity of 32 Feet, 2 Inches in a Second.

This is made out from the 25th Prop. of the 2d Part of Mr. Hugenius de Horologio Oscillatorio; wherein he demonstrates the time of the least Vibrations of a Pendulum, to be to the Time of the Fall of a Body from the Height of half the length of the Pendulum,

dulum, as the *Circumference* of a *Circle* to its *Diameter*; whence, as a *Corollary*, it follows, That as the *Squares* of the *Diameter* to the *Square* of the *Circumference*, so half the *Length* of the *Pendulum* vibrating *Seconds*, to the *Space* described by the *Fall* of a *Body* in a *Second* of *Time*; and the *Length* of a *Pendulum* vibrating *Seconds* being found, 39, 125, or 4 Inches, the *Descent* in a *Second* will be found by the aforesaid *Analogy* 16 Foot and one Inch; and by the last *Prop.* the *Velocity* will be double thereto; and near to this it hath been found by several *Experiments*, which, by reason of the *Swiftness* of the *Fall*, cannot so exactly determine its *Quantity*.

From these Four *Propositions* all *Questions* concerning the *Perpendicular Descent* of *Bodies* are easily solved; and either *Times*, *Height*, or *Velocity* being assigned, one may readily find the other two.

From them likewise is the *Doctrine* of *Projects* deducible, assuming the two following *Axioms*, *viz.*

1. That a *Body* set a moving, will move on continually in a *Right Line* with an *equable Motion*, unless some other *Force* or *Impediment* intervene, whereby it is accelerated, or retarded, or deflected.

2. That a *Body* being agitated by two *Motions* at a time, does by their *compounded Forces* pass through the same *Points* as it would do, were the two *Motions* divided and acted *successively*.

The Learned Mathematician Mr. *Keil*, in his Examination of Dr. *Thomas Burnet's Theory* of the *Earth*, P. 124. proves, That the *Direction* of heavy *Bodies* is not towards the *Center* of the *Earth* any where but at the *Equator*, or at the *Poles*: However they will be all perpendicular to their *Horizons*, and so there can be no *Error* in levelling of *Lines*, and in finding the *Risings* and *Fallings* of the *Ground*. And from hence (as he shews, P. 128.) 'tis plain, the *Surface* of the *Earth* cannot be exactly *Spherical*, but the *Earth's Equatorial Diameter* to its *Polar* is as 692 to 689.

DESCRIPTIBENT, a Term in *Geometry*, expressing some *Line* or *Surface* which by its *Motion* produces a *Plain Figure* or a *Solid*: See *Dirigent*.

DESICCATION, is an *Evaporation* of superfluous *Moisture* by *Heat*.

DESICCATIVE Medicines, are the same with *Drying ones*.

DESIRE, is an *Uneasiness* in the *Mind* upon the absence of any Thing whose present *Enjoyment* carries the *Idea* of *Delight* with it; and is greater or less as that *Uneasiness* is more or less vehement.

DE SON Tort Demesne, are Words of *Form* in an *Action* of *Trespas*, used by way of reply to the *Plea* of the *Defendant*, when the *Defendant* says, He did what he did by the *Command* of his *Master*; the *Plaintiff* replies, That the *Defendant* did it *De Son Tort Demesne*, *viz.* of his own *Wrong*, &c.

DESPAIR, is the *Thought* of the *Unattainableness* of any *Good*, which works differently in *Mens Minds*, sometimes producing *Uneasiness* or *Pain*, sometimes *Rest* and *Indolency*.

DESPOTICK, is the same as absolutely *Supreme*, as when a *Prince* has gain'd such an *Absolute* and *Despotick Power*, that he will not be regulated by the *Laws* of his *Country*, but will govern only by his sole *Will* and *Pleasure*.

DESPUMATION, is a Term in *Pharmacy*, and signifies the clearing and cleansing of any *Liquor*, by letting it boil so as to take off the *Scum*.

DESSEIN, (in *French*) signifies two things in *Painting*, either in general, the *Design* or *Thought* that the *Painter* had about any great *Piece*, whether there be drawn only the *Out-lines* (or *Contours*;

or whether he hath proceeded farther to put in the *Shadows* or the *Colours*; and if there appear much *Masterly Skill* or *Judgment* in the *Thought* or *Design*, we say the *Design* was *Great* and *Noble*, &c.

It also signifies the just *Measures*, the *Proportions* and *external Forms* which those *Objects* ought to have that are drawn in *Imitation* of *Nature*; and in this Sense 'tis one of the *Parts* of *Painting*, and may be called a *just Imitation* of *Nature*.

DESTILLATION, is an *Extraction* of the moist or unctuous *Parts* which are rarified into *Vapour* or *Smoke*, as it were, by the *Force* of *Fire*.

Destillation is performed *per Vesicam*, i. e. in a *Cucurbit* (before describ'd) by a *Retort*; by *Deliquium*, by *Filtre*, by *Descent*, &c. and that either in *Bainne Maria*, *Sand*, *Vapours*, *Dung*, the *Sun*, a *Reverberatory*, &c.

DEBT, or *Debt*, is a *Writ* that lies where any *Sum* of *Money* is due to a *Man* by reason of *Account*, *Bargain*, *Contract*, or *Obligation*, or other *Specialty* to be paid at a certain *Day*, which is not paid, then he shall have this *Writ*; but *Action* of *Debt* will not lie for *Money* due to a *Lord* by his *Tenant* for any *Rent-Service*, but he must distrain for it: So for *Rent-charge* or *Rent-sock*, which any *Man* hath for *Life* in *Tail* or in *Fee*, he shall not have any *Action* of *Debt* as long as the *Rent* continues, but his *Executors* may have an *Action* of *Debt* for the *Arreages* due in the *Lives* of their *Testator*.

DETACHMENT, a *Military Term*, signifying a certain *Number* of *Soldiers* taken out of a greater *Body*, on purpose to be employed in the *Undertaking* of some particular *Enterprize*; it is to form a kind of flying *Camp*, to relieve a *Party* already engaged in *Battel*, to join a separate *Army*, to assist at the *Siege* of a *Place*, to enter into some *Garrison*, &c.

DETENTS, in a *Clock*, are those *Stops* which, by being lifted up or let fall down, do lock and unlock the *Clock* in striking.

DETENT-Wheel, or *Hoop-Wheel*, in a *Clock*, is that which has a *Hoop* almost round it, wherein there is a *Vacancy*, at which the *Clock* locks.

DETERGENT: See *Absfergent*.

DETERMINED Problem, in *Geometry*, is that which hath but one, or but one certain *Number* of *Solutions*. This *Problem* hath but one only *Solution*, *viz.* To describe an *Isoceles Triangle* on a given *Line*, whose *Angles* at the *Base* shall be double to that at the *Vertex*: But this following hath two *Solutions*; To find an *Isoceles Triangle*, whose *Area* and *Perimeter* are given.

A determined *Problem* may be either *Simple* or *Linear*, *Plane*, *Solid* or *Surfold*: Which see.

DETERRATION, is a *Removal* of the *Earth*, *Sand*, &c. from the *Mountains* and higher *Grounds*, down into the *Valleys* and lower *Parts*: This is occasioned by *Rain*, which wash the *Earthy Matter* down by degrees; but this cannot be very considerable, or much raise the *Surface* of the *Earth*, as some have imagined, because a good *Part* of it is sunk into the *Clefts* and *Caverns* of the *Rocks* and *Mountains*, a great *Quantity* is born down into *Rivers*, and thence into the *Sea*, and the richer and finer *Part* helps to compose the *Bodies* of *Plants* and *Vegetables*.

DETERSIVE Medicines, are such as are used to cleanse the *Body* from sluggish, viscous and glutinous *Humours*.

DETINUE, is a *Writ* that lieth against him, who having *Goods* or *Chattels* delivered him to keep, refuseth to deliver them again; and he taketh his *Action* of *Detinue* that intendeth to recover the thing delivered

delivered, and not the Damages sustained by the *Detritum*.

DETONATION, is a Chymical Word, expressing the thundring Noise that is often made by a Mixture being enkindled in the containing Vessel; for the volatile Parts do fly out with great Velocity and Impetuosity: 'Tis the same with *Fulmination*.

DETRUSOR-URINÆ, is a Muscle which is by some reckoned the first proper Membrane of the Bladder, lying under that which is derived from the *Peritonæum*; its Carnous Fibres embracing the whole Bladder like a Hand (as *Spigelius* represents it) compresses it in the Evacuation of the Urine.

DEVASTAVERUNT *bona testatoris*, is a Writ lying against Executors for paying Legacies and Debts without Speciality, before the Debts upon the said Specialities be due, to the Prejudice of Creditors.

DEVENERUNT, is a Writ directed to the Escheator, when any of the King's Tenants holding in *Capite* dies, and when his Son and Heir within Age, and in the King's Custody dies, then shall this Writ go forth, commanding the Escheator, that by the Oaths of Twelve good and lawful Men, he enquire what Lands or Tenements, by the Death of the Tenant, come to the King.

DEVISE, or *Divise*, (in Common Law) is when a Man in his Will bequeaths his Lands or Goods to another after his Decease; and he to whom the Lands or Goods are bequeath'd, is called the *Devisee*.

DEVOURING, if any Fishes are born in an Escutcheon in a feeding Posture, the Herald's Term for it is Devouring, because Fish swallow all their Meat whole.

DEUTEROPATHIA, is a Disease that proceeds from another Disease; for Example, as the Head-Ach from the Distemper of another Part, the Morbifick Matter being translated thither from its former Repositories. *Blanchard*.

DEW, is composed of Steams of the Terrestrial Globe, which, for a while, swim to and fro in the Air, but at last convene into Drops, and then fall down again to the Earth.

DEW of *Vitriol*, so some Chymists will call a kind of *Phlegm* which is drawn from Vitriol in *Balneo Mariae*, or with a gentle Heat.

DEXTER Side or Point, is the Right Side or Point in an Escutcheon. *Vid. Escutcheon*.

DIABETES, so *Galen* calls it, and *Agineta Dipsacus*, from the great Thirst that attends it; and as others will have it, from a certain sort of Serpent called *Dipsacus*, found especially in *Libya*, which poysons with its Bite, and brings an unquenchable Thirst upon the Person affected. The Disease is too great a Fusion of the Blood, whereupon the *Serum* passes the Reins, and is voided in great Quantities by the Passages of the Urine. *Blanchard*.

DIABROSIS, is a Solution of the *Continuum* by Corrosion of the Parts. *Blanchard*.

DIACLYSMA, is a washing of the Mouth to cleanse it, or to strengthen the Teeth or Gums. *Blanchard*.

DIACOPRÆGIA, a Medicine of Goat's Dung, and used against Tumours in the Spleen and Glands behind the Ears, called *Parotides*. *Blanchard*.

DIACOUSTICKS, or *Diaphonicks*, is the Consideration of the Properties of refracted Sound, as it passes through different Mediums.

DIACRISIS, is a Distinction and Dijudication of Diseases and Symptoms. *Blanchard*.

DIADOCHÉ, is a succeeding by a *Crisis*. *Blanchard*.

DIADROME, the same with the *Vibration*, or Motion, or Swing of a Pendulum.

DIÆRESIS, in Anatomy, is the eating out, or consuming of the Vessels of an Animal Body, when, from some cutting corroding Cause, some Ways and Passages are made which naturally ought not to have been; or when some which really are, yet are dilated more than ordinary, so that the Humours which ought to have been contained in the Vessels, run out. *Blanchard*.

DIÆRESIS in Grammar, is the Division of one Syllable into two, as in this Verse of *Tibullus*, *Stamina non ulli dissoluenda Deo*, for *Dissoluenda*. This

DIÆRESIS is usually noted by two Points placed over a Letter, to shew that it is founded by it self, and not joined with any other, so as to make a Diphong; as *Æra* by the Points over the *æ*, is distinguished from *Æra*. 'Tis also a kind of *Metaplasim* or Addition to a Word, by dividing one Syllable into two, as *Aulæ*, by a *Diæresis*, is of three Syllables, instead of *Aulæ*.

DIÆTETICA, is a Part of Physick that prescribes the Use and Knowledge of the *six non-natural Things*, as the Physicians speak.

DIAGONAL, in Geometry, is a Line drawn across from Angle to Angle in any Figure, and is by

some called the *Diameter*; as in this Figure, *ab* is called a *Diagonal*.

Propositions.

1. Every *Diagonal* divides a Parallelogram into 2 equal Parts; for the 2 Δ 's, acb and abd have the Sides $cb = ad$, $ac = db$ (because opposite ones of the Figure;) and the Angle $cab =$ to the alternate one adb , wherefore they are equal to each other. *Q. E. D.*

2. Two *Diagonals* AD and BE being drawn in any Parallelogram, do bisect each other: I say $AC = CD$, and $BC = CE$; for in the Triangles Z and X , the Vertical Angles at C are equal, and

the alternate ones EAD and ADB are also equal, and the Side $AE = BD$; therefore all the Sides of Z are equal to those of X , and consequently $AC = CD$, and $EC = CB$. *Q. E. D.*

3. A Line (as LN) passing thro' the middle Point (m) of the *Diagonal* of a Parallelogram (AD) divides the Figure into two equal Parts: I say $Z + R = T + X$; for $Z + T = R + X$ (because of the

G g

Dia-

Diagonal) and the Triangle $Z =$ Triangle X , as having the vertical Angles at M , and the alternate ones DAB and ADC , and also the Side AM and MD , all respectively equal to each other; therefore the remaining Trapezium R , when the

Triangle Z is taken away, must be equal to T when X is taken away; but if R be equal to T , and $Z = X$, then $Z + R$ must be equal to $X + T$, and each will be equal to half the Parallelogram.

Q. E. D.

DIAGONAL Scale: See *Scale*.

DIAGNOSTICKS, a Term in Medicine, are the present Signs whereby to judge of a Disease, or a Knowledge whereby Men understand the present Condition of a Distemper; and they make it threefold, either a right Judgment of the Part affected, of the Disease it self, or of its Cause.

DIAGRAM, is a Scheme for the Designation or Demonstration of any Figure.

DIAGRYDIUM, or *Diagrydium*, Scamony prepared by boiling it in a hollowed Quince; some prepare it with Juice of Quince, and others with Juice of Lemons, or of pale Roses.

DIAL, the first *Sun-Dial* that was set up in *Rome*, was by *Papirius Cursor*, about the Year of the City 447, (and before that there is no mention, saith *Pliny*, of any Account of Time but of the Sun setting and rising:) This Dial was set up in the Temple of *Quirinus*, but it went not right. About 30 Years after this, *M. Valerius Messala* (says *Varro*) being Consul, brought out of *Sicily*, from the taking of *Catana*, another *Dial*, which he set up on a Pillar near the *Rosstrum*; but for want of its being made for that particular Latitude, it could not go true. Nevertheless they made use of it 11 Years, and then *Martius Philippus*, who was Censor with *L. Paulus*, set up another that was more exact. The Greeks also were a long Time without Clocks and *Sun-Dials*. Some attribute the Invention of *Sun-Dials* to *Anaximenes Milesius*, and some to *Thales*. There are many Kinds of *Dials* mentioned by *Vitruvius*, as, one invented by *Berosus* the *Chaldean*, which was on a reclining Plane, parallel almost to the Equinoctial; on this was an half Circle; and thence 'twas called *Hemicyclus*.

Aristarchus Samius found out the *Hemisphere Dial*, and there were some Spherical ones, with a Needle for a *Gnomon*. The *Discus* of *Aristarchus* was an *Horizontal Dial*, with its Limb raised up all round to prevent the Shadow from extending it self too far off.

DIAL-PLAINS, are plain Superficies upon which the Hour-Lines are drawn in any Latitude, and may be distinguished into *Parallel*, *Perpendicular* and *Oblique*, according to their Position with respect to the *Horizon* of the Place where they are made.

Parallel Plains or *Dials* are such as lie level with the *Horizon*, and on that account termed *Horizontal Dials*.

Perpendicular Plains are such as stand erect to the *Horizon*, and such are all those that are set against an upright Wall or Building; which are of two Sorts, viz. either *Direct* or *Declining*; and these are often called *Mural Dials*.

Erect, Direct South, West, North, East Plains, are those Walls or Plains which face any one of the four Cardinal Points of the *Horizon*, and the *Dials* made upon such a *Plain* are called *Erect, Direct South, West, North, East Dials*.

Erect { South, } Plains declining East or West,
{ North, }
are those *Plains* which lie open to any Two of the Cardinal Points, as to the *{ South, }* and *East,*

or to the *{ South, }* and *West.*
{ North, }

Oblique Plains, reclining from the *Zenith*, or inclining to the *Horizon*, are also of two sorts, viz. either *direct Reclining*, or *Declining* and *Reclining*.

Direct South, West, North or East Recliners, are those reclining *Plains* which lie open to any one of the Cardinal Points of the *Horizon*.

Reclining { South, } Plains declining East or
{ North, } *West*, are those *Plains* which face any Two of the Cardinal Points *{ South, }* and *East*, or to the *South,* and *West.*
{ North, }

DIALECT, is the peculiar Manner of *Idiom*, Spelling and Pronunciation of any Language in particular Places of the Nation: Thus among the *Greeks*, the *Ionick* and *Dorick* Way of Speaking and Writing was different from the *Athenian*, which therefore are called the *Dialects* of the *Greek* Language; and so it is in all Countries.

DIALECTICAL Arguments, in *Logick*, are such as are barely probable, but do not convince or determine the Mind to either Side of the Question; though some will have *Dialecticks* to be the same as the *Art* of true Reasoning in general, and to be as comprehensive as universal *Logick*.

DIALEMMMA, the same with *Apyrexia*.

DIALLING-GLOBE, is an Instrument made of *Brass* or *Wood*, with a Plane fitted to the *Horizon*; and an Index particularly contrived to draw all Sorts of *Dials*, and to give a clear Demonstration of that *Art*.

DIALLING-SPHERE, is an Instrument made of *Brass*, with several Semi-circles sliding over one another on a moving *Horizon*, to demonstrate the Nature of the Doctrine of Spherical Triangles, and to give the true *Idea* of drawing *Dials* on all Manner of Planes: See more in *Dial*.

DIAMETER, is a Line that passes through the Middle of any Figure from one Corner to another; and this should rather be called the *Diagonal*.

DIAMETER of a Circle, is a Right Line which passes through the Center of a Circle, and is terminated at each End by the Circumference dividing the Circle into two equal Parts.

DIAMETER of a Conic Section, is a Right Line drawn through the Middle of the Figure, and bisecting all the *Ordinates*; and if it bisect them at Right Angles, 'tis called the *Axis* of the Section, and often the *Ax*.

DIAMETER Conjugate, in the *Ellipsis*, is the shortest *Axis* or *Diameter*.

DIAMETER *Conjugate*, in the *Hyperbola*, is a Line drawn parallel to the *Ordinates*, and through the Center or middle Point of the *Transverse Axis*, and is always a middle Proportional between the *Latus Rectum*, and the *Latus Transversum*.

DIAMETRICALLY Opposite, is when two things are opposed to one another right across, or directly contrary, as one End of a *Diameter* is to another.

DIANA'S Tree; dissolve an Ounce of *Silver* in 3 Ounces of Spirit of Nitre, then pour the Dissolution into a Matrafs, in which before you had put 18 or 20 Ounces of Water, and two Ounces of *Quick-silver*: The Glass must be filled up to the Neck; and all must lie still on a round of Straw in some cool Place for 40 Days together, during which time the Tree will begin to spread forth its Branches, and will have little Balls at the End which will represent Fruit.

Another like a Fir Tree may be thus made; dissolve an Ounce of Coppel *Silver* in 3 Ounces of *Aqua fortis*; set the Glass in Sand, and evaporate about half the Moisture, after which add to the Remainder 3 Ounces of good distilled Vinegar; let it be a little hot, and keep it stirring; then put the Matrafs into a little cool Place for about a Month, and then the Tree will rise up to the very Top of the Liquor.

To recover the *Silver* again in both these Experiments: In the *Former* take the whole Matter and shake it together, and then boil it for about $\frac{1}{2}$ an Hour in an Earthen Vessel; then let it cool till it's just no more than luke-warm, and pour upon it gently a Quart of Water, in which you had before dissolved 2 Ounces of Salt; a white Precipitate will fall down, which gather and dry. Put it into a Retort in a Sand Furnace, fitting to it a Receiver filled with Water, and beginning with a small Fire at first, increase it till the Retort is red hot. The *Quick-silver* will distil drop by drop into the Receiver; continue the Fire till no more will come; you will find the Mercury in the Bottom of the Receiver, which wash and dry with a Linnen Cloth and Crumbs of Bread. The *Silver* will remain in the Retort, which may be recovered into pure *Silver*, by melting the Matter in a Crucible with a little *Salt Petre*.

In the latter Experiment, to get the *Silver* again, you need only pour salt Water upon the whole shaken together, which will precipitate a white Powder, and that Powder melted in a Crucible with a little *Borax* or *Salt-Petre*, will run into fine *Silver*. Because this way of making *Diana's Tree* is very tedious, Mr. *Homburg* hath given us, in the *Memoirs Mathem. et de Physique*, A.D. 1692. P. 146. the following Method of making this curious Experiment in less than a Quarter of an Hour's Time.

Take four Drams of Filings of fine *Silver*, with which make an *Amalgam*, without heat, with two Drams of *Quick-silver*; then dissolve this *Amalgam* in 4 Ounces of *Aqua fortis*: Pour this Solution into 12 Paris Points of common Water (which is about 3 Gallons *English*); stir it about a while to mingle it well stopp'd, and then keep it in a Glass Vessel

When you would make the Experiment, take about an Ounce of it and put it in a small Viol, wherein put also about the Quantity of a small Pease of the ordinary *Amalgama* of Gold or Silver, which should be as soft as Butter, and set the Viol at rest for about two or three Minutes; presently after which you will see several small Threads or Filaments arising perpendicularly from the little Bulb of the

newly put in *Amalgama*, and which will sensibly grow, and thrust out on the Sides small Branches in the Form of a Tree. The Bulb or Ball of the *Amalgama* will grow hard, and be like a Pellet of white Earth, but the little Tree will be of the Colour of bright *Silver*.

Only observe, That the Water which serves once for this Experiment, will not serve a second time.

Mr. *Homburg* saith, you may vary the Form of this Metalline Tree almost as you please: The stronger you make the first described Water, the thicker will the little Tree be in Branches, and the sooner formed; but if that be weak, the Branches will be sparing, slender, and slow in growing: And afterwards he shews how several other kinds of Trees may be formed also by *Chrysalization* and by *Digestion*.

DIAPASMA, according to *Pliny*, is a dry Medicine made up of dry Powders, to be sprinkled upon something, as either upon Cloaths to perfume them, or upon Ulcers or Wounds several ways, or upon Drink to make it more delicious. *Blanchard*.

DIAPASON, a Greek Word, signifying a Chord including all Tones; 'tis the same with what we call an *Eighth* or an *Octave*, because there are but seven Tones or Notes, and then the *Eighth* is the same again with the first. *Aristotle* says, it was not called *Diocta*, as it should have been, because the ancient Harp, which had all the Tones then known, had but 7 Strings, the Terms whereof are as 2 to 1.

DIAPHEDESIS, is an Eruption of the Blood by reason of the Thinness of the Vessels. *Blanchard*.

DIAPENTE, an Interval of *Musick*, whose Terms are as 3 to 2, it being the second of the *Concords*, and makes an *Octave* with the *Diateffaron*; it is otherwise called a *perfect Fifth*.

DIAPER, in Heraldry, signifies a Bordure fretted all over with some such things as Bordures used to be charged with, all appearing between the Frets; a bearing which hath been used in some *French* and *Belgick* Coats of Arms.

DIAPHANEITY, is the Property of such a Body as is *Diaphanous*, which is one that is transparent like Glass, the Humours of the Eyes, the *Tunica Cornea*, &c. And such a Body hath its Pores so ranged and disposed, that the Beams of Light can pass freely through them every way.

DIAPHORESIS, Sweating, is a Perspiration of all manner of *Effluvia* through the invisible Pores of the Body.

DIAPHORETICKS: See *Sudorifics*.

DIAPHRAGMATICK-ARTERY, is by some said to issue from the Trunk of the *Aorta*, and thence to go to the *Diaphragma*.

DIAPHRAGM, by some called *Septum Transversum* and *Disseptum*: The *Midriff*, is a Muscle composed of two others, which divide the Middle from the Lower Cavity; the First and Superior Muscle arises from the *Sternum*, and the Ends of the last Ribs on each side. Its Fibres from this Semi-circular Origination, tend towards their Center, and terminate in a *Tendon* or *Aponeurosis*, which hath always been taken for the Nervous Part of the *Diaphragm*. The Second and Inferior Muscle comes from the *Vertebra* of the Loins by two Productions, of which that on the Right Hand comes from the First, Second and Third *Vertebra*. That on the Left Side is something shorter, and both these Productions

tions join and make the Lower Part of the *Midriff*, which joins its Tendon with the Tendon of the *O-ther*, so as that they make but one Membrane, or rather Partition.

The *Diaphragm* is covered with a Membrane from the *Pleura* on its Upper side, and by the *Peritonæum* on its Lower; it is pierced in the Middle to make a Passage for the *Vena Cava*, and in its Lower part, for the *Oesophagus*, and for the Nerves which go to the Upper Orifice of the Stomach. And again, between the Production of the Inferior Muscle, passes the *Aorta*, the *Ductus Thoracicus*, and the *Vena Azygos*.

The *Diaphragm* receives Veins and Arteries called *Phrenica* from the *Cava* and *Aorta*, and sometimes on its Lower Part two Branches from the *Vena Ali-posa*, and two Arteries from the *Lumbares*. It hath two Nerves which come from the third *Vertebra* of the Neck, which pass through the Cavity of the *Thorax*, and are dispersed in the Muscles of the *Diaphragm*.

In its Natural Situation the *Diaphragm* is Convex on the Upper side towards the Breast, and Concave on its Lower one towards the Belly: Therefore when its Fibres Swell and Contract, it must become plain on each side, and consequently the Cavity of the Breast is enlarged to give Liberty to the Lungs to receive the Air in Inspiration; and at the same time the Stomach and Guts are prest for the Distribution of the Chyle. But it diminishes the Cavity of the Breast when it resumes its Natural Situation, and presses the Lungs for the Expulsion of the Air in Expiration.

DIAPHRATONTES, are the Membranes called the *Pleura*, which cover the Inside of the *Thorax*, and leave a kind of Partition in the Middle, called *Mediaſtinum*. *Blanchard*.

DIAPHTHORA, is a Corruption of any Part of the Body.

DIAPLASIS, is the Setting of a Limb which was out of Joint.

DIAPLASMA, is an Ointment, or Fomentation.

DIAPNOE, the same with *Diaphoresis*.

DIAPYEMA, the same with *Empyema*.

DIAPYETICA, are Medicines which ripen and concoct Puerile Matter.

DIARIA Febris, the same with *Ephemera*.

DIARRHOEA, is a Looseness in the Belly which ejects several Bilious, Pituitous, and other Feculent Excrements.

DIARTHROSIS, is a good Constitution of the Bones, whereby they are apt to move easily and strongly; such as is in the Arm, Hand, Thigh, Foot, &c.

DIASTOLE, is the Dilatation or Expansion of the Heart, when the Blood flows into it, from the place where it is as it were accended, the Lungs.

DIASTOLE is also an *Accent* in Grammar, which shews that those Words or Sentences to which it is adjoined, are to be separated, and is marked thus (,) 'Tis also the making long a Syllable which is naturally short.

DIASTYLE, is a sort of Edifice, where the Pillars stand at such a distance one from another, that three Diameters of their Thickness are allow'd for *Intercolumniation*.

DIATESSARON, a Word used in Musick, signifying an Interval composed of one greater Tone, one lesser, and one greater *Semi-Tone*; its Proportion being as 4 to 3. In Musical Composition 'tis called a *Perfect Fourth*.

DIATHESIS, is the Natural or Præternatural

Disposition of the Body, whereby we are inclined to perform all Natural Actions ill or well. *Blanchard*.

DIATONICK, a Term which signifies the Ordinary sort of Musick which proceeds by different Tones, either in ascending or descending; it contains only the two greater and lesser Tones, and the greater *Semi-Tone*.

DICHOPHYIA, is a Fault in the Hair, when it parts and disjoins too much. *Blanchard*.

DICHORÆUS, is the Foot of a Latin Verse consisting of four Syllables, of which the first is long, the next short, the Third long, and the Last short. 'Tis compounded of two *Choræus*, as *Comprobare*.

DICROTUS, is a Pulse that beats twice.

DIDYMI, are Twins.

DIEM clausit extremum, is a Writ that lieth for the Heir of him that holdeth Land of the King, either by Knight-Service or Soccage, and dieth, be he under or at full Age, directed to the Escheator of the County, to enquire of what Estate the Party died seized, and who is next Heir to him, and of what Value the Land is.

DIES CRITICI: See *Critici Dies*.

DIES-DATUS, a Term in Law, signifying a Respite given to the Tenant or Defendant by the Court.

DIESIS, in Musick, is the Division of a Tone below a *Semi-tone*, or an Interval composed of a lesser or imperfect *Semi-tone*; so that when *Semi-tones* are placed where there ought to be Tones, or when a Tone is set where there should be only a *Semi-tone*, this is called *Diesis*.

Enharmonical Diesis, is the Difference between the Greater and the Lesser *Semi-Tone*.

These *Dieses* are the least sensible Divisions of a Tone, and are mark'd on the Score in Form of *St. Andrew's Cross*.

DIEU SON ACT, are Words used in our Law, and it is a Maxim, That the Act of God shall pre-judice no Man; and therefore if a House be beaten down by Tempest, or other Act of God, the Lessee for Life or Years shall not only be quit in an Action of Waste brought against him, but hath by the Law a special Interest to take Timber to build the House again, if he will, for his Habitation. So when the Condition of an Obligation consists in two Parts, in the Disjunctive, and both are possible at the Time of the Obligation made, and afterwards one of them becomes impossible by the Act of God, the Obligor is not bound to perform the other part, for the Condition shall be taken beneficially for him.

DIFFERENCE, in Logick, signifies an Essential Attribute belonging to any Species that is not found in the Genus, and is the *Universal Idea* of that Species; thus Body and Spirit are two Species of Substance, which do contain in their Ideas something more than is in that of Substance; in Body we first find Impenetrability and Extension; in a Spirit a Power of Thinking and Reasoning; so that the Difference of Body is impenetrable Extension, and the Difference of a Spirit is Cogitation.

DIFFERENCE, in Mathematicks, is the Remainder when one Number or Quantity is subtracted from another.

DIFFERENCE of Ascension: See *Ascensional Difference*.

DIFFERENCE of Longitudes, of two places on the Earth, is an Arch of the Equator, comprehended between the *Meridians* of those two places.

DIFFERENCES in a Coat of Arms; So the Herald calls such things as distinguish one Family from another, or Persons of the same Family from each other. They are by *Guillim* accounted either *Anticent*,

ciant or *Modern*: The *Ancient* ones are the *Bordures* of all Kinds; the *Modern* are the *File* or *Labe*, *Crescent*, *Mullet*, *Marlet*, &c.

DIFFORM, is a Word used in Opposition to *Uniform*, and signifies that there is no manner of Regularity in the Form or Appearance of a thing. The *Botanists* use it as a Distinction of the Flowers of Plants. See *Flower*.

DIFFUSION, is usually taken to signify the dispersing of the subtle *Effluvia* of Bodies into a kind of Atmosphere all around them; thus the Light diffused by the Rays of the Sun, issuing all round from that amazing Body of Fire, and thus are the Magnetical Particles diffused every where round about our Earth in Parts adjacent to it.

DIGASTRICUS or *Biventer*, is a double Bellied Muscle (whence its Name) which arises from the Process called *Mammiformis* or *Mastoides*, whence descending it becomes Tendinous, passing through the *Stylohyoideus*, and an Annular Ligament fastned to the *Os Hyoides*; from which Bone some Tendinous Fibres do arise, and join with its second fleshy Belly, ascending from thence to its Insertion at the Middle of the Inferior Part of the Lower Jaw. The Middle Tendon of this Muscle, and its Partner, passing through Two Annular Ligaments, fix'd to the *Os Hyoides*, as Ropes through a double Pulley, is a wonderful Contrivance of the Author of Nature to render them capable of pulling the Lower Jaw down, which had their Progress been direct from their Originations, that could not have been performed. Nor are there any Processes, whether of the *Vertebrae* of the Neck, or the neighbouring Parts, that could give an Origination to those Muscles below their Insertion, as in some *Quadrupeds*; wherefore the Divine Architect of Human Bodies has placed this double Pulley below their Terminations, whereby they perform their designed Office. Hence *Deglutition* is hindered when these Muscles are in Action, they then preventing the Ascent of the Tongue and *Larynx*; neither can we at that Time draw the lower Jaw down, because the *Center of Direction* is pulled upwards; wherefore we are obliged on that Occasion to keep the Jaws close together. But in Dogs and other Voracious Animals, who have these Muscles arising from the Transverse Processes of the first *Vertebra* of the Neck, these Actions are not dependent; whence it is they devour their Aliment so quick.

DIGEST or *Pandects*; the 1st Volume or Tome of the Civil Law is called *Digest*, or *Pandects*: *Digests*, because the Author hath put, or digested all things, every Book and Title in its proper and natural Place and Order; and *Pandects* from *πᾶν* and *ἄρξιν*, as containing and comprehending in it self all that ever *Justinian* drew or collected out of 150000 Verses of the old Books of the Law.

This *Digest* was collected from the Works of 27 Venerable and Eminent Old Lawyers, whereof several were before Christ, and the Others flourish'd in the Time of the Emperors, even unto the Time of *Maximinus*, as we find from *Spartianus* and *Lampridius* in that Emperor's Life. The Tome of the *Digests* is divided into 7 Parts, and they again into 50 Books. To this Tome Sir *Thomas Ridley* adds the *Institutions* or *Institutes*; which see under that Word.

DIGESTER, a Vessel so called by its Inventor Mr. *Papin*, and is a kind of *Balneum Maria Clausum*.

DIGESTIO Chymica, a Chymical Digestion, is when things are digested by an Artificial Heat, just as they are naturally in the Stomach, which is when some Matter is put over a gentle Heat, to infuse it

in some proper *Menstruum* or Liquor fit to dissolve it, that for it may, as near as can be, be like the Effect of a Natural Heat.

DIGESTION, the Concoction of the Aliments, or the Dissolution of them, by which they are turned into Chyle.

Mr. *Charles Leigh*, then of *Brazen-Nose College* in *Oxon*, has a Discourse concerning *Digestion*, published in *Phil. Trans.* N. 162. wherein he supposes that there is necessary to Digestion in the Stomachs of Animals, 1. A Liquid *Menstruum*, which by its peculiar Faculty operates upon their Meat, and helps to dissolve it. 2. A gentle Heat in the Stomach, which he thinks it receives from the Liver, and therein falls in with the Opinion of Dr. *Glaucion*. 3. 'Tis necessary that the Stomach have a Natural Situation. 4. That the *Omentum* be assisting; for it hath been found by Anatomy, that where the *Omentum* hath been purified in an Human Body, it was always accompanied with a bad Digestion and loss of Appetite; and 'tis also observable, that those Creatures which have no *Omentum*, as Hares and Conies, &c. do help their Concoction by doubling their hinder Legs, and resting their Bellies upon them. 4. 'Tis necessary that the Stomach should have a *Tunica Villosa*, which both helps to divide the Meat into small Parcels, and also keeps the *Tunica Carnosa* from being too much distended, which would by degrees weaken and injure its Tone. 5. 'Tis necessary that the Guts should lie in a winding Position, and be of a good length; for otherwise the Meat digested in the Stomach would pass away too fast.

The first of these, the *Liquid Menstruum* or *Natural Ferment* of the Stomach, he thinks consists of these Ingredients; 1. The *Saliva* or Spittle. 2. The Juice contained in the Stomachical Glands. And 3. The Nitro-aerial Spirit of the Nerves.

DIGESTIVE Medicines, are either *Internal* or *External*.

The *Internal* are usually prescribed to prepare the Body by Purgation, which they do by making the Humours fluid, attenuating and drawing viscous or tough Substances, tempering such as are sharp, diluting Salts, blunting, concentrating, and imbibing Acids, &c.

External Digestives, are such as ripen a Tumor, or generate good and laudable Matter in a Wound.

DIGIT, in Astronomy, is the Twelfth Part of the Diameter of the Sun or Moon; 'tis used to express the Quantity of an Eclipse.

DIGITATUM Folium, among the Botanists is the Term for the Leaf of the Plant, which either is composed of many simple Leaves set together upon one Foot-stalk, as in Cinque-foil, Vetches, &c. or else when there are many deep Gashes or Cuts in the Leaf, as in those of Straw-Berries, Hops, &c.

DIGITORUM Tensor: See *Extensor Digitorum Communis*.

DIGITS, or *Monadcs*, a Term in Arithmetick, signifying any *Integer* under Ten, as, 1, 2, 3, 4, 5, 6, 7, 8, 9.

DIJAMBUS, is the Foot of a Latin Verse of four Syllables, and compounded of two *iambicks*, so that the first and last are short, and the two middle long, as *Severitas*.

DILATATION, among the Anatomists, is when any Passages or Receptacles in the Body are too much stretched or distended; and in general, it signifies a thing's taking up more Space than it did before.

DILATORIUM, is a Chirurgeon's Instrument wherewith the Mouth is dilated or opened: It is called

called likewise *Speculum Oris*, because by it one may see into the Mouth.

DILATORES Alarum Nasi, are small thin Muscles, having a double Order of Fibres decussating each other, not unlike the *Musculi Intercostales*; they pull up the *Ala*, and dilate the Nostrils.

DILEMMA, is an Argument compounded usually of four or more Propositions, and so disposed, that own or grant which you will of them, yet still the Argument shall press you, and hem you in, with Difficulties not readily to be solved or surmounted, especially if the *Dilemma* be just; in order to which, the *Division* and *Enumeration* of the *Parts* must be adequate and entire; your *Antagonist* must be truly pressed and affected with one or more of the Propositions; and the *Arguer* himself free from a Possibility of having the *Dilemma* returned upon him.

DILUTE, is a Word frequently used by the Writers of Chymistry and Pharmacy, and signifies the Dissolution of the Parts of a dry Body in a moist or liquid one; for when the Body is so dissolved, they say 'tis *diluted*.

DIMENSION, in Geometry, is either Length, Breadth or Thickness: Thus, a Line has, they say, one *Dimension*, viz. Length; a Surface two, viz. Length and Breadth; and a Body or Solid hath all three *Dimensions*. 'Tis used also with Regard to the Powers of any Root in an Equation, which are called the *Dimensions* of that Root; as in a Biquadratic Equation, the highest Power hath 4 *Dimensions*, or its Index is 4.

DIMETIENT, the same with *Diameter*.

DIMINISHED Angle, a Term in Fortification.

See *Angle*.

DIMINUTIO: See *Litotes*.

DIMINUTION, in Musick, is nothing else but the diminishing or abating somewhat of the full Value or Quantity of any Note.

DINUS, according to some, is the Name of a Disease called usually the *Vertigo*.

DIOPTER, is the same with the *Index* or *Albidada* of an *Astrolabe*, or the like *Instrument*.

DIOPTRA, is an Instrument used by Chirurgeons, whereby one may see into the *Matrix*; otherwise called *Dilatatorium*, wherewith the Womb is dilated and enlarged in the Extraction of a dead Fetus out of it, or in the inspecting any Ulcers that are in it: 'Tis also called the *Speculum Matricis*.

DIOPTRICKS, is a Part of *Opticks* treating of the different Refractions of the Light passing through different *Mediums*, as the Air, Water, Glasses, &c.

DIORTHOSIS, a Chirurgical Operation, by which crooked or distorted Members are made even, and restored to their Primitive and regular Shape.

DIOTA, the Chymist's Term for a circulating or double Vessel.

DIPLASIASMUS, is a Reduplication of Diseases; also two Muscles of the Arm, which serve to turn it about. *Blanchard*.

DIPLOE, is the lower thin Plate or Shell of the Skull; also a double Vessel usually with Chymists.

DIPLOMA, the same with *Diploe*; sometimes it is taken for a complicated or folded Cloth.

DIPPING Needle, is an *English* Discovery (Dr. Wallis thinks by Mr. Blagrave, or some other Greshamite, *Phil. Transf.* 276.) of a Property in the *Magnetick Needle*; that besides its Polarity or Verticity, which is its Direction towards the North in a Horizontal Position, it hath also a Direction of Altitude above the Horizon; and that it will (if duly poised about an Horizontal Axis) always point to a

determinate Degree of Altitude or Elevation above the Horizon in this or that Place respectively.

DIPSACUS, according to some, is the same with *Diabetes*.

DIPTERON, in Architecture, is a Name which the Ancients attributed to those Temples which were encompassed with a double Row of Pillars, making two Portico's, which they called *Wings*; but we commonly call them *Iles*, from the *French* Word *Ailes* of the same Signification.

DIPTOTES, are such Nouns in Grammar as have but two Cases, as *Suppetia*, *Suppetius*, &c.

DIRECT; in Astronomy, a Planet is said to be *direct*, when by its proper Motion it goes forward in the *Zodiac* according to the Succession of the Signs, or rather when it appears so to do, the Observer's Eye being placed on our Earth.

DIRECT, *Erect*, *East* or *West* *Dials*, are those whose Planes lie directly open to the East or West Points of the Heavens, or parallel to the Meridian of the Place.

To draw this Dial, the Style's Height may be found according to the Bigness of the Plane, and the Distance of the Hour Lines from each other, by the Direction given under *Polar Dials*, making of them a Table, as in the following one, for the *Lat. 51. Deg. 32. Min.*

Hours.	Angles at Pole.	Tangent.	Hours.
East.	D. M.	Inch. P.	West.
4	30 00	5 77	8
5	15 00	2 68	7
6	Substyle.	60 00	6
7	15 00	2 68	5
8	30 00	5 77	4
9	45 00	10 00	3
10	60 00	17 32	2
11	75 00	37 32	1
12	Infinite.	Infinite.	

Then to describe the Dial, draw the *Horizontal Line* A B; and with 60 *Deg.* from your Chords describe the prick'd Arch C D, whereon set the Co-Latitude of the Place from C to D. From A, through D, draw ADE, representing the Equator of the Dial; then choose a Point in this Line to be the Hour of 6, as at E. Draw 6 e 6 at Right Angles with the Equator; and from E set off the several Tangents as you find them in the Table; and those shall be the several Points for the Hours, and through each Point draw the Hour Lines parallel to the Equator 6 e 6.

The Style may be a straight Pin equal in Height to the Right Line 6, 9. in either Dial, or which is better and more usual, a Rod or Ledge of Iron supported by two Legs, and set upon the Line 6, 6, and of the same Height 6, 9 as the Pin.

A Direct, Erect, East Dial, Lat. 51 Deg. 32 Min.

The West Dial is made after the same manner, only set and numbered a contrary way.

DIRECT, Erect, South or North Dials: See Prime Verticals.

DIRECT, Erect Planes: See Dial Planes.

DIRECT {Inclining
Reclining} Plains: See Dial Planes.

DIRECT South or North {Inclining
Reclining} Dials, are those whose Planes {Incline to the
Recline from the} Horizon
Zenith

and lie directly open to the South or North. These Dials are described after the same manner with Direct South Dials, only observing this Rule in placing the Style.

In South Incliners, the Difference of the Angle of Inclination, and the Height of the Pole, is the Height of the Style above the Plane.

If the Pole's Height be {greater
lesser} than the Angle of Inclination, then the {North
South} Pole is elevated, and the Center is {below.
above.}

In Direct North Incliners, the Sum of the Angles of Inclination and Elevation of the Pole, is the Height of the Style above the Plane.

Note, That Reclining Dials are to be made after the same Manner; for South Incliners are North Recliners, and North Recliners the same with South Incliners, the one being the Back-side of the other.

DIRECT Ray, in Opticks, is the Ray which is carried from a Point of the visible Object directly to the Eye through one and the same Medium.

DIRECT Sphere: See Right Sphere.

DIRECTION, a Term in Mechanicks, wherein, by the Line of Direction, they always mean the Line of Motion that any Body observes, according to the Force impressed upon it, and which is determined or directed to move such a way.

DIRECTRIX of the Conchoid: See Conchoid.

DIRIGENT, a Term in Geometry, expressing the Line of Motion, along which the Describent Line or Surface is carried in the Genesis of any Plane or solid Figure.

Thus, If the Line *ab* move along the Line *ac*, so that the Point *a* do always keep in the Line *ac*, a Parallelogram, as *abed*, will be form'd, of which the Side *ab* is the Describent, and the Line *ac* the Dirigent: So also if the Surface *abed* be suppo-

sed to be carried along the Line *ce*, in a Position always parallel to it self in its first Situation, the Solid *adfh* will be formed where the Surface *ad* is the Describent, and the Line *ce* is the Dirigent.

DISABILITY, in Law, is taken notice of four several ways; viz, by the Act of the Ancestor; by the Act of the Party; by the Act of Law; and by the Act of God.

1. Disability by the Act of the Ancestor, is if a Man be attainted of Treason or Felony; by this Attainder his Blood is corrupted, and thereby himself and his Children are disabled to inherit.

2. Disability by the Act of the Party himself, as if one Man make a Feoffment to another that then is Sole, upon Condition that he shall enfeof a Third before *M.* and when such Feoffment is made, the Feoffee takes a Wife; he hath by that disabled himself to perform the Condition according to the Trust in him reposed, and therefore the Feoffer may enter and out him. Also if a Man be excommunicated, he cannot, during that Time, sue, any Action, but shall be thereby disabled; and so in other Cases.

3. Disability, in Act of Law, is properly when a Man, by the sole Act of Law, is disabled, and so is an Alien born; and therefore if a Man born out of the King's Ligeance will sue an Action, the Tenant or Defendant may say that he was born in such a Country out of the King's Ligeance, and demand Judgment if he shall be answered; for the Law is our Birthright, to which an Alien is a Stranger, and therefore disabled to take any Benefit thereby.

4. Disability by the Act of God, as to be *Non compos mentis*, or *Non sana memoria*, which so disables him, that in all Cases where he gives or passes any thing, or Estate out of him, after his Death it may be disannulled and avoided.

DISCENT, in common Law, signifies an Order or Means whereby Lands or Tenements are derived unto any Man from his Ancestors, as to make his Descent from his Ancestors, and is to shew how and by what Degrees the Lands in Question came to him from his Ancestors. And this Descent is either Lineal or Collateral; Lineal Descent is convey'd downwards in a right Line from the Grandfather to the Father, and from the Father, to the Son, and from the Son to the Nephew, &c. Collateral Descent is springing out of the Side of the whole Blood, as Grandfather, Father's Brother, &c.

DISCENS five Disciformis Cometa, (according to some) is a Comet resembling the Shape of a round Dish or Platter; and the Chief of this kind is called a Solar Comet, from the likeness of its Rays to those

of the *Sun*; and otherwise *Rosa* and *Glyseus*, from its bright Silver Colour mix'd with a Golden or Amber Colour: Those of this sort, which are not absolutely circular, but resemble the Figure of a Shield, are thence termed *Clypeiformes*.

DISCLAIMER, in Law, is a Plea containing an exprefs Denial or Refusal; as if the Tenant sue a Replevin upon a Distress taken by the Lord, and the Lord avow the taking of the Distress, saying, That he holdeth of him as of his Lord, and that he distained for Rent not paid, or Service not performed; then the Tenant denying himself to hold of such Lord, is said to *disclaim*, and the Lord proving the Tenant to hold of him, he loses his Land.

DISCONTINUAL Proportion: See *Discrete Proportion*.

DISCORDS, in Musick, are certain Intervals of Sounds, which being heard at the same time offend the Ear; nevertheless when orderly taken and intermix'd with Conords, they make the best Musick. These *Discords* are the Second, Fourth and Seventh, with their Octaves; that is to say, all Intervals, except those few which precisely terminate the *Concords*, are *Discords*.

DISCOURSE, in a Logical Sense, is that rational Action of our Mind by which we form or infer any new Judgment from others before made; or where-by we can infer or conclude one thing from another.

DISCRETE or *Disjunct Proportion*, is when the Ratio between 2 Pairs of Numbers or Quantity is the same, but there is not the same Proportion between all the four Numbers: Thus, if these Numbers 6 : 8 :: 3 : 4, are considered, the Ratio between the first Pair 6 and 8 is the same as that between 3 and 4, and therefore these Numbers are proportional; but 'tis only discreetly or disjunctly, for 6 is not to 8, as 8 to 3; that is, the Proportion is broken off between 8 and 3, and is not continued all along, as it is in these following, which are called *Continual Proportionals*, viz. 3 : 6 :: 12 : 24.

DISCRETE Quantity, is such as is not continued and joined together, as *Number*, whose Parts being distinct Units, cannot be united into one *Continuum*; for in a *Continuum* there are no actual determinate Parts before Division, but they are potentially Infinite; wherefore it is usually and truly said, *That continued Quantity is divisible in Infinitum*.

DISCRETIVE Propositions, are those where various Judgments are made and denoted by the Particles (*but, notwithstanding*) or Words of the like Nature either exprefs'd or understood: Thus, *Fortune may deprive me of my Wealth, but not of my Virtue: They who cross the Sea, change only their Country, but not their Disposition*, are called *Discrete Propositions*.

DISCUS, among the *Romans*, was a round Quoit of Metal or Stone about a Foot in Diameter, which, in ancient Exercises, they threw in the Air to shew their Strength: Also they gave the same Name to a round Shield consecrated to the Memory of some famous Hero, and hung up in the Temples of their Gods as a Trophy for some great Action. From the Figure of either of which, but rather from the former, comes the Word so much in use among Astronomers, viz. the *Disk* of the Sun or Moon; by which they mean the Round of the Planet's Body as it appears to us.

DISCUS, is used by the Botanists to denote the middle, plain and flat Part of some Flowers; such as *Caltha*, *Flos Solis*, &c. because 'tis in Figure like the ancient *Discus*: And they reckon two kinds of Plants with a *Discous Flower*;

1. Such as have the Flower compounded, and the Seed pappous, but the Leaves and Stalks are not Milky when broken.

2. The *Corymbiferous Plants*, whose Flowers are compounded into a Discous Figure, but their Seeds are not Pappous: Of the former kind are the *Fleabanes*, *Ragweeds*, *Groundsels*, &c. and of the latter are *Daisies*, *Chamemile*, *Tansy*, *Wormwood*, &c.

DISCUSSION, hath two Senfes among Writers; sometimes it signifies the clear treating or handling of any particular Point or Problem, so as thereby the Word implies to *shake* off those Difficulties with which it is embarrassed; and thus we say, such a Point was well *discussed*, when it was well treated of and cleared up. But

DISCUSSION is also used in a Medical Sense, for the dispersing the Matter of any Tumor or Swelling in the Body, and therefore the Surgeons define *Discussion* to be an Evacuation of some thin Matter gathered in any Part by insensible Evaporation; and this is procured by the Natural Heat being increased by proper Medicines.

DISDIAPASON, a Term in Musick, denoting a double Eighth or Fifteenth.

DISEMBOGUE, when a Ship passeth out of the Mouth of some Gulph, they call it *Disemboguing*: They say also of a *River*, that at such a place, or after it hath run so many Leagues, it *disembogues* it self into the Sea.

DISJUNCT Proportion, the same with *Discrete*: Which see.

DISJUNCTIVE Propositions, are those wherein the Disjunctive, Conjunctive (*or*) is found; as, *either the Sun moves about the Earth, or the Earth about the Sun; Men are guided either by Interest or Fear*.

DISLOCATION, the same with *Luxation* or putting a Limb or any Bone of the Body out of Joint.

DISMES Decima are Tythes, and signify the Tenth Part of all the Fruits of the Earth, or tame and profitable Beasts of it, or of Mens Labour.

DISMOUNT, in the common Military Use, is to unhorse, as to dismount the Cavalry; but they call it also *dismounting of Cannon*, when they are thrown off the Carriages, and are broken, or any Horse rendered unfit for Service.

DISPART, a Term in Gunnery, signifying the setting a Mark on the Muzzle-Ring of a Piece of Ordnance, or thereabouts, so that a Sight-Line taken upon the Top of the Base Ring against the Touch-hole, by the Mark set on or near the Muzzle, may be parallel to the Axis of the Concave Cylinder. The common Way of doing which, is, to take the two Diameters of the Base Ring, and of the Place where the *Dispart* is to stand, and divide the difference between them into two equal Parts, one of which will be the Length of the *Dispart*, which is set on the Gun with Wax or Pitch, or fastened there with a Piece of *Twine* or *Marlin*: But an Instrument may be made to do it to all possible Nicety.

DISPENSATORY, is a Book used by *Apothecaries*, wherein all Medicines, at least the most usual, are contained and prescribed, that they may be prepared in the Shops all the Year round.

DISPLAYED, the Term in Heraldry for an Eagle in an erect Posture, and her Wings spread abroad.

DISPONDÆUS, is the Foot of a Latin Verb consisting of four Syllables, and those all long, as *Concludentes*, so that this is a Composition of two *Spondees*.

DISPOSITION: See *Method*. In Architecture they call the just placing of all the several Parts of an Edifice, according to their proper Order, *Disposition*.

DISQUISITION, an Enquiry into the Nature, Kinds and Circumstances of any Problem, Question or Topick, in order to gain a right Notion, and to discourse clearly of it.

DISSEISIN, in Law, signifies an unlawful dispossessing a Man of his Land, Tenement, or other immovable or incorporeal Right.

DISSEISIN upon *Disseisin*, is where the *Disseisor* is disseised by another.

DISSEMINATE Vacuum: See *Vacuum*.

DISSIMILAR Leaves, are the two first Leaves of any Plant at its first shooting out of the Ground; and are so called because they usually are of different Form from the common Leaves of the grown Plant. These Dr. Grew observes to be nothing but the very Lobes of the Seed expanded and thus advanced. Their Use is for the Protection of the *Plume*, which being young and tender, is thus guarded on each Side, and also hath some Rain or Dew gradually conveyed down to it by this Means.

DISSIMILAR Parts, in Anatomy, (by some called *Compound* and *Organical*) are such as can be divided into various Parts different from one another; as the Hand is into Veins, Muscles, Bones, &c. whose Portions are neither of the same Nature nor Denomination.

DISSOLVING Medicines: See *Discussion*.

DISSOLUTION, is when Electuaries and Powders are mingled and dissolved in Water or a Decoction. *Blanchard*.

DISSONANCE, in Musick, is a disagreeable Interval between two Sounds, which, being continued together, offend the Ear.

DISTANCE, in Navigation, is the Number of Degrees, or Leagues, &c. that a Ship has sailed from any given Point.

DISTANCE of the Bastions, in Fortification, is the Side of the *Exterior Polygon*.

DISTEMPER, a Term in Painting for the working up of Colours with something else besides bare Water or Oil; for if the Colours are prepared with the former of these, that kind of Painting is called *Limning*; and if with Oil, 'tis called *Painting in Oil*, and simply *Painting*; but if the Colours are mix'd with Sile, Whites of Eggs, or any such proper glutinous or unctuous Substance, and not with Oil, they then say 'tis done in *Distemper*, as the admirable *Cartons* are at *Hampton Court*.

DISTENTION, is when Parts are puffed up, dilated or relaxed by any thing; as the Guts by Wind raised from Effervescences within them, whence Oppressions and Pains frequently proceed. *Blanchard*.

DISTILLATION, is drawing off some of the Principles of a Mixture, as the Oil, Spirit, Water, &c. in proper Vessels, by the help of a Fire; and is twofold.

1. *Per Ascensum*, when the Matter to be distilled above the Fire.

2. *Per Descensum*, when the Matter to be distilled is below the Fire, and so the Vapour not being able (by the Contrivance of the Vessel) to rise upward, is forced to precipitate and to distil down to the Bottom of the Vessel.

Oil of Cloves, if you would have it White, is best made this Way.

Distillation of Vegetables or Minerals is very different, according to the Nature of the Body to be distilled. Acid Spirits are drawn in a strong Re-

tort, and with very great Fires, and usually in a Reverberatory Furnace. Ponderous Woods are distilled in a Retort after the same manner, and with near the same Degree of Heat, such as *Guajacum*, *Box*, &c. and in these first comes a little Phlegm, and then the Fire increasing, the Spirits fly out in white Clouds; when they cease to come, the Matter in the Receiver is filtrated through a Tunnel lined with Cap-Paper; the Spirit will pass, but leave the Black Fetid Oil in the Tunnel, which afterwards may be rectify'd (if it be worth while) by making it up into Pellets with Sand, and then distilling it over again in a naked Fire, there will come over a clear Oil. The Spirit also may be rectify'd by distilling it over again in a Glass Alembick: Put Fire to the black Coals remaining in the Retort, and they will soon kindle and turn to Ashes; which Ashes may be calcined a while in a Potter's Furnace, and then a *Lixivium* being made of them with Water, and the Water filtrated and evaporated, the fix'd Salt of the Wood will remain at the Bottom; and thus all the five Principles may be drawn from *Amber*, *Ponderous Woods*, &c.

Plants that are Odoriferous are to be distilled *per Vescam*, but first let a strong Decoction of the same Plant be poured hot upon the Plant it self bruised and put into the Body, and there let the Matter digest two Days, the Vessel being close stop'd: Then fit all things for Distillation, and with a Fire of the second Degree draw off about half the Water you poured on the Plant; this will be a very good Water, and taste and smell strongly of the Plant.

Press through a Cloth strongly what remains in the Body, filtrate and evaporate in a gentle Heat till the Matter be of the Consistence of thick Honey. This is the *Extract* of the Plant; but the Extracts of Odoriferous Plants are not so good as those of Vegetables which are not so, because abundance of the finer Volatile Parts evaporate with the Moisture.

Dry what remained in the Cloth after Expression, and then burn it (with more of the Plant dried, if you will;) Make a *Lixivium* of the Ashes, and then filtrate and evaporate to driness, and the fix'd Salt of the Plant will remain at the Bottom. And thus may Balm, Wormwood, Sage, Hyssop, &c. be distill'd, and their Waters, Oils and Extracts made, and their fix'd Salts gain'd.

To distil Plants that are not Odoriferous, 'tis best to proceed thus; pound the Plant, and then fill two Thirds of the *Vesica* or *Alembick* with it, and after that pour on a good quantity of the expressed Juice of the same Plant, so that the bruised Matter may float in the Juice, and not stick to the Bottom or Sides of the Vessel: Then fit on the Head, and draw off about half as much Water as you used Juice; this will be a very good distill'd Water of that Plant. Press through a Cloth what remains in the Still, and let the Juice settle; then filtrate it, and after that, in a small Heat, evaporate about two Thirds of the Liquor in a Glass or Earthen Vessel; then remove the Vessel into a Cellar, or some such cool place, and the *Essential Salt* will shoot out into Crystals; which gather, and keep in a Viol well stop'd; or you may make the *Extract fixed Salt* of it as above directed, as of an Odoriferous Plant.

To distill a Spirit from any Plant like that of Scurvy-Grass, they proceed thus: The Plant is pounded to a Pulp in a Marble Mortar, and then put into an Earthen Vessel so as to fill it but half full; after which the expressed Juice of the same Plant is poured

ed upon it till it be about 6 Inches above the Matter: After this they mix with it all about a Pint of *Yess* or *Barn*, and then stopping the Vessel, they set it to ferment, either in the warm Sun, or in Horse Dung, for three or four Days, or more if it be cold Weather: As soon as you perceive that it hath done fermenting, and that its Surface begins to sink or subside, put the Matter speedily into a Cucurbite or *Vesica*, and luting on the Head, set the Vessel in a *Balneu Vaporis*, and distil, with a gentle Fire, about two Pints of the Liquor, which will be very Spirituous; and if you rectify again, and draw off half of it, it will be a very fine Spirit. What remains in the Body may be distill'd farther, and a Water will run off, that is as good or better than any distill'd Water of that Plant drawn the common way.

After this Manner also the *Ardant* or *Inflammable* Spirit of Roses, &c. may be drawn.

DISTINCT Base, in Opticks, is that precise Distance from the Pole of a Convex Glass, in which Objects, beheld through it, appear *distinct* and well defined; so that 'tis the same with what is otherwise called the *Focus*. The *Distinct Base* is caused by the Collection of the Rays proceeding from a single Point in the Object, into a single Point in the Representation; and therefore Concave Glasses, which do not unite, but scatter and dissipate the Rays, can have no real *Distinct Base*.

DISTINCT Vision: See *Vision*.

DISTORTION, is when the Parts of an Animal Body are ill placed or ill figured.

DISTRESS, in Law, signifies a Compulsion in certain real Actions, whereby to bring a Man to appear in Court, or to pay a Debt of Duty denied; the Effect thereof, most commonly, is to drive the Party distrained to replevy the *Distress*, and so to take his Action of Trespass against the Distrainer, or else to compound with him for the Debt or Duty for which the *Distress* was made. There are several things not *distrainable*; for a *Distress* must be of a thing whereof a valuable Property is in some Body, and therefore Dogs, Bucks, Conies, and the like, that be *ferre nature*, cannot be distrained. 2. Although it be of a valuable Property, as a Horse, (yet when a Man or Woman is riding on him) or an Ax (in a Man's Hand cutting of Wood) and the like, are for that time privileged, and cannot be distrained. 3. Valuable things shall not be distrained for Rent, for Benefit and Maintenance on Trades, which, by consequence, are for the Commonwealth, and are by Authority of the Law there; as a Horse in the Smith's Shop; Materials in the Weaver's Shop for making Cloth; Cloth or Garments in the Taylor's Shop, Sacks of Corn or Meal in a Mill, nor in a Market, nor any thing distrained for *Damages-feasant*, for it is in *Custodia Legis*. 4. Nothing shall be distrained for Rent, that cannot be rendered again in as good a Plight as it was at the time of the *Distress* taken; as Sheaves or Shocks of Corn cannot be distrain'd for Rent, but for *Damages-feasant* they may. 5. Beasts belonging to the Plough shall not be distrain'd, but Goods may. 6. Furnaces, Cauldrons, or the like, fix'd to the Freehold, or the Doors or Windows of a House, or the like, cannot be distrained. When a *Distress* that hath Life in it, is taken, it must be brought into the common Pound, or kept in an open Place, where the Owner may give it Food.

Distress is taken to be either *Real* or *Personal*: *Distress Real* is made upon immoveable Goods, as the *Grand-Cape* and *Petit-Cape*, by which the Land it self is seized. *Distress Personal*, is made by taking

a Man's moveable Goods, and detaining them for Security of his Appearance to the Suit. *Distress* is also either *Finite* or *Infinite*; *Finite* is that which is limited by Law, how often it shall be made to bring the Party to Trial of the Action: *Distress Infinite*, is with Limitation until the Party come, as against a Jury that refuseth to appear *Super certificatione Assise*, where the Process is a *Venire facias, habeas corpora*, and *Distress Infinite*, &c.

DISTRIBUTO Chyli, the Chyle is distributed when, after a due Fermentation in the Ventricle and the Guts, it soaks into and through the Glandulous Tunick of the Intestines; and passing through the Laeteal Veins, and its proper Channel along the Side of the Thorax, at last falls into the Subclavian Vein, that it may circulate with the Blood, and receive its Colour. *Blanchard*.

DISTRICHIASIS, is a double Row of Hair on the Eye-lids.

DISTRINGAS, is a Writ directed to the Sheriff or any other Officer, commanding him to distrain one for Debt to the King, &c. or for his Appearance at a Day.

DISSYLLABLE, is a Word consisting only of two Syllables, as *Virtue*.

DITONE, a double Tone, or the greater Third, is an Interval in Musick which comprehends two Tones; the Proportion of the Tones that make the *Ditones*, is as 4 to 5, and that of the *Semi-ditones* as 5 to 6.

DIVERGENCE Point: See *Vertical Focus*.

DIVERGENT, or *Diverging Rays*, in Opticks, are those *Rays* which going from a Point of the visible Object, are dispersed, and continually depart one from another, according as they are removed from the Object.

DIVIDEND, in Arithmetick, is the Number proposed to be divided into certain equal Parts.

DIVIDUAL, is that part of the *Dividend* distinguished by a Point, in working by the Rule of Division in Arithmetick.

DIVINATORIA Virgula: See *Virgula Divinatoria*.

DIVISIBILITY, is that Disposition of a Body, whereby it is conceived to have Parts, into which it may actually or mentally be divided.

All Quantity is infinitely, or rather indefinitely divisible: for should it be otherwise, it would be divisible into Parts that are not *Quantæ*, which cannot be, for no accidental Change can destroy the essential Properties of a Being: Yet this infinite *Divisibility* can never actually be effected, because when you have divided a Line, or any other Quantity, into any number of Parts, every one of these Parts is further divisible into as many Parts as the whole was, and so on, as is many ways demonstrable in Geometry; wherefore there can be no such thing as a determinate Number of actual Parts in any continued Quantity; which is farther also demonstrable from the Consideration of incommensurable Quantities; as that the *Diagonal of a Square is incommensurable with its Side*, as *Euclid* proves, *Lib. 10. Prop. 117*. And that the Parts in any Line are Infinite or Indefinite, will plainly appear by the following *Diagram*.

Let the Line *ab* be conceived to be drawn parallel to *de* at the perpendicular Distance *cd*, which suppose to be half an Inch: 'Tis plain, the Line *de* being capable of being infinitely produc'd, there may be taken in it as many Points, *o*, *1*, *2*, *e*, as you please: and from *a* to each of them can a Right Line be drawn, as in the Figure, which will divide the Line *cd*, though but of $\frac{1}{2}$ an Inch in Length, into as many Parts as you take in the low-

In *Division* the Number or Quantity to be divided, is called the *Dividend*; that by which you divide, the *Divisor*; and the number of Times that the *Dividend* contains the *Divisor*, is called the *Quotient* or *Quota*, and sometimes the *Parabola*; the Reason of which see under that Word.

○ ○ ca cb
 ca cb

That the same Reason for like Signs giving a positive, and unlike a negative Quotient, must hold in *Division* as well as in *Multiplication*, is clear from considering the Nature of *Division* (which is only resolving the thing into its Parts) therefore, since every Dividend is nothing else but the Product of the Divisor and Quotient multiplied by each other,

Hh 2

the Quotient must consist of such Signs which could produce the Dividend; therefore if the Dividend be divided by a Quantity that hath a similar Sign with it, the Quotient must be positive; if by a Quantity having a dissimilar Sign, it must be Negative.

It may be a General Rule in Compound Division in Algebra, as will, when multiplied into the Divisor, produce the Dividend, for that is always a Rectangle under the Divisor and the Quotient.

An Example of Compound Division in Algebra.

$$zz - 16) z^6 - 8z^4 - 124zz - 64(z^2 + 8zz + 4z^2 - 16z^2)$$

$$8z^4 - 124zz$$

$$8z^4 - 128zz$$

$$4zz - 64$$

$$4zz - 64$$

0

DIVISION in whole Numbers is thus perform'd.

1. To divide by one Figure is very easy, as suppose 6759 were to be divided amongst 3 Men, how much is each Man's Share? Set the Numbers down as you see here; 3) 6759 (2253.

And then say, 3 is contained in 6 (the first Figure towards the Left-hand of the Dividend) twice; wherefore I place 2 in the Quotient; then I go on to the next Figure, and say, 3 is found in 7 twice, and there is one over: I place 2 in the Quotient again; and I imagine the one that was over to stand before the next Figure 5, which will make it 15: Then I enquire how oft I can have the Divisor 3 in 15, and finding it just 5 times, I place 5 in the Quotient. Then I go to the last Figure, and ask how often I can have 3 in 9, which I find to be 3 times I write 3 in the Quotient; and so the Operation is over, 2253 being the true Quotient, or the number of Pounds that each Man must have.

2. When you are to divide a Number by a Divisor that consists of 2, 3, or more Places, the Operation is more tedious and difficult (it being indeed the hardest Lesson in Arithmetick) but yet it may, with a little Practice, be readily perform'd thus; suppose 940488 Crowns were to be divided among a Ship's Company consisting of 263 Men, what is each Man's Share.

1. Set down the Numbers as you see; then first distinguish by a Point a Part of the Dividend, which

$$263) 940488 (3576$$

$$789$$

$$1514$$

$$1315$$

$$1998$$

$$1841$$

$$1578$$

$$1578$$

0

Dividend, which will therefore be 14; but then

considering 6, the Figure of the Divisor, I find I cannot have as I ought, 6 four times in 14; wherefore I conclude I cannot have 263 four times in 940: I try next then what will 3 do; and I find I can have 2 three times, and that there will remain 3, which 3 I imagine to stand before 4, the second Figure of the Dividend, and then it will make it 34; trying therefore with 6, the second Figure of the Divisor, I find I can have that 3 times in 34, and more than enough will remain to be placed before 0, the last Figure of the Dividend; I therefore place 3 in the Quotient just after the crooked Line, and by that Figure which is the

2d Operation, I multiply the Divisor 263, and write the Product 789 orderly under the Dividend 940. Then,

3dly, I subtract the Product 789 from the Dividend, and there remains 151.

4thly, To which I bring down 4, the next Figure to the Right Hand of the Dividend, and which, to shew that I have done with, I mark, by putting a Point under it; so I have now 1514 for a new Dividend. Then do I enquire again, by the Method given in the first Article, how often I can have 263 in 1514, and comparing those Numbers together according to that General Rule, and which a little Practice will make very easy, I find I can have it but 5 times; wherefore I put 5 in the Quotient, and by that multiply my Divisor, and subscribe the Product 1315 orderly under the last Dividend. Then I subtract it also from thence, and find a Remainder of 199; to which Remainder I bring down the next Figure 8 from the Dividend (having also pointed it there) and then I have 1998 for a new Dividend; with which, as before, comparing my Divisor 263, I find that I can have it but 7 times; wherefore placing 7 in the Quotient, by that I multiply the Divisor 263, and subscribing the Product orderly under the Dividend 1998, subtracting it also from thence; and to the Remainder, which is 157, bringing down 8, the last Figure of the Dividend, I have 1578 for a new Dividend; with which, comparing as before, the Divisor 263, I find, on trial, that I can have it just 6 times in it; so I write 6 in the Quotient; by that Figure 6 multiply the Divisor, subscribe the Product 1578 under the Dividend, and making Subtraction, find no Remainder; wherefore I conclude the Division is ended, and that 3576 is the true Quotient, or Number of Crowns each Man is to have for his Share.

And this Example, if carefully heeded, will be sufficient to teach any one the Way of dividing by more Figures than one; the several Operations of which Method are briefly summ'd up in this Latin Verse,

Dic quot, multiplica, subduc, transferq; secundum.

The only true Proof of Division is by Multiplication, for the Product of the Quotient and Divisor must always be equal to the Dividend: Thus, 3576 multiplied by 263, produces 940488, because what is destroyed by Division, is restored by Multiplication.

DIVISION Geometrical, or Division in Lines, is called Application; the Design of which, when it is exercised about the Construction of plain Problems, is only this, viz. a Rectangle being given, as also a Right Line, to find another Right Line, so that the Rectangle contained under it, and the Right Line given, shall be equal to the Rectangle first given; which Effect or Construction is called the Application of a given Rectangle to a Right Line given; and

and the Right Line arising by such Application is called the *Parabola* or *Geometrical Quotient*, and may be found out by the *Rule of Three*, by making, As the Line given: Is to one Side of the Rectangle:: So is the other Side: To the Line sought.

Nor unlike to which is *D. Cartes's* Way of working *Division* in Lines by Scale and Compass: Thus, suppose $ac (=6)$ were to be divided by $ad = 3$, make any Angle at pleasure, and therein set off first $ad (= 3)$ the Divisor, and then on the same Leg $au =$ to Unity: Then, on the other Leg of the An-

gle set $ac (= 6)$ the Dividend, and join dc , and to it, through u , draw $ub \parallel$ to dc , which shall cut off ab the Quotient sought; for, as $ad : au :: ac : ab$; that is, As the Divisor: Is to Unity:: So is the Dividend: To the Quotient; on which depends the Reason of all *Division*.

DIVISION in Decimal Fractions: See *Decimal Fractions*.

DIVISION in Vulgar Fractions: See *Fractions*.

DIVISION of Logarithms: See *Logarithms*, N^o. 7.

DIVISION by Logarithms: See *Logarithms*, N^o. 9.

DIVISION of Proportion: See *Proportion*, N^o. 9.

DIVISOR, in Arithmetick, is the dividing Number, shewing how many Parts the *Dividend* is to be divided into.

DIVORCE, or *Devorce*, is, in the Common Law, a Separation of two Persons actually married together, and therefore is the Solution of the *Vinculum Matrimonii*, and is not only *à Mensa, sed etiam à Thoro*; and therefore a Woman thus divorced, received all again that she brought with her. This is only upon a Nullity of the Marriage, upon some Essential Impediment, as Consanguinity or Affinity within the prohibited Degrees, Pre-contract, Impotency, or such like; of which there are 14 usually sum'm'd up in these Verses by the Divines and Civilians;

*Error, Conditio, Votum, Cognatio, Crimen,
Cultus, Disparitas, Vis, Ordo, Ligamen, Honestas,
Si sis Affinis; si forte coire nequibis;
Si Parochi es duplicis desit presentia Testis,
Raptura si sit nautica, &c.*

DIURESIS, is a Secretion of the Urine by the Reins, which is done after this Manner; There are little Glandules placed near the Emulgent Arteries, wherewith the *Serum* is separated from the Blood, and is conveyed by little Channels (of which the Substance of the Reins does principally consist) to the *Carnucle Papillares*, thence to the *Pelvis*, thence to the *Ureters*, thence to the Bladders, and so out of Doors, *Blanchard*.

DIURETICKS, are those Medicines which by

parting, dissolving, and fusing the Blood, do precipitate the *Serum* by the Reins into the Bladder. *Blan.*

DIURNAL Motion of a Planet, is so many Degrees and Minutes, &c. as any Planet moves in 24 Hours; also the Motion of the *Earth* about its Axis (in the *Copernican System*) is called its *Diurnal Motion*, which causes the Vicissitudes of Days and Nights.

DIURNAL Arch, is the Arch or number of Degrees that the Sun, Moon or Stars describe between their Rising and Setting.

DIUTURNITY, is the long Continuance or Duration of any Being.

DIZZYNESS: See *Vertigo*.

DOCK, is a Pit, great Pond or Creek by the Side of an Harbour, made convenient to work in, in order to build or repair Ships, and is of two sorts.

1. A *Dry Dock*, where the Water is kept out of the *Dock* by great Flood-Gates, till the Ship is built or repaired; but after that, can easily be let in to Float and Launch her.

2. A *Wet Dock*, is any Place in the Ooze out of the Tide's way, where a Ship may be haled in, and do *dock her self*, or sink her self a Place to lie in.

DODECADACTYLUM, is the first of the small Guts, beginning from the *Pylorus* of the Stomach, and ending where the Gut *Jejunum* begins: It is so called as if it were the Length of the twelve Fingers, which yet is never observed in any Men amongst us; perhaps the Ancients mistook, from inspecting the Guts of some Brutes: 'Tis most usually called *Duodenum*. *Blanchard*.

DODECAEDRON: See *Regular Bodies*. This Solid consists of twelve Quinquangular Pyramids, whose Vertexes or Tops meet in the Center of a Sphere that is conceived to circumscribe this Solid, and consequently have their Bases and Altitudes equal; wherefore, having found the Solidity of one of those Pyramids, and multiplied it by the number of Bases, (*viz.* 12.) you have the Solidity of this *Dodecaedron*.

The following Figure being drawn on Pastboard, cut half through, and then folded up, will represent a *Dodecaedron*.

Its Solidity is found by multiplying the Base into 1/2 of its Distance from the Center 12 times. And to find this Distance, take the Distance of two parallel Faces, the Half is the Height.

DODECAGON, a regular Polygon consisting of twelve equal Sides and Angles: In Fortification 'tis a Place with twelve Bastions. **DODE-**

DODECATEMORY: The twelve Signs of the *Zodiack*, *Aries*, *Taurus*, &c. are so called, because each of them is the twelfth Part of the *Zodiack*.

DOGMATICK MEDICINE, is a Rational Practice of Physick; *Hippocrates* was its first Author; and after him *Galen*; therefore those Physicians are called *Dogmatical*, who, upon the Principles, as they pretend, of the School Philosophy, reject all Medicinal Vertues that they think not reducible to manifest Qualities; but *Galen* hath long ago observed very well of such Men, that they must either deny plain Matter of Fact, or assign but very poor Reasons and Causes of many Effects they pretend to explain.

DOME, so the *CHYMISTS* call the arched Cover to their Reverberatory Furnace: See the Figure of it under that Word, or in *Furnace*.

DOME, in Architecture, is a round, vaulted or arched Roof of a Church, or any such great Building.

DOMINICAL LETTER, one of the first seven Letters of the Alphabet, wherewith the Sundays are mark'd throughout the Year in the *Almanack*.

To find the Dominical Letter.

Divide the Year, its 4th, and 4 by 7. what's left subtract from 7, the Letters given. *A* 1, *B* 2, *C* 3, *D* 4, *E* 5, *F* 6, *G* 7.

Example.

In the Year	1701
The 4th Part, omitting Fractions, is	425
To both which add the number	4
The Sum is	2130

Which Sum divided by 7, leaves 2 remaining, and 2 from 7 leaves 5, which shews the Dominical Letter for the Year 1701, is the Fifth in the Order of the Alphabet, that is, *E*.

DOMINICUM, *Demain*, or *Demesne*, are Lands not rented to Tenants, but held in *Demesne*, or in the Lord's own Use and Occupation.

DOMO REPARANDA, is a Writ for one against his Neighbour, by the Fall of whose House he feareth Hurt to his own.

DONJON, in Fortification, is generally taken for a large Tower or Redoubt of a Fortrefs, where the Garrison may Retreat in case of Necessity, and Capitulate with greater Advantage.

DORICK Order of Architecture, was invented by the *Dorians* a People of *Greece*, whence the Name. If its Columns are Simple and Plain without *Pilasters*, *Palladio* saith they ought to be 7 Modules and one Half, or 8 Modules high. The Intercolumniations are to be little less than 3 Diameters of the Column: And this Manner of Building is by *Vitruvius* called *Diastyle*.

But if the Columns have *Pilasters*, their Height, reckoning Base and Chapter, must be 17 Modules and $\frac{1}{2}$; and by the by, though the Module in all the other Pillars be a Diameter divided into 60 equal Parts, yet in this Order the *Module* is to be accounted but as the Semi-diameter, and is therefore of 30 such Parts, according to *Palladio*.

This Pillar hath no proper Base, which is the Reason that mostly in the Ancient Buildings you see them without any Base at all, as in *Marcellus* his Temple at *Rome*, &c.

But when the Attick Base is given it, it much

augments its Beauty, and then the Height of the Base is to be $\frac{1}{4}$ the Diameter of the Column.

The Capital's Height also ought to be half the Diameter of the Pillar at the Base, and the Architecture the same Height. The *Freeze* is a *Module* and $\frac{1}{2}$ Height, and the *Cornice* is a *Module* and $\frac{1}{2}$. The *Triglyph* is one *Module*, and its Capital the 6th Part of one; the *Metops* or Space between *Triglyph* and *Triglyph*, is in Length the same with the Height of the *Triglyph*.

This Order being designed to represent Solidity to us, ought not to be used but in great and massy Buildings, as the Outside of Churches and publick Places.

The Entablature here is more Massy and Tall than in the other Order, because the Strength of the Column is so much greater, it being usually $\frac{1}{4}$ of the Column. The *Cornice* must be without any Foilage or Trimming; and if you allow *Modillions*, they must be Square and Plain.

The *Freeze* here hath a regular Ornament, which are the *Triglyphs*; the *Metops* or Space between which should be exactly Square.

The Architrave of this Pillar hath also a peculiar Ornament, which are certain Pendulous Drops under the *Triglyphs*, which yet seem as it were to be fastened to it.

DORMANT, is the Herald's Term for the Posture of a Lion born sleeping, in any Coat of Arms.

DORSI LONGISSIMUS, is a Muscle which arises in Common with the *Sacrolumbalis* from the Spine of the *Os Ilium*, and the superior Part of the *Sacrum*, and all the Spines of the *Vertebra* of the Loins, Externally Tendinous, Internally Flethy: In its Ascent it is inserted to the Transverse Processes of the *Vertebra* of the Loins, and as it marches over the last Rib this great Muscle divides it self into Two, the Outermost of which is the *Sacrolumbalis*, but the Innermost next to the Spine is the *Longissimus Dorsi*, which ascends with a partly Flethy and partly Tendinous Outside, and Fibres passing somewhat obliquely outward; part of which Tendinous Fibres arise distinct from the inferior Spines of the *Vertebra* of the *Thorax* and Superior of the Loins, from which arise some Flethy Fibres ascending obliquely inwards, and are inserted to the fifth, sixth, and seventh Spine of the *Thorax*, as express by *Bidloo*, and called *Semi-Spinalis*. The other larger Part of this Muscle ascending on the *Thorax*, divides it self into many distinct Flethy Portions, not much unlike a Palm Branch, which are inserted in a twofold Manner to the Transverse Process of each *Vertebra* of the *Thorax* and Tubercle of each Rib, as also to the transverse Processes of the *Vertebra* of the Neck.

When this and its Partner acts, they are not only serviceable in keeping the Trunk of the Body erect, and bending it backwards, but they are also useful in Progression, as it may be observed when either Leg is moved forwards, this Muscle on the same Side is in Action, which seemeth to be advantageous in rendering the *Os Ilium* at that time stable, so that the Thigh may be the more commodiously elevated, in regard it is so moved by a Muscle arising from the *Vertebra* above the *Os Ilium*, namely the *Psoas*.

DORSIPAROUS and *Dorsiferous Plants*, are such as are of the *Capillary* kinds without Stalks, and bearing their Seeds on the Backsides of their Leaves: These are called by some Botanists *Epiphyllisperma*, and by others *Hypophyllisperma*: See *Capillary Plants*.

DORSUM, or *Tergum*, the Back, is the hinder Part of the *Thorax*; but the *Dorsum* of the Hand or Foot is their Outside. *Blanchard*.

DOSE, is a set Quantity of Physick, being usually as much as is given at once.

NOTE ASSIGNANDA, is a Writ that lies for a Widow, where it is found by Office that the King's Tenant was seized of Tenements in *Fee* or *Fee-Tail* at the Day of his Death, &c. and that he holdeth of the King in chief, &c. for in this Case the Widow cometh into the *Chancery*, and there maketh Oath that she will not marry without the King's Leave, and hereupon she shall have this Writ to the Escheator.

And this sort of Widow is called the *King's Widow*.

NOTE unde nihil habet, is a Writ of Dower that lieth for the Widow against the Tenant which bought Land of her Husband in his Life-time, whereof he was seized solely in *Fee-Simple* or *Fee-Tail*, in such sort as the Issue of them both might have inherited it.

DOUBLE-DESCANT: See *Descant*.

DOUBLE Horizontal Dial, invented by Mr. Oughtred, and made of Brass with a double *Gnomon*; one to shew the Hour on the Outward Circle, the other to shew the same Hour in the *Stereographic Projection* (drawn on the Plate.) This not only finds the *Meridian*, Hour, &c. but shews the Sun's Place, Rising and Setting, Declination, Amplitude, Altitude, and Azimuth, Diurnal Arch, and many useful Propositions; and may be very well applied to the making of *Dials*.

DOUBLE or Flank'd Tenaille: See *Tenails*.

DOUBLE-PLEA, in Law, is that wherein the Defendant alledgeth for himself two several *Matters* in Bar of the Action, whereof either is sufficient to effect his Desire in debarring the Plaintiff. And this is not to be admitted in the common Law, wherefore it is well to be observed when a *Plea* is *double*, and when not, for if a Man alledge several Matters, the one nothing depending on the other, the *Plea* is accounted *Double*; if they be mutually depending one on another, then it is accounted but single.

DOUBLE-VESEL, in Chymistry, is when the Neck of one *Bolt-head* or *Matrass* is put and well luted into the Neck of another; and this is used for the *Circulation* of Spirits, in order to their being exalted and refined as high as can be: See *Matrass*. Of this there are several Figures; 'tis sometimes called a *Pellican*, and also *Diotia*.

DOUBLING, in a Military Sense, is to put two Ranks or Files of Soldiers into one, so that when the Word of Command is *Double your Ranks*, then the 2d, 4th and 6th Ranks are to march up into the first third and fifth, so that of 6 Ranks they make but 3, leaving double the Interval there was between them before, which is not so when they double the half Files, because then 3 Ranks stand together, and the 3 others come up to double them; that is, the 1, 2 and 3 are doubled by the 4, 5 and 6th, or on the contrary. *Double your Files* is for each other to march to that next to it on the Right or Left, according to the Word of Command, and then the 6 Ranks are turned into 12, the Men standing 12 deep, the Distance between the Files being now double of what it was before.

DOUCINE, in Architecture, is an Ornament of the highest Part of the *Cornice*, or a Moulding cut in Form of a Wave, half *Convex* and half *Concave*.

DOWER, in Common Law, signifies that which the Wife bringeth to her Husband in Marriage, called by some *Maritagium*; but it is taken most commonly for that which the hath of her Husband after the Marriage is determined, if she out-live him, and this is the third Part of all the Lands of which the Husband was in his Life-time actually seized, in an Estate of *Fee-Simple* or *Fee-Tail*.

DRAWLER, a small Sail in a Ship, the same to a Bonnet (which see) that a Bonnet is to a Course, and is only used when the Course and Bonnet are too shoal to Cloath the Mast.

DRACO, a Constellation in the Northern Hemisphere consisting of 33 Stars.

DRACO VOLANS, with the Meteorologists, is a Fat, Heterogeneous, Earthy Meteor, appearing long and sinuous, something in the Shape of a flying Dragon; and this Shape they will have to arise from the latter Part of the Matter of this Meteor, being fired with greater Impetuosity than what comes first out of the Cloud; and they suppose the broken Parts of the Cloud, and the Sulphureous Matter which adheres to them, forms the apparent Wings of this imaginary Dragon.

DRACUNCULUS, is an Ulcer which eats thro' even a Nerve it self. *Blanchard*.

DRAWN'S Head and Tail, or the Nodes of the Moon, in Astronomy, are two Points where the Orbit of the Moon, which makes with it Angles of 5 degr. cuts the Orbit of the Sun at the *Ecliptic*, the one of them tends Northwards, the Moon being there to have *North* Latitude, and the other Southwards, where she commences *South*. This her Deviation from the *Ecliptic* seems, according to some Men's Fancy, to make a Figure like to that of a *Dragon*, whose Belly is where he has the greatest Latitude, and the Intersections represent the *Head and Tail*; from which Resemblance 'tis so called.

But *Note*, These Points abide not always in one Place, but have a Motion of their own in the *Zodiac*, and *Retrograde* almost 3 Minutes a Day, and compleat their Circle in about 19 Years; so that the Moon can be but twice in the *Ecliptic* during her Mensural Period, but at all other times will have *Latitude* as they call it.

DRAPEY, signifies, in Painting or Sculpture, the Cloathing of any Human Figures, and when the Folds of Garments hang easy and natural, and yet appear strong, we say the Drapery is very good.

DRASTICK Remedies, are those that operate quickly and effectually.

DRAUGHT Compasses, are *Compasses* with several moveable Points to draw fine *Draughts* of *Charts*, *Maps*, *Architecture*, *Fortification*, *Dialling*, &c.

DRAW, a Ship is said to draw so much Water, according to the Number of Feet she sinks into it: Thus, if fifteen Foot from the Bottom of her be under Water, or if she sink into the Water fifteen Foot perpendicular, she is said to draw Fifteen Foot Water: According as she draws more or less Water, she is said to be of more or less *Draught*.

DRAW-BRIDGE, is a *Bridge* made after the Manner of a Floor, to be drawn up or let down (as Occasion serves) before the Gate of a Town or Castle.

DRAWING Medicines: See *Epispatick*.

DRIFT-SAIL, in a Ship, is a Sail used under Water: it's veered out right a-head upon the Sea in a Storm, having Sheets fastned to it as other Sails have, its Use being to keep the Ship's Head right upon the Sea: It's also useful to hinder a Ship's driving with
a Cur-

a Current, and so generally used by Fishermen, especially in the North Seas.

DRIP, in Architecture : See *Larmier*.

DRIVE, a Ship is said to *Drive*, when an Anchor being let fall, it will not hold her fast, but that she sails away with the Tide or Wind; the best way to help which is to veer out more Cable (for the more Cable she has out, the surer and safer she rides) or else to let fall more Anchors.

Also when a Ship is a *Hull* or a *Trye*, we say she *Drives to Leeward*, or in with the Shoar, according to the Way she makes.

DROPS, in Architecture, the same with *Gutta*, which see.

DROPSY : See *Hydrops*.

DRY ; Bodies are called *Dry*, when the Pores intercepted between their more stable Parts, are not filled with any visible Liquor.

DRY *Moat* : See *Moat*.

DUCES TECUM, is a Writ commanding one to appear at a Day in the *Chancery*, and to bring with him some Evidence, or other thing, that the Court would view. There is another kind of *Duces tecum* directed to the Sheriff, upon return that he cannot bring his Prisoner without danger of Death, he being *adeo Languidus* ; then the Court grants a *Habeas Corpus* in the Nature of a *Duces tecum licet Languidus*.

DUCKUP, a Word used at Sea by the Steersman, or he that is at Helm, when either Main-sail, Fore-sail, or Sprit-sail hinder his Sight so, that he cannot see to steer by a Land Mark or the like, for then his Word is *Duckup* the Clew Lines of those Sails : And as to the Sprit-Sail, when a Shot is to be made by a Chafe Piece, and the Clew of that Sail hinders the Sight, they say, *Duckup* the Clew Lines of the Sprit-Sail; that is, hale the Sail out of the Way.

DUCTILITY, is an easy yielding Extension and Spreading of the Parts of any Metal under the Hammer, &c. and this is most remarkably the Property of Gold, whose *Ductility* is so great, as to be really wonderful ; for Mr. *Robault* tells us, That *Gold Beaters* of one Ounce of Gold, make 2790 square *Leaves* of *Gold*, each containing two Inches and ten *Lines* ; and by deducting the Wastes that are cut off (which amounts to near one half of it) the Surface of every *Leaf* of *Gold* will be found to contain 1156 square *Lines* ; so that all of them joined together Side by Side, will make a *Surface* of 315880 square *Lines*. And if the third Part be added to this, as a Consideration for the Loss in the making, 'twill follow, that *Gold-Beaters*, out of one Ounce of *Gold*, beat 4270840 square *Lines*.

DUCTUS ADIPOSI : See *Sacculi Adiposi*.

DUCTUS ALIMENTALIS, so our most accurate Anatomist Dr. *Tyson* calls the *Gula*, Stomach and Intestines, all which make but one continued Canal or *Duct* : And this *Ductus* he very truly makes the proper Characteristic of an *Animal*, or, as the Schools would express it, the *Proprium Quarto Modo*, for all *Animals* have this *Duct*, and none but *Animals*.

DUCTUS BILIARIUS, } See *Porus Bilari-*
DUCTUS HEPATICUS, } *us* ; this and the *Ductus Syficus* together make the *Ductus Communis Cholidocus*, which goes obliquely to the lower End of the *Duodenum*, or Beginning of the *Jejunum*, and after it hath pierced the first Coat, it runs near two Fingers Breadth between the Coat before it opens into the Cavity of the Intestine, which oblique Insertion serves instead of a Valve to hinder the return of the *Bile* into it again.

DUCTUS CHYLIFERUS, is a Vessel, in the lower Part whereof, called the *Receptaculum Chyli*, all the *Lacteal* Veins, and many *Lymphæducts*, are terminated. It arises about the Kidney on the Left Side, and ascending along the *Thorax* near the great *Artery*, ends at the *Subclavian Vein* on the Left Side. It is furnished with several Valves, that the Matter which ascends by it may not fall down again betwixt the fourth and sixth *Vertebra* : It is variously forked or divided. It's Use is to convey the *Chyle* and *Lympha* from the lower Parts to the Heart. This *Duct* is also sometimes called the *Ductus Communis Lympharum*, because the *Lymphatick* Vessels discharge themselves into it, and very usually *Ductus Thoracicus*.

DUCTUS CYSTICUS, is a Pipe going from the Neck of the Gall Bladder to that Part where the *Porus Biliarius* joins it ; 'Tis of the Bigness of a Goose Quill ; it goes not in a straight Line, but as it were deprest by the Liver ; several small *Biliary Ducts* open into it, and its inner Membrane hath many Wrinkles, which retard the Motion of the *Bile*.

DUCTUS PANCREATICUS, is a little Channel which arises from the *Pancreas* or Sweet-bread, running all along the Middle of it, and is inserted into the *Duodenum*, near, or not far off, the Passage which conveys the *Bile* : It carries a Juice, which it discharges into the *Duodenum*, to ferment and volatilize the Meat from the Acid Ferment of the Stomach and the Mixture of the Gall. The Learned Dr. *Graaf* got a Juice out of it that was something acid ; though others doubt of it, and of many Diseases which *Silvius* attributes to the Effervescency of this acid pancreatick Juice with the Gall in the *Duodenum*. However there is sometimes an acid Juice found in it, and often a salt and austere, but frequently an insipid Liquor. This Canal was first found by *Virtfungus*, and is frequently from him called the *Ductus Virtfungianus*.

DUCTUS RORIFERUS, (so the Noble *Bilsius* calls it) the same with *Ductus Chyliferus*.

DUCTUS SALIVARES, or *Salivarii*, are Passages which proceeding from the *Maxillary Glandules* or *Parotides*, go as far as the Jaws and Sides of the Tongue, where they emit the Juice we call *Spittle*, which conduces to the better chewing and swallowing of solid Meat, and much to its Fermentation too. *Steno* was the first who discovered the *Ductus Salivarij exterior*, as he tells us in his Book *De Musculis*.

DUCTUS THORACIUS : See *Ductus Chyliferus*.

DUCTUS UMBILICALIS : See *Funiculus*.

DUCTUS URINARIUS : See *Ureters*.

DUELLISTS, so Mr. *Boyle* calls the two Principles of those Chymical Philosophers, who will needs explicate all the *Phænomena* of Nature from the Doctrine of *Alkali* and *Acid*, and the supposed *Hostility* that there is between them, so that whenever they meet, they do as it were engage and fight a *Physical Duel*.

DULCIFIED Spirit of *Sal Armoniack* : See in *Volatile Spirit of Sal Armoniack*.

DULCIFY, when equal Parts of Spirit of Wine, and any acid Menstruum, such as Spirit of Salt, *Nitre*, *Vitriol*, &c. are digested together for 3 or 4 Day's Time, the Chymists call it *Dulcifying* the Acid Spirit ; and after that 'tis called *Spiritus Salis, Nitri, Vitrioli Dulcis*, &c.

DUM *suit infra etatem*, is a Writ which lies for him that before he came to his full Age, made a Feoffment of his Land in Fee, or for Term of Life, or

in Tail, to recover them again from him to whom he conveyed them.

DUM non fuit compos mentis, is a Writ that lieth against the Alience or Lessee, for him that not being of sound Memory, did alien any Land or Tenements in Fee-Simple, or for Term of Life, Fee-Tail, or for Years.

DUODENUM, is the first of the Intestines of Cuts, and is about 12 Finger's Breadth long; 'tis continued to the *Pylorus*, from which, turning downwards, it runs under the Stomach immediately above the *Vertebra* towards the Left Side, and ends at the First of the Windings under the *Colon*: At its lower End there are two Pipes or Canals which open into its Cavity, one from the Liver and Gall Bladder, called the *Ductus choledochus communis*, the other from the *Pancreas*, called the *Ductus Pancreaticus*. This Intestine differs from the *Jejunum* and *Ileum*, in that its Passage is straighter, and its Coats are thicker.

DUPLICATE PROPORTION, or *Ratio*, must be well distinguished from *Double*: In a Series of *Geometrical Proportionals*, the First Term to the Third is said to be in a *Duplicate Ratio* of the First to the Second, or as its *Square* is to the Square of the Second: Thus in 2, 4, 8, 16, the *Ratio* of 2 to 8 is *Duplicate* of that of 2 to 4, or as the Square of 2 to the Square of 4; wherefore *Duplicate Ratio* is the Proportion of *Squares*, as *Triplicate* is of *Cubes*, &c. and the *Ratio* of 2 to 8 is said to be compounded of that of 2 to 4, and of 4 to 8.

DUPLICATION, is the doubling of any thing, or multiplying of it by 2; also the folding of any thing back again on its self.

DURABLE FORTIFICATION: See *Fortification*.

DURA MATER: See *Mater Dura*.

DURATION, is the *Idea* which we have of the Continuation of the Existence of any thing, and is the same thing with Time, when this is mathematically and absolutely considered; but the vulgar Time is the Measure of this *Duration* taken from the Motion of the Heavenly Bodies, &c.

Mr. Lock defines *Duration* to be the *Idea* which we have of perishing Distance, of which no two Parts exist together.

DURESSE, a Term in Law, signifying a Plea used by way of Exception by him, that being cast into Prison at a Man's Suit, or otherwise by Bearing or Threats hardly used, doth unwillingly seal unto him a Bond during his Restraint; for the Law holdeth such Specialty void, but rather supposeth it to be by Constraint, and *Duresse* pleaded shall avoid the Action.

DYALLING, is the Art of describing Hour-lines truly on any given Plane, so as thereby to shew the Hour of the Day when the Sun shines.

It is founded on this Supposition, That the whole Earth is but a Point in comparison of the *Magnus Orbis*, or the Sphere of the Sun's Motion round it (or of it round the Sun;) and therefore the Hour Lines drawn on any Plane, are in Effect the same with those right Lines produced by the mutual Intersection of a great Circle of the Sphere, parallel to the Plane of the *Dyal*, and to the Planes of the several Hour Circles.

For the Plane of every *Dyal* is parallel to some greater Circle of the Sphere, which is as far from the Plane of the *Dyal*, as is the Point assigned for the Apex or Point of the Style.

The Situation therefore of the Plane is the first thing to be considered, and this, properly speaking, is only in respect of the *Horizon* or the *Meridian*.

In Reference to the *Horizon*, if a Plane lie exactly parallel to it, it is called properly an *Horizontal Plane*, and the *Dyal* drawn on it an *Horizontal Dyal*.

If the Plane be perpendicular to the *Horizon*, as all those of Walls are supposed to be, the *Dyal* described on it is called an *Erect mural Dyal*: If the Plane be oblique to the *Horizon*, it either hangs over towards you, making an acute Angle with it, and then 'tis called an *inclining Plane*, or else it falls off backward from it, making an obtuse Angle with it, and then 'tis called a *Reclining Plane*; and if it recline back equal to the Complement of the Latitude of the Place, it lies in the Plane of the Equinoctial, and is called therefore an *Equinoctial Dyal*.

In respect of the *Meridian*, a Plane is either *Direct* or *Declining*. The Plane of a *Dyal* is *Direct*, when it respects one of the 4 Cardinal Points *Directly*, or when 'tis either parallel to the *Meridian*, as are all direct *East* or *West Dyals* (which therefore are properly called *Meridional*) or perpendicular to it, as are all *Direct*, *Erect North* and *South Dyals*, which, because they lie in the Plane of the *Prime Vertical Circle*, are rightly called *Vertical Dyals* by most Authors.

The Plane of a *Dyal* is *Declining*, when it is not directly opposite to any of the four Cardinal Points, but declines or deviates some way from the *Meridian* or the *Prime Vertical Circle*.

The Fundamental Scheme for *Dyalling*, is the Projection of the Sphere on the Plane of any particular *Horizon*, which you will find how to make under the Word *Projection*.

To find upon any *Dyal* whether the *Parallels* of the Sun's Courses, &c. will be *Parabolas*, *Hyperbolas*, *Ellipses* or *Circles*:

The Style of a *Dyal* being look'd upon as the Earth's Axis, therefore upon any Point thereof (as *c*) which being designed for the Point to trace the Parallel by, project the Sphere.

Then the Sun being in any of the *Parallels* of Declination, for Instance, as *AB* the *Tropick of Can-*

cer, will cast the Shadow of the Point *c* (the Earth's Center) in a straight Line, so that when the Sun hath performed one Diurnal Revolution, the Shadow of the Point doth trace a Conical Surface *DCE*, whose Vertex is *C*, and is similar to the Cone *ABC*: Now the Lines *CD*, *CE*, *CA*, *CB* of these Cones, may be conceived to be infinitely extended.

1. Then, whatever Plane is parallel to the Base of the Cone *DE* or *AB*, the Shadow of the Point *c* will describe upon that Plane a Circle.

2. If any Plane cut either of these Cones parallel to either of the Sides, the Shadow of the Point C will describe upon that Plane a *Parabola*.

3. If a Plane cut the Cone, and likewise one of its Sides produced beyond the Vertex, the Shadow of the Point c will describe upon that Plane an *Hyperbola*.

As here the Plane *AB* cuts the Cone *DCE*, and also the Side *DC* produced to *z*, therefore the Parallels upon that Plane are *Hyperbola's*.

4. If a Plane cuts both Sides of the Cone under the Vertex, the Shadow of the Point C will describe upon that Plane an *Ellipsis*.

DYE, in Architecture, is the Middle of the Pedestal, or that Part which lies between the Base and the Cornice; being so named, because it is frequently made in the form of a *Cube* or *Dye*, and is also called *Dado* by the *Italians*.

DYPTERON, or a *Dypterick* Figure or Order of Pillars in Architecture, is where the Temple, Edifice, &c. is environed round with a two-fold Range of Pillars in the Form of a double Portico. This *Vitruvius* tells us, *Ch. 1. Book 3.* was the Figure of the wonderful Temple of *Diana* at *Ephesus*, which was above 200 Years in Building, all *Asia* contributing to its Expence: These Columns were all of Marble, and 70 Feet high.

DYSESTHESIA, is a Difficulty of, or Fault in Sensation. *Blanchard*.

DYSCRACY or *Intemperature*, is when some Humour or Quality over-abounds in the Body. *Blanchard*.

DYSENTERY, is a Looseness accompanied with Gripings in the Belly, wherein Bloody and Purulent Excrements, and sometimes Membranous Pie-

ces of the Intestines too are excerned, always, or very frequently, attended with a continual Fever and a Drought. *Blanchard*.

DYSEPULOTICA, are great Ulcers beyond Cure. *Blanchard*.

DYSOREXIA, a want of Appetite, proceeding from an ill Disposition or diminished Action of the Stomach. *Blanchard*.

DYSPATHY, is an Impatient Temper, or a Languishing under some grievous Disease or Trouble of Mind. *Blanchard*.

DYSPEPSIA, is a Difficulty of Digestion, or Fermentation in the Stomach and Guts. *Blanchard*.

DYSPHONIA, is a Difficulty of Speech from an ill Disposition of the Organs. *Blanchard*.

DYSPNOEA, is a Difficulty of Breathing, wherein the Breath is drawn often and thick, occasioned by the Stuffing of the Lungs. *Blanchard*.

DYSTHERAPEUTA, are Diseases of difficult Cure. *Blanchard*.

DYSTHRIACHISIS, is a continual Defluxion of Tears from the pricking of Hairs in the Eye-lids, which grow under the Natural Hairs. *Blanchard*.

DYSTICHIA, is a double row of Hair on the Eye-lids. *Blanchard*.

DYSTOCIA, is a Difficulty of bringing forth; or a preternatural Birth; as when the *Fetus* comes forth obliquely, transverse, or with its Feet foremost, or when the Passages are strained by Inflammation or otherwise, or when the *Fetus* is very large, weak, fat, or dead. *Blanchard*.

DYSTRICHIASIS, is when the Hairs grow inverse. *Blanchard*.

DYSURIA, is a Difficulty of Urine, proceeding from an ill Disposition of the Organs, or from an Obstruction of them by the Stone, Gravel, or Viscous Clammy Humours, accompanied with an Heat of the Urine. *Blanchard*.

E A R. This curious Instrument of Hearing, is divided into the *External* and *Internal Ear*. The

EAR External, is composed of a Cartilage covered with a Skin very delicate, under which you meet with another Nervous Tegument, that immediately embraces the whole Cartilage; which, after some few Folds, terminates in that part of the Ear which is called the *Concha*, for its Resemblance to the Entrance of a small Shell: Besides these, it hath two Muscles;

The First is made up of certain Carneous Fibres, fixt to that part of the *Pericranium* that covers the Muscous *Crotaphytes*, and descends in a straight Line to insert it self at the upper part of the second Folding of the Ear.

The Second likewise consists of five or six Carneous Fibres, that take their Rise from the Upper and foremost part of the *Apophyses Mastoides*, and descending obliquely for about an Inch, terminate at the Middle of the *Concha*.

Arteries it hath from the *Carotides*, one Branch of which passeth behind, and the other before; and the Distribution of these is attended by Veins from the *External Jugular*.

The Hole of the Ear, is a Tube reaching from the *Concha* to the *Tympanum*, and consists partly of

a Cartilage, and partly of a Bone, the Skin that covers it is furnished with an infinite Number of Glandules of a yellowish Colour, each of which hath its Tube opening into the Cavity of the Ear, and sending forth that yellow glewy Substance, which is commonly found there: At the End of this Passage is seated the Membrane, called the *Tympanum*, or *Drum*, being almost round, dry, thin, and transparent, and is incased in a Channel cut in the Bone at the End of the Tube.

After this Membrane succeeds a Cavity called the *Barrel*, from the likeness it has to the *Barrel* of a *Drum*, being on the Sides encompassed by the Bone, closed before by that Membrane, and behind by the Surface of the *Os Petrosum*. This Barrel contains in it two Channels, two Apertures, four Bones, three Muscles, and one Branch of the *Nerve*.

The Channel that goes from the Ear to the Palate, is called the *Aqueduct*.

The Apertures, or Windows, are situated in the Superficies of the *Os Petrosum*, opposite to the *Tympanum*; the highest is the Oval-Window, in the Bottom of which is a small Edge whereon the Basis of the *Iacus* rests; the other, which is called the Round Window, has a small Channel, in which is set a very fine, dry, and diaphanous Membrane, like that of the *Tympanum*.

The first of the Bones is called *Malleus*, whose Length is about $\frac{1}{2}$ of an Inch, the Diameter of its Breadth is one Third of its Length.

The Second is the *Incus*, the longest of whose Legs is joined to the *Stapes* by the Mediation of the fourth Bone.

Of the three Muscles which are contained in this Cavity, Two belong to the *Malleus*, the Third to the *Stapes*. Lastly, The Branch of the Nerve which passes behind the *Tympanum*, has been taken by some for the Tendon of the Muscle of the *Malleus*, and is a Branch of the fifth Pair.

The two Windows open into a Cavity, which is hewn in the *Os Petrosum*, called the *Labyrinth*, divided likewise into three Parts, viz. the *Entry of the Labyrinth*, the three *Semi-circular Canals*, and the *Concha*.

The Entry of the Labyrinth is situated behind the Oval Window, and hath Nine Apertures, viz. the Oval one, and the Right one, the first of which leads into the upper Part of the *Concha*; five belong to the *Semi-circular Canals*, and the two last transmit two Branches of the softer Portions of the *Auditory Nerve*, &c.

The *External Ear* collects the Sounds, and augments the Impression by the various Reflections the Voice undergoes in its Passage thro' the Folds of it.

The Use of the Muscles is thought to contract or dilate the *Concha*, as the Tremblings of the Air are strong or weak.

In the *Internal Ear* the *Tympanum* is stretched and made slack again by the Muscles of the *Malleus*; in the Tension of it both Muscles act, but in the Relaxation, only the External, whose Action it is to reduce it from a Concave to a Plain, as is manifest from the Insertion of the Muscles; the Determination of which Action proceeds from the various Dispositions and Appulse of the Objects, as a sharp Note is caused by a Body, whose Parts are so disposed, as to be capable of very quick Vibrations, which they as suddenly impress on the Air: On the contrary, the flat Note proceeds from the slower Strokes of a Body, with Parts that can only be so agitated; to which Differences the *Tympanum* readily complies; and does, as it were, put on their particular Character; this is delivered thence to the *Malleus*, and so forward, till at last the same Fluctuation is caused in the *Os Petrosum*, and in the *Labyrinth*.

The Aquæduct serves chiefly for the Ingress and Egress of Air to and from the Cavity, into which it opens.

From the Communication of the harder Portion of the Auditory Nerve, with the Branches of the Fifth Pair, which are distributed to the Organs of the Voice, proceeds that Sympathy between Speaking and Hearing. From the Communication of other Nerves follow the Motions of the Body, and even of the Spirits, which often accompany the Sounds we hear; as in the Effects of *Musick*, &c.

EARING, aboard a Ship, is that Part of the Bolt-Rope (or Rope wherein the Sail is sewed) which at the four Corners of the Sail is left open in the Form of a Ring: The two uppermost of which four Earrings are put over the Yard-Arms to fasten the Sail to the Yard; and into the lower Earrings the Tacks and Sheets are seized, or, as they call it, are there bent unto the Clew.

EARTH: The Surface of the whole Earth Mr. Keil, in his Examination of Dr. Burnet's Theory, makes to be 170881012 *Italian Miles*, and the *Italian Mile* is little less than the *English* one.

The Orbit of the Earth (or the Circumference of a Great Circle of it) according to the *French Measures*, is 123249600 *Paris Feet*, or 24649 $\frac{40}{100}$ *English Miles*.

The Mean Semi-diameter of the Earth is 196158000 *Paris Feet*; or 3933 *Miles* (of 5000 Feet to a Mile;) But the Earth is higher at the Equator than at the Poles by 82500 Feet or 17 *Miles*.

So that the Radius of the Earth may be taken in a round Number as 200000000 Feet.

The Solid Content of the Globe of the whole Earth is 30000 000000 000000 000000 Cubick Feet.

According to Mr. *Cassini*, the Earth's greatest Distance from the Sun is 22374, mean Distance 22000, and least Distance 8022 Semi-diameters of the Earth.

On Supposition that the Sun's Parallax be 32 Seconds, which is a Mean between 40 Seconds and 24 Seconds, the Earth's mean Distance from the Sun will be 54000000 of Miles. Mr. *Whiston*.

Sir *Is. Newton* takes the Earth's Diameter, seen from the Sun, to be 24 Seconds, and consequently the Sun's Parallax to be 12 Seconds; which agrees with our Accurate Astronomer Mr. *Flamsteed*, and *Horrox's* Observations; and then the Distance from the Earth to the Sun will be much greater.

The Figure of our Earth is most probably that of an *Oblate Spheroid*, swelling out towards the Equatorial Parts, and flattened or contracted towards the Poles; so that the Diameter of it at the Equator, is longer than the Axis by about 34 Miles, according to Sir *Is. Newton*; for the Polar Diameter or Axis: Is to the Equatorial one :: As 689: To 692.

If the Earth were ever in a Fluid State, its Revolution round its Axis must necessarily make it put on such a Figure; because near the Equatorial Parts must needs be the greatest Centrifugal Force, and consequently there the Fluid would rise and swell most.

And that it should be so now, seems necessary to keep the Sea in the Equinoctial Regions from overflowing the Earth thereabouts.

Experiments also made on Pendulums, which require different Lengths to swing Seconds here, and at the Equator, prove the same thing.

And if what Mr. *Cassini* says, in *Philosophical Transactions*, Numb. 278, is certain from Experience, viz. that the Degrees of one and the same Meridian on the Earth, increase about $\frac{1}{3}$ Part as you go Southward, or are longer towards the Equator in any Proportion, then the Earth must needs be of such a Figure; as indeed is that of *Jupiter*, as appears from Observation.

The Learned Dr. *Gregory*, in his *Astronomia Geometrica* &c; *Physica*, Prop. 52. Lib. 3. shews a Method to determine the Figure of the Earth exactly, and to find the Ratio of the Axis of it to its Equatorial Diameter: And demonstrates, That the Earth must be of the Figure now mentioned, viz. an *Oblate Spheroid*.

He shews also, That the Prolate Spheroidical Figure of the Earth, is the Reason both of the Recession of the Equinoctial Points; and also, That the Earth's Axis doth twice every Year change its Inclination to the Ecliptick, and as often return back again to its former Position. *Astron. Pag. 77. Lib. 1. Prop. 64.*

The Earth's mean Revolution, in respect of the fix'd Stars, is 23 Hours, 56 Minutes.

Captain *Halley*, in his Observation of *Mercury* in the Sun at *St. Helena*, 1677. tells us, That the Annual Motion of the Earth is so exceeding swift, as far to exceed that of a Bullet shot out of a Cannon, and to be after the Rate of 3 *English* Miles and an half in a Second, which is 210 Miles in a Minute, and 12600 Miles in an Hour.

The Axis of the Earth is inclined to that of the Ecliptick, in an Angle of 66 Degrees 30 Minutes.

And tho' in one Annual Revolution, its Axis appears to keep exactly parallel to it self; yet in many Years this Position becomes sensibly changed. *Greg. Astron.*

The Earth doth not describe an Orbit round the Sun properly by her own Center, but by the Common Center of Gravity of the Earth and the Moon. And this is the Reason of the Inequality of the Earth's Motion. *Greg. Astron.*

The Earth's Horizontal Parallax to an Eye at the Sun's Surface, will be fifteen Minutes, the half of the Sun's apparent Diameter.

Our most Accurate Astronomer Mr. *Flamsteed*, found the Distance of the Pole-Star from the Pole, to be greater about the Summer Solstice than at the Winter, by about 40 or 45 Seconds; and this he saith, he confirmed by repeated Observations, made for above seven Years successively, as he acquaints Dr. *Wallis* in a Latin Letter to him in the Year 1698, which Letter is published in the Third Volume of Dr. *Wallis*'s Latin Works: And since that he hath told me, That he finds a sensible Annual Parallax in others of the fixed Stars, as well as that; and from thence he concludes (I think very justly) that the Earth must move Annually round the Sun.

As to the Reason of the Parallelism of the Earth's Axis in all Parts of its Annual Orbit, see the Word *Parallelism*.

That the Earth is nearer to the Sun in *December*, than it is in *June*; and consequently, that its Perihelion is in the Month of *December*, is plain,

First, Because the Sun's apparent Diameter is then greater than at *Midsummer*.

And also, Because the Earth moves much swifter then, by one 25th Part, than at *Midsummer*.

And from hence it is, that there are about eight Days more in the Summer Half-Year, from *March* to *September*, than in the Winter, from *September* to *March*.

Mr. *Whiston*, in his *Lemmata*, proves very easily, That the Annual Motion belongs to the Earth about the Sun, not to the Sun about the Earth.

For when from the Moon's Orbit, and the Planet's Orbits, and Periodical Times, 'tis certain, That the Law of Gravitation towards the Earth and towards the Sun is the same; and by consequence, all the Periodical Times of Bodies revolving about each of them, are in the same Proportion to one another, compared with their several Distances from each of them; on which Hypothesis this Proportion suits the Phenomena of Nature: the same must be the true one, and to be fully acquiesc'd in.

Now 'tis known, That on the Hypothesis of the Earth's Annual Motion, her Periodical Time exactly suits, and is so between that of *Mars* and *Venus*, as the Proportion observed through the whole System; but on the other Hypothesis 'tis enormously different: For when the Moon undoubtedly, and on this Hypothesis, the Sun also revolves about our Earth; and when the Distance of the Sun is to that of the Moon, as about 10000 to 46; and the Moon's Periodical Time less than 28 Days; the Periodical

Time of the Sun is by the Rule of Three discoverable thus;

As the Cube of the Moon's Distance, 46 equal to 97336: To (the Cube of the Sun's Distance 10000 equal to 100000000000, or almost as 1 to 10000000) :: So must the Square of the Moon's Periodical Time, 28 Days equal to 784: Be to the Square of the Sun's Periodical Time, 7840000000, whose Square Root 88204, are Days also, equal to 242 Years.

So that on the Hypothesis of the Sun's Revolution about the Earth, its Periodical Time must undoubtedly be 242 Years, which all Experience attests to be but a single one: So that the Controversy between the *Ptolemaick* and *Pythagorean Systems* of the World, is to a Demonstration determined, and the Earth's Annual Motion for ever unquestionably established.

N. B. This Computation is upon a Supposition, that the Sun's Horizontal Parallax is 32 Seconds, which Mr. *Whiston* takes as a middle Rate: But if you suppose it to be but 10 Seconds, which agrees much better with the Observations of our greatest Astronomers, Mr. *Flamsteed* and Mr. *Cassini*, who both make the Sun to be distant from us 11000 Semi-diameters of our Earth; then the Sun's Motion thro' the *Magnus Orbis*, will be found not to be performed in less than 597,3 Years, as any one may easily find by Calculation, as above.

He tells us also, *Lemma 56*. That if our Earth once revolved about the Sun in a Circular Orbit, whose Semi-diameter were equal to the Earth's Original Distance from the Sun, 6 Degrees past its Perihelion, the Annual Period was exactly equal to 12 Synodical or 13 Periodical Months. 'Tis evident, that 12 Synodical, or 13 Periodical Months, (equal to each other in this Case) are 355 Days, 4 Hours, 19 Minutes. 'Tis also evident, that the Eccentricity of the Earth's Orbit, or the Distance between the Focus and Center of its Ellipsis, was, according to the ancient Astronomers, *Hipparchus* and *Ptolemy*, $\frac{11}{1000}$ of the entire middle Distance. By the Moderns 'tis found somewhat less, (and those who know Sir *Is. Newton*'s Philosophy, will easily allow of some Diversity in different Ages) by *Tycho* 'twas determined to be near $\frac{18}{1000}$; by *Cassini* since $\frac{17}{1000}$; and last of all, by our most Accurate Observer Mr. *Flamsteed* $\frac{1691}{100000}$ or near $\frac{177}{1000}$, as *Cassini* had before determined.

All which considered, we may very justly take the Middle between the Ancient and Modern Eccentricity, $\frac{19}{1000}$, for the true Original one, and about $\frac{186}{100000}$, or more nicely $\frac{18,6}{1000000}$, for the Difference between the Ancient Semi-diameter of the Circular Orbit and the middle Distance in the present Ecliptick one; the Point of Acceleration being about 6 Degrees past the Perihelion, not just at it.

Then, by the Golden Rule, As the Cube of 100000 (the middle Distance in the Ellipsis): To the Cube of 98154, (the Semi-diameter of the Ancient Circle) :: So is the Square of 525949, (the Number of Minutes in our present Solar Year): To the Square of the Number of Minutes in the Ancient Solar Year, whose Root being 511459 Minutes, or 355 Days, 4 Hours, 19 Minutes, appears to be exactly and surprisingly equal to the Lunar Year beforementioned.

Upon

Upon this *Hypothesis* the Ancient Solar and Lunar Year were exactly commensurate and equal; and 11 Days, 1 Hour, 30 Minutes shorter than the present Solar Year.

EARTH, which the Chymists call *Terra Daningra*, and *Caput Mortuum*, is the last of the five Chymical Principles, and is that which remains after all the other Principles are extracted by Distillation, Calcination, &c.

EARTH-BAGS, in *Fortification*, the same with Canvas-Bags, which see.

EARTHQUAKES: Mr. Boyle thinks that *Earthquakes* are often occasioned by the sudden fall of Ponderous Masses in the Hollow Parts of the Earth, whereby those terrible Shocks and Shakings are produced.

The Learned Dr. Woodward, in his Essay towards a Natural History of the Earth, gives the following Account of *Earthquakes*, which is much the best of any I have seen.

He supposes the Subterranean Heat or Fire, which is continually elevating Water out of the Abyss, to furnish the Earth with Rain, Dew, Springs, and Rivers, when it is stopped in any part of the Earth, and so diverted from its ordinary Course by some accidental Glut or Obstruction in the Pores or Passages through which it used to ascend to the Surface, becomes by this means preternaturally assembled, in a greater quantity than usual, into one Place; and therefore causes a great Rarefaction and Intumescence of the Water of the Abyss, putting it into very great Commotions and Disorders, and at the same time making the like Effort on the Earth, which is expanded upon the Face of the Abyss; and that this occasions that Agitation and Confusion of it, which we call an *Earthquake*.

That this Effort is in some *Earthquakes* so vehement, that it splits and tears the Earth, making Cracks, and Chasms in it some Miles in length, which open at the Instant of the Shock, and close again in the Intervals betwixt them; nay, 'tis sometimes so extremely violent, that it plainly forces the superincumbent *Strata*, breaks them all throughout, and thereby perfectly undermines and ruins the Foundation of them; so that these failing, the whole *Tract*, as soon as ever the Shock is over, sinks down to rights into the Abyss underneath, and is swallowed up by it, the Water thereof immediately rising up, and forming a Lake in the Place where the said *Tract* before was.

That several considerable Tracts of Land, and some with Cities and Towns standing upon them; as also whole Mountains, many of them very large, and of great Height, have been thus totally swallowed up.

That this Effort being made in all Directions indifferently, upwards, downwards and on every side, the Fire dilating and expanding on all Hands, and endeavouring proportionably to the Quantity and Strength of it, to get Room, and make its way thro' all Obstacles, falls as foul upon the Water of the Abyss beneath, as upon the Earth above, forcing it forth which way soever it can find Vent or Passage, as well through its ordinary Exits, Wells, Springs, and the Outlets of Rivers; as through the Chasms then newly open'd; through the Camini or Spiracles of *Aetna*, or other near *Vulcano's*; and those *Hiatus* at the Bottom of the Sea, whereby the Abyss below opens into it, and communicates with it.

That as the Water resident in the Abyss, is, in all Parts of it, stored with a considerable Quantity of Heat, and more especially in those where these extraordinary Aggregations of this Fire happen; so

likewise is the Water which is thus forced out of it, inasmuch that when thrown forth, and mixed with the Waters of Wells, of Springs, of Rivers, and the Sea, it renders them very sensibly hot.

That it is usually expelled forth in vast Quantities, and with great Impetuosity, inasmuch that it hath been seen to spout out of deep Wells, and fly forth at the Tops of them upon the Face of the Ground; with like Rapidity comes it out of the Sources of Rivers, filling them so of a sudden, as to make them run over their Banks, and overflow their Neighbouring Territories, without so much as one drop of Rain falling into them, or any other concurrent Water to raise and augment them.

That it spews out of the Chasms opened by the Earthquake in great abundance, mounting up in mighty Streams to an incredible Height in the Air, and this oftentimes at many Miles Distance from any Sea.

That it likewise flies forth of the *Vulcano's* in vast Floods, and with wonderful Violence: That 'tis forced through the *Hiatus's* at the Bottom of the Sea with such Vehemence, that it puts the Sea immediately into the most horrible Disorder and Perturbation imaginable, even when there is not the least Breath of Wind stirring, but all till then calm and still, making it rage and roar with a most hideous and amazing Noise, raising its Surface into prodigious Waves, and tossing and rowling them about in a very strange and furious manner; oversetting Ships in the Harbours, and sinking them to the Bottom, with many other like Outrages.

That 'tis refunded out of these *Hiatus's* in such Quantity also, that it makes a vast Addition to the Water of the Sea, raising it many Fathoms higher than ever it flows in the highest Tides, so as to pour it forth far beyond its usual Bounds, and make it overwhelm the adjacent Country; by this means ruining and destroying Towns and Cities, drowning both Men and Cattle; breaking the Cables of Ships, driving them from their Anchors, bearing them along with the Inundation several Miles up into the Country, and there running them aground; stranding Whales likewise, and other great Fishes, and leaving them at its return upon dry Land.

That these Phenomena are not new, or peculiar to the Earthquakes which have happened in our Times, but have been observed in all Ages, and particularly these exorbitant Commotions of the Water of the Globe.

This we may learn abundantly from the History of former Times; and 'twas for this reason that many of the Ancients concluded rightly enough, that they were caused by the Impulses and Fluctuation of Water in the Bowels of the Earth; and therefore they frequently called Neptune, *Σεισθηρ*, as also *Κνωσθηρ*, *Ενοσθηρ*, and *Τινασθηρ*; by all which Epithets they denoted his Power of shaking the Earth.

They supposed that he presided over all Water whatever, as well that within the Earth as the Sea, and the rest upon it; and that the Earth was supported by Water, its Foundations being laid thereon; on which Account it was, that they bestowed upon him that Cognomen *Γασηρ*, or Supporter of the Earth, and that of *Θεμελις*, or The Sustainer of its Foundations.

They likewise believed, that he having a full Sway and Command over the Water, had Power to still and compose it, as well as to move and disturb it, and the Earth by means of it; and therefore they also gave him the Name of *Ασπληρ*, or, The Establisher; under which Name several Temples were

were consecrated to him, and Sacrifices offered whenever an Earthquake happen'd, to pacify and appease him, requesting that he would allay the Commotions of the Water, secure the Foundations of the Earth, and put an end to the Earthquake.

That the Fire it self, which being thus assembled and pent up, is the Cause of all these Perturbations, makes its own way also forth, by what Passages soever it can get vent, through the Spiracles of the next *Vulcano's*, through the Cracks and Openings of the Earth above mentioned, through the Apertures of Springs, especially those of the *Therma*, or any other way that it can either find or make; and being thus discharged, the Earthquake ceaseth till the Cause returns again, and a fresh Collection of this Fire commits the same Outrages as before.

That there is sometimes in Commotion a Portion of the Abyss of that vast Extent, as to shake the Earth incumbent upon it for so very large a Part of the Globe together, that the Shock is felt the same Minute precisely in Countries that are many Hundreds of Miles distant from each other; and this, even though they happen to be parted by the Sea lying betwixt them: And there want not Instances of such an Universal Concussion of the whole Globe, as must needs imply an Agitation of the whole Abyss.

That though the Abyss be liable to these Commotions in all Parts of it, and therefore no Country can be wholly exempted from the Effects of them; yet these Effects are no where very remarkable, nor are there usually any great Damages done by Earthquakes, except only in those Countries which are Mountainous, and consequently Stony and Cavernous underneath, and especially where the Disposition of the *Strata* is such, that those Caverns open into the Abyss, and so freely admit and entertain the Fire, which assembling therein, is the Cause of the Shock; it naturally steering its Course that Way where it finds the readiest Reception, which is towards those Caverns, this being indeed much the Cause of Damps in Mines. Besides, that those Parts of the Earth which abound with *Strata* of Stone or Marble, making the strongest Opposition to this Effort, are the most furiously shattered, and suffer much more by it, than those which consist of Gravel, Sand, and the like laxer Matter, which more easily give way, and make not so great Resistance; an Event observable not only in this, but all other Explosions whatever.

But above all, those Countries which yield great Store of Sulphur, and Nitre, are, by far, the most injured and incommoded by Earthquakes; those Minerals constituting in the Earth a kind of Natural Gunpowder, which taking Fire upon this Assembly and Approach of it, occasions that murmuring Noise, that Subterranean Thunder which is heard rumbling in the Bowels of the Earth during Earthquakes, and by the Assistance of its explosive Power, renders the Shock much greater, so as sometimes to make miserable Havock and Destruction.

And 'tis for this Reason that *Italy*, *Sicily*, *Anatolia*, and some Parts of *Greece*, have been so long and so often alarm'd and harass'd by Earthquakes, these Countries being all Mountainous and Cavernous, abounding with Stone and Marble, and affording Sulphur and Nitre in great Plenty.

That *Aetna*, *Vesuvius*, *Hecla*, and the other *Vulcano's*, are only so many Spiracles serving for the Discharge of this Subterranean Fire, when 'tis thus preternaturally assembled. That where there hap-

pens to be such a Structure and Conformation of the Interior Parts of the Earth, as that the Fire may pass freely and without Impediment from the Caverns wherein it assembles, unto those Spiracles, it then readily and easily gets out, from time to time, without shaking or disturbing the Earth: But where such Communication is wanting, or Passages not sufficiently large and open, so that it cannot come at the said Spiracles without first forcing and removing all Obstacles, it heaves up and shocks the Earth with greater or lesser Impetuosity, according as the Quantity of Fire thus assembled is greater or less, till it hath made its way to the Mouth of the *Vulcano*, where it rusheth forth sometimes in mighty Flames, with great Velocity, and a terrible bellowing Noise.

That therefore there are scarcely any Countries that are much annoyed with Earthquakes, that have not one of these Fiery Vents, and these are constantly all in Flames when any Earthquake happens, they disgorging that Fire which, whilst underneath, was the Cause of the Disaster; and were it not for these *Diverliculae*, whereby it gains an Exit, 'twould rage in the Bowels of the Earth much more furiously, and make greater Havock than now it doth.

So that though those Countries where there are such *Vulcano's*, are usually more or less troubled with Earthquakes; yet were these *Vulcano's* wanting, they would be more troubled with them than now they are; yea, in all probability, to that Degree, as to render the Earth for a vast Space around them perfectly uninhabitable.

In one word, so Beneficial are these to the Territories where they are, that there do not want Instances of some which have been rescued and wholly delivered from Earthquakes by the breaking forth of a new *Vulcano* there, this continually discharging that Matter, which being till then barricado'd up and imprisoned in the Bowels of the Earth, was the occasion of very great and frequent Calamities.

That most of these Spiracles perpetually, and at all Seasons, send forth Fire more or less; and though it be sometimes so little that the Eye cannot discern it; yet even then, by a nearer approach of the Body, may be discovered a copious and very sensible Heat continually issuing out.

EASE, in the Sea Phrase, is the same as *slack*, or let go slack: Thus, they say *Ease the Bowling*, *Ease the Sheet*, i. e. let it go slacker.

EBBING and Flowing of the Sea: See *Tides*.

EBULLITION: The great Boiling, Struggling or Effervescence which arises upon the mingling together of an Acid and an Alkalizate Liquor; and from hence any Intestine violent Motion of the Parts of a Fluid, occasioned by the struggling of Particles of different Natures, is called by this Name, *Ebullition*.

That a considerable *Ebullition* may be produced without Heat (*da veniam verbo*) nay, that a Degree of Cold may be produced greater than was in either of the Bodies singly, and that it shall arise purely upon their Mixture, though accompanied with a great Struggle, Tumult, Noise and Froth:

Mr. Boyle plainly proves from this Experiment:

He shook one Part of Oil of Vitriol into 12 Parts of common Water; the Mixture was at first sensibly warm: Then the Ball of a Thermoscope was placed within it, till the includ'd Spirit had gained the Temperament of the Mixture; but then a convenient Quantity of Volatile Salt of Sal Armoniack being

being gradually put in, to satiate the acid Spirits of the Mixture, the Spirit in the Thermoscope descended above an Inch.

EBOLICA, are Medicines which help the Delivery in hard Labour: Also Medicines which cause Abortives. *Blanchard.*

ECCENTRICITY, in the *Ptolemaick Astronomy*, is that Part of the *Linea Apfidum* lying between the Center of the Earth and of the Eccentric, (*i. e.*) that Circle which the Sun is supposed to move in about our Earth, and which hath not the Earth exactly for its Center: And the Ancients found this must be supposed, because the Sun sometimes appears large, and then it is nearest to us, and sometimes smaller, and then further off.

ECCENTRICITY Simple or Single, in the new *Elliptical Astronomy*, is the Distance between the Center of the *Ellipse* and the *Focus*; or between the Sun and the Center of the Eccentric.

ECCENTRICITY Double, is the Distance between the *Foci* in the *Ellipse*, and is equal to twice the Single Eccentricity.

ECCENTRICK Circles, are Circles not having the same Center. Of which Kind several Orbits were invented by Ancient Astronomers, to solve the Appearances of the Celestial Bodies.

The Eccentrics of the Planets they called also *Deferents*, because they seemed to carry the Body of the Planet round in their Circumferences.

ECCENTRICK Equation, in the old Astronomy, is an Angle made by a Line drawn from the Center of the Earth, and another drawn from the Center of the Eccentric, to the Body or Place of any Planet; the same with the *Prosthapheresis*; and is equal to the Difference (accounted in an Arch of the Ecciptick) between the Sun's or Planets real and apparent Place.

ECCENTRICK Place of a Planet, is that very Point of the Orbit, where the Circle of Inclination coming from the Place of a Planet in his Orbit, falls therein with Right Angles.

In *Philosop. Transact.* N. 57. there is a Geometrick Method of Signior *Cassini* for finding the Eccentricities of the Planets.

And in N. 128. there is another Direct and Geometrick Method for finding the *Apbelions*, *Eccentricities* and *Proportions* of the Orbits of the Primary Planets. By Mr. *Halley*.

ECCHOPROTICA, the same with *Catbarticum*.

ECCHYLOMA, the same with *Extradum*.

ECCHYMOMA, are Marks and Spots in the Skin, arising from the Extravafation of Blood.

Blanchard.

ECCHYMOISIS, the same with *Ecchymoma*.

ECCOPE, the same with *Extirpatio*.

ECCRIMOCRITICA, are Signs to judge of a Dissemper from particular Excretions. *Blanchard.*

ECCRISIS, is a Secretion of Excrements out of an Animal Body, or out of some Part of it.

ECHINUS, among the Botanists, is the prickly Head, Cover of the Seed, or Top of any Plant: So called from its Likeness to a Hedge-hog.

ECHINUS, in Architecture, is a Member or Ornament first placed on the Top of the *Ionick Capital*, taking its Name from the Roughness of the Carving, resembling the prickly Rind of the Chestnut, and not unlike the Thorny Coat of a Hedge-hog.

This Ornament is made use of by Modern Architects in Cornices of the *Ionick*, *Corinthian* and *Composite* Orders, and generally set next to the *Abacus*, being carved with Anchors, Darts and Ovals, or Eggs; whence 'tis called *Ove* by the French, and

Ovolo by the Italians; but the English Workmen commonly call it the *Quarter round*.

ECLEGMA, the same with a *Linctus Lambative*, *Loch*, or *Loboch*, being a Medicine design'd to heal or ease the Lungs in Coughs, Peripneumonies, &c; being usually composed of Oils and Syrups, and sometimes Powders incorporated together into a Consistence thicker than a Syrup, but not so thick as an Electuary.

ECLIPSE, is a Deprivation of the Light of one of the Luminaries, when by their Conjunction in the Orbit of the Sun, or in the Ecciptick, his Face, by the Interposition of the *Moon's* Body, is hidden from our Sight; or when by their Opposition in the same Orbit, the *Moon*, by the Shadow of the intervening Earth, is obscured.

So that in a *Lunar Eclipse*, she really loses her Light, and is obscured, by wanting the Illumination of the Sun either totally or partially. But in an *Eclipse* of the Sun, he loses not his Light, but only we are deprived of it in part by the Interposition of the *Moon's* Body between us and the Sun: And therefore this ought rather to be called an Eclipse of the Earth; for 'tis the Earth that is deprived of Light, and not the Sun.

A central Eclipse of the *Moon*, is when not only the entire Body of the *Moon* is covered by the Shadow, (which is a Total one; as when it is covered by it in Part, it is called a Partial one) but also the Center of the *Moon* passes through the Center of that Circle, which is made by a Plane cutting the Cone of the Earth's Shadow at Right Angles with the Axis, or with that Line which joins the Centers of the Sun and the Earth.

For the Method of Calculation of the Eclipses of both the Luminaries, see Dr. *Gregory's* Astronomy, Book IV. Sect. 7. and 8; and Mr. *Flamsteed's* Doctrine of the Sphere, in *Moor's* Mathematicks, Part the Second.

Because the Earth (or Sun) always moves in the Ecciptick, the *Moon* can never be Eclipsed, but when her *Plenilunium* happens in or near her *Nodes*, (that is, in the Intersection of the Plane of the Orbit with that of the Ecciptick.)

The Shadow of the Earth obscuring the *Moon*, though projected into a Cone of a vast Length, yet reaches not so far as the Planet *Mars*, for he is never Eclipsed by it, tho' he be in the Plane of the Ecciptick, and at Opposition to the Sun.

If the *Moon* be so near the *Node*, that the Aggregate of the apparent Semi-diameters of the *Moon* and of the Earth's Shadow be greater than the *Moon's* Latitude, she will be Eclipsed, otherwise not. And because the Sum of the Semi-diameter of the *Moon* and of the Earth's Shadow, is always greater than that of the Semi-diameters of the *Sun* and *Moon*; for the Former is never less than 53, and the Latter never greater than 35, 'tis plain, that *Lunar Eclipses* may happen in a greater Latitude of the *Moon*, or when she is farther from the *Node* than *Solar* ones; and in this respect, of one and the same Place upon the Earth, will more often become visible there; though in regard to the View of the whole Earth, the *Solar Eclipses* will happen more frequently.

Our most Accurate Astronomer Mr. *Flamsteed*, in the Second Part of his Excellent Doctrine of the Sphere, which is Printed in the First Vol. of Sir *Jonas Moor's* Mathematicks, gives you an Orthographic Projection of the Sphere on a Plane touching the *Moon's* Orbit, at Right Angles to the Line connecting the Centers of the Earth, Sun, or given Star, by Right Lines proceeding from any of them

to the Sphere, whereby are determined the Moon's Parallax in Altitude, Longitude, and Latitude; and by it he shews also how to determine the Breadth of the Semi-diameter of the Disk of the Penumbra, and the Earth's Shadow in an Eclipse, and how that of the Sun is made.

He teaches also very briefly and plainly, how the true Places of the Sun and Moon, her Latitude, Hourly Distance, Horizontal Semi-diameters and Parallaxes may be found by Calculation; as also, how to find the same way, the Times of the mean and true Conjunctions or Oppositions of the Luminaries; as also, the principal Phases of a Solar Eclipse for the Meridian of *London*, with the Longitudes from it, and the Latitudes of such Places as the Eclipse will be seen at, or where the said Phases shall appear; that is, where the Eclipse begins in the Vertex of the Rising, or Ends in the Vertex of the Setting Sun: Where he rises or sets Centrally Eclipsed; where the Eclipse ends in the lowest Point of the Rising, or begins in the Lowest Point of the Sun Setting; where the Sun is Centrally Eclipsed in the Meridian; and to mention no more, where the Sun is Centrally Eclipsed in the Nonagesimal Degree, without the help of Nonagesimal Tables; of which he gives an Example, and demonstrates the Reason of the *Calculus*.

He gives there also a Geometrical Construction of Eclipses, shewing how to find the exact Conjunction, &c. of the Luminaries, Digits then darkened, Inclination of the *Cusps*, End of the Eclipse, or Time when any possible Number of Digits shall be darkened, by Scale and Compass; all which is done with great Plainness, Brevity and Accuracy, and is very well worth the Mathematical Reader's Perusal.

ECLIPSIS, in a Medicinal Sense, is a Defection of the Spirits, or Fainting, or Swooning.

ECLIPTICK, is a great Circle of the Sphere; supposed to be drawn through the Middle of the Zodiack (which see) and making an Angle with the Equinoctial (in the Points of *Aries* and *Libra*) of $23^{\circ}, 20'$, which is the Sun's greatest Declination.

This is by some called *Via Solis*, or the Way of the Sun, because the Sun, in his Annual Motion, never deviates from this Line, as all the other Planets do more or less; from whence the Zodiack hath its Breadth. 'Tis this Line which is drawn on the Globe, and not the Zodiack; but in the New Astronomy, the *Ecliptick* is that Path or Way among the fix'd Stars, which the Earth appears to describe to an Eye placed in the Sun, as in its Annual Motion it runs round the Sun from West to East: And if you suppose this Circle to be divided into 12 equal Parts, they will be the 12 Signs, each of which is denoted or distinguished by some Asterism or Constellation.

Note, If the Spectator's Eye be supposed to be on the Earth, the Sun will appear always to be in the opposite Sign to what the Earth is in.

ECLYSIS, is when the Strength of the Patient is a little decayed, proceeding from a want of a sufficient Warmth and Spirits in the Body. *Blanchard*.

ECPHRACTICUM, is a Medicine good against Obstructions.

ECPHRAXIS, is a taking away of Obstructions in any Part. *Blanchard*.

ECPHYSESIS, is a Disease in which the Patient breathes thick.

ECPHYSIS, is any Process that coheres with, or adheres to a Bone.

ECPIEMA, the same with *Empiema*.

ECPIESMA, is a Juice squeezed out; also the Dregs which remain of any Thing that is squeezed; likewise a Fracture of the Skull, wherein the broken Parts press upon the Meninges or Skin of the Brain. *Blanchard*.

ECPIESMUS, is a very great Protuberance of the Eyes.

ECPLEXIS, is a Fright or Stupor.

ECPNEUMATOSIS, the same with *Expiration*.

ECTOTOSIS, the same with *Luxation*.

ECPUSTICA, are condensing Medicines: See *Incrassantia*.

ECPYESIS: See *Empiema*.

ECRITHMUS, is a Pulse which observes no Method nor Number, incident to any Age. *Blanchard*.

ECTHLIMA, is an Ulceration arising from a violent Compression in the Surface of the Skin. *Blanchard*.

ECTHLIPSIS, is a Figure in Grammar relating to the Dimension of *Latin* Verses, whereby the Letter *M*, with its preceding Vowel, is cut off, because the succeeding Word begins with a Vowel, as in this Verse;

O Curas Hominum! O quantum est in Rebus Inanis!

Where the *um* in *Hominum* and *Quantum* is entirely cut off, and not founded before the Vowels *o* and *e*.

ECTHYMATA, are Pimples or certain breakings out in the Skin, as the Small Pox, &c. *Blanchard*.

ECTHYMOSIS, is a Commotion or Intumescence of the Blood; also a Cheerfulness of the Mind. *Blanchard*.

ECTILOTTICA, are Medicines which consume Callous Parts, and pull out Hairs, &c. *Blanchard*.

ECTROPIUM, is a growing of the Eye-lids, when the lower is shorter than the upper. *Blanchard*.

ECZEMATA, are extreme hot, or, as it were burning Pimples: Some take *Hydroa* for *Eczemata*, but it is a Mistake. *Blanchard*.

EDDY, is when the Water at any Place runs back, contrary to the Tide or Stream, and so falls into the Tide or Current again. The Seamen call also that *Eddy Water*, which falls back, as it were, on the Rudder of a Ship under Sail, the *Dead Water*. They call also an *Eddy Wind*, that which returns, or is beat back from any Sail, &c.

EDULCORATION, (*i. e.* Sweetning) is a Term used by the Chymists for the clearing of any Matter from the Salts it may be impregnated or mixed with, by washing it thoroughly in common Water.

EFFECTIONS, is a Word used by Geometers, in the same Sense with the *Geometrical Construction* of Propositions, and often of *Problems* and *Practices*; which, when they are deducible from, or founded upon some General Proposition, are called the *Geometrical Effections* thereunto belonging.

EFFERVESCENCE, a Word much used by the Modern Philosophers and Chymists; it expresses a greater Degree of Motion and Struggling of the small Part of a Liquor, than we understand by the Word *Fermentation*, and implies a great Ebullition or Boiling up with some Degree of Heat; and is the usual Term for the Effect of pouring an acid Liquor, (as suppose *Oil of Vitriol*) on an *Alkalifate* one, as on *Oil of Tartar per Deliquium*; for a very great Com-

moti-

motion, struggling Heat, and boiling will immediately arise; which may be called a great *Effervescence*.

Lenery defines it to be an Ebullition or Boiling of any Liquor without the Separation of its Parts; but that doth not fully express the Meaning of the Word.

EFFLUVIUMS, are such very small Particles or Corpuscles, as are continually flowing out of all mix'd Bodies.

The very great Subtily and Fineness of the Effluvia of many Bodies, appears from their being able for a long time together, to produce sensible Effects, without any sensible, or at least, considerable Diminution of the Bulk or Weight of the Body that emits them.

And that these *Effluvia* may considerably operate upon, and have great Effect on Bodies within the Sphere of their Activity, Mr. *Boyle* proves from these Considerations;

1. That the Number of the Particles or Corpuscles emitted as Effluvia out of any Body, is *vastly great*.

2. That they are of a very *penetrating* and *permeating* Nature, and so can most easily insinuate themselves into the Bodies they operate upon.

3. That they are moved with vast Celerity, and oftentimes with all manner of Directions, and very various Modifications.

4. That there is often a wonderful Congruity or Incongruity of the Bulk and Shape of these Effluvia, to the Pores of the Bodies they penetrate into and act upon.

5. That especially in Animal and Organical Bodies, these Effluvia may excite great Motions of one Part of the curious Engine upon another, and thereby produce very considerable Effects in the Animal Oeconomy.

6. That they may have sometimes a Power to make themselves be assisted in their Operations by the more Catholic Agents of the Universe; such as Gravity, the Pressure of the Atmosphere, Light, Magnetism, &c.

EJECTION, the same with *Dejection*.

EJECTIONE Custodia, is a Writ which lieth properly against him that casteth out the Guardian from any Land during the Minority of the Heir.

EJECTIONE Firme, is a Writ that lieth for the Lessee for Term of Years; that is cast out before his Term expired, either by the Lessor or a Stranger.

EIRE, or *Eyre*, in *Britton*, Cap. 2. signifies the Court of Justice *itinerant*. And Justices in *Eyre*, are those which *Bracton* in many Places calleth *Judicarios itinerantes*, of the *Eyre*. The *Eyre* also of the Forest is nothing but the *Justice-Seat* otherwise called, which is, or should by Ancient Term, be held every three Years by the Justices of the Forest.

ELABORATORY: See *Laboratory*.

ELASTICK Force, primarily, is the Force of a Spring when bent, and endeavouring to unbend it self again.

In Physicks, 'tis taken for the Endeavour of Springing or Elastick Particles, when compress'd or crowded into a little Room, to dilate and evolve themselves again: Wherefore by this Name they frequently call such an Explofion of Animal Spirits as is frequent in Cramps or Convulsions. The Effect of this Power, or this Quality in Bodies, is called *Elasticity*; and Bodies that have it, *Elastick Bodies*.

And as a *Soft Body* is that which when press'd yields to the Stroke, and loses its former Figure, and cannot recover it self again; so an

Elastick Body is that which though it yields for a while to the Stroke, yet can afterwards recover its former Figure by its own natural Power; and if it can do this with the same Force as that which press'd upon it, we say 'tis perfectly *Elastick*.

If there were no *Elasticity*, the Laws of Motion found by Mathematicians, about the Percussion of two Bodies, would hold universally, and be without Exception true: And the Bodies (as Mr. *Keil* observes in his *Introduct. ad Veram Physicam*, P. 151.) would move jointly that way towards which the stronger Body tended before the Shock or Percussion, and with a Celerity easily determinable by those Laws of Motion. But because there are very few Bodies without some Degree of *Elasticity*, even soft Clay, Wax, &c. containing within them some Particles of Elastick Air; from hence it is, that Bodies which strike or move one against another, do spring or leap back, and move with very different Velocities, sometimes one way, sometimes another.

If you imagine a String or Wire to be strained, and fastened firm at each End, then 'tis plain, that if either the Middle Part of the String (or any other) be either drawn by the Hand, or press'd by a Weight out of the right Position it was at first in; then if the Force that removed it, be not greater than the Elastick Force of the String, the String will fly back; and if the Weight or Body be not removed, drive it before it, as the String of a Cross-bow doth the Bullet; and the acquir'd Velocity of the String will carry it beyond its first right Position towards the opposite Parts, and that so far as till the Motion that way be equal to the Elasticity of the String; and then being quite destroyed, the String will return again as before; and thus springing forward and backward; would (abstractly from the Resistance of the Medium) like a double Pendulum, make continual Vibrations. Thus also, if you suppose any Weight to fall on an immoveably fix'd and perfectly Elastick Body; on the Contact, the Parts of the Elastick Body will spring back or recede inwards, till the Elastick Force be raised up equal to the *Momentum* of the falling Body; and then this latter ceasing, the Elastick Force will cast the Body upwards or from it, with the same Velocity it came down, or was impelled against it, recovering again its former Figure; but if both the Bodies being Elastick, neither of them be fixed or moveable, then the Elastick Force will act equally in each Body, and produce equal Mutations of Motion.

And from this *Elasticity* in Bodies arises that *Re-silition* or leaping back from one another, which we observe in many Bodies on their moving swiftly one against another. The usual Method to judge whether Bodies are endowed with this Elastick Quality or not, is to enquire whether, on being struck, they give any *Tinnitus*, or ringing Sound, or indeed any sensible Noise; for if they do, you may conclude them in some Measure Elastick; and that they are so in Proportion to the Strength and Acuteness of the Sound they emit.

Mr. *Keil* gives these Rules for the Motion of Elastick Bodies.

T H E O R E M.

If two Bodies perfectly Elastick strike one against another, there will be or remain in each the same Relative Velocity as was before; that is, such Bodies will recede from each other with the same Velocity that they met together with.

For the compressive Force or the Magnitude of the Stroke in any given Bodies, arises from the relative Velocity of those Bodies, and is proportional to it: And Bodies perfectly Elastick, will restore themselves completely to the Figure they had before the Shock: or in other Words, the Resistive Force is equal to the Compressive; and therefore must be equal to the Force with which they acceded, and consequently they must by Elasticity recede again from each other with the same Velocity. Q. E. D.

COROLLARY.

Hence taking equal Times before and after the Shock, the Distances between the Bodies will be equal: And therefore the Distances of the Bodies from the common Center of Gravity will, in the same Times, be equal.

Whence the Laws of the meeting of Bodies perfectly Elastick are easily deduced, which he doth by this Problem.

PROBLEM.

To determine the Rules of the direct Meeting or Shock of Bodies perfectly Elastick.

One Construction will serve for all Cases of this Problem.

Let there be two Bodies, *A* and *B*, perfectly Elastick, whose common Center of Gravity let be *C*, and let *D* be the Point of Concourse where the Bodies meet; make *CE* always equal to *CD*. Then I say, that after the Concourse or Shock, the Right Line *CE* will express the Velocity of the Body *A* from *E* towards *A*; and the Right Line *EB* will express the Velocity of the Body *B*, from *E* towards *B*.

DEMONSTRATION.

Since the common Center of Gravity of any Bodies, proceeds on with the same uniform Progression, and with the same Velocity both before and after the Shock and Impulse, as he proves in *Theorem 18*; and that in a Time equal to that in which the Body *A* moves the Length *AD*, or the Center of Gravity *C* moves the Length *CD*; and after the Concourse, the same Point *C* will move the Length *DK* = to *DC*. This being so, let *Ka* be taken equal to *CA*; then, since by *Cor.* of the preceding *Theorem*; taking equal Times both before and after the Impulse, the Distances of the Bodies from the common Center of Gravity will always be equal; then at what time the common Center of Gravity will be in *K*, the Body *A* will be found to be in *a*; and therefore after the Impulse, its Motion will be from *D* towards *a*, and its Velocity will be expressed by *Da*, which is the Length run over in that Time: But because *CE* = *CD*, or to *KC*, and *Ca* = *Ka*, the Difference between the Right Lines *CE* and *Ca* will be equal to the Difference between the Right Lines *KD* and *Ka*; that is, *EA* = *Da*: But the Right Line *Da* expresses the Velocity of the Body *A* after the Shock or Impulse, and consequently its Velocity will also be expressed by the right Line *EA*. Besides, since the relative Velocity of these Bodies remains the same both before and after the Shock, and that the right Line *EA* denotes the Velocity of the Body *A*, the Velocity of the Body *B* must necessarily, after the Impulse, be denoted by the Line *EB*, and the Direction of the Motion will be from *E* towards *B*.

COR. I.

Hence, if the Body *B* be at rest, the Points *D* and *B* will be co-incident, as in the Case of the three first Lines in the Figure: and because *B : A :: AB : CB*, therefore, by Composition, *B + A : A :: AB : CB*; and doubling the consequent Terms of the Proportion, *B + A : 2 A :: AB : 2 CB*; that is in Words, *As the Aggregate or Sum of the Bodies : Is to the Double of the moving or striking Body :: So will the Velocity of the striking Body be before the Shock : To the Velocity of the quiescent Body after it.*

COR. II.

Wherefore if the Bodies *A*, *B* are equal, the Sum or Aggregate of them must be *2 A*: Whence the Velocity of the Body *B*, after the Shock, shall be equal to *AB*, the Velocity of the Body *A* before it; and consequently the Points *E* and *A* being co-incident, *AE*, the Velocity of the moving Body after the Impulse or Shock, will be = 0; that is, none at all. Which also may be easily shewn thus; because the Bodies *A* and *B* are equal, *AC* will be = *CB* = *CD* = *CE*; wherefore the Point *E* will co-incide with *A*, and consequently the Body *A*, after the Shock, will be at rest, and the Body *B* will move with the Velocity *EB* or *AB*.

If therefore a perfectly Elastick Body strike directly against another equal to it, and which is at rest; after the Shock the moving Body will lose all its Motion, and the Quiescent move on with the Velocity of the Former.

C O R. III.

If the Bodies *A* and *B* are equal, and both move the same way, as in Line the 4th of the Figure, they will move also both the same way after the Shock, and with the mutual Exchange of their Velocities.

For since $CE = CD$, and $AC = CB$; $CE - AC$, that is, EA , must be $= CD - CB$, or to BD ; and consequently, the Velocity of the Body after the Shock, will be equal to that of *B* before it. Besides, since $EA = BD$, EB will be $= AD$; and therefore the Velocity of the Body *B* after the Shock, must be equal to that of *A* before it.

C O R. IV.

If the equal Bodies *B* and *A* move with contrary Directions, as in Line the 10th of the Figure, they will also, after the Concourse and Shock, move contrary ways, and with their Velocities counter changed.

For since $AC = CB$, and $CE = CD$, $AC - CE$; that is, AE must be equal to $CB - CD$, or to BD ; and therefore the Velocity of the Body *A*, after the Shock, will be equal to that of *B* before it. Besides, since $EA = BD$, AD will be $= EB$: But AD expresses the Velocity of the Body *A* before the Shock, and EB the Velocity of *B* after it; wherefore the Truth of this Corollary is plain.

After this he shews a very easy Method to bring these Theorems to Practice, by a Calculation in Numbers.

For suppose (1) the Bodies *A* and *B* both move the same way, and that the Velocity of the precedent Body *B* be c , and that of the subsequent *A* be C ; wherefore the relative Velocity of these two Bodies will be $C - c$, and the Sum of their Motions the same way $AC + Bc$: Let x denote the Velocity of the subsequent Body *A* after the Concourse and Shock; then because the relative Velocity of Bodies before and after the Shock continues the same, the Velocity of the Body *B* will be expressed by $x + C - c$.

For the relative Velocity of Bodies is equal to that by which the Velocity of the Swifter exceeds that of the Slower; and therefore that Excess must be expressed by $C - c$. Wherefore, since the Velocity of the subsequent Body $A = x$, its Motion towards *D* must be Ax : And since the Velocity of the preceding Body $B = x + C - c$, its Motion also towards *D* must be expressed thus, $Bx + BC - Bc$; and the Sum of these two Motions will be equal to the Sum of the former Motions: That is, in Species, $Ax + Bx + BC - Bc = AC + Bc$; and by Transposition, $Ax + Bx = 2Bc - BC + AC$; and then by Division, $x = \frac{2Bc - BC + AC}{A + B} = \text{Velocity of the Body } A$.

And so also the Velocity of the Body *B* is $= x +$

$$C - c = \frac{AC - BC + 2Bc}{A + B} + C - c = \frac{AC - BC + 2BC + AC + BC - Ac - Bc}{A + B} = \frac{2AC - At + Bc}{A + B}$$

If BC be greater than $AC + 2Bc$; then x or $\frac{AC - BC + 2Bc}{A + B}$ will be a Negative Quantity; and consequently the Velocity of the Body *A* will have a contrary Direction, and its Motion towards *D* will be Negative.

If the Body *B* be at rest, that is, if $c = 0$, then the Velocity of the Body *A* after the Shock will be $+ \frac{AC - BC}{A + B}$, forwards or backwards according as the Sign $+$ or $-$ prevails.

If the Bodies *A* and *B*, with the Velocities C and c move contrary Ways, and consequently meet one another directly; their Motion the same way will be expressed by $AC - Bc$, and the relative Velocity of the Bodies will be $C + c$.

Let then x stand for the required Velocity of the Body *A* after the Shock; its Motion that way, which it went before the Shock, will be expressed by Ax , and the Velocity of the Body *B* will be $x + C + c$ (for the relative Velocity of Bodies is not altered by the Shock) and then the Motion in the Body *B* towards *D*, will be $Bx + BC + Bc$; wherefore the Sum of the Motions the same way will be $Ax + Bx + BC + Bc$ which (by his 14th Theorem about the Laws of Motion) will be $= AC - Bc$; so that $Ax + Bx = AC - BC - 2Bc$, and $x = \frac{AC - BC - 2Bc}{A + B}$.

And the Velocity of the Body *B* will be

$$\frac{AC - BC - 2Bc}{A + B} C + c = \frac{AC - BC - 2Bc + AC + Ac + BC + Bc}{A + B} = \frac{2AC + Ac - Bc}{A + B}$$

If $BC + 2Bc$ be greater than AC , the Motion of the Body *A* will be backwards or a contrary way; in which Case x or $\frac{AC - BC - 2Bc}{A + B}$

Whatever be the Physical Cause of Elasticity; Sir Isaac Newton, Prop. 23, Book 2. of his admirable Princip. demonstrates, That "Particles which mutually avoid or fly from one another by such Forces as are reciprocally proportional to the Distances of their Centers, will compose an Elastick Fluid, whose Density shall be proportional to its Compression.

And *vice versa*, "If any Fluid be composed of Particles, that fly or avoid one another, and hath its Density proportional to its Compression, then the Centrifugal Forces of those Particles will be reciprocally as the Distances of their Centers.

ELATERISTS, Mr. Boyle's Word, are such as hold the Doctrine of *Elaterium*, or the Spring and Weight of the Air, which he defends against *Linus*.

ELATERIUM is the Juice of wild Cucumbers made up in a thick and hard Consistence: Also, according to some, any Medicine that purges the Belly.

ELECTICA: See *Atrabentia*.

ELECTION *de Clerk*, is a Writ that lieth for the Choice of a *Clerk*, assigned to take and make Bonds called *Statute-Merchant*; and is granted out of the *Chancery* upon Suggestion made, That the *Clerk* formerly assigned is gone to dwell in another Place, or hath Hindrance to lett him from following that Business, or hath not Land sufficient to answer his Transgression if he should deal ami's.

ELECTRICITY, is the Quality that Amber, Jet, Sealing-Wax, &c. have of attracting all Kinds of very light Bodies to them, when the attracting Body is rubbed or chafed. And this is most probably the Effect of a *Material Effluviu* (as the Noble Mr. Boyle expresses it in his Notes on this Quality) issuing from, and returning to the *Electrical Body*, and assisted also in some Cases by the External Air. For the Solution of this Phenomenon there are several Hypotheses, and all Mechanical.

1. *Cabvus* supposes, That actual Streams do issue out of the *Electrick Body* when agitated by Attrition; and that these do diffusi and repel the Ambient Air, which, after it hath been driven off a little way, makes, at it were, a little Whirl wind from the Resistance which it finds in the remoter Air, to which these *Electrick Streams* did not reach: And that the Streams shrink quickly back again to the attracting Body, do, in their Return, attract or bring along with them such light and small Bodies as they meet with in their way. To which Mr. Boyle adds, that the Gravity of the incumbent Atmosphere surmounting the specific Gravity of the little rarified Atmosphere of the *Electrick Body*, may probably facilitate the Tendency of the small Particles of Matter towards the attracting Body.

2. Our Famous *Gilbert*, Sir K. Digby, *Gassendus*, Dr. Brown, and many others, suppose, That on rubbing or chafing, the *Electrick Body* is made to emit Rays or Files of an unctuous Nature, which, when they come to be condensed and cooled by the Ambient Air, do lose their Agitation, and then shrink back again into the Body from whence they fall'd out; and by that means do carry along with them such light and small Bodies as happen to be fastened or sticking to their further Ends. *Gassendus* thinks also, That these unctuous Effluvia being emitted all manner of ways, do decussate frequently, or cross one another; and by this Means do take the better hold of Straws, &c. into whose Pores they insinuate themselves.

3. *Des Cartes* being not able to imagine that so solid a Body as Glass was capable of emitting Effluvia; (tho' it is certain that two Pieces of Glass rubbed one against another, will send forth an unpleasing Odour, which must consist of material Effluvia) he had recourse to the Operation of his *Materia Prima* for the Solution of *Electricity*; but he speaks of it doubtfully himself, and unintelligibly to the Reader, as it appears to me; therefore I shall refer you to the Place it self, where if you think it worth while, you may see what he saith at large. *Vid. Cartes Princip. Lib. 4 Chap. 184. p. 210.*

Mr. Boyle, in order to prove *Electricity* to be a Quality which hath, like all others, in natural Bodies, a Mechanical Original, hath given us the following Observations and Experiments about this Effect; from whence a very good guess may be made how *Electrical Attraction* is produc'd, viz.

1. That *Electrical Bodies* do not at all, or at best but very rarely attract, but when they are warm'd, and thereby sollicit to emit Effluvia more copiously.

2. That these Bodies warm'd only by the Fire, don't attract so forcibly as they will when heated

by rubbing; tho' if they are first warmed at the Fire, and then rubbed afterwards, they will attract most speedily and powerfully. So that Heat seems necessary in general to put the Parts into Agitation; and rubbing or chafing in particular, to give them their most proper Modification.

3. *Tersion* (as he calls it) or *Wiping*, is almost universally necessary, as well as Attrition or Rubbing, to produce *Electricity*; for thereby the Steams or Effluvia can the better get out, when there is nothing to stop up, or choak the Pores of the attracting Body.

4. The *Magnetical Effluvia* will pervade all manner of Bodies freely; yet the Interposition of the finest Linnen or Paper will hinder the Operation of all *Electrical Particles*; which seems to confirm their being something of an unctuous Nature.

5. This Effect is very much weaken'd if the Weather be thick and cloudy, and especially if the South Wind blow, as *Kircher* asserts from his own Experience. But it always continues some time after it is once excited by rubbing and chafing, and doth not cease in an Instant.

6. *Electrical Bodies* attract all Things indifferently, whereas the Magnet draws only Iron and Steel.

7. Our Excellent Naturalist suspended a fine large Piece of very *Electrical Amber* by a Silken Thread, and then had one end of it rubbed strongly on a little Cushion, and then he found that when the Amber was made to hang perfectly at rest, if the Cushion was brought near it, tho' not to touch it, it would plainly make the Amber tend towards it, and follow it. From whence it plainly appears, that other Bodies can draw or move the *Electrick one*, as well as it, the others; and that it is by Accident only, and not from Necessity, that the small attracted Bodies go to the *Electrick one*.

8. By many repeated Experiments he found this *Electrical Quality* to be producible and destructible.

9. He found also that a Piece of Amber did sensibly attract when the Air was pumped out of the Receiver; which confirms the Hypothesis of those that suppose actual Strings or little unctuous Rays to go out of the *Electrical Body*.

10. He found also, that after an *Electrical Body* had been well rubbed, there was a certain Nick of Time in which the light Body would instead of being attracted, be actually driven away from the *Electrical Body*, by the Effluvia going briskly out and not yet returning again; which much confirms the Hypothesis of *Gilbert*, *Digby*, *Brown*, &c. mentioned in N. 2. See Vol. II.

ELECTUARY, is a Medicine of a Consistence, thicker than a Syrup or Linctus, and composed of hard things reduced to Powder, and accurately mixed with Syrups, Conerves, Honey, &c.

ELEGIT, is a Writ Judicial, that lieth for him that hath recover'd Debt or Damages in the King's Court against one not able in his Goods to satisfy, and directed to the Sheriff, commanding him that he make Delivery of half the Parties Lands or Tenements, and all his Goods, Oxen and Beasts of the Plow excepted.

ELEMENTS, is a Word used by Natural Philosophers, in the same Sense usually as *Principles*; and by the Elements and Principles, or as they sometimes call them the *Elementary Principles* of a Natural or Mixed Body, they mean those simple Particles out of which the Mixed is composed, and into which 'tis ultimately resolved.

The Word comes from L, M, N, three of the Letters of the Alphabet; and is also frequently used for the first Principles or Rudiments of any Science.

Thus

Thus the Propositions of *Euclid* are called his Elements, because they contain the first Principles of Geometry.

ELEOSACCHARUM, is Sugar incorporated with some Drops of distilled Oil, so as to make the Oil more easy and agreeable to be swallowed by the Patient.

ELEPHANTIASIS Arabum, of which the *Greeks* speak nothing, but the *Arabians* do frequently, is a kin to a *Varix* or crooked Swelling in the Veins, and proceeds from thence, and is only a Tumour in the Feet. *Avicenna* treats of this Distemper, where he speaks of the *Varices*; yet *Rhazes* differs from him, and *Haly Abbas* follows the *Greeks*, who say, That an *Elephas* is a Disease which corrupts all the Members of the Body, and is as it were, an *Universal Cancer*. But neither is he consistent with himself, when he writes, that *Ulcers* in the Legs and Feet are called *Elephas*; and that *Elephantiasis Morbus* is an Apostume proceeding from Melancholly in the Legs and Feet; and the Sign of it is, That the Shape of the Foot is like the Figure of an Elephant. All the rest treat separately of a *Leprosy* and an *Elephantia*, and make the latter to be a Swelling of the Feet, proceeding from Melancholly and Pituitous Blood, and the crooked Swelling of the Veins, whereby the Feet resemble the Feet of an Elephant in Shape and Thickness: And this sort of Tumour is often seen in Beggars who wander much. *Blanchard*.

ELEPHANTIASIS Græcorum, which the *Arabians* call a *Leprosy*: It is called also *Elephas*, *Elephantiasis*, and *Elephantia*, from an Elephant, as some think, because it makes People big like an Elephant, which is a foolish Notation of the Word; for the Body is no bigger, though the Disease be. Others think 'tis so called, because the Distemper lying in the Legs, maketh them stiff and equal like an Elephant; or because 'tis a strong vehement Disease like an Elephant, with such like Stuff. *Galen*, in his 14th Chapter of Tumours, says, that "This Disease is called a *Saturiasmus* when first it begins, because it makes the Face like that of a Satyr; for the Lips are thick, the Nose swells, the Ears Decay, the Jaws are red, the Forehead is set with Tumours like so many Horns." Though others think it is called *Saturiasmus*, because the Persons afflicted are much inclined to Leachery at the beginning, as Satyrs are. *Celsus* describes it thus: "The whole Body (says he) is so affected, that the very Bones may be said to be corrupted. The upper Parts of the Body are full of Spots and Tumours, the Redness whereof is gradually turned into Black: The Top of the Skin is unequally thick, thin, hard, soft, rough, as if it had Scales on it; the Body decays, the Bones, Calves of the Legs, and Feet, swell. When the Disease is old and inveterate, the Toes and Fingers are hid in the Swelling, and a small Fever arises, which easily consumes a Man laden with so many Infirmities. *Blanchard*."

ELEVATION of a Mortar-piece or Gun, is the Angle which the Chase of the Piece, or the Axis of the hollow Cylinder, makes with the Plane of the Horizon.

ELEVATION of the Pole, is the Height or Number of Degrees that the Pole, in any Latitude, is raised, or appears above the Horizon.

ELEVATION of the Pole, in Dyalling, is the Angle which the Style makes with Subtylar Line.

To find the Elevation or Height of the Pole, having given the Declination and Meridian Altitude or Zenith Distance of the Sun or Star.

Note, 1. If the Sun or Star have no Declination, the Zenith Distance is the Latitude or Height of the Pole; and if the Sun or Star come to the Meridian due North, the Latitude is Southerly; if it come to the Meridian South, the Latitude is Northerly.

2. If the Sun or Star be in the Zenith, the Declination is the Latitude; and if the Declination be Southerly, the Latitude is Southerly; but if the Declination be Northerly, the Latitude is Northerly.

Rule 1.

If the Declination be North or South, and the Meridian Altitude be the same way that the Declination is, the Difference between the Declination and Zenith Distance, is the Height of the Pole towards which the Declination is.

Example 1.

Declination North, — 23°. 30'. EK.
Zenith Distance North, — 8. 30. ZK.
Latitude North, — 15. 00. EZ.

But if the Declination be less than the Zenith Distance, then the contrary Pole to the Declination is elevated: As,

Zenith Distance South, 48°. 30'. ZK.
Declination South, — 20. 00. EK.
Latitude South, — 28. 30. EZ.

Example

Example 2.

Zenith Distance North, $50^{\circ} . 00'$.
Declination North, — $15 . 00$.
Latitude South, — $35 . 00$.

Rule 1.

If the Sun or Star's Declination be North or South, and the Zenith Distance be contrary to the Declination, the Sum of the Co-altitude and Declination is the *Height of that Pole* that the Declination is towards.

Example.

Zenith Distance South, $31^{\circ} . 30'$. ZK.
Declination North, — $20 . 00$. EK.
Latitude North, — $51 . 30$. ZE.

Note, If the Declination be the same way that the Meridian Altitude is, and greater than the Meridian Altitude, then the Sun or Star may have two Meridian Altitudes in 24 Hours, viz. the one above the Pole, and the other below.

In such Case the Sum of the Co-declination and Altitude, is the *Height of the Pole* towards which the Declination is.

Example.

Declin. North $21^{\circ} . 30'$. its Compl. $68^{\circ} . 30'$.
Meridian Altitude North, — $10 . 30$.
Elevation of the North Pole, — $79 . 00$.

But if the Meridian Altitude be greater than the Declination, then the Difference between the Zenith Distance and Co-declination, is the *Height of the Pole* towards which the Declination is.

Example.

Declination North, $22^{\circ} . 30'$.
Zenith Distance, — $10 . 30$. North.
Latitude North, — $12 . 00$.

Note, Which way soever the Meridian Altitude be, if the Meridian Altitude and twice the Co-declination be less than 180 Degrees, the Sun or Star hath two Meridian Altitudes in 24 Hours, and the Latitude is found by the 2d Rule.

Example.

Meridian Altitude South, — $77^{\circ} . 00'$.
Decl. $62^{\circ} . 00'$. North Compl. $28 . 00$.
Sum, $133 . 00$.

Which is less than $180^{\circ} . 00'$. Therefore,

Zenith Distance South, $15^{\circ} . 00'$.
Declination North, — $62 . 00$.
Latitude North, — $75 . 00$.

ELEVATOR, the same with *Elevatorium*.

ELEVATOR *Labii Inferioris*, is a Muscle which, with its Partner, lies within the lower Lip. They arise fleshy from the inferior Part of the Gums of the lower Jaw which belong to the *Dentes Incisivos*, and descend directly to their Implantations in the Inferior Part of the Skin of the Chin. Hence it is, when these act, they make divers Indentations in the Chin, as may be observed in living Persons, when the lower Lip is drawn upwards.

ELEVATOR *Labii Superioris*, is a Muscle which arises fleshy from the Fore-part of the *Os Quatum* of the upper Jaw, immediately above the *Elevator Labiorum*, and descends obliquely under the Skin of the upper Lip, joining with its Partner in a middle Line from the *Septum Narium*, to its Termination in the *Sphincter Labiorum*. Its Name shews its Use.

ELEVATOR *Labiorum*, is a Muscle which lies between the *Zugomaticus* and the *Elevator Labii Superioris Proprius*. It arises from the *Os Quatum* of the upper Jaw, and descends to its Inferion under the Termination of the . . . Its Name shews its Use.

ELEVATOR *Oculi*, is a Muscle of the Eye, called *Superius* from its Moral Signification, it being one of the common Marks of a haughty Disposition to look high; wherefore its opposite Muscle is called *Humilis*. This Muscle arises sharp and fleshy near the Place where the *Optick Nerve* enters the *Orbit*; and becoming a fleshy Belly, makes a thin Tendon inserted to the *Tunica Scleratis* on the Superior and Fore-part of the Bulb of the Eye under the *Adnata*.

ELEVATORES, or *Elevating Muscles*, are those that serve to draw the Parts of the Body upwards.

ELEVATORIUM, so called from the lifting up, is a Chyrurgeon's Instrument, wherewith Pieces of Skulls that are depressed are raised up again.

ELIXATION, is the boiling of any thing for a Medicinal Use in a proper Liquor, in order that the thing may impart its Vertue to the Liquor 'tis boiled in.

ELIXIR, the Chymist's Name for a very fine and useful Tincture; as *Elixir Proprietatis*, *Solutis*, &c.

ELIXIR *Proprietatis*, is a Tincture of Myrrh, Aloes and Saffron, drawn by Spirit of Wine and Spirit of Sulphur. This is *Paracelsus* his way, and is really the best of any, though many others are prescribed.

ELIPSIS, in Grammar, is that Figure whereby some Part of our Discourse is left out or retrenched: As in the Latin Expression *Paucis te volo*, in which Words *verbis alloqui* are left out. This Figure is very common in the Oriental Languages.

ELLIPSIS, in Geometry, is an Oval Figure; 'tis produced from the Section of a Cone by a Plane cutting both sides of the Cone (but not parallel to the Base, for then it produces a Circle) and meeting with the Base produced, as $FDKEO$ in the second Figure following.

But first I will give you Dr. Wallis's General and Geometrical Way of demonstrating the General Property of the *Ellipse*, and which he expresses thus.

PROP. I.

In the Ellipse the Squares of the Ordinates are equal to the Differences between two Rectangles, of which the Greater are as the Abscissa; the Lesser as the Squares of the Abscissa.

For,

1. The Squares of DO are = Rectangles $BD \times DS$ every where, because SB is the Diameter of a Circle.

2. Drawing then SF parallel to Aa , the *Latus Transversum*, and producing the BS 's every where to F , the Lines DS will every where be = $DF - FS$, where the DF 's are all equal, because SF parallel Aa .

3. You will find also, That the Rectangles under BD and DS (= DO q) will be = to the Rectangle under BD and DF , deducting that under BD and FS : That is, $BD \times DS = BD + DF - BD \times FS$.

4. Also because the DF 's are all equal, the Rectangle BDF will still be as the BD 's; and those BD 's, because of the similar Triangles ADB , will still be as the DA 's, or the Abscissa. Wherefore the Rectangles BDF will every where be as the Abscissa AO ; which is the Proof of the first Part.

5. But the Squares $BD \times FS$, since both the BD 's and FS 's are every where as the AD 's, must be in a duplicate Ratio of, or as the Squares of the Abscissa AD .

6. Wherefore, since the Square of the Ordinate DO (= $DB \times DS$) is equal to $BD \times DF - BD \times FS$ (Prop. 3.) the Proposition is plain.

COROLLARY I.

Hence 'tis plain, That if you have the Right Lines BD and DS , you have the Ordinate DO , but *à contra*, because the Lines BD , DS may vary infinitely, and yet make a Rectangle equal to DO q. Wherefore the Conick Writers thought to determine the Ordinates another Way; for instead

of BD , they took in the Section the Line AD , or the Abscissa; and instead of AS they substituted another imaginary Line, suppose LA (which they called the *Latus Rectum*) and ordered it, so, that it should be a fourth proportional reciprocally to the Lines AS , BD and DA : So that every where it should be $BD \times AS = DA \times LA$, and consequently the *Latus Rectum* = $\frac{BD}{AD} \times AS$,

and $AS = \frac{DA}{BD} \times LA$.

PROP. II.

The Square of any Ordinate (IK) in the Ellipsis, is equal to the Rectangle (IL) under the *Latus Rectum* (EL) and the Abscissa (EI) less, or abating out of it another Rectangle made by the same Abscissa (ED) and a fourth Proportional (RS) to the *Latus Transversum*, the *Latus Rectum* (DE) and the Abscissa.

Draw a Parallel to the Section, as MB , which note with b , and continue the Axis of the Section till it meet with the Diameter of the Base of the Cone produced in the Point F , and draw it on to M , and call AM , c .

Draw also the *Latus Primarium* EP , and parallel to it NO through any given Point, I : Call the Side of the Cone, in which the upper Vertex of the Section is, a . Let the Abscissa EI be noted with eb ; and then (working by the similar Triangles BCA and EIN) according to the Rule of proportions, NI will be expressed in this Notation by ec . Let the produced part of the Base MC be called d ; and the *Latus Transversum*, or Transverse Diameter ED , be called ob : Then will ID be = $ob - eb$.

Since the Triangles BMC , DEP , and DEO are all Similar, work for a fourth proportional to express EP , and you will find it to be ed ; and IO in this Notation (by the same Way of working) will be $ed - ed$.

Here also, as in the Parabola and Hyperbola, the Square IK = Right-angle NIO , which you will find in the *Ellipsis*, must be noted by $oeed - eecd$; as in the Hyperbola (you may see) 'tis $oeed + eecd$.

If therefore you divide $oeed - eecd$ = the Square of the Ordinate IK , by EI the Abscissa in this Notation = eb , it will stand thus, $\frac{oeed - eecd}{eb}$, or $\frac{ecd - ecd}{b}$, which is equal to the Line IS , and which, with the Abscissa $EI = eb$, will make ES a Rectangle = to IK Square.

And if you work here to find the *Latus Rectum*, according to the Canon given in the Parabola, by saying, as $b : c :: od : \frac{odc}{b}$, you will have $\frac{odc}{b}$ for

COROLLARY I.

In any *Ellipsis*, draw an Ordinate as IK , and suppose the Focus to be in N , and the *Latus Rectum* LM applied in N at Right-angles to the Axis.

Then will the Square of $\frac{ocd}{2b}$ ($= \frac{1}{4}$ the *Latus Rectum*) = Square of LN be $= \frac{occd}{4bb}$. Wherefore by this Proposition, As Square IK : Square LN :: Rectangle DIE : Rectangle DNE ; that is, $occd - eecd : \frac{occd}{4bb} :: oebb - \frac{occd}{4}$. Wherefore the Rectangle DNE ; $= \frac{occd}{4}$.

Now Rectangle DNE + the Square of CN = Square CE (by 5. e. 2. *Euclid*) and consequently CN Square = CE Square - Rectangle DNE : that is, $\frac{oebb}{4} - \frac{occd}{4}$ (for $CE = \frac{1}{2} ob$). And therefore CN , the Distance from the Center to the Focus, is equal to $\frac{\sqrt{oebb - oecd}}{4}$.

COROLLARY II.

And from hence will arise this Canon for determining the Foci of an *Ellipsis* from the Square of half the *Latus Transversum*; Subtract the fourth part of the Figure. (or $\frac{1}{4}$ of the Rectangle under the *Latus Rectum* and *Transversum*) and then extract the Square Root of the Remainder: That shall be the Distance of the Focus from the Center, and then subtract that from half the *Latus Transversum*, and it gives EN the Distance of the Focus from the Vertex.

COROLLARY III.

Which Rule is very easy in Practice, for $\frac{oebb}{4}$ is only the Square of CE (half the *Latus Transversum*) and $\frac{occd}{4}$ nothing but the Rectangle of $\frac{1}{4}$.

CE into LM the *Latus Rectum* (for $\frac{ob}{4} \times \frac{ocd}{b} = \frac{occd}{4}$.)

Wherefore find MN a mean Proportional between LM and $MO = \frac{1}{4} DE$; then on CM ($= CE$) describe a Semi-circle, and in it apply MN , and then draw CN , which shall be the Distance of the Focus from the Center.

COROLLARY IV.

Since in *Cor. I.* 'twas proved, that the Rectangle DNE + CN Square $= CE$ Square; that is, Rectangle $DNE = CE$ Square - CN Square. Call CN Square, mm ; and then will the Rectangle $DNE = (CE$ Square) $\frac{oebb}{4} - mm$: Which Notation, as one of the same Nature in the Hyperbola, will be of use hereafter.

PROP. IV.

In the *Ellipsis*, The *Latus Rectum*: Is to the *Latus Transversum* :: As the Square of any Ordinate, IK : Is to the Rectangle DIE , made by the Lines intercepted between it and the Vertices of the *Latus Rectum*.

For the *Latus Rectum* is $\frac{ocd}{b}$, and the *Latus Transversum* ob ; the Square of the Ordinate $oecd - eecd$, and the Rectangle DIE is $oebb - eebb$, IK is b , as hath been shewn in the former Propositions: Place therefore these four Quantities in the Form of Proportionals, viz.

As $\frac{ocd}{b} : ob :: oecd - eecd : oebb - eebb$.

And multiplying the Extremes and Means, you will find the same Quantity $oebbcd - oeebcd$ produced both ways, which shews they are truly proportional. Q. E. D.

COROLLARY I.

Wherefore, if the *Latus Rectum* and the *Axis Transversus* be given in the *Ellipsis*, 'tis easy to find the second Axis, by making, As $ob : \frac{ocd}{b} :: \frac{oebb}{4}$ ($=$ Rectangle DCE) : To $\frac{occd}{4} =$ Square AC .

Wherefore AC is known, and consequently its Double AB .

Whose Square must be $oocd$ = Rectangle of the *Latus Rectum* into the *Transversum*; i.e. the Figure, as Apollonius calls it. Wherefore the *Axis Secundus*, and any Second Diameter, is a mean Proportional between the *Latus Rectum* and *Transversum*; or to speak with Apollonius, is equal in Power to the Figure.

COROLLARY II.

Since the Square of $AC = \frac{oocd}{4}$, and the Squ. of CN (the Distance of the Focus from the Center) = $\frac{oobb - oocd}{4}$, by Corol. 1. of Prop. 2. Put them into one Sum, and they will make $\frac{oobb}{4}$, which therefore must be equal to Square AN , and consequently the Line $AN = \frac{ob}{2}$; i.e. to half the *Latus Transversum*.

Wherefore, if you have the Axes in an Ellipsis, 'tis easy to find the Foci; for you need only open the Compasses to the Distance DC , and setting one Foot in A , cross the *Transverse Diameter* in the Points N and N .

COROLLARY III.

Since by Cor. 1. Prop. 2. the Rectangle DNE has been proved equal to $\frac{oocd}{4}$, which, by Cor. preceding, = AC^2 , 'tis plain Rectangle $DNE = AC$ Square.

COROLLARY IV.

The Square of CE (= half the *Transverse Diameter*) : Is to the Square of AC half the Diameter *secunda* :: As *Latus Transversum* : To *Latus Rectum*.
For $\frac{oobb}{4} : \frac{oocd}{4} :: oobb : oocd :: obb : ocd$
:: $\frac{oobb}{b} : \frac{oocd}{b} :: ob : \frac{oocd}{b}$; i.e. *Latus Transversum*, *Latus Rectum*.

COROLLARY V.

Also since CE Square : AC Square :: ob : $\frac{oocd}{b}$; that is, by this Prop. As Rectangle DIE : Square IK . Therefore Square CE : Square AC :: Rectangle DIE : Square IK ; that is also (by Cor. 3.) As Square CE : Rectangle DNE :: Rectangle DIE : Square IK .

COROLLARY VI.

Wherefore there will be found a new and useful Way of expressing the Square of the Ordinate IK (which we found above in Prop. 1. was $oocd - eecd$) if you make, As CE Square ($= \frac{oobb}{4}$):

Rectangle $DNE = (\frac{oobb}{4} - mm)$, by Corol. 4. Prop. 2.) :: So Rectangle DIE : To a fourth Proportional; which working Algebraically by the Rule of Three, will be found to be $oebb - eebb - 4emm - 4mnee$

The Advantage of which Notation will sufficiently appear in the next Proposition.

PROP. V.

In the Ellipsis, the Aggregate or Sum of the Right Lines KN and Kn , drawn from the same Point K , in the Curve of the Ellipsis, to both the Foci N and n , is always equal to the *Transverse Diameter* or *Axis DE*.

The Proof of which depends on the Consideration, of the Rectangled Triangles IKN and IKn , where the Sides being given, the Hypothenuses are easily had.

For if (as in Cor. 4. Prop. 2.) you call $CN = m$, then will m be $\sqrt{oobb - oocd}$, and $IN = CI$

+ $CN = \frac{1}{2}ob - eb + m$; but In will be = $Cn - CI = m - \frac{1}{2}ob + eb$.

Wherefore the Square of $IN = \frac{1}{4}oobb - oebb + eebb + obm - 2ebm + mm$; and the Squ. of $In = \frac{1}{4}oobb - oebb + eebb - obm + 2ebm + mm$.

Now if to each of these Squares you add the Square of IK , which (by Cor. 6. of the precedent) was $oebb - eebb - \frac{4emm}{4} + \frac{4mnee}{4}$, the Sum will be KN Square (or the Square of the Hypothenuse) which is = $\frac{1}{4}oobb + obm + 2ebm + mm - \frac{4emm}{4} + \frac{4emm}{4}$.

And Square $Kn = \frac{1}{4}oobb - obm + 2ebm + mm - \frac{4emm}{4} + \frac{4emm}{4}$

And consequently extracting the Roots of those Equations (which is very easy) you will have $KN = \frac{1}{2}ob + m - \frac{2em}{e}$, and $Kn = \frac{1}{2}ob - m + \frac{2em}{e}$.

Which

Which two added together, are manifestly equal to ob the Transverse Diameter. *Q. E. D.*

COROLLARY I.

From whence arises the Reason of the Ordinary Way used by Gardeners, &c. to describe Ovals or Ellipses by two Pins in the Transverse Diameter at N and n , and a String mov'd about them by another Pin,

as F ; for by this Means the Point F will always be in the Ellipse; and since a Circle is described by a String moving round one Pin placed in the Center, 'tis plain a Circle is an Ellipse, whose Foci are coincident.

COROLLARY II.

Hence also 'tis easy to describe an Ellipse on a Plane Geometrically, by only Scale and Compasses: For

having drawn the Axis Transversus DE , and in it taken the Foci n and N ; at a Distance, not more than half the Transverse Axis, with the Compasses in N strike an Ark, as f , and set the same Distance from E to G .

Then opening the Compasses to the remaining Distance GD , with one Foot in n cross the Ark f , and that Point will be in the Ellipse: And thus you may find as many Points as you please with all Readiness imaginable.

ELLIPTICAL Compasses, is an Instrument made in Brads, to draw at one Revolution of the Index, any Ellipse or Oval.

ELLIPTICAL Dial, is an Instrument made commonly of Brads, with a Joint to fold together, and the Gnomons to fall flat, commodiously contrived to take little room in the Pocket. By it may be found the true Meridian, Hour of the Day, Rising and Setting of the Sun, with several other Propositions of the Globe.

ELLIPTICAL Space, is the Area contained within the Curve of the Ellipse.

The Elliptical Space $d a e b$: Is to a Circle described on the Transverse Axe de : As the Conjugate Diameter, or Axis Rectus ab : Is to the Transverse Axe de .

Draw fo , gn perpendicular to Ce .

Then will $fo : fc :: gn : gc$.
And therefore $fo : gn :: fc : gc$.
 $:: ac : ce$.
 $:: ab : de$.

But this Proportion of $fo : gn :: ab : de$ will be true, wherever the Perpendiculars fo and gn are drawn; that is, of all the Indivisible of the outer Circle and Ellipse: Wherefore the Plane Spaces made out of them, must, in the whole, be in the same Proportion to one another: That is, the Ellipse to the Circle, is as the Conjugate ab , to the Transverse Diameter de . *Q. E. D.*

COROLLARY I.

Wherefore the Quadrature of the Ellipse will be had, when that of the Circle is found, and vice versa.

COROLLARY II.

The Ellipse is a mean Proportional between the greater and lesser Circle; For a Circle, or any similar Figure on ab : will be to one of the same Kind on de : As ab : To a third Proportional; i.e. As the Ellipse: Is to the greater Circle :: So is the lesser Circle: To it, viz. as ab to de .

The Investigation of the Tangent to the Ellipse.

Let $BE = q$, $BC = x$, $EC = y$, $CD = n$,
 $AC = t$.

BE the Transverse Ax, H the Center, FA the
 Tangent, FC , OD Ordinates.

CD is supposed indefinitely small.

$$AC^2 : FC^2 :: AD^2 : GD^2,$$

$$\text{But } GD^2 = OD^2,$$

$$\text{Wherefore } AC^2 : FC^2 :: AD^2 : OD^2.$$

$$\text{But } FC^2 : OD^2 :: EC \times BC : ED \times BD,$$

$$\text{Therefore } AC^2 : AD^2 :: EC \times BC : ED \times BD,$$

$$\parallel : CH :: \parallel \parallel$$

By Similar Triangles,
 Because CD is indefinitely small.

By the Curve's Property.
 By Equality of Proportion.

$$t^2 : t^2 + 2tn + n^2 :: qx - nx : qx - x^2$$

$$\text{Wherefore } t^2 qn - 2nxt^2 - n^2 t^2 = 2tnqx$$

$$\text{Therefore } t^2 q - 2xt^2 - nt^2 = 2tqx - 2tx^2$$

$$\text{And consequently } t^2 q - 2xt^2 = 2tqx - 2tx^2$$

$$\text{Wherefore } tq - 2xt = 2qx - 2x^2$$

$$\text{And therefore } t = \frac{2qx - 2x^2}{q - 2x}. \quad Q. E. I.$$

The last Step in Symbols.

By forming an Equation, and casting off the Terms
 common on both Sides.

By dividing all by n .

Casting off n , or putting $n = 0$.

By dividing all by t .

By dividing by $q - 2x$.

PROPOSITION. I.

$$\text{I say, } AC : CE :: AC : CH.$$

$$t : 2q - 2x :: x : q - 2x$$

$$\text{Wherefore } t : q - x :: x : \frac{q}{2} - x$$

$$\parallel AC : CE :: BC : CH. \quad Q. E. I.$$

By the last Equation resolv'd into an Analogy.
 By dividing the second and fourth Term by 2.

PROPOSITION II.

I say, $HC : HB :: HB : HA$ $\frac{1}{2} \text{ of } x : q :: q : x$ Wherefore $\frac{q}{2} - x : x :: q - x : \frac{2qx - 2xx}{q - 2x}$ And therefore $\frac{q}{2} - x : \frac{q}{2} - x + x ::$ $q - x : q - x + \frac{2qx - 2xx}{q - 2x}$ That is, $\frac{q}{2} - x : \frac{q}{2} :: q - x : \frac{q^2 - qx}{q - 2x}$ Or, $\frac{q}{2} - x : \frac{q}{2} :: q - x : \frac{q^2}{q - 2x} - \frac{qx}{q - 2x}$ But $q - x : q - x + x :: \frac{q^2}{q - 2x} - \frac{qx}{q - 2x}$ $\frac{q^2}{q - 2x} - \frac{qx}{q - 2x} + \frac{qx}{q - 2x}$ That is, $q - x : q :: \frac{q^2}{q - 2x} - \frac{qx}{q - 2x}$ $\frac{q^2}{q - 2x}$ But $q - x : \frac{q^2 - qx}{q - 2x} :: \frac{q}{2} - x : \frac{q}{2}$ Wherefore $\frac{q}{2} - x : \frac{q}{2} :: q : \frac{q^2}{q - 2x}$ And consequently, $\frac{q}{2} - x : \frac{q}{2} :: \frac{q}{2} : \frac{q^2}{2q - 4x}$ $HC : HB :: HB : HA$

By the last Step of the last Proposition.

By Substituting the Value of t .

By Compounding.

By casting off Contradictories.

By expressing the last Term in two Parts.

By compounding the two last Terms.

Casting off Contradictories.

By a Step before.

By Equality of Proposition.

By Dividing the two last Terms by 2.

Sir *Is. Newton Prop. XI. Prob. 6. of Princip. Philosoph. Mathemat.* demonstrates, That if any Body revolve round another in an Ellipsis, the Centripetal Force or Gravity of it will be in a Duplicate Ratio, or as the Square of its Distance from the *Umbilicus* or *Focus*.

ELMINTHES, or *Helminthes*, are little Worms bred in the Guts; especially that called *Rectum*, or the Lowermost, the Strait or Great Gut.

ELODES, or *Helodes*, a sort of Fever accompanied with a violent and perpetual Sweating.

ELONGATION, in Astronomy, signifies the Removal of a Planet to the furthest Distance it can be from the Sun, as it appears to an Eye placed on the Earth; but this is most commonly taken notice of in *Venus* and *Mercury*.

The utmost Elongation of *Venus* can be but 45 Degrees, and that of *Mercury* but of 30 Degrees; which is the Reason this Planet is so rarely seen.

ELONGATION, in Chirurgery, is an imperfect Luxation; occasioned by the stretching or lengthening of the Ligaments of any Joint. *Blanchard*.

ELOPEMENT, is when a married Woman departs from her Husband and dwells with an Adulterer; for which, without voluntary Reconciliation to the Husband, she shall lose her *Dowry*; nor shall

the Husband in such case be compelled to allow her any *Alimony*.

ELYTHROIDES, or *Vaginalis*, is a second proper Tunick which immediately involves the *Testes*.

EMANCIPATION, a Term in the *Roman Law*, signifying the setting free of a Son from the Subjection of his Father; which was so hard by the *Roman Law*, that (they say) before a Son could be released from such Subjection, he should be sold (imaginarily) three times by his natural Father to another Man; and this Person the Lawyers called *Pater Fiduciarius*; a Father in Trust; after this he was to be bought again by the natural Father, and then on his manumitting of him he became Free. Now they called this imaginary Sale *Mancipatio*, and consequently, the setting of any Person free from it, *Emancipatio*. *Blount*.

EMBATTELED, or *Crenelle*, a Term in Heraldry, when the Out-line of any *Ordinary* is of this Figure,

which represents the Battlements of a Wall or Castle.

EMBLEMES (in Law) are the Profits of Lands which have been sowed; but sometimes it is taken more largely, for any Profits that arise and grow naturally from the Ground, as Grains, Fruit, Hemp, &c. If the Tenant for Life sow the Land, and afterwards die, the Executor of the Tenant for Life shall have the *Emblements*, and not he in Reversion: But if a Tenant for Years sow the Lands, and before he hath reaped his Term expires, there the Lessor, or he in Reversion, shall have the *Emblements*.

EMBOLISM, is the Excess of the *Solar Year* above the *Lunar*, whereby the *Lunations* happen every subsequent Year, eleven Days sooner than in the foregoing; which, when they amount to thirty Days, make a new Month, called the *Embolisimical Lunation* or *Embolisimical Month*; which must be added, to make the common *Lunar Year* equal to the *Solar*.

EMBOLUS, is the Sucker of a Pump or Syringe; which, when the Pipe of the Syringe is close stopp'd, can't be drawn up, but with the greatest Difficulty; and when forced-up by main Strength, will, on being let go, return again with great Violence.

The *Aristotelians* attribute this Effect to the common Notion of Nature's Abhorrence of a *Vacuum*. But Mr. Boyle found, that in his exhausted Receiver the Sucker would be as easily drawn up, tho' the Orifice of the Pipe were close stopp'd, as it would be when open in the common Air. From whence it seems plain, that the Difficulty of drawing back this *Embolus* or Sucker, when the End of the Syringe is stopp'd, arises from the Pressure of the Atmosphere on the external End of the Sucker; which having at the other End no *Counter-pressure*, nor Spring of the Air to balance it, must press with all its Weight and keep down the Sucker; but when by pumping the Air out of the Receiver, this Pressure, or its equivalent Spring of the Air is taken away, there is nothing to keep down the Sucker, and so it may be easily drawn up. He found also, That when the Sucker could in *vacuo* thus easily be drawn back, yet on the Re-admission of the Air it would be forc'd in again, and raise along with it a considerable Weight, which was suspended at the external End of the Sucker. *Vid. Continuation of Physico-Mechan. Exp. Part 1.*

EMBRACEUR, or *Embrasour*, (in Law) is he that when a Matter is in Trial between Party and Party, comes to the Bar with one of the Parties (having received some Reward so to do) and speaks in the Cause; or privily labours the Jury, or stands there to over-look and survey them, thereby to put them in Fears and Doubt of the Matter, the Penalty whereof is 20 *L.* and Imprisonment at the Justice's Discretion. But Persons learned in the Law may speak in the Cause of their Clients.

EMBRASURE, in Architecture, is the Enlargement made in the Walls, to give more Light and greater Convenience to the Windows and Doors of a Building.

EMBRASURES, in Fortification, are the Holes in a Parapet, through which the Cannons are pointed to Fire into the Moat or Field: They are generally 12 Foot distance from one another; every one of them being from 6 to 7 Foot wide without, and about 3 within; their Height above the Platform is 3 Foot on that Side toward the Town, and

a Foot and a half on the other Side toward the Field, that so the Muzzle may be sunk on occasion, and the Piece brought to shoot low.

EMBROCCATION, (from *ἐμβροχῶ*), *Irrigation*, or *Wetting* is a kind of Fomentation, wherein the fomenting Liquor is let distil, drop by drop, or very slowly, upon the Part of the Body to be fomented.

EMBRYO, is the *Fetus* in the Womb of the Mother, before its Members come to be distinctly form'd.

EMBRYOTHLASTES, an Instrument with which Chirurgeons break the Bones of a dead Child, that it may be the more easily taken out of the Womb.

EMBRYOTOMY, the Anatomical Dissection of an *Embryo* or *Fetus*.

EMBRYULCUS, an Iron Hook with which Chirurgeons pull a dead *Fetus* out of the Mother's Womb.

EMERGENT, the same with *Emerison*.

EMERSON, in Astronomy, is the Time when any Planet that is eclipsed begins to *emerge* or get out of the Shadow of the eclipsing Body. When any Body also, lighter in Specie than Water, being thrust violently down into it, rises again, 'tis said to *emerge* out of the Water; and this is the most proper Signification of the Word.

EMETICK, or *Vomitive Medicines*, are those which with their pungent Particles contract the Fibres of the Stomach upwards, and so eject at the Mouth whatsoever is offensive to the Stomach, as is the commonly received Notion. But Dr. Purcell, in his Book of *Vapours*, p. 39 supposes that Vomiting is caused by Salts, which prick and corrode the Nerves of the Stomach, from whence the Spirits flow to the Brain in great quantity; and either by the Proximity of the Origin of those Nerves, or by the Angle of Incidence, they are forced into the Nerves belonging to the Diaphragm, and the Muscles of the lower Belly; both which contracting themselves, squeeze the Stomach into a less compass, and so make it eject its Contents: and though some part of the Matter may go downwards by the *Pylorus*, yet the far greater Quantity must go upwards, because when the Diaphragm is contracted, it forces down the Liver, and makes it compress the *Pylorus*, and hinder any Thing from passing out that way; and this Account he confirms by the Experiments of Dr. Chirac, an eminent Anatomist at *Montpellier* in France, and of his own made upon Dogs, above twenty times; And how he solves the Difficulty of the Muscles of the Diaphragm, and of the Abdomen contracting themselves both at the same time, when they are really Antagonists to one another, you will see in his Book, p. 43.

EMETICK Tartar, is only Cream or Crystal of Tartar powder'd and mix'd with a quarter part of *Crocus Metallorum*, and then the Mixture is boiled in an earthen Pan in a sufficient Quantity of Water, for about 8 or 9 Hours: It must be stirred about continually, and new Water put in as the Former boils away. The hot Liquor at last is strained through a woollen Cloth, and then about half of it is gently evaporated; the rest is set to cool; and it will shoot into Crystals. 'Tis a fine, gentle, yet certain Vomitive. The Dose from 3 or 4 Grains to 10 or 12.

EMMENAGOGUES, are Medicines which excite the Menstrues.

EMMOTON, is a Liquid Medicine which is injected into Ulcers.

EMOLLIENTIA, softning Things, are such as with a moderate Heat and Moisture dissolve those Parts which before cohered close; and dissipating others, make them loose and soft.

EMPA-

EMPALEMENT, according to our Learned Dr. Grew, is the outmost Part of the Flower of a Plant encompassing the Foliation of the Attire: 'Tis compounded of the three general Parts of all Plants, the Skin, the Cortical, and the Ligneous Bodies, each Empaler being (whether consisting of one or more Pieces) as another Leaf, and is designed to be a Guard and a Band to the Flower where it is weak and tender; and therefore such Plants as have Flow-ers with a firm and strong Basis, as Tulips, &c. have no Empalement, nor need any.

EMPANEL, in Law, signifies the Writing and Entering the Names of a Jury into a Parchment Schedule or Roll of Paper by the Sheriff, which he hath summon'd to appear for the Performance of such public Service as Juries are employ'd in.

EMPARLANCE, in Common Law, signifies a Desire or Petition in Court of a Day, to pause what is best to do: And 'tis called by the Civilians *Petitionem induciarum*.

EMPASMA, the same with *Catapasma*.

EMPATTEMENT, according to some, is the same with *Talus* in Fortification; which see.

EMPERICKS, are the same with Mountebanks, or bold ignorant Pretenders to the Practice of Physick. However *Empirical* Medicines, as some are pleased to call the very best in Use, are by no Means totally to be slighted, nor that Practice of this Art, which is built on Experience, to be condemn'd; but only the daring Attempts of such ignorant Pretenders as are no way qualify'd to judge of the Symptoms of a Disease, nor the peculiar Circumstances of their Patient's Temper and State of Body.

EMPHATICAL, is used in two Senses; when any thing is spoken with great Earnestness and Emotion of Mind, we say, 'twas spoken very *Emphatically*, or with a great *Emphasis*. 'Tis also used by the old Natural Philosophers for those *Apparent Colours* (as they would call them) which are often seen in Clouds before the Rising, or after the Setting of the Sun, or those in the Rain-bow, &c.

And these, because they are not permanent or lasting, they will not allow to be true Colours: But since these *Emphatical Colours* are Light, modified chiefly by Refraction, and with a Concurrence of Reflections, and some other accidental Variations; and being the proper Objects of Sight, and capable as truly to affect it as other permanent Colours are, there is no reason for excluding them from the Number of true and genuine Colours, since all other Colours are only Modifications of Light as these are.

EMPHRACTICK, the same with *Emplattomena*, or *Emplasticks*.

EMPHRAXIS, is an Obstruction in any Part.

EMPHYSEMA, is an Inflammation or a windy Swelling or Blowing up any Part of the Body. *Blanchard*.

EMPHYTON *Thermon*, or *Calor Innatus*, is the innate Heat, or Heat first supposed to be produc'd in the Fœtus from the Parent's Semen, which afterwards, when Respiration is begun, and the Fœtus subsists of it self, decays forsooth, by Degrees. Many Philosophers and Physicians call this Heat an *innate or native Spirit*, and say that it consists of three Parts, of a *primogenial Moisture*, an *innate Spirit*, and Heat. Whence Fernelius defines *innate Heat* to be a *primogenial Moisture every way qualified with an innate Spirit and Heat*. *Blanchard*.

EMPIRICAL Medicine, now-a-days called *Quackery*, is a practising Physick, without enquiring either into the Nature of the Disease, or of the Medicines employed to cure them; but depending sole-

ly on the Authority of experienced Medicines, which are usually apply'd too universally, in all Cases and Circumstances alike. *Acron Agrigenius* was the first Author of it, who neglecting the Reasons of Things, contented himself with bare Experience.

Quacks first flourished amongst the *Egyptians*; from this Trade came *Mountebanks*; and those that now practice Physick after this bold and heedless rate, are called *Empericks*.

EMPLASTRUM, a Plaster, is a Medicine applied outwardly to the Skin, spread upon Linnen or Leather: It is commonly made of Oils, or of those Things which are of a like Consistence with Oil; as Swine's-grease, Butter, slimy, viscous Extractions from Gums, Roots, &c. Also of Powder and Wax, are these Things which are of a like Consistence with Wax, as Rosin, Pitch, Gum, &c. The Mass whereof being yet hot, is formed into a *Cylindrical Figure*. *Blanchard*.

EMPLASTICKS, } are Salves which so
EMPLATTOMENA, } conspire and shut up
the Pores of the Body, that Sulphurous Vapours cannot pass. *Blanchard*.

EMPNEUMATOSIS, is an alternate Dilatation of the Thorax, whereby the external Air is continually breathed in, and by the Wind-pipe and the Lungs, is communicated to the Blood to accend it. *Blanchard*.

EMPORIUM, is often used for the *common Sensory* in the Brain.

EMPROSTHOTONUS, is a continual Contraction of the Muscles of the Neck towards the Foreparts. *Blanchard*.

EMPYEMA, properly so called, is a Collection of purulent Matter in the Cavity of the *Thorax*; but largely taken, signifies the same in the *Abdomen* too. *Blanchard*.

EMPYREUMATA, are little Feverish Remains after a *Crisis*; also that thick viscous Matter which subsides to the Bottom in distilled Waters. *Empyreuma* signifies also that Taste and Smell of the Fire which in Distillations affects some Oils, Spirits and Waters, by reason of their being drawn off by too great a Degree of Heat.

EMRODS: See *Hamorrhoids*.

EMULGENT Vessels, are the two large Arteries and Veins which spring, the Former from the descending Trunk of the *Aorta* or great Artery, the Latter from the *Vena Cava*. They are both inserted into the Kidneys, and the *Emulgent Arteries* carry the Blood (with the *Serum*) to them, and the *Emulgent Veins* bring it back again after the *Serum* is separated from it by the Kidneys.

EMULSION, is a Liquid Medicine to be taken inwardly, of the Form and Colour of Milk, whence comes its Name (*Quasi Lamentiens*.)

EMUNCTORIES, are the Cavities into which the Excrements of an Animal Body are emptied, as the pituitous Humour of the Brain, into the Nostrils; the yellow thickish Humour, which we call Ear-wax, into the Ears; the Excrements, into the Bowels; the Urine, into the Bladder, &c.

ENEMON, is a Medicine which stops the Blood, or which, by binding, cooling or drying, closes the Passages of the Vessels which were open; stops or diminishes the Fluidity and violent Motion of the Blood. *Blanchard*.

ENÆOREMA, is that Crass Substance which is suspended in the Middle of the Urines, call'd the *Hypostasis Urine*. *Blanchard*.

ENALLAGE, a Figure in Grammar, whereby there is a Change either of a Pronoun, as when a Possessive is put for a Relative, as *Suus* for *Ejus*; or

of a Verb, when one *Mood* or *Tense* is put for another, *Ecce*.

ENALURON, the Term in Heraldry for a Bordure charged with *Martlets*, or any Kind of Birds: Thus they say, he beareth *Argent*, a *Bordure Azure*, charged with an *Enaluron* of *Martlets*; meaning, that there are *Martlets* all round the *Bordure*.

ENARTHROSIS, is (in Anatomy) a kind of Jointing, when the Cavity that receives it is deep, and the Head of the Bone that is inserted is oblong, as may be seen in the Huckle-bone and its Cavity; in the principal Bone of that Part of the Foot which immediately succeeds the Leg, with the Bone call'd *Cymbiforme*.

ENCATHIS, or *Encathis*, is the *Caruncula Lacrymalis*; which see.

ENCAUMA, or *Epicauma*, is a deep, hard, and crusty Ulcer of the Eye. *Blanchard*.

ENCIENT a *French* Term, in Fortification, signifying the whole Enclosure, Circumference, or Compass of a Fortified Place, whether composed of Bastions or not.

ENCEPHALOS, is whatsoever is within the Compass of the Skull, as the Brain, the *Cerebellum*, the *Medulla Oblongata*, &c.

ENCHARAXIS: See *Scarificatio*.

ENCHEIRESIS Anatomica, is a Readiness in Dissections, when an Anatomist shews the Parts of a Body dexterously and expeditiously.

ENGHYMONA, is an Afflux of the Blood, whereby the external Parts are render'd black and blue; as in the Scurvy, Blood-hot Eyes, &c. Also an Afflux of the Blood by the Quickness and Suddenness of its Motion, as in Anger and Joy. *Blanchard*.

ENCHYTA, or *Infundibulum*, is an Instrument wherewith Liquids are infilled into the Eyes, Nostrils and Ears.

ENCHYSMA, the same with *Clyster*.

ENCOPE, is an Incision of any Part, as in a Gangrene, &c.

ENCRANIUM, the same with *Cerebellum*.

ENCROACHMENT, or *Accroachment*, in Common Law, signifies an unlawful gaining upon the Right or Possessions of another.

END for End: When a Cable, Hawser or other Rope of a Ship is run clear off from the Block or Place it was wound about, they say at Sea, *'Tis run out End for End*.

ENDECAGON; a plain Figure in Geometry, of eleven Sides and Angles.

ENDEIXIS, is an Indication of Diseases, whereby is shewn what is to be done: As for Example, a *Plethora*, or too great Fullness of Blood, indicates the opening of a Vein. *Blanchard*.

ENDEMICAL, *Endemial*, or *Endemious Disease*, is that some call *Morbus Vernaculus*, *Ecce Communis*; that is, a Disease which always infects a great many in the same Countrey, proceeding from some Cause peculiar to the Countrey where it reigns: Such is the Scurvy to the *Hollanders*; intermitting Fevers to the Inhabitants of our Submarine and Marshy Places, &c.

ENDITEMENT, or *Indictment*, in Common Law, is the same with *Accusatio* in the Civil Law, tho' in some Points it differs. It may be thus defined: An *Indictment* is a Bill or Declaration made in Form of Law (for the Benefit of the Commonwealth) exhibited as an Accusation of one for some Offence, either Criminal or Penal, unto Jurors, and by their Verdict found and presented to be true, before an Officer, having Power to punish the same Offence. It is always at the Suit of the King, and differs from an Accusation in this, that the *Preferer*

is no way tied to the Proof thereof, upon any Penalty, if it be not proved, except there appear Conspiracy.

ENDORSE, a Term in Heraldry, signifying the $\frac{1}{2}$ Part of a *Pale*; and some say it is not used but when the *Pale* is between two of them; but this *Guilim* finds fault with as too bold a Saying.

He beareth *Or*, an *Endorse* Gules.

ENDORSED, when two Lions are born rampant, and turning their Backs to each other, the Heralds say they are *Endorsed*; but if their Faces be towards each other, they call it *Combatant*.

ENDOWMENT, signifies the giving or assuming of a Dower to a Woman; also the setting or severing of a sufficient Portion for a Vicar towards his perpetual Maintenance when the Benefice is appropriated; and such a Vicarage is called a *Vicarage Endow'd*.

ENDOWMENT de la plus belle part, is where a Man dying, seized of some Landsholden in Knight's Service, and other some in Socage, the Widow is sped of her Dower, rather in the Socage Lands, than those holden in Knight's Service, as being *le plus belle part*, the fairer Part.

ENEMA, the same with *Clyster*.

ENERGETICAL Bodies or Particles, are such as are eminently active, and which produce manifest Operations of various Natures, according to the various Circumstances and Motions of such Bodies or Particles.

ENERGY, in a Medicinal Sense, is an Agitation or Operation of the Animal Spirits and Blood.

ENFANS Perdans, the same with *Forlorn Hope* in an Army; which see.

ENFILE, in Fortification, signifies a Situation of Ground which discovers a Post according to the whole Length of a Right Line, so that it can be scoured with the Cannon, and rendred almost Defenceless: Wherefore to

ENFILE or *Enfilade* the Curtain or Rampart, is to sweep the whole Length of it with the Cannon.

ENFRANCHISE, to make Free, to incorporate a Man into a Society or Body-politick, or to make one a Free *Denizon*.

ENGINE, in the general, is any Mechanick Instrument composed of Wheels, Screws of Pulleys, in order to lift, cast, or sustain any Weight, or to produce any considerable Effect which cannot so easily be obtained by the bare Application of Men's Hands without such help; such as Warlike *Engines*, *Engines* to raise Water, Cranes, &c.

And here I think it proper to give the Reader a Description of two very useful *Engines*, which are the Invention of one of our own Nation, *Thomas Savery*, Esq; a Gentleman very skilful in all Things of this Nature, and now Treasurer to the Sick and Wounded Office.

The First is an *Engine* to row Ships and Boats at Sea, or in a River, when there is a stark Calm or very little Wind.

A Description of this the Inventor published in the Year 1698, with his Answers to the Objections raised against it by Mr. *Dummer*, and others: And the Thought is so natural, and the Manner of its working so plain and easy, that 'tis an amazing thing to one that there is no more use made of it.

He fits a Wheel to the Drum-head of the Captain, whose Teeth turn a Trundle-head; through which is run an Iron Bar that reaches clear across, and goes through the Sides of the Ship; and on its Ends, without Board, at a convenient Distance from the Ship's

Fig: 2.

THE
ENGINE
For
Raising Water
BY FIRE.

Fig: 1.

The
ENGINE
Working in a
MINE. Place this at the word Engine

B. Lens delin: I. Sturt sculp:

Ship's Sides, are fastened two Drum-heads like that on the Capstan, in which are fitted, to take out at pleasure, 6 or 8 Paddles; and at the outermost Ends of the Paddles is fastened an Iron Pin with an Head to it; by which Means, and by the help of a Cord, taking an half turn round about all these Pins, both the Paddles may be *swifted* or strain'd, and strengthened so, that they shall all work proportionably; and also the Paddles may with a Luff Tackle be the more handily and easily lifted in and out, in order to be fitted into or taken out of the Drum-heads of the Bar: See the Figure annexed.

Now here if the Men will but work, if there be enough of them, and the Paddles be made proportionably large, according to the number of the Men that can be brought to work at the Capstan; I cannot see but that the *Engine* will give the Vessel fresher Way than any Oars can do, work'd by the same, or a far greater number of Hands, as the Experiments that have been tried do abundantly shew, according to the best Information I can get of the Matter.

The other *Engine* is for raising Water by the Force of Fire, in which he hath shewed as great Ingenuity, Depth of Thought, and true Mechanick Skill, as ever discovered it self in any Design of this Nature.

The Description of this Engine is as follows.
See the Figure.

A denotes two Furnaces, whose Fire-places are *B*, 1; 2, and their Funnel or Chimney *C*.

In these two Furnaces are placed two Vessels of Copper, which he calls *Boylers*, the one a larger, as *L*, the other a smaller, as *D*.

These *Boylers* have each a *Gage Pipe*, as *G* and *N*, of which *G* goes within eight Inches of the Bottom, but *N* reaches only half way down the great *Boyle*.

By these Pipes, before the *Engine* can work, you must first fill the small *Boyle* quite full, and the great *Boyle* two Thirds full of Water: Then light the Fire at *B* 1, and make the Water in *L* boil, by which Means the Steam of it being quite confined, must needs be wonderfully compressed, and therefore will, on the opening of a Way for it to issue out (which is done by turning *Z* the Handle of the Regulator from you) rush with a great Force thro' the *Steam Pipe* *O*, 1, into the Receiver *P* 1, driving all the Air before it, and forcing it up into the Force-Pipe through the Clack *R*, 1, as you will perceive by the Noise and Ratling of the Clack. And when all the Air is thus driven out, the Receiver *P*, 1, will be very much heated by the Steam: When you find that it is thoroughly emptied, and is grown very hot, as you may both see and feel, then pull the Handle of the Regulator towards you, by which Means you will stop the *Steam-Pipe* *O*, 1, so that no more Steam can yet come into it, but you will open it a Way into *O*, 2, and by that Means fill the Receiver *P*, 2, with the Steam, as the other was before. While this is doing, let some cold Water be poured on the Receiver *P*, 1, by which Means the Steam there being cooled, and condensed, and contracted into a very little Room, and consequently pressing but very little (if at all) on the Valve or Clack *R*, 1, at the Bottom of the Receiver, *P*, 1. There is nothing there to counterbalance the Pressure of the Atmosphere on the Surface of the Water in the lower Part of

the Sucking-Pipe *T*; wherefore it will be pressed up, and ascend into, and fill the Receiver *P*, 1, driving up before it, as it rises, the Clack or Valve *R*, 2, which afterwards falling down again and shutting close, hinders the Descent of the Water that Way.

Then (the Receiver *P*, 2, being in the mean time emptied of its Air) turn the Handle of the Regulator from you, and the Force of the Steam coming from the *Boyle*, will be all upon the Surface of the Water contained in the Receiver *P*, 1, where it gravitates or presses hard upon it, and still increases its Spring or Elasticity till it comes to over-balance, or exceed the Weight of the Water in the Receiver, which then it will necessarily drive up through the Passage *Q*, *R*, 1, *Q*, *Q*, into the Force-pipe *S*, and at last discharge it out at the Top, as you see in the Figure.

After the very same Manner, tho' alternately, is the Receiver *P*, 2, filled with and emptied of Water; and by this Means a constant Steam is kept continually running out at the Top of the Force-pipe *S*, and so the Water is raised very easily from the Bottom of the Mine, &c. to the Place where it is designed to be discharged.

Only I should add, That after the *Engine* begins to work, and the Water is risen into and hath filled the Force-Pipe *S*, then it fills the little Cistern *X*, and by that Means feeds the Pipe *Y*, which he calls the *Condensing-Pipe*, because Water is conveyed down from thence to cool the Receivers when thoroughly heated by the Steam, in order to make them *Suck* (as 'tis usually called) the Water out of the Well up into the Receiver.

Also a little above that Cistern goes the Pipe *E*, which conveys Water from the Force-pipe into *D* the lesser *Boyle*, which is there placed to replenish the greater *Boyle* *L* when the Water in it begins to be almost consumed. Now when there is need of doing this, turn the Cock *E* so, that there can be no Communication between the Force-pipe *S*, and the lesser *Boyle* *D*; and putting in a little Fire at *B*, 2, the Water there will grow presently hot; and when it boils, its own Steam, which hath no vent out, pressing on its Surface, will force the Water up the Pipe *H*, through *K*, into the great *Boyle* *L*, and so long will it run till the Surface of the Water in the *Boyle* *D*, get to be as low as the Bottom of the Pipe *H*; and then the Steam and Water will run together, and by its Noise and rattling of the Clack *I*, will give him that works the *Engine* sufficient Assurance that *D* hath emptied and discharged it self into *L*, and carried in as much Water as is then necessary; after which, by turning the Cock *I* again, you may let new cold Water out of *S* into *D* the lesser *Boyle*, as before: And thus will there be a constant Motion, and a continual Supply of the *Engine* without fear of Decay or Disorder.

Also to know whether *L* want replenishing or not, you need only turn the Cock *N*, and if Water come out, there is no need to replenish; but if Steam only come, you may conclude there is: And the like will the Cock *G* do in reference to the lesser *Boyle* *D*, shewing when 'tis necessary to supply that with fresh Water from *S*; so that in working the *Engine* there is very little Skill or Labour required, it being only to be injured by either a stupid or wilful Neglect.

Of the Uses and Application of this *Engine*, the Reader will find a full Account in the Inventor's Book called the *Miner's Friend*.

ENGIZOMA, is a Blow upon the Skull, where- with the Bone descends to the inner Membrane of the Brain, and presses upon it. Also an Instrument in such like Cases. *Blanchard.*

ENGONASIS *Hercules*, the Name given by Astronomers to one of the Northern Constellations, containing about 48 Stars.

ENGONIOS, is the bending of the Arm or Leg.

ENGRAILED, a Term in Heraldry, when a Bordure, &c. is formed by a Line of this Shape;

and the little Arches turn outward from the Center of the Escutcheon; for if they turn the other way, 'tis called *inverted*.

ENGYSCOPE, the same with a *Microscope*, being an Instrument to view small Bodies distinctly; and 'tis so called, because it brings the Eye much nearer to these small Bodies, and consequently makes them appear to us to have larger Parts and Dimensions than they had before: See *Microscope*.

ENHARMONICAL, } a Term in Musick, u-
ENHARMONICK, } sually applied to the last of the three kinds of Musick, abounding in *Diesis*, which are the least sensible Division of a Tone: See *Diesis*.

ENIGMA, or *Riddle*, is an obscure Allegory, where the Natural Sense of the Words are not presently perceptible, being, in Appearance, frequently Contradictory.

ENIXUM-SAL, is the Chymical Term for what they otherwise call a *Neutral Salt*, which participates both of the Nature of an *Acid* and an *Alkali*; as *Common Salt*, *Nitre*, *Alum*, *Vitriol*, &c.

ENNEADECATERIDES, the same with the *Golden-Number*; which see; or the *Cycle of the Moon*.

ENNEAGON, is a Polygon of Nine equal Sides.

ENNEATICAL Days, signifies every ninth Day of a Sickness, which some will suppose doth bring some great Alteration in the Disease.

ENNEATICAL Years, are every ninth Year of ones Life, which, by some weak Men, are thought to bring a great Mutation of Fortune along with them.

ENNEEMIMERIS, is one kind of the *Cesura* of a *Latin Verse*, where, after the fourth Foot, there is an odd Syllable ending a Word, which helps to make the next Foot with the following Word; as in this Instance,

Ille latus Niveum Mollis fultus Hyacintho.

Where all the four kinds of the *Cesura* occur.

ENORTHROSIS: See *Diarthrosis*.

ENQUEST, is taken for an Inquisition by a Jury, which is the most usual Trial in all Causes both Civil and Criminal within this Realm; for in Causes Civil, after Proof is made on either Side of so much as each Party thinketh good for himself; if the Doubt be in the Fact, it is refer'd to the Discretion of twelve indifferent Men, empanell'd by the Sheriff for that Purpose; and as they bring in their Verdict, so Judgment passeth; for the Judge saith, The Jury findeth the Fact thus, and the Law is thus. For the *Enquest* in Criminal Causes, see *Fury*.

ENS, or *Being*, is whatever hath any kind of Being or Existence; for that which hath no Existence nor Essence, is really nothing at all. This the Schools, (who make a great Variety of Beings) call *Ens Reale*, and *Ens Positivum*, to distinguish it from their *Ens Rationis*, which is only an imaginary thing, a Creature of the Brain, and exists nowhere but in the Understanding.

ENS PRIMUM, according to the Cant of *Paracelsus*, is the most Efficacious Part of any natural mixt Body, Vegetable, Animal, or Mineral, which he pretends to have been able to separate from them, and with it to effect prodigious things towards the Renovation and Restoration of Youth: And though he delivers his Processes so obscurely, as to encourage no Body to try them; yet Mr. Boyle gives us a Process of Mr. L. F. Chymist to the French King, whereby the *Ens Primum*, or Essence of any Vegetable, may easily be obtained, as he had tried himself, and is as follows.

Gather, at a convenient Season of the Year, and Time of the Day, *Balm*, for Instance, or some other fitting Herb (for all Plants cannot this way be turned into Water) beat it to a soft Mass or Pulp in a Marble Mortar, and then putting it into a Bolt-head hermetically sealed, digest it for 40 Days in a Dughil, or some Analogous Heat: After this take out the Matter, which will now be much more liquid than before, and separating from it the Dregs or grosser Parts, digest it anew in a gentle Bath, that the remaining grosser Parts also may subside; filtrate it, and then add to it the fix'd Salt drawn from the former Dregs dried and calcined. To this prepared Liquor add equal Parts of the Liquor of good Sea Salt, well purified, melted, and then let it run *per Deliquium*. Seal up then the Mixture in a Bolt-head, and let it be exposed to the Sun for six Weeks longer; at the End of which Term there will swim upon the Liquor the *Ens Primum* of the Plant in a liquid transparent Form, sometimes of a Green, and sometimes of a Reddish Colour, according to the Nature of the Plant thus managed.

Mr. Boyle says, That Mr. L. F. assured him once in the presence of another Virtuoso, to whom he appealed for the Truth of the Fact, as having been made acquainted with the Operation, That a special Friend of his thus drawing the Essence of Balm, tried it upon himself for about a Fortnight, taking it according to *Paracelsus* his Description; before the End of which Time the Nails of his Hands and Feet came off without pain, being succeeded by a Set of new ones; and convinced him so far of the Efficacy of it, that he having no need of any such help, left off taking it; and tried it no farther; but that giving it to an old Woman of 70 Years of Age, who served in the House, it produced the *Menses* again, and that so copiously, as wonderfully to startle the old Woman.

Nay, he told Mr. Boyle farther, on his enquiring why he did not try it on Beasts, That he gave of it, tho' but in a little quantity, as having not much of it left, to an old Hen, who on the sixth Day began to moult her Feathers till she grew stark naked; but before a Fortnight was passed, received others in their room, which were fairer and better coloured than the former Feathers.

This is an odd Relation, but however 'tis easy to make Trial of Matter of Fact; and I wonder no one hath attempted all this while to prosecute a thing which is so easy to effect, and whose Success would reward sufficiently the Explorer's Pains and Time, if it will do.

ENS Veneris, is a Sublimation of equal Parts of the Powder of *Cyprus Vitriol*, calcined till 'tis of a dark Colour, and of Salt-Armoniack into the Form of a Yellow Flower; and they are so called from some Particles of Copper which they have carried away from the Vitriol: The Chymists calling Copper *Venus*.

Mr. Boyle commends them as an admirable Medicine in the Rickets, obstinate Cachexies, Loss of Appetite, and all Obstructions. Their Dose is from six Grains to a Scruple.

ENS CONCED: See *Inconced*.

ENSIFORMIS Cartilago, or *Mucronata*, is the lowest Part of the *Sternum*, or the Breast Bone; and because of its pointed triangular Shape, 'tis called *Mucronata* and *Ensiformis*: 'Tis about an Inch long, and on the Out-side of it there is formed a Cavity in the Breast called *Scrobiculus Cordis*, or the Heart-Pit; and a gnawing Pain which is sometimes felt here, is called *Cardialgia*, the Heart-burn: But this Pain proceeds not from the Heart, but from the upper Orifice of the Stomach, which lies under this Cartilage, and hath the Name of *Cardia*, because of its great Consent with the Heart, as some fancied formerly.

ENTABLATURE, or *Entablement*, a Term in Architecture, signifying the *Architrave*, *Frise*, and *Cornice* of a *Pillar*, being, in effect, the Extremity of the Flooring, which is either supported by Pillars, or by a Wall, if there are not Columns.

ENTAYLE, in common Law, signifies *Fee-tail*, or *Fee-intailed*, or *Abrided*.

ENTELECHIA, a Greek Word used by *Aristotle* to express the Human Mind: They tell us, that *Hermolaus Barbarus* went to the Devil to know the Meaning of it; and either the Devil for him, or his own great Understanding, renders it *Perfecti-babia*; by which his Readers are much the wiser.

The Ancient Commentators on *Aristotle* interpret it by the Word *Actus*, and mean by it a kind of *Substantial Form*, by which Action is produced in the Body.

The Modern Peripateticks come nearer to what perhaps was *Aristotle's* Meaning: for they make a kind of Motion and happy Modification of Matter qualifying the Whole, to be able to perform such Acts as are proper to it: And thus *Cicero* in his *Tuscul. Quest.* renders *Entelechia*, *quadam quasi Continuada & perennis Motio*.

ENTERENCHITA, is a Clyster-Pipe, which is also called *Siphon* and *Syringa*.

ENTEROCELE, or *Hernia Intestinalis*, is the fall of the *Intestines*, especially of the *Ilium*, thro' the Processes of the *Peritoneum*, dilated into the Groins, or outward Skin that covers the *Scrotum*. *Blanchard*.

ENTEROEPIPOCELE, a sort of Rupture, in which the Guts and Caul fall down into the *Scrotum* together. *Blanchard*.

ENTEROMPHALUS, or *Hernia Umbilicalis*, a Rupture of the Navel, or the Bunching out of the Guts at the Navel, which is common with Teeming Women.

ENTERPLEDER, in Common Law, signifies as much as *Cognitio prejudicialis* in the Civil; that is, the discussing of a Point incidentally falling out before the principal Cause can take end. For Example, Two several Persons being found Heirs to Land, by two several Offices in one County, the King is brought in doubt to which of them Livery ought to be made, and therefore first they must in-

terplead; that is, formally try between themselves who is the right Heir.

ENTHYMEME, is a Syllogism perfect in the Mind, but imperfect in the Expression; because some one of the Propositions is suppressed, as being too clear and common, and easily supplied by the Understanding of those with whom we discourse: As, *Every Right-lined Triangle hath all its three Angles just equal to two Right ones; therefore it will be so in an Isosceles*; where the Proposition, that an *Isosceles* is a *Right-lined Triangle*, is omitted, as being sufficiently known, and therefore it would have been impertinent to have inserted it.

ENTIRE Tenancy, is contrary to *Several Tenancy*, signifying the sole Possession in one Man, whereas the other signifieth Joint or Common in more.

ENTOYRE, the Term in Heraldry to Blazon a Bordon when it is charged with things without Life, such as *Bezants*, *Plates*, &c.

ENTRING-LADDER, in a Ship, is of two Sorts; one is used by the Ship's Sides in a Harbour, or in fair Weather, for Persons to go in and out of the Ship; the other is made of Ropes with small Staves for Steps, and is hung out of the Gallery to enter into the Boat, or to come Aboard the Ship from thence, when the Sea runs so high, that they dare not bring the Boat to the Ship's Side for fear of *Staving* of her.

ENTRUSION, in Law, signifies a violent or unlawful Entrance into Lands or Tenements, being utterly void of a Possessor, by him that hath no Right unto them.

ENTRUSION de gard, is a Writ that lies where the Infant within Age, entered into his Lands, and held his Lord out; for in this Case the Lord shall not have the Writ *de communi Custodia*, but this.

ENTRY, a Term in Law, signifies properly the taking Possession of Lands or Tenements: 'Tis used also for a Writ of Possession.

And in the Plea of Entry there be three Degrees.

First, Where a Man demandeth Lands or Tenements of his own Seisin, after the Term is expired.

The Second is, Where one demandeth Land or Tenements, lett by another after the Term is expired.

The Third, Where one demandeth Lands or Tenements of that Tenant that had Entry by one to whom some Ancestor of the Plaintiff did lett for a Term now expired; according to which Degrees, the Writs for more fit Remedy are varied.

A Writ of Entry differeth from an *Assise*, because it lieth for the most part against him who entered lawfully, but holdeth against Law; whereas an *Assise* lieth against him that unlawfully disseised: Yet sometimes a Writ of Entry lieth upon an Intrusion.

There are Five Things which put the Writ of Entry out of the Degrees, viz. *Intrusion*, *Succession*, *Disseisin* upon *Disseisin*, *Judgement*, and *Escheat*.

1. *Intrusion*, is when the Disseisor dies seized, and a Stranger abates.

2. *Succession*, is when the Disseisor is a Man of Religion, and dies, or is disposed, and his Successor Enters.

3. *Disseisin upon Disseisin*, is when the Disseisor is disseised by another.

4. *Judgement*, is when one recovers against the Disseisor.

5. *Eſcheat*, is when the Diſſeiſor dies without Heir, or doth Felony, whereby he is Attaint, by which the Lord *Enters*, as in his *Eſcheat*.

ENTRY *ad Communem Legem*, is a Writ which lies where Tenants for Term of Life, Tenant for Term of another's Life, Tenant by the Courtſey, or Tenant in Dower, aliens and dies, he in the Reverſion ſhall have this Writ againſt whomſoever is in.

ENTRY *ad terminum qui prateriit*, lies where a Man Leases Land to another for Term of Years, and the Tenant holds over his Term, the Leſſor ſhall have this Writ.

ENTRY *cauſa Matrimonij prelocuti*, is a Writ which lies where Lands or Tenements are given to a Man upon Condition, That he ſhall take the Donor to his Wife within a certain Time, and he eſpouſes another, or otherwiſe diſables himſelf that he cannot take her according to the ſaid Condition; then the Donor and her Heirs ſhall have the ſaid Writ againſt him, or againſt whoever elſe is in the ſaid Lands.

ENTRY *in caſu Proviſo*, lies if Tenant in Dower aliens in Fee, or for Term of Life, or for another's Life living the Tenant in Dower, he in the Reverſion ſhall have this Writ.

ENTRY *in caſu conſimili*, is a Writ that lies where Tenant for Life, or Tenant by the Courtſey aliens in Fee, he in the Reverſion ſhall have this Writ.

ENTRY *ſine aſſenſu Capituli*, lies where an Abbot, Prior, or ſuch as has Convent or Common Seal, aliens Lands or Tenements of the Right of the Church, without the Aſſent of the Convent or Chapter, and dies, then the Succeſſor ſhall have this Writ.

ENVELOPE, in Fortification, is a Mount of Earth, ſometimes raiſed in the Ditch of a Place, and ſometimes beyond it, being either in form of a ſimple *Parapet*, or of a ſmall *Rampart* bordered with a *Parapet*. Thoſe *Envelopes* are made when one would only cover the weak Places with ſingle Lines, without any Deſign of advancing toward the Field, which cannot be done but by Works that require a great deal of Breadth; ſuch as *Horn-works*, *Half-Moons*, &c.

Theſe *Envelopes* are ſometimes called *Sillons*, *Contergards*, *Conſerves*, *Lunettes*, &c.

ENUNCIATION, with the Logicians, is the ſame as a Propoſition.

ENURNY, the Herald's Term for a *Bordure* of a Coat of Arms being charged with any kind of Beaſts.

ENVY, is by ſome well enough defined to be an Uneaſineſs of the Mind, cauſed by the Conſideration of a Good we deſire, obtained by one we think ſhould not have had it before us.

EPACMASTICA, is a Fever that commonly grows ſtronger. *Blanchard*.

EPACT, is uſed for a Number, whereby we note the Exceſs of the common *Solar Year* above the *Lunar*, and thereby may find out the Age of the Moon every Year: For the *Solar Year* conſiſting of 365 Days, the *Lunar* but of 354, the *Lunations* every Year get 11 Days before the *Solar Year*; but thereby in 19 Years the Moon compleats 20 times 12 *Lunations*, or gets up one whole *Solar Year*; and having finiſhed that Circuit, begins again with the *Sun*; and ſo from 19 Years to 19 Years: For the ſirſt Year afterwards, the Moon will go before the *Sun* but a 11 Days; the ſecond Year 22 Days, which is called the *Epaet* of that Year; the third Year 33 Days; but 30 being an entire *Lunation*, caſt that a

way, and 3 ſhall be that Year's *Epaet*, the next Year 14; and ſo on, adding Yearly 11 Days, and caſting away 30, when the Number amounts to more.

To find the *Epaet*, having the Prime or Golden Number given, you have this

R U L E.

Divide by 3, for each one left add Ten.
30 reject; the Prime makes *Epaet* then.

Example.

Anno 1701, Golden Number 11, divided by 3, leaves 2; therefore 10 times 2, which is 20, added to 11, makes 31, from which take 30, the Remainder is 1, the *Epaet* for the Year 1701.

EPANORTHOSIS, is a Greek Word, the ſame with *Correctio* or *Emendatio* in Latin; and ſignifies a Pathetical Form of Speech, in which the firſt Expreſſion appearing too weak, the Speaker ſtill endeavours to correct or mend it, by uſing ſtronger ways of ſpeaking.

EPAPHALESIS, is an irritated or repeated *Phlebotomy*. *Blanchard*.

EPAR: See *Hepar*.

EPARMATA, are Tumours of the Glandules, called *Parotes*, behind the Ears. *Blanchard*.

EPAULE, in Fortification, is the Shoulder of the Baſtion, or the Angle of the *Face* and *Flank*; whence that Angle is often called the Angle of the *Epaule*.

EPAULEMENT, in Fortification, is a *Side-work* made either of Earth thrown up, of Bags of Earth, Gabions, or of Faſcines and Earth, of which latter make the *Epaulements* of the Places of Arms for the Cavalry behind the Trenches are. Sometimes the Word

EPAULMENT is uſed for a *Demi-Baſtion*; and ſometimes it ſignifies a *Square Orillon*, which is a Maſs of Earth almoſt Square, faced and lined with a Wall, and deſigned to cover the Cannon of a *Cazemate*.

EPENTHESIS, in Grammar, is the Addition of a Vowel or Conſonant in the Middle of a Word; but if it be prefix'd, 'tis called *Prothefis*, if added at the End *Paragoge*.

EPELÆUM, is the Place from the *Hypogaſtrium*, or Part of the Abdomen, to the Secret Parts. *Blanchard*.

EPHELIS, or *Ephellides*, is *Freckles* in the Face, Neck, or Hands, &c.

EPHELCIS, is that bloody Subſtance which is brought up in ſpitting of Blood: Alſo a Shell or Cruſt that is brought over Ulcers. *Blanchard*.

EPHEMERA, or *Diaria*, is a continued Fever which laſts but a Day; if it laſts above a Day, it is called *Synochus Simplex*. *Blanchard*.

EPHEMERIS, thoſe Books or Journals which contain the Daily Motions of the Planets, and other Circumſtances relating thereto, for every Day in the Year, are called an *Ephemeris*, or *Ephemerides*.

EPHIALTES, or *Incubus*, the *Night-Mare*, is a depraved Imagination, whereby People aſleep fancy that their Wind-pipe is oppreſſ'd by ſome ſuperincumbent Body; and that their Breath is ſtopp'd: This ſeems to proceed from Compreſſion of the *Cerebellum*, when the Ventracles are too full of Moisture; for if thoſe who are thus affected lie upon their Backs, then the whole Bulk of the Brain lies upon

upon the *Cerebellum*; whereupon all the Pores and Passages being stop'd by so much Weight, the Spirits are hindred from influencing the Nerves called *Per vagum*, and the *Intercoſtal Nerves*; which being thus deſtitute of Spirits, the Lungs are oppreſſed and ſtag, and cannot perform their Office. *Blanchard.*

EPIDROSIS, is Sweating.

EPHIMERIS, or *Ephimerides*, is a Diary or Daily Register of the Motions and Places of the Heavenly Bodies, eſpecially ſhewing their Place at Noon: The ſame with *Ephemeris*.

EPHIPTIUM, or *Sella Equina*, or *Turſuca*, is Part of the Bone *Sphenoides*, wherein the *Pituitary Gland* is placed.

EPIALA, a kind of continual Fever, wherein both Heat and Cold is felt at the ſame time. *Blanchard.*

EPICARPIUM, is a Medicine applied outwardly like a Plaiſter or a *Cataplaſm*; applied to the Puſle or Wriſt of the Hand to drive away intermitting Fevers.

EPICAUMA, is a cruſty Ulcer that ſometimes happens to the Black of the Eye.

EPICERASTICA, are Medicines which obtund and temperate ſharp Humours.

EPICHEIRESIS, the ſame with *Encheireſis*.

EPICHEREMA, is a kind of Complex Argumentation conſiſting of many Propoſitions depending one upon another, whereby at laſt ſome particular Point is made out: As when *Cicero*, in his Oration *pro Milone*, argues, That thoſe who lay in wait to deprive a Man of his Life, or of his Money, may, by the Law of Nature, of Nations, and by common Practice, be juſtly ſlain: And therefore, ſince it appears that *Clodius* did by ſeveral Acts prove himſelf to be in ſuch a Deſign, 'twas lawful for *Milo* to kill him. 'Tis a kind of *Sortes*, which ſee.

EPICRASIS, is a gradual Evacuation of ill Humours in the Blood.

EPICUREAN Philoſophy, was the Natural Philoſophy firſt taught by *Epicurus* and *Democritus*, and afterwards delivered in Verſe by *Lucretius*: It is much the ſame with the preſent Mechanical Philoſophy, which ſee.

EPICYCLE, a little Circle whoſe Center is in the Circumference of a greater; or a ſmall Orb, which being fixed in the Deferent of a Planet, is carried along with its Motion, and yet with its own peculiar Motion, carries the Body of the Planet faſtened to it round about its proper Center, which Ancient Aſtronomers attribute to all the Planets, for ſolving their Appearances, except the Sun.

EPICYEMA, is a Superſtation.

EPIDEMICK Diſeaſe, is one proceeding from a common Cauſe, ſpreading it ſelf over divers Countries at divers times; ſuch are the Plague, Malignant Fevers, &c.

EPIDERMIS: See *Cuticula*.

EPIDIDYMIS, or *Epididymida*, or *Pariſtata*, in Latin *Supergeminalis*; it is a winding Veſſel, making a Figure like the Winding of crooked Veins that are ſwolln with ill Blood, and is affixed to the Back of the Teſticles: Its greater Globe is annexed to the Teſticles, conſiſting of one Veſſel or Paſſage above five Ells long: The leſſer Globe is connected to the Veſſel that carries the Seed. *Blanchard.* See *Teſtes*.

EPIGASTRICK Artery, is ſaid by ſome to be a Branch of the *Black Artery*; and diſtributes it ſelf amongſt the Muſcles of the *Epigaſtrius*.

EPIGASTRIUM, is the Fore-part of the *Abdomen* or *lowermoſt Belly*, whoſe upper Part is called *Hypochondrium*, the middle Part *Umbilicalis*, and the lowermoſt *Epigaſtrium*.

EPIGLOTTIS; is the fifth Cartilage of the *Larynx*, the Cover of the Opening of the Wind-pipe: It is alſo called *Sublinguim*: See *Cion*.

EPIGONATIS, is the Whirl-bone of the Knee:

EPILEPSY, or *Morbus Caducus*, is the Falling-Sickneſs, becauſe that the Perſons affected fall down on a ſudden; or *Herculeus*, becauſe it is hard to be cured; alſo *Laes Deifica*, *Sonticus*, *Comitalis*, *Sacer*, &c.

EPINYCTIDES, are Pimples that ſend forth Matter, and are painful, eſpecially in the Night. *Blanchard.*

EPIPAROXYSMUS, is when a Patient endures more Fits in a Fever than uſual, which happens in inordinate Converſe. *Blanchard.*

EPIPEOMETRY, in Mathematicks, ſignifies the meaſuring of Figures that ſtand on the ſame Baſe.

EPIPHONEMA, is an *Exclamation* containing ſome Sentence, or great Senſe, placed at the End of a Diſcourſe; being a preſſing and lively Reflection upon the Subject whereof we ſpeak.

EPIPHORA, in general, ſignifies a Deſluxion of Humours into any part; but is more eſpecially applied to denote the Deſluxion of a thin Rheum from the Eyes, which is commonly called involuntary Weeping, and flows continually from the Corners of the Eyes.

EPIPHYSIS, *Appendix*, *Adnaſcentia*, *Addamentum*, ſignify one Bone that grows to another by ſimple and immediate Contiguity, though not with ſo even a Surface, but with ſome kind of Ingreſs of one Bone into the Cavity of the other, like that Coarticulation wherewith the Bones form the Joints, but without any Motion. *Blanchard.*

EPIHYLLOSPERMIOUS Plants, are the ſame with the *Capillaries*, which bear their Seed on the Back-part of their Leaves: See *Capillaries*.

EPIPLASMA, the ſame with *Cataplaſma*.

EPILOCELE: See *Enteroccephalocela*.

EPILOIS dextra, a Branch of the *Celiac Artery*, which runs through the Right Side of the inner or hinder Leaf of the Caul, and the *Colon* that is next to it.

EPILOIS poſtica, is a Branch of the *Celiac Artery*, ſpringing out of the lower end of the *Splenica*, and running to the hinder Leaf of the *Omentum*, and the *Colon* annexed to it.

EPILOIS ſiniſtra, is a Branch of the *Celiac Artery*, and is beſtowed on the Lower and Left Side of the *Omentum*.

EPILOMPHALUM, is a Navel Rupture, when it jets out by reaſon of the Inteſtines or Caul bearing too hard upon it.

EPILOON, *Omentum*, or *Reticula*, the Caul, is a Cover ſpread over the Inteſtines, ariſing from the bottom of the little Ventricle, and the Back of the Gut *Colon*; to wit, from the Doubling of the *Peritoneum*: It is ſhaped like a Net, or a Fowler's Bag; and abounds with ſeveral Sanguinary Veſſels. Its Uſe is to cheriſh the Stomach and the Guts with its Fat. *Blanchard.*

EPI SARCIDIUM, the ſame with *Anaſcara*.

EPISEMASIA, is the very Time that a Diſeaſe firſt ſeizes a Perſon; and is properly called *Significatio*. *Blanchard.*

EPIſION, is the Place of the Secret Parts, or *Aqualculus*. *Blanchard.*

EPIſPASTICKS, the ſame with *Attrahentia*, or Bliſters.

EPIſPHERIA, are Windings and Turnings in the outer Subſtance of the Brain, that the Sanguiferous Veſſels may paſs more ſecurely. *Blanchard.*

EPIſTO-

EPISTOMIA, are the utmost Gapings and Meetings of Vessels.

EPISTROPHEUS, or *Cardo*, is the second Vertebra of the Neck; so called from turning, because the Head turns upon it. *Blanchard.*

EPISTYLE, in Architecture, is a Mass of Stone, or Piece of Timber laid upon the Capital of a Pillar.

The Ancient *Grecians* frequently made use of this Word, to signify that which we call the *Architrave*.

'Tis the first Member of the *Entablature*, and is usually broken into two or three Divisions, which the Architects call *Fascia*, Swathes, Fillets, Bands, or Lifts.

EPITHEME, is a Medicine of a Liquid Form, externally to be applied to some particular Part.

EPITRITUS, a Foot of a Latin Verse consisting of four Syllables; of which the *Grammarians* reckon four kinds.

The First is compounded of an *Iambus* and a *Spondeus*, as *Salutantes*, where the first Syllable is short, and all the rest long.

The Second is made out of a *Trocheus* and a *Spondeus*; as *Cincitati*, where the first Syllable is long, the second short, and the two last long.

The Third is compounded of a *Spondeus*, and an *Iambus*; as *Communicans*, where the two first Syllables are long; the third short, and the last long.

The Fourth consists of a *Spondeus* and a *Trocheus*; as *Incantare*, where the three first Syllables are long, and the last short.

EITROPE, is a Figure in Rhetoric, whereby we freely grant a thing that might be deny'd, to obtain another that we desire.

EPNEUMATOSIS, the same with *Expiratio*.

EPOCHA, or *Epoche*, in Chronology, signifies some remarkable Occurrence, from whence some Nations date and measure their Computation of Time.

The *Julian Epocha* takes its Name from *Julius Caesar's* Reformation of the *Roman Calendar*; which was done 45 Years before Christ, in the 708 Year from the building of *Rome*, and in the 731 Olympiad.

The *Ethiopick Abyssyn*, or as some call it, the *Diocletian Epocha*; others the *Era* of the Martyrs, because it bore Date with a very severe Persecution: This *Epocha* began Aug. 29. A.D. 284. and in the first Year of the Emperor *Diocletian*. 'Tis used by the *Egyptians* and *Abyssynes*.

The *Turkish* or *Arabick Epocha*, which they call the *Hagira*, bears Date from *Mabomet's* Flight from *Mecca*, A.D. 622. July 16.

The *Persick* or *Jesdegerdick Epocha*, takes its Date either from the Coronation of the last *Persian* King *Jesdegerdis*, or *Jesdagerdis*; as some say; or from his being conquered rather by *Ottoman* the *Saracen*, which was June 16. A.D. 632.

EPOMIS, is the upper part of the Shoulder, called also *Acromion*.

EPOMPHALUM, is a Plaster, or any such thing, applied to the Protuberances of the Navel.

EPULIS, is an Excrescence in the Gums, which is so large, as sometimes to hinder the opening of the Mouth.

EPULETICK Medicines, are the same with *Cicatrizantia*.

EQUABLE Motions, are such as always continue the same Degree of Velocity, and are neither accelerated nor retarded; but if there be an Acceleration or Retardation of the Velocity of two or more

Bodies, and it be exactly and uniformly the same in them both or all, they say such Bodies are

EQUABLY Accelerated or retarded.

EQUALITY, is the exact Agreement of two things in respect of Quantity.

EQUANIMITY, is an even, equal, calm Frame of Mind and Temper under good or bad Fortune; whereby a Man appears to be neither Dispirited, Soured, nor rendred Uneasy by Adversity; nor puffed up, nor overjoy'd with Prosperity.

EQUATION, or the *Total Prosthapheresis*, in the Ptolemaick Theory of the Planets, is the Difference between the Planets *mean* and *true* Motion; or the Angle made by the Lines of the true and mean Motion of the Center: But the

EQUATION or *Physical Prosthapheresis*, is the Difference between the Motions of the Center of the *Epicycle* in the *Equant*, and in the *Eccentric*; as the

EQUATION, or *Optical Prosthapheresis*, is the Angle made by two Lines drawn from the Center of the *Epicycle* to the Centers of the World, and of the *Eccentric*.

EQUATION of the Orbit, is the same with the *Total Prosthapheresis*, or *Equation Total*.

EQUATION, in Algebra, is a mutual comparing of two equal things of different Denominations; as $3s. = 36d.$ $10 \text{ Crowns} = 2l. 10s. = 50s. = 600d. = 2400 \text{ Farthings}$, &c. $a = b + d$, $c + R$

$$36 = \frac{c}{2}, \text{ \&c.}$$

The *Terms of an Equation*, are the several Quantities or Parts of which any Equation is composed, connected together by the Signs + and —: As in this Equation $a = b + c$, the Terms are a , b , and c , where 'tis supposed, that some Quantity represented by a , is equal to the Sum of b and c , or to b and c added together.

Whenever any Question or Problem is proposed in Algebra, we always suppose the thing sought or required to be known or done; and then by putting the Letter a , or some other Vowel (most now use the last Letters of the Alphabet z, x, y) for the unknown Quantity, or for the Thing sought, and Consonants for whatever is known or given, in order to distinguish one from the other: The Question or Problem is first thoroughly considered, and then duly stated; and after this judiciously compared, transformed, and varied by Addition, Subtraction, Multiplication, Division, Extraction of Roots, &c. according as the Nature of the Thing and the Rules of Art direct: till at last the Quantity sought, or at least some Power of it, becomes equal to some known or given Quantity, and so is it self of consequence discovered.

After a Question is duly stated, 'tis proper to consider whether it be subject to any Limitations or not: To which end the Writers of Algebra give these general Rules.

1. If the Quantities sought or requir'd, are more than the number of the given Equations, the Question is capable of innumerable Answers: See *Kersey's Algebra*, p. 30r. Vol. I.

2. But if the given Equations, independent one upon another, are just as many as the Quantities sought, then the Question hath only one certain and determinable number of Answers.

3. If the Quantities sought or required, are less in number than the given Equations, the Question is yet more limited, and is sometimes discoverable to be impossible to be resolved, by reason of such Equations being inconsistent with each other.

EQU

The Natural Day is measured not only by one entire Conversion of the *Equinoctial* or 24 *Equinoctial* Hours, (which is indeed taken to be performed in equal Times) but increases by so much, as answers to that Part of the *Sun's* (or *Earth's* Annual Motion) as is performed in that Time. For when that Part of the *Equinoctial*, which (with the Sun) was at the Meridian Yesterday at Noon, is come thither again to Day: It is not yet Noon, (because

(because the Sun is not now at the Place where Yesterday he was, but is gone forward about one Degree more or less) but we must stay till that Place where the Sun now is, comes to the Meridian, before it be now Noon.

This Additament (above the 24 *Equinoctial Hours*, or entire Conversion of the *Equinoctial*) is upon a double Account unequal.

First, Because the Sun, by reason of its *Apogæum* and *Perigæum*, doth not at all Times of the Year, dispatch in one Day an equal Arch of the *Ecliptick*; but greater Arches near the *Perigæum*, which is about the Middle of *December*; and lesser near the *Apogæum*, which is about the Middle of *June*; as will appear sufficiently by the *Tables* of the Sun's Annual Motion.

Secondly, Though the Sun should in the *Ecliptick* move always at the same rate, yet equal Arches of the *Ecliptick*, do not in all Parts of the *Zodiack* answer to equal Arches of the *Equinoctial*, by which we are to estimate Time; because some Parts of it, as the two Solstitial Points, lie nearer to a parallel Position to the *Equinoctial* than others; as these a-

bout the two *Equinoctial* Points, where the *Ecliptick* and *Equinoctial* do intersect: Whereupon an Arch of the *Ecliptick* near the Solstitial Points, answers to a greater Arch of the *Equinoctial*, than an Arch equal thereto near the *Equinoctial* Points; as doth sufficiently appear by the Table of the Sun's Right Ascension.

If you imagine another Sun to move in the Heavens in an equal Motion, not in the *Ecliptick*, but in the *Equinoctial*; the Difference between their coming to the Meridian every Day (or to any one and the same Hour-circle) will be the *Equation of Time*. And because the true Sun, and that Point of the Equator where his right Ascension ends, come always to the Meridian together, the *Equation of Time* may be defined to be that Space of Time which is passed over, while an Arch of the Equator, comprehended between the extreme Point of the true Sun's Ascension, and the Place of the feigned Sun, passes over the Meridian: And if this Arch be turned into Time, it gives the true *Equation of Time*.
Dr. Greg. Astron.

Mr. Flamsteed's Tables of Equation of Natural Days.

Leap-Year.

EQUATOR : See *Equinoctial*.

EQUICRURAL : See *Isofoles*.

EQUICULUS, or *Equus minor*, a Constellation in the Northern Hemisphere, consisting of 4 Stars.

EQUILATERAL Triangle : See *Triangle*.

EQUILIBRIUM, in Mechanics, is when the two Ends of a Balance hang fo exactly even and level, that neither doth ascend or descend, but do both keep in a Position parallel to the Horizon ; which is occasioned by their being both charged with an equal Weight.

EQUIMULTIPLES, are Numbers or Quantities multiplied by one and the same Number or Quantity : See *Proposition*, No. 13.

EQUINOCTIAL, (in the Heavens) or Equator on the Earth, is a great Circle, whose Poles are the Poles of the World. It divides the Globe into two equal Parts ; that is, the Northern and Southern Hemispheres. It passes through the East and West Points of the Horizon ; and at the Meridian is raised as much above the Horizon, as is the Complement of the Latitude of the Place.

Whenever the Sun cometh to this Circle, it maketh equal Days and Nights all round the Globe, because he then always rises due East, and sets due West, which he doth at no other time of the Year, whence it hath its Name. All Stars also which are under this Circle, or which have no Declination, do always rise due East, and set full West, &c.

All People living under this Circle, (which, in Geography, is called the Line) have their Days and

Nights equal : At Noon the Sun is in their Zenith, or directly over their Heads, and casts no Shadow.

From this Circle (on the Globes) is the Declination or Latitude accounted on the Meridian.

And the Circles which run through each Degree of Latitude or Declination, are called Parallels of Latitude or Declination.

Through this Equinoctial all the Hour-Circles are drawn at Right Angles to it, and through the Poles of the World, at every 15th Degree, on the Celestial Globe.

And the Equator on the Terrestrial Globe is divided by the Meridians into 36 equal Parts.

The Natural Day is measured by the Revolution of the Equator, and is ended when the same Point of the Equator comes again to the same Meridian, which is in 24 Hours.

Wherefore since the Equator (as all great Circles are) is divided into 360 Degrees, each Hour must be $\frac{1}{24}$ of that Number, or 15 Degrees ; therefore 1 Degree of the Equator will contain 4 Minutes of an Hour ; and 15 Minutes of a Degree, will make a Minute of an Hour, or 60 Seconds ; and consequently 4 Seconds answer to one Minute of a Degree.

Hence the following Tables are made for converting Degrees and Minutes, &c. of the Equinoctial into Time, and *Vice versa*.

T A.

TABLE I.

To convert Parts of the Equinoctial into Time.

Degrees.	Hours.	1
Minutes.	1	2
Seconds	2	3
Thirds.	3	4
1	0	4
2	0	8
3	0	12
4	0	16
5	0	20
10	0	40
15	1	0
30	2	0
60	4	0
90	6	0
180	12	0
360	24	0

Whose Use is this :

Suppose you would readily know how many Hours, Minutes and Seconds, &c. there are in 19 Degrees, 13 Minutes, 7 Seconds of the Equator.

H. " "

Against 15 Degrees, in the first Table, you find	1	0	0	0
Against 4 Degrees	0	16	0	0
Also against 10 Minutes you will find	0	0	40	0
And against 3 Minutes	0	0	12	0
Then against 5 Seconds you will find	0	0	0	20
And against 2 Seconds you have	0	0	0	8
Add all up together, and it makes	1	16	52	28

TABLE II.

To convert Time into Parts of the Equinoctial.

Hours	Degr.	Minut.	Degr.	1
		Second	1	2
		Thirds	2	3
		Fourth	3	4
1	15	1	0	15
2	30	2	0	30
3	45	3	0	45
4	10	4	1	0
5	75	5	1	15
6	90	6	1	0
9	135	10	2	30
12	180	20	5	0
15	225	30	7	30
18	270	40	10	0
21	315	50	12	30
24	630	60	15	0

Again, for the Use of this Table.

Suppose you would find how many Degrees, Minutes, Seconds, &c. of the Equator, answer to 23 Hours, 25 Minutes, 17 Seconds, and 9 Thirds.

H. " "

Against 21 Hours, in the Table, you find	315	10	0	0
Against 2 Hours	30	0	0	0
Against 20 Minutes you have	5	9	0	0
And against 5 Minutes	1	15	0	0
Then against 10 Seconds you find	0	12	30	10
And against 5 Seconds	0	0	15	0
Against 2 Seconds	0	0	30	0
Then against 6 Thirds there is	0	0	1	30
And against 3 Thirds you have	0	0	0	45

All which added rightly together, make 351 19 17 15

EQUINOCTIAL Colure : See Colure.

EQUINOCTIAL Dial, is that whose Plane lies parallel to the Equinoctial.

To make this Dial, is no more than with 60 Degrees of your Line of Chords to describe a Circle, wherein draw two Diameters crossing each other at Right-Angles; then divide this Circle into 24 equal Parts or Hours, which subdivide as you please.

Note, That every Hour is 15 Degrees, therefore the Half-hour will be 7 Degrees, 30 Minutes, and the Quarter 3 Degrees, 45 Minutes.

That being done, set up a straight Pin perpendicular to the Plane in the Center of the Circle, and place the Plane parallel to the Equinoctial, and the Meridian Line true North and South, and the Dial is fitted.

These Dials are commonly set up in a Frame to be elevated to any Latitude.

EQUINOCTIAL Orient : See *Orient*.

EQUINOCTIAL Occident : See *Occident*.

EQUINOXES, are the precise Times in which the Sun enters into the first Point of *Aries* and *Libra* ; for then moving exactly under the *Equinoctial*, he makes our Days and Nights equal. This he doth twice a Year, about the 10th of *March*, and 12th of *September*; which therefore are called the *Vernal* and *Autumnal Equinoxes*.

It is found by Astronomical Observation, That the *Equinoctial Points* (which are the first Points of the Signs *Aries* and *Libra*) go backward every Year 50 Seconds.

And our admirable Sir *Isaac Newton*, taking the Matter into Consideration according to his Principles, found, by Calculation, That they must recede 49 Minutes, 58 Seconds, which is surprizingly near the Truth.

The Space from the *Vernal* to the *Autumnal Equinox*, is 8 or 9 Days longer than from the *Autumnal* to the *Vernal*, by reason of the Position of the *Perihelion* of the Earth's Orbit near the *Winter Solstice*.

EQUINUS Barbatus, a kind of Comet, called also *Equinus Ellipticus*, *Equinus Quadrangularis* : See *Hippus*.

EQUIPOLLENCE, in Logick, is when there is an *Equivalence* or Agreement, either as to the Nature of the Thing, or as to the Grammatical Sense of any two, or more Propositions; or in plain Words, when two Propositions signify one and the same thing, tho' they express it after different manners; they are properly said to be *Equipollent*.

EQUITY, is the Virtue of treating all other Men according to common Reason and Justice, or as we would be gladly treated our selves, when we understand rightly what is our due.

EQUITY, in the Law, usually signifies the *Court of Chancery*, where Controversies are supposed to be determined according to the exact Rules of *Equity* and Conscience, by mitigating the Rigor of the Common Law, tho' even by the Common and Statute Law there is also an *Equity*. *Aequitas sequitur Legem*, is an old Maxim in Law; but from the great Increase of Suits in *Chancery*, some have thought fit to give it this Construction, That in all Causes after a Man has been at Law, he must go in to *Equity*.

EQUIVALENCE in Things, is that which expresses an Agreement in Nature or Circumstances, between any two Things proposed.

EQUIVOCAL, in Logick, is that which hath a doubtful or double Signification.

Any Equivocal Word, is that which contains more Significations than one, or that which serves for several Notions : See *Homonymous*.

EQUIVOCAL Generation, is the Production of Plants without Seed: Insects or Animals without Parents in the Natural Way of Coition between Male and Female.

The Learned World begins now to be satisfied, that there is nothing like this in Nature; and since the Use of Microscopes, and a more particular Application to Enquiries of this Kind, a prodigious Number of Plants have been discovered to have *Seeds*; and of Animals (*Insects*) have been found to be produced Univocally, or in the ordinary way of

Generation, which before were thought to be Univocally produced. See *Vol. II*.

ERASED, the Herald's Word, expressing any thing violently torn off from its proper Place; and 'tis used in Contradistinction to *Couped*, which signifies a Thing clean cut off.

ERECT Declining Dials, are those whose Planes are not directly opposite to any of the four Cardinal Points, but Decline from the Meridian or Prime Vertical Circle.

For the drawing of the Hour-Lines on these Dials, there is given the Latitude of the Place, and the Declination of the Plane, in order to find,

First, The Height of the Style above the Plane.

Secondly, The Distance of the Substyle from the Meridian.

Thirdly, The Inclination of the Meridians, or Difference of the Meridians; which are all the Requisites necessary to be known before the Dial can be described.

1. To find the Style's Height above the Plane, say,

As the Radius is to the Co-sine of the Plane's Declination :

So is the Co-sine of the Elevation of the Pole, to the Sine of the Style's Height.

2. To find the Substyle's Distance from the Meridian, say,

As the Radius is to the Sine of the Plane's Declination :

So is the Co-Tangent of the Elevation of the Pole, to the Tangent of the Substyle's Distance.

3. To find the Inclination of the Meridians, say,

As the Radius is to the Co-Tangent of the Declination :

So is the Sign of Elevation of the Pole, to the Co-Tangent of the Inclination of the Meridians.

These being found; Then with a Line and Plumet, let fall a Perpendicular to the Horizon, and that shall be the Meridian or Hour Line of 12.

Then if your Plane decline $\left\{ \begin{array}{l} \text{Westward,} \\ \text{Eastward,} \end{array} \right\}$ place the Substyle's Distance (from the Line of Chords) to the $\left\{ \begin{array}{l} \text{Right} \\ \text{Left} \end{array} \right\}$ Hand of the Meridian.

Also having found the Inclination of the Meridians, find what Angle each Hour makes at the Pole with the Substyle, by subtracting 15 Degrees for each Hour that is between the Substyle and Meridian, as long as it can be done from the Inclination of the Meridians; and by adding 15 Degrees for the other Hours.

And with the Hour-Angles at the Pole, find the Hour-Arches by this Proportion.

As the Radius is to the Sine of the Style's Height :: So is the Tangent of the Hour-Angle : To the Tangent of the Hour-Arch.

Of these Hour-Angles and Hour-Arches frame a Table, as was shewed in making a Horizontal Dial.

Example.

A South Erect Dial, Declining Eastward 45 Degrees, 00 Minutes. Latitude 51 Degrees, 32 Minutes.

The Requisites may be found by the foregoing Canons, *vi. z*

The Height of the Style,	26	06
Substyle's Distance from the Meridian,	29	21
Inclination of Meridians,	51	57

Now, since the Inclination of Meridians is less than 60 Degrees, and greater than 45 Degrees, 'tis certain the Substyle must be between 8 and 9 of the Clock.

Then the Hour-Angles at the Pole are also found by subducting 15 Degrees from the Inclination of Meridians (supposed to be set against 12) the Remainder will be for the Hour 11; and from that Angle against 11, subtract 15 Degrees, the Remainder set against 10; and from that Remainder subduct 15 Degrees, the Residue set against 9; and that because 'tis less than 15 Degrees, take the Difference to 15 Degrees, which set against 8; then by continual Addition of 15 Degrees, you'll have the Numbers against the remaining Hours.

Lastly, Find the Hour-Arches according to the Canon given for that Purpose: *viz.* by the continual Addition of the Sine of the Style's Height, 26 Degrees, 6 Minutes to the Tangent of every Hour's Distance from the Substyle, and that will give new Tangents of the Hour-Arches, as in the following Table.

The East Decliner.				
Hours	Angles at Pole.		Hour Arches.	
	D.	M.	D.	M.
3	83		374	31
4	68		347	31
5	53		330	20
6	38		319	01
7	23		310	37
8	8		33	34
Substyle	Substyle		Substyle	
9	6	57	2	26
10	11	57	10	3
11	36	57	18	19
12	51	57	29	21
1	66	57	45	58
2	81	57	72	27

To describe the Dial.

First draw the Horizontal Line ACB; and at Right-angles to it the Meridian CO 12; then with 60 Degrees of your Line of Chords, from C describe the Semi-circle AOB; and set off 29 Degrees, 21 Minutes (the Distance of the Substyle from the Meridian) from O to N, on the West Side of the Meridian, because the Plane declines East. Set off also the several Hour Arches (as) to Degrees, 37 Minutes for 7 and 5 a Clock, 18 Degrees, 19 Minutes for 11 and 1 a Clock, &c. both ways from the Substyle on the Circle NRO; and draw Lines from the Center C through these several Points: So you'll have the true Hour Lines defined.

Then from your Chords, set off the Style's Height 26 Degrees, 6 Minutes from N to R; and a Right-line

line drawn through *R* from *C*, represents the Axis or Style, and your Dial is finished; as also three others, viz. a South Erect Dial, declining West as much; and a North Erect Dial, declining East and West as much, only placing the Numbers of the Hours and the Style representatively upon each Plane.

An Erect Declining Dial may be Geometrically made thus:

Having given the Elevation of the Pole, and Declination of the Plane;

First draw two Lines intersecting each other at Right-angles: From the Point of Intersection, suppose *b*, make the Angle *e b d* equal to Elevation of the Equator; make another *n b d* equal to the Declination of the Plane. Draw *d e* perpendicular to the Meridian; from any Point taken at pleasure, suppose *d*, make *b n = d e*; from *n* let fall a Perpendicular to the Meridian *n m*; let this Perpendicular *n m* be transferred, and set upon the former Perpendicular on the other Side of the Meridian equal to *d p*.

Let the Substyle be drawn through *b* and *p*; unto which, in the point *p*, draw a Perpendicular for the Contingent, as *p r*. Then from *b*, through *r*, draw the Style, whose Altitude above the Substyle shall be equal to the Angle *p b r*.

From *p* to the Style, let fall the Perpendicular *p s*; make *p o* on the Substyle equal to *p s*: From *o*, at any Distance, describe the Equinoctial Circle, which divide into 24 or 48 parts, beginning your Division in that part of the Circle, *W*, which is cut by the Ruler applied to *b* and *x*, which is the point of Intersection of the Contingent and the Meridian.

Make points in the Contingent, where 'tis cut by a Ruler applied to the Center *o*, and every Division; through which points, from the Center *b*, draw the Hour-Lines.

ERECT Declining Planes: See Dial Planes.

ERECT Direct Planes: See Dial Planes.

ERECT Direct East or West Dials: See Direct Erect East or West Dials.

ERECT Direct South or North Dials: See Prime Vertical.

ERECTORES Penis, by some called *Erigentes*, by others *Directores*, by *Spigelius*, *Collaterales Penis*; are a pair of Muscles arising Flethy from the outward Knob of the *Os Ilicium*, below the Beginning of the Cavernous Bodies of the *Penis*, in whose thick Membranes they are inserted; Their Use is to help to erect the *Penis*, which they do by pulling towards the *Ossa Pubis*, whereby its greatest Vein

is compressed, and the reffluent Blood denied its passage under those Bones, and therefore the *Penis* must swell.

ERICHTHONIUS: See *Auriga*.

ERIDANUS, or *Radus*, a Southern Constellation consisting of 28 Stars.

ERMENOIS, is when the Field is Or, and the Powdering is Sable.

ERMIN, in Heraldry, signifies a Coat where the Field is Argent, and the Powdering is Sable.

And on the contrary,

ERMINES, is when the Field is Sable, and the Powdering Argent.

ERODENTIA, are Medicines which grow and prey upon the Flesh with their Acute Particles. *Blanchard*.

ERPES: See *Herpes*.

ERRHINES, are Medicines designed to purge away pituitous Humours from the Head, without making the Patient sneeze, tho' to be taken up the Nose. They are either *Liquid*, *Soft*, or *Solid*.

The *Liquid* are made of the Juices of *Cephalick*, cleansing Herbs, extracted by Wine or other Liquors; to which Spirit of Wine is sometimes added; or of a Decoction of fit Simples, to which are added sometimes Juices, Honey, Syrup, and Powders too.

The *Soft* is made of Powders, with Honey, Oil, or Juices, boiled to a kind of Ointment.

The *Solid* is given either in form of a Powder, and that has place especially in Medicines which provoke Sneezing; or in form of a Pellet, and it is called *Nasale*, and is prepared of fit Powders mixed with viscid Extractions from Seeds, Gums, Roots, &c. with Wax, or with Turpentine. *Blanchard*.

ERRONES, or *Erratick*, or *Wandering Stars*; the same with the *Planets*.

ERROR, in Law, signifies a Fault in pleading, or in the Process; and thereupon the *Writ of Error* is brought to remedy this Oversight; which *Writ* is that which lieth to redress false judgments given in any Court of Record.

There is likewise a *Writ of Error* to reverse a Fine or Recoveries; and for redressing and preventing Errors in Fines and Recoveries: *Vide* the Statute 23 *Car. 1. C. 3.* for inrolling them; and *vide* 16th of *Car. 2. C. 4.*

ERYSIPELAS, is a Swelling of a bright yellowish Colour, inclining to Red (whence its Name is derived) possessing the Skin, and going no deeper, attended with a pricking Pain, but not beating; it hath a Sympomatick Fever accompanying it usually; it is apt to spread, and sometimes blisters the Skin: If the Skin be preffed with the Finger, it yieldeth, and the Redness vanishes for a time.

ERYSIPELATODES, is a Swelling like the former, tho' with easier Symptoms; and therefore may be taken for a Kind of *Bastard Erysipelas*; in it the Skin is of a more dark Colour.

ERYTHREMATA, are red Spots like Fleabites, commonly in Pestilential Fevers. *Blanchard*.

ERYTHROIDES, is the Red Membrane of the Testicles, the first of the proper Tunicks. *Blanchard*.

ESCALADE, or *Scalade*, is a furious Attack upon a Wall,

Wall, or a Rampart, carried on with Ladders to mount up upon it, without going on inform, breaking Ground, or carrying on of Works to secure the Men.

ESCARP: See *Scharp*.

ESCHAR, is a Crust, or hard Skin, Rind, or Shell brought over any Ulcer, or raised with a red hot Searing-Iron.

ESCHAROTIE, is a Searing-Iron, a small Pone, a Cautey, or the like, which burns the Skin and Flesh into a crusty Substance. *Blanchard*.

ESCHEAT, in Law, signifies any Lands or other Profits that fall to a Landlord within his Manor by way of Forfeiture, or the Death of his Tenant, dying without Heir General or Special, or leaving his Heir within Age, and Unmarried. *Mag. Charta, Chap. 31*.

ESCHEATOR, is an Officer who takes notice of the King's Escheats in the Country, and certifies them into the Exchequer.

ESCOCHEON of *Pretence*, is an Inesccheon, or little Esccheon, which a Man that hath married an Heiress, and hath Issue by her, may bear over his own Coat of Arms, and in it the Arms of his Wife; and the surviving Issue will bear both Coats Quarterly.

ESCOUADE, is usually the third part of the Company of Foot; 'tis so divided for mounting of Guards, and for the more convenient relieving one another: 'Tis equivalent to a *Brigade* of a Troop of Horse.

ESCUTCHEON (from *Scutum* a Shield) is the Coat or Field on which any Arms are born in Heraldry; 'tis usually of this Form: And in it the Heralds give divers Names to several Points or Places: Thus, the Point D, they call the *Dexter Chief*; C, is the *Middle Chief*; and S, the *Sinister Chief* Point; H, is called the *Honour Point*; and F, the *Fesse Point*; N, is called the *Nombril Point*; and d, the *Dexter Base*; B, the *Middle*; and s, the *Sinister Base-Point*.

the *Dexter Base*; B, the *Middle*; and s, the *Sinister Base-Point*.

ESPAULEMENT, the same with *Epaulement*, a Work in Fortification made on the Side of a Bastion, of either Earth thrown up, Gabions, Fascines, &c. And those Epaulements which are for the Places of Arms for the Cavalry behind the Trenches, are usually made only of Fascines and Earth. This Word signifies also sometimes a *Demi-Bastion*; and sometimes 'tis used for a Square Orillon, or a Square Mass of Earth, faced or lined with a Wall, designed to cover the Cannon of a *Cazemate*.

ESPAUL, or *Epaule*; (which see in Fortification, the same with the Shoulder of a Bastion, or the *Angle of the Shoulder*; which see.

ESPLEES, a Term in Law, signifying the full Profit that the Ground or Land yieldeth.

ESPLENADE, a Term in Fortification, the same with the Glacis of the Counterscarp originally; but now 'tis usually taken for the empty Space between the Glacis of a Cittadel, and the first Houses of the Town.

ESSENCE, is that which constitutes the peculiar Nature of any thing, and makes it be what it is. Thus the Essence of a Circle is, that its Radii, or Semi-diameters be all equal; the Essence of a Square is, that it have 4 Right-angles, and 4 equal Right-lined Sides.

ESSENCE also, in Chymistry, signifies the *Bal-*

samick part of any thing separated from the thicker Matter, so that whenever this is done by means of Extraction, the *Balsamick* part is called *Essence*, by way of Eminence; sometimes thickned Juices are called *Essences*: But 'tis better to call these by their own Name, to avoid Confusion. Some call Compounds of Oil and Sugar *Essences*; but it is an Abuse of the Word. *Blanchard*.

ESSENDI *quietum de Tolonia*, is a Writ that lieth for Citizens and Burgesies of any City or Town, that hath a Charter or Prescription, to exempt them from Toll through the whole Realm, if the same happen to be any where exacted of them.

ESSENTIAL *Properties*, are such as necessarily depend on the Nature and Essence of any thing. Thus 'tis the Essential Property of every Rectilineal Triangle, to have the Sum of its 3 Angles equal to 2 Right ones. And of every Rectangled Triangle to have the Square of the Hypotenuse equal to the Sum of the Squares of the Legs.

ESSENTIAL *Salt* of Plants is thus drawn: The Plant is pounded in a Mortar, and its Juice extracted and filtrated, which after that is set in a Cellar, or some such cool Place to Crystallize, and the Salt will shoot out into Crystals every way. This Salt is the true or *Essential Salt* of the Plant; for here is no change at all made in it by the force of Fire, but the means of drawing it are easy and natural.

ESSERE, *Sora*, and *Sore*, are little Pusshes or Wheals, something red and hard, which quickly infect the whole Body with a violent itching, as if one were stung with Bees, or Wasps, or Flies, or Nettles; yet they vanish after a little time, and leave the Skin as smooth and well colour'd as before. It differs from an *Epinychis* in this, that an *Epinychis* sweats out Matter, but an *Essere* does not. *Blanchard*.

ESSOYNE, in Law, signifies the Allegation of an Excuse from him that is summon'd to appear, and answer to an Action Real, or to perform Suit to a Court Baron upon just Cause of Absence. This the *Civilians* call *Excusatio*.

The Causes that serve to *Essoyne* any Man summon'd, are divers; but drawn chiefly to 5 Heads: Whereof

The First is, *Ultra Mare*, whereby the Defendant shall have 40 Days.

The Second, *De Terra Sancta*, where the Defendant shall have a Year and a Day, and these must be laid in the beginning of the Plea.

The Third is called, *Malo Veniendi*, call'd also *Common Essoyne*.

The Fourth is, *De malo lecti*.

The Fifth, *De servitio Regis*.

ESSONIO *de malo lecti*, is a Writ directed to the Sheriff, for the sending of 4 lawful Knights to view one that hath *Essoyn'd* himself, *De malo lecti*.

ESTIVAL *Occident*: See *Occident*.

ESTIVAL *Orient*: See *Orient*.

ESTIVAL *Solstice*.

ESTOPPEL, (in Law) signifies as much as an Impediment, or Bar of an Action, growing from his own Fact, that hath, or otherwise might have had this Action.

ESTREAT, in Law, is used for the true Copy or Duplicate of an Original Writing.

For Example, Of Amerciaments or Penalties set down in the Rolls of a Court, to be levied by the Bayliff, or other Officer, of every Man for his Offence.

ESTREPE, in Law, is to make Spoil by a Tenant for Life in Lands, or Woods, to the Prejudice of him in Reversion.

And *Estrepageant* signifies the Spoil made by Tenant for Life upon any Lands or Woods, to the Prejudice of the Reversioner.

ESURINE Salts, are such as are of a corroding, fretting, and eating Nature; they abound in the Air of Places situate near the Sea side, and where great Quantities of Coal are burnt; as appears from the speedy rusting of the Iron-Bars in the Windows, &c. of Houses built in such Places.

ETAPPE, in the Art of War, is the Allowance of Provisions and Forage, which Soldiers have in their March thro' the Kingdom to or from Winter-Quarters. Wherefore the

ETAPPIER, is he that contracts with any Country, or Territory, for furnishing Troops in their March with Provisions and Forage.

ETATE probanda: See *Elate probanda*.

ETCHING, is a way used in making Prints, by drawing with a Needle upon a Copper-plate covered over with a Ground of Wax, &c. and well blacked with the Smoke of a Link, that it may take off the Figure of the Drawing or Print, which having its back-side Tintured with white Lead, will by running over the stricken-out Lines with a *Stiff*, impress the exact Figure on the Black or Red Ground; which Figure is afterwards with Needles, drawn deeper quite thro' the Ground, and all the *Shadows* and *Hatchings* put in; and then a Wax Border being made all round the Plate, there is poured on a sufficient Quantity of well-tempered *Aqua-Fortis*, which insinuating into the Strokes, made by the Needles in the Ground, eats the Figure of the Print or Drawing into the Copper-Plate. There is no certain Time in which this is done, but usually the *Aqua-Fortis* will eat deep enough in about half an Hour. *Brown's Ars Pictoria*.

ETHERIAL Oil, so the Chymists call a very fine or exalted Oil, or rather Spirit that is inflammable; as *Oil of Turpentine*, &c.

ETHICS, is that Art which teaches us to seek out those Rules and Measures of Human Actions, that lead to true Morality and Happiness; and which acquaints us with the Means to practice them.

The Writers upon it usually divide it into two Parts; The First contains an Account of the Nature of Moral Good and Evil. And

The other Enumerates the several Virtues in which the Practice and Exercise of Morality consists; and which are the proper Means for us to obtain true Felicity, the End of all Moral Actions.

ETHMOIDALIS, is a Suture that surrounds a Bone of that Name, and separates it from the Bones which are about it.

ETHMOIDES, is a Bone which resembles a Sieve, placed above the inner part of the Nose, and full of little Holes to receive the Serous and Pituitous Humours from the soft Pappy Processes of the Brain. *Blanchard*.

ETYMOLOGY, is that part of *Grammar*, which teaches the Original of Words, in order the better to distinguish and establish their true Signification.

EVANID, so some call those Colours which are not of very long duration, as those in the Rainbow, in Clouds before and after Sun-set, &c. These also are called *Fantastical* and *Emphatical* Colours; which see.

EVAPORATION, in Chymistry, is when any Liquor is set over a gentle Heat, that the Fire may gently carry off some of the Moisture, and yet not lessen the Quantity of the Matter the Liquor is impregnated with; to *Evaporate* to a *Pellicle*: See *Pellicle*.

EUCHYMIA, is a good Temper of the Blood, or other Juices, or Fluids in an Animal Body.

EUCRASIA, is a good Temper of the Parts of the Body.

EVECTION, or *Libration* of the Moon, is an Inequality in her Motion, by which, at or near the Quarters, she is not in that Line which passeth thro' the Center of the Earth to the Sun, as she is at her Syzygies, or Conjunction and Opposition, but makes an Angle with that Line of 2 Degrees 50 Minutes, according to the Observation of *Tycho* and *Bullialdus*.

The Moon revolving uniformly about her Axis, in a Month's time, makes her Day to be of a Month in length; and her Face always is turned the same way towards the lower *Umbilicus* of her Orbit; and for that Reason, and the Position of the *Umbilicus*, deviates this way and that way a little from the Earth; which is her *Libration* in *Longitude*: But her *Libration* in *Latitude*, is occasioned by the Inclination of the Moon's Axis to the Plane of the Orbit.

EVEN Number, is that which may be divided into two Parts; as 4, 10, 40, &c. are *Even Numbers*, so far as each of them may be divided into two equal Parts.

EVENLY Even, is that which an *Even Number* doth measure by an *Even* one; as 32 is said to be a *Number Evenly Even*, because 8, an *Even Number*, doth Measure it by 4, which is likewise an *Even Number*.

EVENLY Odd, is that which an *Even Number* doth measure by an *Odd* one; as 30, which 2 or 6, *Even Numbers*, do measure by 15 or 5 *Odd Numbers*.

EUEXIA, is a good sound Habit of Body.

EVOLUTION, is used by *Dr. Pell*, and others, for the Extraction of Roots out of any Powers; and so is directly contrary to *Involution*; which see.

EVOLUTION, in *Tactics*, is the Motion made by a Body of Men in changing their Posture, or Form of drawing up; either to make good the Ground they are upon, or to possess themselves of another; that so they may attack the Enemy, or receive his Onset more advantageously: And these *Evolutions*, are *Doubling of Ranks*, or of *Files*, *Countermarches*, and *Wheelings*.

EUEPSIA, a good and easy Digestion.

EUPHORIA, is the well-bearing of the Operation of a Medicine; that is, when the Sick Person finds himself eas'd or reliev'd by it; then they say it wrought upon the Patient *cum Euphoria*.

EUPNOEA, is a right natural Respiration.

EUPORIA, is an easy Preparation of Medicines, or the easiness of their Operation. *Blanchard*.

EURYTHMY, in Architecture, signifies the exact Proportion between all the Parts of a Building.

EUSARCOS, is one that is well fleshed. *Blanchard*.

EUSTOMACHUS, is a good Stomach; as also Meat convenient for it.

EUSTYLE, in Architecture, is a kind of Edifice where the Pillars are placed at a most convenient distance one from another; the *Intercolumniations* being all just two Diameters and a quarter of the Pillar, except those in the middle of the Face before and behind, which are in distance three Diameters.

EUTHANASIA, is a soft quiet Death, or an easy Passage out of this World.

EUTROPHIA, is a due Nourishment of the Body.

EXACERBATIO: See *Paroxysmus*.

EXACTION, in Law, is a Wrong done by an Officer or one pretending to have Authority in taking a Reward or Fee for that which the Law allows not. The Difference between *Exaction* and *Extortion* is this:

Extortion, is where an Officer extorts more than his Due.

Exaction, is where he wrests a Fee or Reward where none is due.

EXÆRESIS, is an Extraction of things out of the Body, that are hurtful to it.

EXAGOON, the same with *Hexagon*.

EXAMINERS in *Chancery*, are two Officers that *Examine*, upon Oath, Witnesses produced on either side, upon such Interrogatories as the Parties to any Suit do exhibit to that purpose; and sometimes the Parties themselves are by particular order examined also by them.

EXANASTOMOSIS, is an opening of the Extremity of the Vessels. *Blanchard*.

EXANTHEMA, is a certain Efflorescence upon the Skin of the Head, like those which appear in the Skin of the whole Body. It is described two ways by *Sennertus*; one is, that at least it changes the colour of the Skin, as in continued malignant Fevers, wherein the Skin is spotted as with Flea-bites; the other is, when certain little Swellings break out of the Skin, which may be call'd *Papilla*. *Blanchard*.

EXARTHREMA, the same with *Luxatio*.

EXARTICULATION: See *Dislocation*.

EXCENTRICK, the same with *Eccentrick*.

EXCEPTIO, is the incorporation or mixture of dry Powders with some Moisture or other. Thus Electuaries are made, Powders and Pulps are mixt with Honey or Syrup; and the Powder of Pills with Syrup, Honey, Wine or Juice.

EXCEPTIVE Propositions, are those where a Thing is affirmed of the whole Subject, except some one of the Inferiors of the Subject, by adding a Particle of Exception, which denotes that what is predicated does not agree with that Inferior, which visibly includes two Judgments, and renders those Propositions compos'd in Sense. As if one should say, None of the Sects of the ancient Philosophers, except that of the *Platonic*, have acknowledged God to be Incorporeal. The Covetous Man does nothing well, but when he dies.

EXCHANGE, in Common Law, is as much as *Permutation* with the *Civilians*. It hath a peculiar Signification, and is used for that Compensation which the Warranter must make to the Warrantee, Value for Value, if the Land warranted be recovered from the Warrantee.

EXCHEQUER, is the Court or Place to which are brought all the Revenues belonging to the Crown.

This Court consists, as it were, of two Parts, whereof one dealeth Specially, in the hearing and deciding of all Causes appertaining to the Prince's Coffers; The other is called, *The Receipt of the Exchequer*, which is properly employ'd in the receiving and paying Money. It is also a Court of Record, wherein all Causes touching the Revenues of the Crown are handled.

EXCISION, the cutting out, or cutting off of any part of the Body.

EXCLAMATION, is a violent Extension of the Voice, when the Mind comes to be disturbed and agitated with some furious Impulse or Passion.

EXCLUSIVE Propositions, are those which denote, that a Predicate so agrees with its Subject, as to agree with that alone, and no other: Whence it follows, that they include two various Judgments,

and by consequence are compos'd in Sense. Which is express'd by the Word (*only*) or some such like Words: Thus, *Virtue only makes Nobility, nothing else renders a Man truly Noble*.

EXCOMMUNICATO Capiendo, is a Writ directed to the Sheriff, for the Apprehension of him who standeth obstinately excommunicated Forty Days; for such a one not seeking Absolution, hath, or may have, his Contempt certified into the *Chancery*; whence issueth this Writ for the laying of him up without Bail or Mainprise, until he conform himself.

EXCOMMUNICATO Deliberando, is a Writ to the under Sheriff, for the Delivery of an Excommunicate Person out of Prison, upon Certificate of the Ordinary of his Conformity to the Jurisdiction Ecclesiastical.

EXCOMMUNICATO Recipiendo, is a Writ whereby Persons excommunicated being for their Obstinacy committed to Prison, and unlawfully delivered thence before they have given Caution to obey the Authority of the Church, are commanded to be sought for, and laid up again.

EXCORIATION, is when the Skin is rubb'd or torn off, or fretted away from any part of the Flesh.

EXCORTICATION: See *Decortication*.

EXCREMENTS, of an Animal Body, are whatsoever is separated from the Aliments after Concoction, and is to be thrown out of the Body; as the Moisture of the Mouth, Spittle, Snot, Milk, Bile, Sweat, the Wax of the Ears, the Excrements of the Belly and Bladder. *Blanchard*.

EXCRESCENCE, any sort of Swelling; and more particularly a Fleishy Tumour.

EXCRETION, the separating of Excrements or Excrementitious Humours from the Aliments and Blood.

EXECUTION, in Common Law, signifies the last Performance of an Act: As of a *Fine*, or of a *Judgment*; that of a *Fine*, is the obtaining Possession actually of things contained in the same by virtue thereof, which is either by Entry into the Lands, or by Writ.

There are two sorts of *Executions*, one *Final*, another with a *Quousque* tending to an End.

An *Execution Final*, is that which maketh Money of the Defendant's Goods, or extendeth his Lands, and delivereth them to the Plaintiff; for this the Party accepteth in Satisfaction, and this is the End of the Suit, and all that the King's Writ commandeth to be done.

The other Sort with a *Quousque* is tending to an End, and not Final, as in the Case of a *Capias ad Satisfaciendum*, &c. This is not Final, but the Body of the Party is to be taken, to the intent and purpose to satisfy the Defendant; and his Imprisonment is not absolute, but until the Defendant do satisfy: So that the Body is but a Pledge for the Debt.

EXECUTIONE facienda, is a Writ commanding Execution of a Judgment.

EXECUTIONE facienda in Withernamum, is a Writ that lieth for the taking of his Cattle, who formerly hath convey'd out of the Country the Cattle of another; so that the Bayliff having Authority from the Sheriff to replevy the Cattle so convey'd away, could not execute his Charge.

EXECUTOR, is he that is appointed by any Man in his Last Will and Testament, to have the disposing of all his Substance, according to the Contents of the said Will. This *Executor* is either *Particular* or *Universal*: *Particular*, as if this or that

thing only be committed to his Charge: *Universal*, if all.

EXECUTOR *de son tort*, is he that takes upon him the Office of an *Executor* by Intrusion, not being so constituted by the Testator, nor for want thereof appointed by the Ordinary to Administer.

EXEGESIS *Numeroſa aut Linealis*, is the Numeral or Lineal Solution or Extraction of Roots out of *Aſſected Equations* in Algebra, firſt invented by *Vieta*. *Ozanam* calls it *La Rhetique*. Of this you have a very good Account by the Famous *Mr. Collins*, in *Phil. Transf. N. 46*.

EXEMPLIFICATION of *Letters Patents*, is a Copy or Duplicate of *Letters Patents*, made from the Inrollment thereof, and ſealed with the Great Seal of *England*; which *Exemplifications* are as effectual to be ſued or pleaded as the Originals themſelves.

Note, That nothing but Matter of Record ought to be *Exemplified*.

EXEMPLIFICATIONE, is a Writ granted for the Exemplification of an Original.

EX gravi Querela, is a Writ that lieth for him to whom any Lands or Tenements in Fee within a City, Town, or Borough, being deviable, are deviſed by Will, and the Heir of the Deviſor entred into them, and detaineth them from him.

EXHALATION, is whatever is raiſed up from the Surface of the Earth or Water by Means of the Heat of the Sun, that of the Subterraneous Fire, &c. ſuch as Vapours, Miſts, Fogs, &c.

EXHAUSTED Receiver, is that Body or Veſſel of Glaſs, &c. which hath the Air drawn out of it by *Mr. Boyle's*, or any other Engine for that purpoſe; and which, tho' not containing an abſolute Vacuum, ſeems to be empty of all true Elastiſtick Air, and therefore is, properly ſpeaking, *Exhausted* of Air.

EXHAUSTIONS, a Term in Mathematicks, where they have what they call, *The Method of Exhaustions*, of frequent Uſe in the Ancient Mathematicians, ſuch as *Euclid*, *Archimedes*, &c. This is founded on what *Euclid* ſaith in his Tenth Book, viz. *That thoſe Quantities whoſe Difference is leſs than any aſſignable, are equal*; for if they were unequal, be the Difference never ſo ſmall, yet it may be ſo multiplied, as to become greater than either of them; if not ſo, then it is really nothing. This he aſſumes in the Proof of the firſt Prop. of Book 10. which is, *That if from the greater of two Quantities you take more than its Half, and from the Remainder more than its Half, and ſo continually, there will at length remain a Quantity leſs than either of thoſe propoſed*.

On this Foundation they demonſtrate, That if a Regular Polygon of infinite Sides be inſcribed in, or circumscribed about a Circle, the Space that is the Difference between the Circle and the Polygon will, by degrees, be quite exhausted, and the Circle equal to the Polygon: *Vid. Archimed. de Dimensione Circuli*. *Wallis's Algebra*, P. 280. *Pardie's Elements of Geometry*, Book 4. Prop. 28.

EXHIBIT, in Law, is when a Deed, Acquittance, or other Writing, is in a Chancery Suit exhibited to be proved by Witneſs; and the Examiner writes on the back, That it was ſhewed to ſuch a one at the ſame time of his Examination: This is there call'd *An Exhibit*.

EXIGENDARY: See *Exigenter*.

EXIGENT, is a Writ that lieth where the Defendant in an Action Perſonal cannot be found, nor any thing within the County whereby he may be

Attached or Distrained; and is directed to the Sheriff, to proclaim and call five County Days one after another, charging him to appear under the pain of Outlawry. This Writ lieth alſo in an Indictment of Felony, where the Party indicted cannot be found.

EXIGENTER, is an Officer in the Court of *Common Pleas*, whereof there are Four. They make all Exigents and Proclamations in all Actions where Proceſs of Outlawry doth lie, and Writs of *Superſedeas*, as well as the *Protonotaries* upon ſuch Exigents as were made in their Offices. But making Writs of *Superſedeas* is now taken from them by an Officer in the ſame Court.

EX Mero motu, are Words formerly uſed in any Charter of the Prince, whereby he ſignifieth, That he doth that which is contained in the Charter, of his own Will and Motion, without Petition or Suggeſtion made by any other; and the Effect of theſe Words, are to bar all Exceptions that might be taken unto the Inſtrument wherein they be contained, by alledging, That the Prince in paſſing that Charter, was abuſed by any falſe Suggeſtion.

EXOMPHALOS, is a Protuberance of the Navel, common to Infants.

EXONERATIONE Seſſe, is a Writ that lieth for a King's Ward to be diſburthened of all Suit, &c. to the County, Hundred, Leet, or Court-Baron, during the time of his Wardſhip.

EXOPHTHALMIA, is a Protuberance of the Eye, out of its natural poſition.

EXOSTOSIS, is a Protuberance of the Bones out of their natural place.

EXPANSION. *Mr. Lock* ſaith this Word expreſſes the Idea which we have of *Laſting Diſtance*, all whoſe parts exiſt together, which is a Metaphyſical Notion of the Word. What is meant by it in a Phyſical Senſe, you will in part ſee under *Exploſion*. Tho' *Expansion*, among Naturaliſts, is often taken alſo for the ſwelling or increaſe of the apparent Bulk of the Fluids when agitated by Heat. And the Quantity of this, in ſeveral Inſtances, *Mr. Halley* gives in *Philof. Transf. N. 197*. where he ſhews, That by Experiment Water was found by him to expand it ſelf one 26th part of its Bulk when it was made to boil, but hardly would it expand at all by a moderate Heat.

But *Mercury* did with a very gentle Heat expand it ſelf one 74th part of its uſual bulk when cold.

Spirit of Wine, with an Heat (at higheſt) that was much leſs than that of boiling Water, expanded it ſelf gradually till it had increaſed to a 12th part of its bulk when cold, and then fell a boiling and emitting Bubbles copiouſly.

There is alſo an *Expansion* of Water made by freezing, which *Mr. Boyle*, in his Book of Cold, tells us, he found to be about $\frac{1}{12}$ part of a Space more than the Water uſually takes up.

The Law of the *Expansion* of Air is this, *That the Spaces unto which Air of a given Quantity is compreſſed, are reciprocally proportionable to the compreſſing Weights*. *Philof. Transf. N. 13*. Whence *Dr. Gregory* proves, *Aſtron. P. 407*. That a Globe of Air of but one Inch in Diameter, if it had ſo great an *Expansion* as it will have at a Semidiameter's Diſtance of the Earth from it, will fill all the Planetary Regions, as far as, and far beyond the Sphere of *Saturn*.

EX PARTE talis, is a Writ that lyeth for a Bayliff or Receiver, that having Auditors aſſigned to hear his Account, cannot obtain of them reaſonable Allowances, but is caſt into Priſon by them. The manner in this caſe, is to take this Writ out of the *Chancery*, directed to the Sheriff, to take the four Mainpennors,

pernors, to bring his Body before the Barons of the *Exchequer*, at a Day certain, and to warn the Lord to appear at the same time.

EXPECTANT, Fee, in Common Law, signifies Land given to a Man, and to the Heirs of his Body, the Remainder to him and his Heirs: Here is a Fee-simple Expectant after the Estate Tayle.

EXPENSIS militum levandis, is a Writ directed to the Sheriff, for levying the Allowance for Knights in Parliament.

EXPENSIS militum non levandis ab hominibus de dominico, nec à Nativis, is a Writ to prohibit the Sheriff from levying any Allowance for the Knights of the Shire, upon those that hold in ancient Demefne, &c.

EXPECTORATION, the raising and casting forth of Phlegm, or other Matter, out of the Lungs.

EXPERIMENTUM Crucis, is such an Experiment, as like a Cross set up where divers ways meet, to direct Travellers in their true Course, guides and directs Men into the true Knowledge of the Nature of the Thing they enquire after.

EXPIRATION, is an alternate Contraction of the Chest, whereby the Air, together with fuliginous Vapours, is expelled by the Wind-pipe.

EXPLOSION, properly signifies a Hissing off the Stage, but by Naturalists an Action of the Animal Spirits, whereby the Nerves are suddenly contracted; the Reason is, That some *Heterogeneous Particles* are mixed with the Animal Spirits, by which they are violently expanded and driven into a Confusion, like the parts of fired Gunpowder. That violent Effervescence, Ebullition and Expansion which arises from the mixture of some contrary Liquors, is called *Explosion*, of which Mr. Boyle gives several Experiments at the End of his Experiments about Flame and Air; as when Spirit of Nitre and Spirit of Wine, Oil of Vitriol and Oil of Turpentine, and when Oil of Vitriol and Sal Armoniac are mingled together.

EXPONENT of the Ratio, or Proportion between any two Numbers or Quantities, is the Quotient arising when the Antecedent is divided by the Consequent. Thus 6 is the Exponent of the Ratio which 30 hath to 5. Also a Rank of Numbers in Arithmetical Progression, beginning from 0, and placed over a Rank of Numbers in Geometrical Progression, are called *Indices*, or *Exponents*: And in this is founded all the Reason and Demonstration of *Logarithms*; for *Addition* and *Subtraction* of these Exponents, answers to Multiplication and Division in the Geometrical Numbers, as you will find more at large in the Word *Logarithm*.

EXPRESSION, in Chymistry or Pharmacy, is the Term for the Action of pressing out the Juices or Oils of Vegetables; and thus Oils so made, are called Oils by *Expression*; as those made by Fire are called Stillitious Oils.

EXPREST Oils, are those that are prepared by squeezing out the oily Juice of Fruits or Seeds; such as Oil Olive, Oil of Sweet and Bitter Almonds.

EXTASY, is a Deprivation of the Judgment and Imagination, familiar to Mad and Melancholy Persons.

EXTENDI facias, is a Writ commonly called, *A Writ of Extent*, whereby the Value of the Land, &c. is commanded to be made and levied in divers Cases.

EXTENSOR Carpi Radialis, is a Muscle of the Wrist, by some called *Bicornis* and *Radius externus*. It has two Beginnings, and indeed seems to be two distinct Muscles, the outermost arising fleshy above the external Portuberance of the *Os Humeri*, immedi-

ately below the *Sapinator Radii Longus*, in its descent becomes a fleshy Belly, and grows Tendinous above the middle of the *Radius*. The other Beginning of this Muscle is partly Fleshy and partly Tendinous below the former, either from the *Apex* of the Extuberance of the *Os Humeri* or superior part of the *Radius*, and continues Fleshy somewhat lower than the Superior, both Tendons marching under the *Entensores Pollicis*, run under the *Ligamentum Annulare*, and are inserted to the superior parts of the *Osse metacarpi* of the Fore and Middle Fingers.

EXTENSOR Carpi Ulnaris, is a Muscle of the Wrist, which hath an acute tendinous Beginning from the outward Extuberance of the *Os Humeri*, and becomes Fleshy as it descendeth, according to the Length of the *Cubit*, growing Tendinous again as it marcheth over the inferior part of the *Ulna*; and passing under the Annular Ligament, it is inserted to the superior part of the Metacarpal Bone of the Little Finger. If this Muscle and the *Ulnaris Flexor* act, they move the Hand sideways towards the *Ulna*; and in like manner, if the *Radialis Flexor* and *Extensor* act, they move it towards the *Radius*.

EXTENSOR Digitorum Communis, seu Digitorum Tensor, is a Muscle of the Fingers, which has an acute tendinous Origination from the outward Extuberance of the *Os Humeri* between the *Extensores Carpi*, becoming Fleshy in less than half its progress. It is divided into three portions, which become so many Tendons, (of which the Middlemost is the longest) passing under their Annular Ligaments between the lowest parts of the *Ulna* and *Radius*, march separately over the *Dorsum Manus*, and remitting tendinous Filaments to each other as they pass the first Internodes of each Finger, and are afterwards inserted to the superior parts of the first, second, and third Bones of the four, middle, and third Fingers.

There being no Force required in the Extension of the Fingers, we need not wonder that the Muscles employ'd in that Office, are no larger in proportion to their Antagonists.

EXTENSOR Indicis, seu Indicator, is a Muscle of the Fingers, which arises fleshy from the middle of the external part of the *Ulna*, next the *Radius*, immediately below the *Extensores Pollicis*, and descending obliquely, becomes Tendinous as it passes under the Annular Ligament at the lower part of the *Radius* and *Carpus*, passing over the *Os Metacarpi Indicis*, and joining with the Tendon of the *Extensor Communis*, is inserted with it to the superior part of the third Bone of the Fore Finger. The Tendon of it is sometimes divided. Its Name declares its Use, which is to extend the Fore Finger.

EXTENSOR primi Internodii Pollicis, is a Muscle of the Thumb which arises Tendinous from the upper part of the *Ulna*, immediately below the *Sapinator Radii brevis*, soon growing Fleshy, and becomes Tendinous again as it descends obliquely over the Tendons of the *Radialis Extensor*, and is inserted to the superior part of the first Bone of the Thumb. This is divided into two, and sometimes into three distinct Muscles.

EXTENSOR Secundi Internodii Offis Pollicis, is a Muscle of the Thumb, which arises broad and fleshy from that part of the *Radius* next the *Ulna*, and becoming Tendinous, passes under the same *Involucrum* with the Tendons of the *Extensor primi*, &c. to its Implantation of the superior part of the second Bone to the Thumb.

EXTENSOR tertii Internodii Offis Pollicis, is a Muscle of the Thumb, which has a broad, partly

tendinous, but chiefly fleshy Origination from the *Ulna*, immediately below the beginning of the *Extensor primi Internodii*, or between it and the Indicator; as also from the Ligament between the last named Bone and the *Radius*, whence descending obliquely, becoming Tendinous as it marches in a proper *Sinus* on the inferior *Appendix* of the *Radius*, wherein it's enclosed by its Annular Ligament, and passes over the two Tendons of the *Radialis extensor*, to its Insertion at the superior part of the third Bone of the Thumb. When this acts, it does not only extend the Thumb, but brings it somewhat backwards, insomuch that some Persons can place it on the superior and back part of the *Ossa Metacarpi*.

EXTENSOR minimi digiti, is a Muscle which arises partly Tendinous at the Extremitie of the external *Apophysis* of the *Os Humeri*; and partly Fleshy from the superior part of the *Ulna*, between the *Extensor Communis Digitorum*, and *Musculi Ulnaris Extensor*, and becoming Tendinous as it passes under the *Ligamentum Annulare* at the *Carpus*, it is there divided into two, sometimes three Tendons, which are united in one at its Insertion to the superior part of the third Bone of the Little Finger. Its Name declares its Action.

EXTENSOR Pollicis Pedis Brevis, is a Muscle of the great Toe, arising Fleshy from the fore part of the *Os Calcis*, being dilated into a Belly, soon becomes a long slender Tendon, passing obliquely over the upper part of the Foot, and is inserted to the superior part of the second Bone of the great Toe, which it extends or pulls upwards.

EXTENSOR Pollicis Pedis Longus, is a Muscle of the great Toe, which takes its Beginning large and fleshy, from the fore part of the *Fibula*, from immediately below its superior *Appendix*, to four Finger's Breadth above the inferior one, and descending under the *Ligamentum Annulare* of the *Tarsus*, between the Tendon of the *Tibialis Anticus* and those Tendons of *Extensor Pedis Longus*, and marching along the superior part of the Foot, is inserted to the upper part of the second Bone of the Great Toe. Its Name intimates its Use to be, to extend the Toe.

EXTENT, in Law, hath two Significations, sometimes signifying a Writ or Commission to the Sheriff for the valuing of Lands or Tenements; sometimes the Act of the Sheriff upon this Writ. But it frequently signifies the Estimate or Valuation of Lands, when done to the utmost Value, was said to be in the full *Extent*.

EXTERGENT Remedies: See *Abstergent*.

EXTERIOR Polygon: See *Polygon exterior*.

EXTERIOR Talus: See *Talus*.

EXTERNAL Angles: See *Angles external*.

EXTERNUS Auris, vel Luxator externus, is a Muscle which lies in the upper part of the *Meatus Auditorius*, having a short fleshy Body, with a long slender Tendon. It arises from the external and superior Margin of the *Meatus Auditorius*, soon becoming a slender Tendon, passes directly to the upper part of the *Membrana Tympani*, on which it defends for some space to its Insertion in the long Process of the *Malleus*, where it is contiguous to the said Membrane. This draws the *Manubrium* of the *Malleus*, together with the *Membrana Tympani*, forwards.

EXTIRPATIONE, is a Writ Judicial that lyeth against him, who, after a Verdict found against him for Land, &c. doth maliciously overthrow any House upon it, &c. And 'tis either *ante Judicium*, or *post Judicium*.

EXTINGUISHMENT, in Law, is an Effect

of Consolidation; as if a Man have a Yearly Rent due to him out of any Lands, and afterwards purchase the same Lands; now both the Property and Rent are consolidated or united into one Possessor, and therefore the Rent is said to be *extinguished*. Also, where a Man hath a Lease for Years, and afterwards buyeth the Property; this is a Consolidation of the Property and the Fruits, and is an *Extinguishment* of the Lease. So if a Man have a High-way Appendant, and after purchase the Land whereon the High-way is, then the High-way is *extinct*; and so it is of Common Appendant.

EXTIRPATION, is the cutting off, or out of the Body any Part; tho' cutting off a Part is more properly called *Amputation*.

EXTORTION, a Law Term, signifying an unlawful or violent wringing of Money, or Moneyworth from any Man: As also, the Exaction of unlawful Usury, winning by unlawful Games, and all taking more than is due.

EXTRACT, is that pure, unmix'd, and efficacious Substance, which, by the help of some Liquor, is separated from the duller and more unactive parts of Plants, &c. This Extract is usually of the Consistence of a stiff Electuary. All Extracts of Vegetables are made after the following manner.

Bruise the Body, or powder it grossly, and then let it steep warm a convenient while in some proper Water, as from 12 Hours a Day, &c. according to the Nature of the Plant; at least, let the Liquor just boil, and then press it hot thro' a Cloth; after this evaporate the filtered Liquor to its due Consistence.

Thus are the Extracts of Rhubarb, Gentian, Wormwood, &c. made.

EXTRA Judicial, in Law, is when Judgment is given in a Cause or Case not depending in that Court where such Judgment is given, or wherein the Judge has not Jurisdiction.

EXTRACTION, is a separating of the subtle Part of a mixed Body, from the more gross: For Example, when the Strength of any Medicine is extracted by Spirit of Wine, that which is left after the Evaporation of the *Menstruum*, is called the *Extract*.

EXTRACTION of Roots, in Mathematicks, is the Method of finding out the true Root of any Number of Quantity given: See *Square Root*, *Cube Root*, &c.

In Philos. Trans. N^o. 240. the Ingenious Mr. Abre de Moivre gives the following Method of Extracting the Root of an Infinite Equation.

THEOREM.

If $az + bz^2 + cz^3 + dz^4 + ez^5 + fz^6$,
 $\&c. = gy + hy^2 + iy^3 + ky^4 + ly^5 + my^6$,
 $\&c.$

$$\begin{aligned} \text{Then will } z \text{ be } &= \frac{g}{a} y + \frac{b - bAA}{a^2} y^2 + \\ & \frac{i - 2bAB - cA^3}{a^3} y^3 + \frac{k - bB^2 - 2bAC}{a^4} y^4 + \\ & \frac{-3cA^2B - dA^4}{a^5} y^5 + \frac{l - 2bBC - 2bAD}{a^6} y^6 + \\ & \frac{-3cAB^2 - 3cA^2C - 4dA^3B - eA^5}{a^7} y^7 + \\ & \frac{m - 2bBD - bCC - 2bAE - cB^3}{a^8} y^8 + \\ & \frac{6cABC - 3cA^2D - 6dA^4B^2 - 4dA^3C}{a^9} y^9 + \\ & \frac{-5eA^4B^2 - fA^6}{a^{10}} y^{10}, \&c. \end{aligned}$$

For

For the understanding of this Series, and in order to continue it as far as we please, it is to be observed,

1. That every Capital Letter is equal to the Coefficient of each preceding Term: Thus, the Letter *B* is equal to the Coefficient $\frac{b-bA^2}{a}$.

2. That the Denominator of each Coefficient is always *a*.

3. That the first Member of each Numerator, is always a Coefficient of the Series $gy + by^2 + zy^3$, &c. viz. The first Numerator begins with the Coefficient *g*, the second Numerator with the second Coefficient *b*, and so on.

4. That in every Member after the first, the Sum of the Exponents of the Capital Letters is always equal to the Index of the Power to which this Member belongs: Thus, considering the Coefficient $\frac{k-bB^2-2bAC-3cA^2B-dA^4}{a}$ which

belongs to the Power y^4 , we shall see that in every Member bB^2 , $2bAC$, $3cA^2B$, dA^4 the Sum of the Exponent of the Capital Letters is 4. (Where it may be taken notice of, that by the Exponent of a Letter, is meant the Number which expresses what Place it has in the Alphabet: Thus 4 is the Exponent of the Letter *D*.) Hence is derived this Rule for finding Capital Letters of all the Members that belong to any Power.

Combine the Capital Letters as often as you can make the Sum of the Exponents equal to the Index of the Powers to which they belong.

5. That the Exponents of the same Letters which are written before the Capitals, express how many Capitals there are in each Member.

6. That the Numeral Figures or *Uncie* that occur in these Members, express the Number of Permutations, which the Capital Letters of each Member are capable of.

For the Demonstration of this,

Suppose $z = Ay + By^2 + Cy^3 + Dy^4$, &c. Substitute this Series in the room of *z*, and the Powers of this Series in the room of the Powers of *z*; there will arise a new Series: Then take the Coefficients which belong to the several Powers of *y*, in this new Series, and make them equal to the corresponding Coefficients of the Series $gy + by^2 + zy^3$, &c. and the Coefficients *A*, *B*, *C*, *D*, &c. will be found much as is determined in the *Theorem*.

This *Theorem* might have been made much more general, by supposing

$az + bz^{\frac{n}{m+2}} + cz^{\frac{n}{m+1}}$ &c. = $g'y + by^{\frac{n}{m+1}}$ + $zy^{\frac{n}{m}}$ &c. Then all the Powers of the Series $Ay + By^2 + Cy^3$, &c. designed by the universal Indices, must have been taken successively.

This *Theorem* may be applied to what is called the *Reversion of Series*; such as finding the *Number* from its *Logarithm* given; the *Sine* from its *Ark*; the *Ordinate* of an *Ellipsis* from an *Area*, given to be cut from any Point in the *Axis*.

But to make a particular Application of it, we'll suppose this Problem was to be solved, viz. The

Chord of an *Ark* being given, to find the Chord of another *Ark* that shall be to the first as *n* to 1.

Let *y* be the Chord given, *z* the Chord required;

Now the *Ark* belonging to the Chord *y*, is $y + \frac{y^3}{6d} + \frac{3y^5}{40d^3} + \frac{y^7}{112d^5}$; and the *Ark* belonging to the

Chord *z*, is $Z + \frac{z^3}{6d^2} + \frac{3z^5}{40d^4} + \frac{5z^7}{112d^6}$, &c.

The first of these *Arks* is to the 2d, as *i* to *n*; therefore multiplying the Extremes and Means together,

we shall have this Equation, $Z + \frac{z^3}{6d^2} + \frac{3z^5}{40d^4} + \frac{5z^7}{112d^6}$, &c. = $ny + \frac{ny^3}{6d^2} + \frac{3ny^5}{40d^4} + \frac{5ny^7}{112d^6}$, &c.

Compare these Two Series with the Two Series of the *Theorem*, and you'll find $a = 1$, $b = 0$, $c = \frac{1}{6d^2}$, $d = 0$, $e = \frac{3}{40d^4}$, $f = 0$, $g = n$, $h = 0$,

$i = \frac{n}{6d^2}$, $k = 0$, $l = \frac{3n}{40d^4}$, $m = 0$, &c.

Hence $z = ny + \frac{n-n^3}{6d^2}y^3$, &c. Or $ny + \frac{1-n^2}{2 \times 3d^2}y^3$, &c. supposing *A* to denote the whole preceding Term, which will be the same Series as Sir *Iaac Newton* has first found.

On the same Method this general Problem may be solved.

The *Abcissa* corresponding to a certain *Area* in any Curve being given, to find the *Abcissa*, whose corresponding *Area* shall be to the first in a given Ratio.

The *Logarithmetick Series* might also be found, without borrowing any other Idea, than that *Logarithms* are the *Indices of Powers*.

Let the Number, whose *Logarithm* we imagine, be $1 + z$; suppose its *Logarithm* to be $az + bz^2 + cz^3$, &c.

Let there be another Number $1 + y$: Therefore its *Logarithm* will be $ay + by^2 + cy^3$, &c.

Now if $1 + 2 = 1 + y$, it follows, That $az + bz^2 + cz^3$, &c. : $ay + by^2 + cy^3$, &c. :: *n* : 1.

That is, $az + bz^2 + cz^3$, &c. = $nay + nby^2 + ncy^3$, &c.

Therefore we may find the Value of *z*, express by the Powers of *y*.

Again, since $1 + z = 1 + y$; therefore $z = 1 + y - 1$.

That is, $z = ny + \frac{n}{1} \times \frac{n-1}{2}y^2 + \frac{n}{1} \times \frac{n-1}{2} \times \frac{n-2}{3}y^3$, &c.

Therefore *z* is doubly express by the Power of *y*: Compare these Two Values together, and the Coefficients *a*, *b*, *c*, &c. will be determined, except the first (*a*) which may be taken at Pleasure, and gives accordingly all the different Species of *Logarithms*.

The following Converging Series for the Extracting of the Roots of all Equations, whether Simple or Adjected, the late Mr. Wastell of the Navy-Office sent me, and desired me to Publish.

Let $\begin{cases} A = \text{to any Absolute Number.} \\ N = \text{to any Number assumed.} \\ n = \text{to the Exponent of any Power.} \\ p, q, r, s, \&c. \text{ the several Coefficients in any Equation.} \end{cases}$

Then, in any Equation, it will be

$$\pm 1 \times x^n \pm p \times x^{n-1} \pm q \times x^{n-2} \pm r \times x^{n-3} \pm s, \&c. = A$$

And we have universally,

$$x = \frac{A + 1 \times n - 1 N^{n-1} \pm p \times n - 2 N^{n-2} \pm q \times n - 3 N^{n-3} \pm r \times n - 4 N^{n-4} \pm s, \&c.}{\pm 1 \times N^{n-1} \pm p \times n - 1 N^{n-2} \pm q \times n - 2 N^{n-3} \pm r \times n - 3 N^{n-4} \pm s, \&c.}$$

In which Series observe,

- I. That the same Sign in the given Equation, must be in the Theorem or Series respectively.
- II. Any Term which is wanting in the Equation, must be omitted in the Series.
- III. The Quotient at every Operation must be made a new N .
- IV. That it terminates in the Root, or falls into a Series, if it be a *Surd*.
- V. Such Series will be produced (in Number of Places) by a Geometrical Progression from Unity; (whose Ratio is two) each Operation.
- VI. The nearer N is taken to the true Root, the sooner it will converge to it.

And in his Edition of *Parson's Arithmetick*, Book 2. Chap. 21. you may see a further Account of this Series, and the same exemplified in Numbers.

EXTRAMUNDANE Space, is the infinite, empty, void Space, which is by some supposed to be extended beyond the Bounds of the Universe, and consequently, in which there is really nothing at all.

EXTRAVASATED, in Anatomy, is whatever is put or let forth out of the Vessels, as Blood out of the Veins or Arteries, into the Cavities of the Body, &c.

EXTREME and mean Proportion, in Geometry, is when a Line is so divided, that the whole Line is to the greater Segment, as that Segment is to the other.

Or, as *Euclid* expresses it, when 'tis so divided, that the Rectangle under the whole Line, and the lesser Segment, shall be equal to the Square of the greater Segment.

The Invention whereof is as follows.

Let the given Line be $AB = a$, and for the greater Segment put x ; the lesser will be $a - x$.

Then by the Hypothesis

$$a : x :: a - x ::$$

Therefore $a a - a x = x x$, consequently $a a = x x + a x$.

And by adding $\frac{1}{4} a a$ on each Side, to make $x x + a x + \frac{1}{4} a a$ a complete Square,

The Equation will stand thus;

$$\frac{5}{4} a a = x x + x a + \frac{1}{4} a a$$

Now

Now since the latter is exactly a Square, its Root $x + \frac{1}{2}a = \sqrt{\frac{1}{4}aa}$; and by Transposition it will be $\sqrt{\frac{1}{4}aa} - \frac{1}{2}a = x$; which last Equation is a Canon to find x .

For at the Foot of $AB = a$, set at Right Angles $CB = \frac{1}{2}a$: Then draw CA , the Square of which is equal $AB^2 + CB^2 = \frac{1}{4}aa$. And therefore $AC = \sqrt{\frac{1}{4}aa}$; make $CD = CA$.

From whence $CB = \frac{1}{2}a$ being taken as the Case requires, there remains $BD = x$; which transfer into AB , it shall find the Point E , where AB is cut according to *Extreme and Mean Proportion*.

The Synthetical Demonstration whereof, Euclid gives in the 11. c. 2.

This cannot be done exactly in any Numbers; but if you would have it tolerably near, add together the Square of any Number, and the Square of its half, and extract as near as you can the Square Root of the Sum; from whence taking half the whole Number, the Remainder is the greater Part.

EXTUBERANCES, are Swellings forth, or Risings up in the Flesh, or other Parts of the Body.

EXULCERATION, is a Solution of Continuity, proceeding from some gnawing Matter, and in soft Parts of the Body is attended with a loss of their Quantity; it differs from an Abscess which commonly follows a Crisis.

EXUVIE, the Shells, and other Marine Bodies, which are found every where in the Bowels of the Earth, and which were certainly left there at the Universal Deluge, because they are now proved by Dr. Woodward and others, to be the Real Spoils of once living Animals, and not Stones, or Natural Fossils; he very properly calls them the *Exuvie* of Animals.

EYE, is the wonderful Organ of Sight: The Eyes are placed in two large Cavities, which they call *Orbitæ*, hollowed out of the Bones of the Skull on each Side of the Nose; which *Orbitæ* are invested on their Inside with their *Pericranium*, and to it the Feet and Origines of the Muscles adhere firmly. These are the first containing Part of the Eye; the next are the *Palpebræ*, or Eye-lids; which see under *Palpebra*.

The Eye hath four Tunicles; of which one is called *Common*, and the other Three *Proper*.

The Common Tunicle is called *Adnata*, and this springs from the *Pericranium*, and is spread over all the White of the Eye, above the *Sclerotica*, reaching as far as the *Iris*. By this the Eye is kept firmly within its Orbit, from whence it is also called *conjunctiva*. It is of very exquisite Sense, and has many Capillary Veins and Arteries creeping through it, which are most conspicuous in an Ophthalmia, or Inflammation of the Eye. Under this Tunicle are Tendons of the Muscles extended and expanded to the Circumference of the *Iris*, which increases its Whiteness; and some take them for a second Tunicle, calling it *Innominata*.

The *Proper* Tunicles of the Eye are Three, according to the threefold Substance of the Optick-Nerve. For this Nerve (as all the other) consists of Two Tunicles springing from this, the *Dura* and *Pia Mater*, and an inner Marrowy Substance.

From the *Dura Mater* springeth the utmost Coat of the Nerve; and from the Tunicle that is spread next under the *Adnata*, called *Sclerotica* from its Hardness; but in its fore Part where it covereth the *Iris* and *Pupilla*, it is named *Cornea*, from its tran-

sparency, tho' sometimes this latter Name includes the whole Tunicle, as well behind and on the Sides, as before.

That which lieth next under the *Cornea*, is much thinner than it, and is called *Choroides*, from its resembling the Membrane *Chorion*, wherein the *Fœtus* is included in the Womb. Its forepart is otherwise called *Uvea*, because it is somewhat of the Colour of a Grape. This springs from the *Pia Mater*, and is spread from the Bottom or Center of the Eye behind, all over the Eye to the *Pupilla*; to whose Circumference when it is come, it becomes double, making with one Part the *Iris*, with the other the *Ligamentum ciliare*.

On the Inside it is of a dusky Colour (in Man) but blacker on the Outside. But where it makes the *Iris*, it is of divers Colours, resembling the Rainbow, from whence it borrows its Name: Yet in some it is more Blue, in others Black, in others Grey.

This Tunicle is perforated before as wide as the *Pupilla* (or Sight of the Eye) to permit the Rays of visible Species to pass into the Crystalline Humour.

Next unto which Crystalline Humour lies the *Ligamentum ciliare*, the second Part of the duplicated *Uvea*. This consists of slender Filaments, or Fibres (like the Hairs of the Eye-lids) running like so many Black Lines from the Circumference of the *Uvea* to the Sides of the Crystalline Humour, which they encompass and widen, or constringe as there is Occasion, by contracting or opening the *Foramen* of the *Uvea*.

The third Tunicle is made of the Medullar Substance of the Optick Nerve, and is called *Retina*, or *Retiformis* (Net-like;) This seemeth to be the principal Organ of Sight. For as Dr. Briggs well argues, neither the Crystalline Humour, through which the Rays pass much refracted, nor the Tunicle *Choroides*, are at all fit for this Use: For this latter Part (as rising from the *Pia Mater*) cannot communicate the Impressions of the Rays to the Medullar Part of the Brain, which it does not at all touch: Whereas the Medullar Fibres of the *Retina* have Communication therewith, as springing therefrom, and therefore can well perform that Office. The Fibres of this Tunicle are extended from the Bottom or inner Center of the Eye, where the Optick Nerve enters it, as far as the *Ligamentum ciliare*, (to which it affords Animal Spirits for the Continuance of its Motion.) If one take this *Tunica Retina*, and put it into warm Water, shaking it a little, to wash off the mucous Substance that cleaves to it, and then hold it up to the Light, these Filaments will appear very numerous, like the Threads of the finest Lawn.

Next to the Tunicles of the Eyes, are the Humours contained in them to be considered; and these are in Number Three, viz. *Aqueus*, *Crystallinus*, and *Vitreus*. The second weighs as much again as the first, and yet not so much as the third by a sixth Part. The Crystalline is the most dense of Consistence by much; and the Glassy more dense than the Watry.

The *Aqueous* Humour is outermost, being pellucid and of no Colour (as neither are the other Two.) It fills up that Space that is betwixt the *Cornea* and the Crystalline Humour before. If any thickish Particles swim in it, then Gnats, Flies, Spiders-Webs, and the like, will seem to be flying before the Eyes: But if those Particles grow still thicker, and close together, so as to make a Film, and this be spread before the Hole of the *Pupilla*, then is the Sight quite taken away, which Disease is call'd a *Cataract*.

This Humour is very clear and thin, and therefore easily diffusable; but by which way its Expence should be supplied, is difficult to determine. Some think it is fed by the Arteries, out of which this Water issues through I know not what Glands; others derive it from the Nerves, and a third Sort from the Lympheducts.

But Dr. *Anthony Nuck* refutes all these Opinions.

The first, from the Non-appearance of any Glands.

The second, from the no (or at the most a very small quantity of) Liquor that at any time can be observed in the Nerves; whereas if the *Tunica cornea* be prick'd, and all or the greatest Part of this Aqueous Humour be let out, he has found by repeated Experiments, that it will be recruited again in Six Hours Space.

The third Opinion he refutes from the general Office of Lympheducts; which is, to bring back from the Circumference to the Center, and not contrarily, because the Valves wherewith they every where abound, cannot admit of that Motion. Wherefore exploding all these Opinions, he establishes a new one of his own, upon the Score of the new Vessels that he has observ'd to terminate in the *Tunica cornea*, (which he calls *Ductus Oculorum aquosi*, which we shall describe from him by and by) affirming, That these Ducts are the Conduits by which this Humour is fed; and that they supply it ordinarily with several Drops daily, because of the continual Transpiration of it, by Pores looking from within outwards. As to the Particles of this Humour, from several Experiments he has made, he thinks it is demonstrable:

1. That it contains in it a very limpid and pellucid Water.
2. Viscid and Tenacious Particles.
3. A Salt and an Acid.
4. Earthy Particles.
5. That it wants not also its Volatile Spirit.

The *Crystalline Humour* (so called from its being as clearly transparent as Crystal) is placed betwixt the Aqueous and the Vitreous, but not exactly in the Middle or Center of the Eye, but rather towards its Fore-part. It is inclosed in the Bosom, as it were, of the Vitreous Humour, and is flattish on the Fore-side, but rounder behind. It is more bright and thick than either of the other two.

It has been the common Opinion, That it has been inclosed in a proper Membrane, which is called either *Crystallina* from its Transparency, or *Aranea* from its most fine Texture. But Dr. *Briggs*, a very accurate Anatomizer of the Eye, denies any such Tunicle, affirming, That it is merely adventitious when the Humour is exposed for some time to the Air, or is gently boil'd.

As to the Collection or Reception of the Rays of things visible, this Humour is the primary Instrument of Sight; tho', as was said before, the *Tunica Retina* is the Principal as to Perception, because

through it the Rays are communicated to the common Sensory.

The Third and last Humour of the Eye is the *Vitreous*, so called, because it is the like to molten Glass. This is thicker than the Aqueous, but thinner than the Crystalline, and much exceeds them both in Quantity, for it fills up all the inner or hinder Hemisphere of the Globe of the Eye, and a pretty deal towards the lateral Superficies of the former. It is round behind, but hollow in the middle forwards, to receive the Crystalline into its Bosom. This Humour is also said to be separated from the other Two by a proper Tunicle called *Vitreæ*, which the aforesaid Ingenious Author likewise denies.

The Eyes have Arteries from the *Carotides*, which bestow Twigs on their Muscles, and on their Tunicles: and these are accompanied with Veins springing from the Branches of the Jugulars. As for their Nerves, they either assist the Sense of Seeing, and are called the Optick Nerves, which we have reckon'd from the Second Pair; or serve for the moving of them, being inserted into their Muscles; and to this Purpose serve the third and fourth Pair, as some Twigs of the Fifth.

As to the Lympheducts, besides these Vessels, Dr. *Anthony Nuck*, whom we cited but just now, has discovered a fifth Sort of Vessel, called by him, *Ductus oculorum aquosi*, which he believes to recruit the continual Consumption of the watry Humour of the Eye.

He says, They are of an uncertain Number, and may be plainly discern'd to run along the *Tunica Sclerotica*, and to penetrate at length the *Cornea*, where their Orifices have such a Valve as the Ureters have in the Urinary Bladder, or the *Porus bilaris* in the *Vesica fellea*.

In the *Tunica Sclerotica*, and *Cornea*, they are of a dusky Colour, but not before they arrive thereat. They admit of a Probe of a pretty Bigness, and are of a stronger Make than Lympheducts.

He has taken great Pains to trace them to their Origin, but has not yet been able to follow them farther than the Optick Nerve: So that he knows not whether their Rise may be from some Gland not yet discovered, or whether the *Glandula pituitaria* may not send forth some Shoots that constitute these Ducts.

The Action of the Eyes is *Vision*: (See that Word) Which is very well defined by *Diermerbroeck*, viz. That it is a Sense whereby from the various Motion of visible Rays collected in the Crystalline and Vitreous Humours, and darting upon the *Tunica Retina*, the Colours of visible Objects are perceived, with their Site, Distance, Greatness, Figure, and Number; the Medium of which Perception is the Light.

EYE, in a Ship; the Hole wherein the Ring of the Anchor is put into the Shank, is called the *Eye of the Anchor*; and the Compass, or Ring, which is left of the *Strap* to which any *Block* is seized, is called also the *Eye of the Strap*.

EYE, in Architecture, is the middle of the *Volute* of the *Ionick* Chapter, which is cut in the Form of a little Rose.

EYE-LIDS: See *Palpebra*.

FACE, in Architecture, is a flat Member, which hath a great Breadth, and small Projecture; as in Architraves, &c. It is also taken for the Front, or Exterior part of a great Building, which immediately presents it self to view.

FACE of a *Bastion*, or of the *Bulwark*, is the most advanced Part of a Bastion toward the Field, or the Distance comprehended between the Angle of the Shoulder, and the flanked Angle.

FACE of a *Place*, is the Curtain together with the two Flanks raised above it, and the two Faces of the Bastion that look towards one another, and flank'd the Angle of the Tenacle.

FACIES *Hypocratica*, is when the Nostrils are sharp, the Eyes hollow, the Temples low, the Laps of the Ears contracted, and the Lobes inverted, the Skin above the Forehead hard and dry, the Complexion pale, livid, of a leaden Colour, or black, *blanchard*.

FACTITIOUS, signifies made by Art, and is usually taken in opposition to the Word *Natural*: Thus Soap is a factitious Body, or Concrete, made by Art; but *Fullers-Earth* is a natural Concrete, form'd in the Bowels of the Earth by the Author of Nature.

FACTORS: In Multiplication the Multiplicand and Multiplier are often called *Factors*, because they do *Facere Productum*, make or constitute the Product.

FACULÆ, are certain bright or shining Parts, which the Modern Astronomers have sometimes observed upon, or about the Surface of the Sun; but they are but very seldom seen.

FACULTY, in Law, is used for a Privilege or Special Power granted unto a Man by Favour, Indulgence, and Dispensation, to do that which by the Common Law he cannot do.

FACULTY is a Power or Ability to perform any Action. The Ancients usually reckon three sorts of Faculties, *Natural*, *Vital*, and *Animal*; and according to their Doctrine, the

Natural Faculty, is that by which the Body is nourished and augmented, or another like it generated: So that it may be distinguish'd into the three Faculties that perform their Functions of *Nutrition*, *Growth*, and *Generation*: And the first of these was also subdivided into the *Attrahere*, *Retentrix*, *Concoctrix*, and *Expultrix Faculty*.

Vital Faculty, is that which preserves Life in the Body, and performs the Functions of *Pulse* and *Respiration*.

Animal Faculty, is that by which the Soul performs the Functions of *Imagination*, *Reasoning*, *Memory*, *Sense*, and *Motion*.

But these, like most other Distinctions of the Ancient Philosophers, are both useless and ill grounded.

FÆCES: See *Excrements*. 'Tis also taken for the gross Substance that settles after Fermentation, or remains after Distillation.

FAINT, or *Feynt Action*, is as much as *Feigned Action*, viz. such an Action, as though the Words of the Writ be true, yet for certain Causes he hath no Title to recover thereby; whereas in a false Action the Words of the Writ are false.

FAINT Vision: See *Vision*.

FAIT (in Law) a Deed, which is a Writing sealed and delivered, to prove and testify the Agreement of the Parties whose Deed it is; and consists of three principal Points, *Writing*, *Sealing*, and *Delivery*.

By *Writing* is shew'd the Parties Name to the Deed, their Dwelling-places, Degrees, Thing granted, upon what Consideration, the Estate limited, the Time when granted, and whether Simply, or upon Condition, &c.

Sealing, is a further Testimony of their Consents, as appears by these Words, *in witness whereof*, &c. *In cuius rei testimonium*, &c. without which the Deed is insufficient.

Delivery, tho' it be set last, it is not the least; for after a Deed is Written and Sealed, if it be not Delivered, it is to no purpose: And therefore in all Deeds care must be taken, that the *Delivery* be well proved.

FAKE, is one Round or Circle of a Cable quilled up out of the way: The Seamen will ask (as a Cable is veered out) how many *Fakes* there are left, that is, how much is behind unweered out.

FALCATED, the Astronomers say the Moon, or any Planet appears *falcated*, when the enlightened Part appears in the Form of a Sickle, or Reaping-hook; which is while she is moving from the Conjunction to the Opposition, or from New Moon to Full; but from Full to a New again, the enlightened part appears *gibbous*, and the Dark *falcated*.

FALCON: See *Falcon*.

FALCONET: See *Falconet*.

FALL, the Seamen call that part of the Rope of a Tackle which is haled upon, the *Fall*. Also a Ship is said to

FALL off, when being under Sail, she keeps not so near the Wind as she should do. They say also that a Ship hath

FALLS when she is not *Flysb*, but hath Rifings of some Parts of her Decks more than others.

FALLING-SICKNESS: See *Epilepsy*.

FALLOPIAN Tubes, or the *Tuba Fallopiana* in Anatomy, are two slender Vessels situated on each side the *Uterus*, whose use is to afford a Passage to a more subtil part of the *Genitura Masculina* towards the *Ovaria*, to impregnate the Eggs that afterwards are to drop into them from thence; and when they are, as it were, ripen'd, to convey them along their inner Cavity to the *Uterus*.

These *Tube* are about four or five Fingers breadth long, and their Substance is composed of two Membranes which come from the external and internal ones of the Womb; they have the same Arteries, Veins, Nerves, and Lymphatics, as the *Ovaria* have. They take their Name from their first Discoverer *Fallopins*.

FALSE Attack: See *Attack*.

FALSE BRAYE, in Fortification, is a small Mount of Earth four Fathom wide, erected on the Level round the Foot of the Rampart, on that side towards the Field, and separated by its Parapet from the *Berne*, and the Side of the Moat. 'Tis made use of to Fire upon the Enemy, when he is already so far advanced, that you cannot force him back from off the Parapet of the Body of the Place: And also to receive the Ruins which the Cannons make in the Body of the Place.

FALSE Claim, (in Law) is where a Man claims more than his due.

FALSE Imprisonment, is a Trespass committed against a Man, by *imprisoning* him without lawful Cause.

FALSO Judicio, is a Writ that lieth for *false Judgement*, given in the County, Hundred, Court-Baron, or other Courts, being no Courts of Record, be the Plea Real, or Personal.

FALSE Position: See *Position*.

FALSO retorno brevium, is a Writ which lies against the Sheriff, for False returning of Writs.

FALX, in Anatomy, is one of the three Processes made by the doubling of the *Dura Mater*; it rises by a narrow Beginning from the *Crista Galli*, to which it is fastned; and as it approaches the Hinder part of the Head, it grows broader and broader, till it terminate where the *Longitudinal Sinus* ends. It divides the *Cerebrum* into two Hemispheres, near as deep as the *Corpus Callosum*. 'Tis called *Falx* from its resembling a Sickle.

FAMES Canina: See *Gynodes Orexis*.

FANCY: See *Phantasy*, or *Imagination*.

FANTASTICAL Colours, the same with those called *Emphatical*; which see.

FARCIMALIS Tunica, the same with the *Al-lantoides*.

FARTHELL; *Farthelling* is the same with what the Seamen now call *Furl* or *Furling*; which is taking up their Sails and binding them close to the Yards.

FASCIA Lata, vid. *Membranosus Musculus*.

FASCIA, a Term in Architecture, as the *Fascia's* of the Architrave; which are the three Bands of which it is composed.

Vitruvius admits no *Fascia's* in the *Tuscan* or *Doric* Orders; but is not imitated by any in that particular Circumstance.

FASCIAE, in the Planet *Mars*, are certain rows of Spots parallel to the Equator of that Planet, which look like Swathes or Fillets wound round about his Body.

FASCIALIS, a Muscle so called: See *Sartorius*.

FASCIATION, is a binding of Swathes about a Limb that is to be cured.

FASCICULUS: See *Manipulus*.

FASCINES, or *Faggots*, in Fortification, are small Branches of Trees, or Bavin's bound up in Bundles; which being mix'd with Earth, serve to fill up Ditches, to make the Parapets of Trenches, &c. Some of them are dipt in melted Pitch or Tar, and being set on fire, serve to burn the Enemies Lodgments or other Works.

FASHION-PIECES, are those two Timbers which describe the Breadth of the Ship at the Stern, and are the outermost Timbers of the Stern, on each side, except aloft, where the Counters are.

FASTIDIUM Cibi, the same with *Anorexia*.

FASTIGIUM, the same with *Fronton*; which see.

FATT of Animals, the learned Dr. *Grew* takes to be a curdling or coagulating of the Oily Parts of the Blood, either by some of its own Saline Parts; or by the Nitrous Parts of the Air mingled therewith: And hence it is, that some Animals, as Conies, and Field-Hares, grow fat in Frosty Weather, the Oily Parts of the Blood being then ordinarily coagulated with a greater Abundance of Nitrous Parts received from the Air into their Bodies; and for the same Reason it is, that the Fat of Land Animals is hard; whereas that of Fishes is soft, and runs all to Oil, because the Water in which they live, hath but few Nitrous Parts in it, in comparison of Air.

And that which induced him to make these Conclusions, was this Experiment:

He took Oil-Olive, and poured upon it highly rectified Spirit of Nitre, and then digested them together for some Days: By degrees the Oil became of the Colour and Consistence of Marrow, and at last *congealed*, or hardened into a white Fat or Butter, which would dissolve only by the Fire like the Fat of Animals: And he observed, that this Oil hardened into Fat most, upon the Exhalation of some of the Sulphureous Parts of the Spirit of Nitre; which Exhalation was effected by unstopping the Glass, after some time of Digestion, and suffering the Oil to dissolve and thicken divers times by successive Heat and Cold. And from hence he infers, That the *true congealing Principle*, is a Spirit of Nitre separated from its Sulphur: And he says, If we would get this, we might congeal Water in the midst of Summer. *Power of Mixture*, Lett. 1. p. 233.

FAT, in the Sea Phrase, is the same with Broad. Thus, if the *Trussing in*, or *Tuck* of a Ships Quarter under Water be deep, they say the hath a *Fat Quarter*.

FACUS and *Frumen*, the same that *Pharynx*.

FAUCON, a sort of Cannon, whose Diameter at the Bore is $5\frac{1}{4}$ Inches, Weight 750 Pound, Length 7 Foot, Load $2\frac{1}{4}$ Pound, Shot $2\frac{1}{2}$ Diameter, and $2\frac{1}{2}$ Weight.

FAUCONET, a sort of Ordnance, whose Diameter at the Bore is $4\frac{1}{2}$ Inches, Weight 400 Pounds, Length 6 Foot, Load $1\frac{1}{2}$ Pound, Shot something more than two Inches Diameter, and $1\frac{1}{4}$ Pound weight.

FAVUS: See in *Achor*.

FAYLING of Record, is when an Action is brought against one who pleads any Matter or Record, and avers to prove it by Record; and the Plaintiff saith, *Nul tiel Record*, whereupon the Defendant hath a Day given him to bring it in, at which Day he fails, or brings in such a one as is no bar to this Action; this is said to be *failer of Record*.

FAYNT-PLEADER, in Law, signifies a False, Covenous, or Collusory Manner of Pleading, to the Deceit of a third Party.

FEALTY, in Law, signifies an Oath taken at the Admittance of every Tenant, to be true to the Lord of whom he holdeth his Land.

FEAVER, is a Fermentation, or inordinate Motion of the Blood, and a too great Heat of it, attended with Burning, Thirst, and other Symptoms, whereby the Natural Oeconomy or Government of the Body is variously disturb'd.

Feavers, in general, may be divided into two sorts, viz. *Continual*, or *Intermittent*: *Continual Feaver* is that whose Fit is continued for many Days, having its Times of Remission, and of more Fierceness, but never of Intermission.

Intermittent Feavers, commonly called *Agues*, have certain Times of Intermission, beginning, for the most part, with Cold or Shivering, ending in Sweat, and returning exactly at set Periods.

As for the several Subalteran Spices of *Continual* and *Intermitting Feavers*, you will find them particularly enumerated in the Books of Physicians.

FEAZING, at Sea, is the ravelling out of the Cable or any great Rope at the Ends.

FEBRIFUGE, is a Medicine which will cure an intermitting Feaver: Thus we say the *Cortex Peruvianus*, or *Jesuits-Bark*, rightly given, is the most certain *Febrifuge*.

PECULAE, are Dregs that subside in the Squeezing of certain Vegetables; as in *Briomy*, &c.

FEE, *Feudum vel Feodum*, in Common Law, signifies, as Sir Henry Spelman defines it, a Right which the Vassal hath in Land, or some immoveable thing of his Lord's, to use the same, and take the Profits thereof Hereditarily, rendering unto his Lord such Feudal Duties and Services as belong to Military Tenure, the meer Propriety of the Soil always remaining to the Lord.

This Word *Fee* is sometimes used with us for the Compass or Circuit of a Manor or Lordship; also for a Personal Right Incorporeal, as to have the keeping of Prisons in *Fee*. And 'tis taken for a Reward or Wages given to one for the Execution of his Office: As also, for that Consideration given a Sergeant at Law, or Counsellor, or a Physician, for their Counsel and Advice in their Profession.

FEE-ABSOLUTE, or *Fee-simple*, is that of which we are seized in these general Words, *To us and our Heirs for ever*.

FEE-CONDITIONAL, or *Fee-Tail*, is that whereof we are seized to us and our Heirs with Limitation; that is, the Heirs of our Bodies, &c. And this *Fee-Tail* is either *General* or *Special*:

General, is where Land is given to a Man, and the Heirs of his Body.

Fee-Tail Special, is that where a Man and his Wife be seized of Lands, to them and the Heirs of their Bodies.

FEE-FARM, in a Legal Sense, signifies Lands held of another in *Fee*, that is, in Perpetuity to himself and his Heirs, for so much Yearly Rent as it is reasonably worth, more or less, so it be the Fourth Part of the Worth: *Old Tenures*.

FEE-SIMPLE: See *Fee-Absolute*.

FEE-TAIL: See *Fee-Conditional*.

FIELD, in Heraldry, is the whole Surface of any Escutcheon or Shield, being supposed to be overspread with some Metal, Furr, or Colour, and containing the Charge, if there be any. In Blazoning a Coat, you must always begin with the Field: See *Blazon*.

FELLOWSHIP, or *Partnership*, in Arithmetick, is a Rule of very great Use to balance Accounts amongst Merchants and Owners of Ships; for when any Number of Persons put together a general Stock, so that it be required to give to every one his proportional Share of the Loss or Gain:

The *Golden Rule* several ways repeated, will fully answer such Questions.

For, *As the whole Stock* (or general Antecedent): *Is to the Total thereby gain'd or lost* (which is the general Consequent) :: *So each Man's particular Share: Is to his proper Share of Loss or Gain*.

Wherefore let the several Moneys of every Partner be gathered into one Sum, which makes the First Term, the common Gain or Loss the Second; every Man's particular Share the Third, working the *Golden Rule* so many several times as there are Partners.

There be two Parts of this Rule, *without Time*, and *with Time*.

Fellowship without Time.

Example I.

A, B, and C freight a Ship with Wine; viz. A lays out 1342 l. B, 1178 l. C, 630 l. the whole 212 Tun of Wine is sold at 32 l. a Tun. What shall each Man receive?

First find out the Price received, by multiplying 212 by 32, which makes 6784: Then add up the several Stocks, 1342 l. 1178 l. and 630 l. which makes 3150 l. and the Work stands thus;

$$3150 : 6784 :: \begin{cases} 1342 : \text{Answer } 2890,199+ \\ 1178 : \text{Answer } 2537,001+ \\ 630 : \text{Answer } 1356,800 \end{cases}$$

$$\text{Proof } 3150 \quad 6784$$

Example II.

A hath Half a Ship, B a Quarter, C one Sixteenth, and D three Sixteenths: The Master of the Ship brings an Account, and clears 120 l. How much must each Person have?

Account the Ship is 16, and the Gain 120 l.

$$16 : 120 :: \begin{cases} 8 : \text{Answer } 60 \\ 4 : \text{Answer } 30 \\ 1 : \text{Answer } 7,5 \\ 3 : \text{Answer } 22,5 \end{cases}$$

$$16 \quad 120$$

Fellowship with Time.

Example I.

A Ship's Company take a Prize of 300 l. which is to be divided amongst them, according to their Pay and Time they have been on Board: The Officers and Midship-men 5 Months, and the Sailors 3 Months: The Officers one with another, 40 s. per Month; the Midship-men 30 s. per Month; and the Sailors 22 s. per Month: There were 6 Officers, 12 Midship-men, 84 Sailors: What must each Party have of the Prize?

For a general Stock I begin first with the Officers, which are 6, and that multiplied by the Rate of 40 s. gives 240, which multiplied by 5 Months, make 1200 s.

After the same Fashion I find the Midship-men's Stock 1800 s. and the Sailor's 5544 s. All added together make 8544 s. for the whole Stock, and the Work stands thus:

$$8544 : 300 :: \begin{cases} 1200 : \text{Answer } 42,1232 \\ 1800 : \text{Answer } 63,2029 \\ 5544 : \text{Answer } 194,6629 \end{cases} \quad 299,999 = 300$$

Which Decimals reduced, give for

Example II.

A, B, C enter into Partnership, the First of January, for a whole Year; A the same Day disbursed 100 l. whereof he received back again upon the first of April 20 l. B payeth on the first of March 60 l. and more the first of August 100 l. C payeth the first of July 140 l. but the first of October withdraweth 40 l. At the Year's End their clear Gain is 142 l. How much therefore ought every particular Person to have?

Answer.

A 51 l. B 55 l. C 36 l. which makes the whole Gain 142 l. without Consideration of Interest. For A 100 into 3, is 300 l. and 80 into 9 = 720, in all 1020 l. for A: For B, 60 into 10, is 600, and 100 into 5, is 500, in all 1100 for B: For C, 140 into 3, is 420, and 100 in 3, is 300; into all 720 for C.

Now 1020 + 1100 + 720 = 2840 for the General Antecedent, and the Gain 142 for the General Consequent; then the Rule stands thus;

$$2840 : 142 :: \begin{cases} 1020 : \text{Answer } 51 \\ 1100 : \text{Answer } 55 \\ 720 : \text{Answer } 36 \end{cases}$$

142 l.

FELO de se, is he that commits Felony by Murthering of himself.

FELONY, in Common Law, is accounted any Offence, that is in Degree next *Petit-Treason*, and compriseth divers Particulars, as Murther, Theft, killing of a Man's Self, Sodomy, Rape, wilful burning of Houses, and such like.

The Difference between *Felony* and lighter Offences, is this, That the Punishment thereof is Death; yet not in all Cases: For *Petit-Larceny*, which is the stealing of any Thing under Value of Twelve Pence, is *Felony*, because the Indictment against such a one must have these Words *Felonice cepit*; and yet this is not punished by Death, though it be loss of Goods. Any other Exception I know not, but that a Man may call that Felony, which is under *Petit-Treason*, and punished by Death. And of this may be reckon'd two sorts, one lighter, that for the first time may have the benefit of the Clergy; another that may not.

FEMOREUS: See *Crureus*.

FEMUR, and *Femen*, the Thigh, the Part from the Buttocks to the Knee; it is so called *à ferendo* from bearing, because it holds up, and sustains an Animal. It consists but of one Bone, but that the greatest and longest in the whole Body, whose external and fore Part is gibbous or rising, but the internal hinder Part flat and bending. Grammarians make *Femen* to be the hinder fleshy Part; and *Femur* the former outward Part. *Blanchard*.

FEND, (for defend) is the Sea Word for saving a Boat from being dash'd against the Rocks, Shore, or Ship's Sides. This they call *Fending the Boat*; and accordingly

FENDERS with them signifies any Pieces of old Cable Ropes or Billets of Wood, which they hang over the Ship's Side to keep other Ships from rubbing against her: Boats have the same, as also little short Staves, called by this Name of Fenders, with which they keep the Boat from beating and staving against the Ship's Side.

FENESTRA Ovalis, is a Hole in the Barrel of the Ear, whereon the Basis of the *Stapes* stands: It is the Entry to the *Vestibulum*.

FENESTRA Rotunda, is a Hole in the Barrel of the Ear, which leads to the *Cochlea*, and is covered by a fine Membrane, inclosed in a Rift of this Hole.

FEOD: See *Fee*.

FEODARY.

FEOFFEE, is he that is infeoffed, or to whom the Feoffment is so made.

FEOFFMENT, in Common Law, signifies any Gift or Grant of any Honours, Castles, Manors, Messuages, Lands, or other corporeal and immovable Things of like Nature unto another in *Fee-Simple*; that is, to him and his Heirs for ever, by the Delivery of Seisin, and the Possession of the Thing given, whether the Gift be made by Deed or Writing: And when it is in Writing, 'tis called, *The Deed of Feoffment*; and in every *Feoffment*, the Giver is called the *Feoffor*, or *Feofator*.

And the proper Difference between a Feoffor and a Donor, is, that the Feoffor gives in *Fee-Simple*, the Donor in *Fee-Tail*.

FEOFFOR, is he that infeoffs, or makes a Feoffment to another, of Lands or Tenements in *Fee-Simple*.

FERDEMOULIN, a Bearing in Heraldry of this Figure. It represents the Iron-Ink, or Ink of a Mill; and is born by the Name of *Bevertham*, and also by the Name *Turner*.

FERMENTATION, is an easy, gentle, slow Motion of the Intestine or inward Particles of a mix'd Body, arising usually from the Operation of some Active Acid Matter which rarifies, exalts, and subtilizes the soft and sulphureous Particles, as when *Leaven* or *Yeast* rarifies, lightens, and ferments *Bread*, or *Wort*, &c. And this Motion differs much from that usually called *Ebullition* or *Effervescence*, which is a violent boiling and struggling between an Acid and an Alkali, when mix'd together.

Hence any gentle Motion of the Parts of the Blood, or Juices in the Body, occasioned by something which helps to clarify, exalt, and subtilize them, and to reduce them into an Healthful and Natural State, is called by this Name of *Fermentation*, as well as in the expressed Juices of Fruits, &c. *Lemery* confounds *Effervescence* and *Fermentation* together, but I think erroneously.

FERRUGINOUS, that which hath in it something of the Nature of Iron; as those Waters have which are otherwise called *Chalybeate*, such as those of *Tunbridge Wells*, &c.

FERULE, which the Surgeons call *Splinters*, are little Chips or Planes, which are made of different Matter, according to the Nature and Necessities of the Places to which they are applied, as of Barks of Trees, of the Bark of the Herb *Sagapene*, in Latin, *Ferula*; whence they have their Name: They are made of Firr, Paper glw'd together, Leather, &c. which are apply'd to Bones that have been loosened or disjointed, after they are set again. *Blanchard*.

FESSE, one of the Honourable Ordinaries in Heraldry, representing a broad Girdle, or Belt of Honour, which Knights at Arms were anciently girded withal: It possesseth the Center of the Escutcheon, and contains in Breadth one third part thereof; thus.

He beareth *Azure*, a *Fesse Or*, by the Name of *Eliott*.

The *Fesse* is divided into the *Barry*, and the *Clasett* of the *Barrulet*; which see.

Fesse Point, is the very middle Point: See the Word *Escutcheon*.

FEUDE. *Littleton* makes a *Feude* a Tenure; The *Civilians* define it to be a Grant of Lands, Honours or Fees made either to a Man at the Will of the Lord, or Sovereign, or for the *Feudatory's* (i. e. the Person to whom the Grant is made) own Life, or to him and his Heirs for ever; upon Condition that he and his Heirs (in Case where the *Feude* is perpetual) do acknowledge the Giver and his Heirs to be their Lord and Sovereign, and shall bear Faith and true Allegiance to him and his for the said *Tenure*, and shall do such Service to him and his for the same, as is between them covenanted, or is proper to the Nature of a *Feude*.

And hence the last Volume or Tome of the Civil Law, is called the

FEUDES: That is, the Books of Customs and Service that the Subject or Vassal doth to his Prince or Lord for the Lands, Tenures; or Fees that he holdeth of him.

This Part of the Civil Law was not much in use in the Old Emperors Time; but it seems to be acknowledged by *Justinian* in his Novels; where he calls them: Some derive them from the ancient *Clientels* among the *Romans*, before Christ's Time, as *Badeus* in particular: Others bring them from the Practice of *Alexander Severus*, who to encourage them to perpetual Service in his Wars, divided the Lands of the Enemy amongst his Soldiers. So *Lampridius* in the Life of *Alexander Severus*.

But others refer it to the Time of *Constantine the Great*, who settled the Lands out of which the Soldiers had formerly their Wages, on them and their Heirs for ever, provided they found and maintained for ever such a Number of Soldiers.

But let its Original be what or when it will, it came but late into the Body of the Civil Law, and to constitute, as it doth now, a particular Volume of it.

The Compilers or Collectors of it, were *Obertus de Horito*, and *Giraldus Compagistus*, two Senators of *Milan*, who drew it partly from the *Civil Law*, and partly from the ancient Customs of *Milan*, but without any good Form or Order. For the Original of *Feudes*, see *Cujacius*, and Sir *Henry Spelman's Glossary*.

FIBRA Auris, the same with *Lobus Auris*.

FIBRÆ, *Fibres*, by the Anatomists are accounted little round oblong Vessels, and are either *Musculous* or *Nervous*.

The *Nervous*, are such as have no Valves, and by which the Spirits flow conveniently from the Nerves to the several Parts.

The *Musculous Fibres* receive the Blood from the Arteries, and discharge themselves into the Veins, and have a great many Valves: They are called Long, Round, or Oblique, from their Form

and Situation. Some small Threads interwoven with Trees and Leaves, are called *Fibres* too; and so are the small Threads which stick to their Roots, and which fasten the small Roots to the Earth: Also, those Strings which go from the bottom of the bulbous Roots are called by this Name; and in general, it signifies any small Strings which compose the Texture of any Part of an Animal or Vegetable Body.

FIBULA, a Term in Surgery, as the Ancients mention it; for if there be a Wound in the Flesh, says *Celsus*, that gapes, and cannot easily be closed, it is improper to sew it, you must apply a *Fibula*: But because this way of closing the gaping of Wounds by *Fibula's* was usual amongst the Ancients, they have not been at all solicitous in describing either their Matter or Form. *Guido* tells us, That they made these *Fibula's* of Iron Circles as it were, or Semicircles crooked backward on both sides; the Hooks whereof being fastened on both sides to the gaping Wound, answered exactly one another; but since this must be an insupportable Pain to the poor Patient, it is hardly credible, that they meant any such thing by their *Fibula's*.

The Opinion of *Fallopins* is more probable, who tells us, That it was only sewing up the Wound with a Needle and Thread, which is commonly used at this Day.

Sanctorius writes thus, We need not discourse much of *Fibula's*, since the use of them is almost out of doors; and tho' the Ancients have not describ'd them, yet they forbear not to acquaint us how to use them, as *Argentarius* falsely imagines: For not only Physicians, but some of the Ancients knew the Form of them, since *Corn. Celsus* has inform'd us, That *Fibula's* as well as *Sutures*, were made of a Needleful of soft untwisted Silk or Thread, where-with they sewed the gaping Lips of the Wound together.

Some call *Acia*, or this Needleful of Thread, *Vinculum*, *Ligatura*, *Colligatio*, *Obligatio*, *Ligamentum*; all which signifies tying or binding. Whoever would be further inform'd in this Particular, may consult the Incomparable *Rhodius*, in his Discourse about *Acia*. *Blanchard*.

FIBULA, or *Focile minus*, in Greek *πρόγον*, is the lesser and outer Bone of the Leg; it seems to join the Muscles of the Leg like a Button or Clasp, in Latin *Fibula*; it is the hinder Bone betwixt the Knee and the Feet, smaller than the other Bone called *Tibia*, and fastened outwardly to it, as the Bone called *Radius* in the Arm is to the Cubit; its round Head does not extend as far as the Knee upward, but receives the lateral Knob of the *Tibia* in a small Sinus which it hath in its inner Side; downwards it goes farther than the other Bone called *Tibia*, and therefore is altogether as long a Bone as that, tho' much smaller. They part in the Middle, because the Muscles that extend the Feet and Toes are placed there; in which Interval a slender, broad, membranous Ligament joins them together lengthways: It is joined likewise to the *Tibia*, by its lower End, which is received into a small Sinus of it; and then it extends into a large Process which forms the outward Ankle, embracing the external Side of the *Atragalus*.

FICHANT Flank: See *Flank*.

FICHANT Line of Defence: See *Fixed Line of Defence*.

FICUS, are the external Protuberances of the *Anus*, otherwise called the *Piles*. They are also sometimes called *Mariscae*, and *Sycoses*.

FIDD, an Iron Pin used at Sea to splice or fasten Ropes together. 'Tis made tapering and sharp at one end. There are also Fidds of Wood, which are much larger than the Iron ones. The Pin also in the Heel of the Topmast, which bears it upon the Chets-trees, is called a Fidd. There is also a *Fidd Hammer*, whose Handle is a *Fidd*, or made tapering into that form.

FIELD-Port: See *Fortin*.

FIERI facias, is a Writ Judicial that lieth at all times within the Year and Day, for him that hath recovered in an Action of Debt or Damages, to the Sheriff, to command him to levy the Debt or the Damages of his Goods against whom the Recovery was had.

FIFTH, a term in Musick, the same with *Diapente*; which see.

FIGHTS, in a Ship, are the waste Cloths which hang round about her in a Fight, to hinder the Men from being seen by the Enemy; and they call those Bulkheads afore or abaft the Shift which are put up for Men to stand secure behind and Fire on the Enemy in case of Boarding, *Cloze Fights*.

FIGURAL, or *Figurate Numbers*, are such as do or may represent some Geometrical Figure, in relation to which they are always considered; and are either *Lineary*, *Superficial*, or *Solid*; which see.

FIGURATE Descant: See *Descant*.

FIGURATIVE Speeches, are ways of expressing our selves, in which we use an improper Word, which Custom has applied to another Subject.

FIGURE, in Physicks or Natural Philosophy, is the Surface or terminating Extrems of any Body.

FIGURE, in Conicks, according to *Apollonius*, is the Rectangle made under the *Latus Rectum* and *Transversum* in the *Hyperbola* and *Ellipsis*.

FIGURE, in Geometry, is a Space compassed round on all Sides, and are either *Rectilineal*, *Curvilineal* or *Mixt*.

FIGURES, in Arithmetick, are the 9 Digits or Numeral Characters, 1, 2, 3, 4, 5, 6, 7, 8, 9, and 0.

FIGURES in Discourse, are extraordinary ways of Speaking, different and remote from such as are Ordinary and Natural, and they are either *Grammatical* or *Rhetorical*.

FIGURES Curvilineal, are such as have their Extremities crooked, as *Circles*, *Ellipses*, &c.

FIGURES Grammatical, are used in Construction, when we digress from the common and ordinary Rules, as by omitting some Word; and leaving it to those to whom we speak, to supply it.

FIGURES Mixt, are such as are bounded partly by right Lines, and partly by crooked ones, as a *Semicircle*, *Segment of a Circle*, &c.

FIGURES Plane, (or *Plane Surfaces*) are such as are terminated and bounded by right Lines only.

FIGURES Rectilineal, are those that have their Extremities all right Lines, as *Triangles*, *Quadrilaterals*, &c. *Polygons* Regular, Irregular, &c.

FIGURES Rhetorical, serve sometimes to express the Commotions and violent Agitations of the Mind in our Passions or warm eager Discourses; and sometimes only to embellish and adorn our Speech, or to move the Audience the more pathetically.

FILACER, is an Officer in the *Common-Pleas*, so called, because he Files those Writs whereon he makes Process. There are fourteen of them in their several Divisions and Counties. They make out all original Process, as well Real, as Personal and Mixt; and in Actions merely Personal, where the

Defendants be Return'd or Summon'd, there goeth out the Distress infinite until Appearance: if he be Returned *nihil*, there Process of *Capias* infinite, if the Plaintiff will; or after the third *Capias* the Plaintiff may go to the *Exigent* of the Shire, where his Original is grounded, and have an Exigent or Proclamation made.

FILAMENTS, little, thin, slender Rags like Threads, such as sometimes appear in Urine: Also the small Fibres or Threads which compose the Texture of the Muscles, &c. or other Parts of any Animal or Vegetable Body, are sometimes called by this Name.

FILE, or *Label*, in Heraldry is of this Form, tho' sometimes of more and sometimes of fewer Points. 'Tis sometimes born as a Charge in a Coat Armour, of which *Gwylim* gives many Instances: But 'tis usually the difference or mark of Distinction which the Elder Brother bears in his Coat during his Father's Life.

Some distinguish *File* and *Label*, calling the File the upper Horizontal Line, and the Label the Point that issues from it.

FILE, in Military Language, is a row of Men standing one behind or below another from the Front to the Rear.

FILET, a little Member in Architecture, which appears in the Ornaments and Mouldings, and is otherwise called *Lisfel*.

FILLET, in Heraldry, is a 4th part of the Ordinary called a *Chief*, and is placed in the chief Point of the Escutcheon.

FILTRATION, is the passing a Liquor (in order to its Purification) through a woollen Cloth, or usually through a Coffin of brown Paper; and this the Chymists mean when they direct you to *Filtrate* any thing.

The most exact way of Filtration, is to take a long piece of linnen or woollen Cloth, and dipping one end of it in the Liquor to be Filtrated, hang the other (which must be the longer end) over the brims of the Vessel, and you will see the Liquor rise up and run over the brims through the Body of the *Filtre*; and it will do so very pure, and free from all Dregs.

The Cause of the ascent of Liquors in the *filtre*, is generally said to be, that the Liquor swelling those parts of the *filtre* that touch it, by entering into the Pores of the Threads of which it is composed, doth raise them up, make them touch, and wet those that are next above them; and these again the next Threads, and so on till you come to the brims of the Vessel, and then the Liquor runs over and descends in the other part of the *Filtre*, which hangs down, by its own natural Gravity.

But 'tis certain that in very slender glass Pipes, whose Cavities are not much larger than Hairs, Water or any Fluid (but Quicksilver) will ascend in them to a considerable height, as soon as ever you dip their ends into it; and in Pipes or Tubes of much larger Bores, the Liquor will be higher (something) within the Tube than without it. And yet here the swelling of the parts of the glass Pipe cannot be urged as the Reason for the ascent of the Water in them.

If also you fill a Pipe of a moderate Bore with the powdered *Calx* of a Metal, (as Mr. Boyle tried it with *Minium* or red Lead) and then immerse the lower end of this Tube in Water, the Water shall gradually arise in the Tube till it attain the height of 30 or 40 Inches; and yet it cannot be said that any of the Particles of this Metalline Powder, are swelled at all by the Water.

Therefore

Therefore the true Cause of the ascent of Water in a Philtre, is probably this: That every Philtre being composed of a great Number of long small solid Bodies, which lie very close together, the Air getting in between them, loses much of its pressure, and cannot gravitate there so strongly as it doth on the Fluid without them: Wherefore the Parts of the Water between the Threads of the Filtrè must be pressed upwards, and ascend till they come so high, as by their Weight to counter-balance the general pressure on the other Parts of the Surface of the Water.

FIMBRIATED, a Term in Heraldry, signifying that an Ordinary is edged round with another of a different Colour, as thus.

He beareth Or, a Cross, Patee Gules Fimbriated Sable.

FINAL Causes, are such great, wise, and good Ends as God Almighty, the Author of Nature, had in Creating and Proportioning, in Adapting and Disposing, in Preserving and Continuing, all the several Parts of the Universe. On this Subject the Honourable Mr. Boyle hath a very good Discourse: And that good Mathematician Mr. Keil of Oxford, in his Refutation of Burnet's *Theory of the Earth*, shews that Final Causes are the best Principles for Men to regulate their Philosophical Theories and Speculations by.

FINE, in common Law, hath divers Applications; for sometimes 'tis used for a formal or ceremonious Conveyance of Lands or Tenements, or of any Things inheritable, being in *esse tempore finis*, to the end to cut off all Controversies. Others define it to be a final Agreement had between Persons concerning any Lands or Rent, or other thing whereof any Suit or Writ is between them hanging in any Court. A Fine hath in it five essential Parts.

1. The Original Writ taken out against the Cognitor.
2. The King's Licence, giving the Parties Liberty to accord; for which he hath a *Fine* called the *King's Silver*, being accounted a Part of the Revenue of the Crown.
3. The Concord it self, which thus beginneth *Et est concordia talis*, &c.
4. The Note of the *Fine*, which is an abstract of the original Concord, and beginneth in this manner: *Scil. Inter R. Querentem* &c. *S. E. uxorem ejus, desorciante*, &c.
5. The Foot of the *Fine* which beginneth thus: *Hec est finalis concordia facta in curia Domini Regis apud Westmonasterium a die Pasche in quindecim dies, anno*, &c. So as the Foot of the *Fine* includeth all, containeth the Day, Year, and Place, and before what Justice made.

This Word *Fine* sometimes signifies a Sum of Money paid for an Income to Lands or Tenements let by Lease; and sometimes, an Amends, Pecuniary Punishment or Recompence upon an Offence committed against the King and his Laws, or against the Lord of the Mannor.

FINE annullando levato de Tenemento quod fuit de antiquo dominio: Is a Writ to the Justices for the dissanulling of a *Fine* levied of Lands holden in Ancient Demesne to the Prejudice of the Lord.

FINE capiendo pro terris, &c. Is a Writ lying for one that upon Conviction by a Jury, having his Lands and Goods taken into the King's Hands, and his Body committed to Prison, obtaineth Favour for

a Sum of Money, &c. to be remitted his Imprisonment, and his Lands and Goods to be re-delivered unto him.

FINE force, signifies an absolute Necessity or Constraint not avoidable; as when a Man is constrained to do that which he can no way avoid, we say, He doth it *de fine force*.

FINE levando de Tenementis tenentis de Rege in Capite, &c. is a Writ directed to the Justices of the Common Pleas, whereby to licence them to admit of a *Fine* for Sale of Lands holden in *Capite*.

FINE non capiendo pro pulchre placitando, is a Writ to inhibit Officers of Courts to take *Fines* for fair Pleading.

FINE pro redisseisina capienda, &c. is a Writ that lieth for the Release of one laid in Prison for a *Resseisin*, upon a reasonable *Fine*.

Fines for Alienation, are reasonable *Fines* paid to the King by his Tenants in Chief, for Licence to Alien their Lands.

FINITE, is what hath fix'd and determined Bounds or Limits set to its Power, Extent or Duration.

FINITOR, the same with *Horizon*; and 'tis so called, because the Horizon finiteth or terminates your Sight, View, or Prospect.

FIRMAMENT, by some Astronomers is taken for the Orb of the Fixed Stars, or an Eighth Heaven: But more properly, 'tis that Space which is expanded or arched over us above in the Heavens.

FIRMNESS or *Solidity*, Mr. Boyle describes to consist principally in this, that the Particles composing such Bodies as we call Firm or Solid, are pretty gross; and either are *so much at Rest*, or are *so Intangled* one with another, that there is a mutual Cohesion of their Parts; and that they cannot flow from, slide over one another, or diffuse themselves every way from one another, as the Parts of Fluid Bodies can; and consequently the Figure of Firm or Solid Bodies, ought rather to be attributed to the Connexion of the Parts that compose them, than to the Impressions of outward Bodies.

And in his History of Firmness, he proves by Experiments, and good Considerations upon them, the several Parts of the above given Description. As,

1. He shews the *Grossness* of Parts are (*cateris paribus*) requisite to Firmness or Solidity, because *Minutens* he had before proved, was necessary to the Parts of Fluid Bodies.

2. Rest also, and *juxta Position* of Parts, he demonstrates by many Experiments, are in a Degree absolutely requisite to produce this Effect. And,

3. The Pressure and Weight of the Incumbent Atmosphere he judges contributes much toward it, because of the strong Adherence of two Pieces of Polished Glass, or Marble together, in the open Air, which will immediately separate in the exhausted Receiver.

4. The Texture of the Bodies, and the Figures of their Parts many contribute much to this Effect; as if they be of an hooked Form, or any way entangled one in another, they must be disjoined with difficulty, and consequently will be in the Form of a Solid.

And 'tis a very surprizing Experiment, that two Parts of Spirit of Wine, mixed with one of Spirit of Hartshorn, or Urine (both highly rectified) will, in a Minute, unite into a consistent Body, or white *Coagulum*; which some call *Offa alba*.

FIRST MOVER: See *Primum Mobile*.

FISHES, are Pieces of Timber used to strengthen the Masts or Yards aboard of a Ship, when they begin to fail in a Stress of Weather. They both nail the Fishes on with Iron Spikes, and also *would* them, as they call it; that is, winding Ropes hard round about

about them. There is also a Tackle called

The Fish, which hangs at the End of the *David* by the *Sirap* of the *Block*, in which is the Runner of the *Fish-hook*; by which Means the Fluke of the Anchor is haled up to the Ship's *Bow*, or *Chainsaille*. Perhaps this Tackle was called a *Fish*, from that which the Ancients called the *Dolphin*, which was a pointed and vastly heavy Piece of Iron, and which they used to heave up by a Tackle to a good Height, and then, when they come near enough to the Enemy's Ship, let it fall at once, which would break or pierce a Hole through the Bottom of the Enemy's Vessel, and sink her.

FISSURA Ossis, is the Term for a Cleft or a Fracture of a Bone lengthways.

FISSURES, the several *Layers* or *Strata*, of which the Body of our Terrestrial Globe is composed, are distinguished from one another, and divided Horizontally or Parallely by some Interruptions which they call *Fissures*; and these are intersected again by other *Fissures*, which, by reason of their Situation, are called *Perpendicular Fissures*: See *Woodward's Nat. Hist. of Earth*, P. 10.

FISTULA, is a long Cavity, strait or winding about, in any Part of the Body, being a narrow and callous Ulcer of difficult Cure, proceeding usually from an Aposteme. *Blanchard*.

Fistulae differ from winding Ulcers in this, that *Fistulae* are callous and hard, but Ulcers are not. *Blanchard*.

FISTULA Lachrymalis, is when the *Punctum Lachrymale*, the little Hole in the Bone of the Nose, through which the Liquid Matter of the Tears passes to the Nostils; is grown hard and callous from an Ulcer of the *Carnicula* (which are *Glandules* placed at the greater Corners of the Eye) by which means there happens a continual Defluxion of Tears. *Blanchard*.

FISTULA Pulmonis, in some Writers, is the same with the *Apera Arteria*.

FISTULA Sacra, is that Part of the Back-bone which is perforated. *Blanchard*.

FISTULA Urimaria, the same with the *Urethra*.

FITCHEE, the Term in Heraldry, when the lower Part of any Cross is sharpened into a Point, thus.

Azure a Cross potent Fitchee.

FIXED Line of Defence, in Fortification, is drawn along the Face of the Bastion, and terminates in the *Courline*.

FIXED Signs of the Zodiack, according to some, are *Taurus*, *Leo*, *Scorpio*, and *Aquarius*. And they are so called, because the Sun passes them respectively in the Middle of each Quarter, when that particular Season is more settled and fixed than under the Sign that begins or ends it.

FIXITY, or *Fixtness*, is the opposite Quality to *Volatility*; and the Excellent Mr. Boyle reckons these Qualifications following to be the most conducing for the rendring of a Portion of Matter *Fixt*.

1. That its Corpuscles be singly of a proportionate large Bulk or Grossness, so as to be too big and unwieldy to be carried up by Heat, or to be buoyed up in the Air.

2. That these Corpuscles have also a proportional Degree of Ponderousness or Solidity.

3. That their Figure and Make also be such as renders them unfit for Avolation, either from their Shape, being branched, crooked, hooked, &c. so that they be entangled one with another, and cannot easily be extricated, loosened, or separated: And therefore whatever will produce these three Requisites in any Body, will render it of a fixt Nature.

4. To these may be added also the bringing the Corpuscles or Particles of any Body to touch one another in a considerably larger Part of their Surface.

FIXT Nitre, is Salt-petre melted in a Crucible, and then made to flame, by throwing in a Spoonful of Powder of Coals; and this is repeated till no Flame nor Denotation arise: After this 'tis cooled, powdered, and dissolved in Water, and then evaporated into a fine white Salt. 'Tis a Salt much like that of Tartar, and is used, like it, to help draw Tinctures out of Vegetables. Some Chymists give it the Name of *Alkabeft*, because 'tis, as they say, a kind of Universal Dissolvent. If this Salt be exposed to the Air in a cool Place, it will all dissolve into a Water, or as they say, run *per Deliquium*; and this is called, *The Liquor of Fixt Nitre*.

FIXED Stars, are such as do not, like the Planets or *Erratick Stars*, change their Positions or Distances in respect of one another.

Because these *Fixed Stars* have no sensible Parallax arising from the Annual Motion of the Earth, they are justly esteemed to be at such an immense Distance, as to have no sensible Effect on our Earth.

The Honourable Mr. Roberts hath a pretty Discourse about the Distance of the *Fixed Stars*, which is published in *Philos. Trans. N. 209*. The Substance of which is as follows.

Since the *Pythagorean System* of the World has been revived by *Copernicus*, (and now by all Mathematicians accepted for the *True one*) there seemed Ground to imagine, that the Diameter of the Earth's Annual Course (which according to our best Astronomers, is at least 40000 Times bigger than our Earth's) might give a sensible Parallax to the *Fixed Stars*, though the other could not, and thereby determine their Distance more precisely.

But though we have a Foundation to build on, so vastly exceeding that of the Ancients, there are some Considerations may make us suspect, that even this is not large enough for our Purpose.

Mr. *Hugens* (who was very exact in his Astronomical Observations) tells us, he could never discover any visible Magnitude in the *Fixed Stars*, tho' he used Glasses which magnify the apparent Diameter above a hundred Times.

Now, since in all likelihood the *Fixed Stars* are Suns (perhaps of a different Magnitude) we may, as a reasonable Medium, presume they are generally about the Bigness of our Sun.

Let us then (for Example) suppose the *Dog-star* to be so.

The Distance from us to the Sun being about a hundred Times the Sun's Diameter, it is evident, that the Angle under which the *Dog-star* is seen in Mr. *Hugens*'s Telescope, must be near the same with the Angle of its Parallax to the Sun's Distance, or Semidiameter of the Earth's Annual Course; so that the Parallax to the whole Diameter can be but double such a Quantity, as even to Mr. *Hugens*'s nice Observation, is altogether insensible.

The Distance therefore of the Stars seems hardly within the reach of any of our Methods to determine; but from what has been laid down, we may draw some Conclusions that will much illustrate the prodigious vastness of it:

1. That the Diameter of the Earth's Annual Orb (which contains at least 160 Millions of Miles) is but as a Point in Comparison of it; at least it must be above 6000 Times the Distance of the Sun: For if a Star should appear through the aforesaid Telescope half a Minute broad (which is a pretty sensible Magnitude) the true apparent Diameter would not exceed 18 third Minutes, which is less than the 6000 Part of the apparent Diameter of the Sun, and consequently the Sun's Distance not the 6000 Part of the Distance of the Stars.

2. That could we advance towards the Stars 99 Parts of the whole Distance, and have only $\frac{1}{100}$ Part remaining, the Stars would appear little bigger to us than they do here; for they would shew no otherwise than they do through a Telescope, which magnifies an hundred-fold.

3. That at least Nine Parts in Ten of the Space between us and the *Fixed Stars*, can receive no greater Light from the Sun, or any of the Stars, than what we have from the Stars in a clear Night.

4. That Light takes up more time in travelling from the Stars to us, than we in making a *West-India Voyage* (which is ordinarily performed in six Weeks:) That a Sound would not arrive to us from thence in 50000 Years, nor a Cannon Bullet in a much longer Time. This is easily computed by allowing (according to Sir *Isaac Newton*) ten Minutes for the Journey of Light from the Sun hither; and that a Sound moves about 1200 Foot in a Second. But Sir *Isaac Newton* doth not allow above 968 Feet for the Motion of Sound in a Second of Time: And the *Florentine Academicks* make it about 1000 Feet.

Our Learned and Accurate Mr. *Flamsteed* saith, he hath discovered a sensible Parallax of the Earth's Annual Orbit in respect of the *Fixed Stars*; of which he published an Account in a Letter to Dr. *Wallis*, in the Year 1698, which is Printed in the Third Volume of *Wallis's Mathematical Works in Latin*.

FLAGS, on Board a Ship, are Colours, Ancients, or Standards which the Admirals of a Fleet bear on their Tops. The Admiral in Chief carries his on his *Main-Top*, the Vice Admiral his at the *Fore-Top*, and the Rere-Admiral his at his *Misken-Top*.

FLAIR, the Seamen say that the Work doth *flair over*, when a Ship being housed in near the Water, a little above that the Work hangs over a little too much, and so is let out broader aloft than the due Proportion will allow.

FLAMMA *Vitalis*; some do suppose that there resides in the Heart of Animals such a fine and kindled, but mild Substance, as they call a *Vital Flame*; and to its Preservation they judge the Air taken in by Respiration to be necessary, as it is to the Conservation of ordinary Flame.

The Excellent Mr. *Boyle*, by several Experiments purposely made in his exhausted Receiver, about the Relation between Flame and Air, found that the Vital Flame of Animals (if the Life may be so called) did survive or outlast the Flame of Spirit of Wine, or of a Wax or Tallow Candle; since the Animals would remain alive and well for 3 or 4 Minutes after the Receiver was evacuated, whereas no common Flame would last there one Minute.

The Light of Glow-worms that Noble Gentleman found also would presently be destroyed by the Exhausting Motion of the Air, by his Engine, as it would be re-produced again by its Admission into the Receiver.

FLANCH, an Ordinary in Heraldry, formed by an Arch-line, which begins at the Corners of the *Chief*, and ends in the *Base* of the *Escutcheon*, thus.

He beareth *Ermin*, two *Flanches Vert*.

Flanches are always born by Pairs: The *Flanch* bends in more than the *Flank*.

FLANK, in Fortification, is that Part of the Bastion which reaches from the Courtine to the Face, and defends the opposite Face, the Flank, and the Curtain.

There is also the Oblique or Second Flank, which is that Part of the Courtine where they can see to scour the Face of the opposite Bastion; and is the Distance between the Lines *Razant* and *Fitchant*.

The *Low*, *Covered*, or *Retired Flank*, is the Platform of the Casemate, which lies hid in the Bastion.

The *Flanks* of a Battalion, or an Army are its Sides.

They use also the Word to *Flank* an Army; that is, to discover and fire upon its Sides.

Any Fortification which hath no Defence right forwards, is on that Account Faulty and Defective; and to render it compleat, one Part must be made to flank another. The Courtine therefore is the strongest Part of any Fortified Place, because it is flanked by the two *Flanks* at its Ends.

FLANK, is also a Term of War, signifying one Side of a Battalion of an Army; as to attack the Enemy in Flank, is to discover and fire upon them on one Side.

FLANK of the Courtine, or *Second Flank*, is that Part of the Courtine between the Flank and the Point, where the *Fitchant Line of Defence* terminates.

To FLANK, in general, is to discover and fire upon the Side of any Place; but to

FLANK a Place, is to dispose a Bastion, or other like Work, in such a manner, that there shall be no Part of it but what is defended; so as you may from thence play upon Front and Rear: For any Fortification that hath no Defence, but just right forwards, is Faulty; and to render it compleat, one Part ought to be made to Flank the other: Hence the Courtine is always the strongest Part of any Place, because 'tis flanked at each End.

Fitchant FLANK, is that from whence a Cannon playing, fireth its Bullets directly in the Face of the opposite Bastion.

FLANK *Razant*, is the Point from whence the Line of Defence begins, from the Conjunction of which with the Courtine, the Shot only razeth the Face of the next Bastion, which happens when the Face cannot be discovered but from the Flank alone.

Retired FLANK, or the *Lower* or *Covert Flank*, is that Exterior Part thereof which advanceth to secure the Innermost; which advanced Part, if it be rounded, is called the *Orillon*; so that this *Flank Retire*, as the *French* call it, is only the Platform of the *Casemate*, which lies hid in the Bastion.

Simple FLANKS, are Lines which go from the Angle of the Shoulder to the Courtine, and whose

principal Function is the Defence of the Moat and Place.

FLANK'D, or *Double Tenaille*: See *Tenaille*.

FLANKING Line of Defence: See *Rasant Line of Defence*.

FLANKING Angle: See *Angle*.

FLANK'D Angle, is the Angle formed by the two Faces of the Bastion, and so forms the Point of the Bastion.

FLASK, is in Heraldry an *Ordinary* made by one Arch-line drawn downwards to the *Base Point*: It seems to be the Representation of a Bow, when bended; and they are always born double, thus,

The Field is Or, Two Flasks Azure.

Some Heralds say, The *Flask* is a Reward for a Man of Virtue and Learning, who hath deserved well of his Prince in an Embassy.

FLAT; to *flat* a Ship, is to hale in the Fore-sail by the Sheer, as near to the Ship's Sides as may be, which is called, *Flatting in the Fore-sail*. This is done when a Ship will not fall off from a Wind without it, though the Fore-sheet was haled aft.

FLAT Bastion: See *Bastion*.

FLAT-BOTTOM'D Moat: See *Moat*.

FLAT Crown: See *Corona*.

FLATUS, are Effervescencies excited in the Body from Wind let in, or from Flatulent Meats, or from the Bile and Pancreatick Juice mixed together, whence Wind and Noise.

FLEDWIT, a Term in Law, signifying a Discharge or Freedom from Amerciaments, where one having been an Outlaw'd Fugitive, cometh to the Peace of our Lord of his own accord.

FLEMESWITE, in Law, signifies the Liberty to challenge the Cattel, or Amerciaments of your Man, a Fugitive.

FLESH, of any Animal Body, is by Anatomists defined to be a Similar and Fibrous Part, soft and thick: Of this they reckon five Kinds.

1. Muscular, Fibrous, or Fistular Flesh, such as is the Substance of the Heart, and other Muscles.

2. *Parenchymous* Flesh, as that of the Lungs, Liver, and Spleen was thought to be by the Ancients; but since the Use of Glasses 'tis plainly discovered that there is no such thing as a *Parenchyma*, properly speaking, but that all the *Viscera*, as well as other Parts of the Body, are *Vascular*, and nothing but *Plexus*, or Net-work of small Vessels and Canals.

3. *Viscerous*, such as the Flesh of the Stomach and Guts.

4. *Glandulous*, as that of the *Tonsils*, the *Pancreas*, the Breasts, &c.

5. *Spurious*, so they call the Flesh of the Lips, Gums, the *Glands of the Penis*, &c. because 'tis of a Constitution different from all the rest.

FLEXOR Carpi *Radialis*, is a Muscle of the Wrist, which ariseth Tendinous from the Internal Extuberance of the *Os Humeri*, becoming Flethy, adheres strictly to the *Pronator Radij-Teres*, and in half its Oblique Progress to the *Carpus* it becomes a flat Tendon, which passeth over the Annular Ligament, and is inserted to the upper Part of the *Os Metacarpi*, which sustains the Fore-finger: Its Name shews its Use.

FLEXOR Carpi *Ulnaris*, is a Muscle of the Wrist, which arises Tendinous from the same Tubercle of

the Shoulder-bone, with the *Flexor Radialis*; as also from the superior and external Part of the *Ulna*, where the *Musculus Perforans* doth arise; and continuing Flethy according to the length of the *Ulna*, is partly inferred by a short strong Tendon into the fourth Bone of the *Carpus*, and partly into the *Os Metacarpi*, which sustains the Little-finger. Its Name declares its Use.

FLEXOR *Secundi Internodii Digitorum Pedis*: See *Perforatus Pedis*.

FLEXOR *Tertii Internodii Digitorum Pedis*: See *Perforans*.

FLEXOR *Tertii Internodii*, or *Longissimus Pollicis*, is a Muscle of the Thumb, which is observed to have a twofold Beginning;

The First and Superior of which ariseth acutely from the Internal Extuberance of the *Os Humeri*, between the *Perforatus* and *Perforans*, becoming a Flethy Belly, and then Tendinous, joins with the middle Tendon of its other larger Head.

The Second or Inferior Origin of this Muscle (is that Part of it which is commonly described) arising with a double Order of Flethy Fibres for some space on the *Radius*, from immediately below its Superior Part, which uniting in a middle Line or Tendon (not unlike the *Fibrilla* of a Feather, joining to their *Stamina*) which passing over the Articulation of the *Carpus*, becomes entirely Tendinous, as it runs over the *Flexor primi & secundi Internodii* to its Implantation at the Superior Part of the third Bone of the Thumb.

FLEXOR *Pollicis Brevis*, is a Muscle of the great Toe, which ariseth from the Superior Part of the *Os Cuneiforme Medium*, and running over the Termination of the *Musculus Peroneus*, is implanted into the *Ossa Sesamoidea* of the Great Toe, who are likewise tied to the Superior Part of the second Bone of the said Toe which bends it.

FLEXOR *Pollicis Pedis Longus*, is a Muscle of the Great Toe, which is a direct Antagonist to the *Extensor Longus*: It arises opposite to it from the Back-part of the *Fibula*, with a double Order of Flethy Fibres, running to a middle Tendon (like the *Flexor tertii internodii Pollicis Manus*) which ceaseth to be Flethy as it passes over the Juncture, and runs through a Channel on the Internal Part of the *Os Calcis*, under the Tendon of the *Musculus Flexor Digitorum Longus Perforans*, over the *Flexor Pollicis Brevis*, and is inserted to the upper End of the second Bone of the Great Toe: Its Use is to bend the Toe.

FLEXOR *primi & secundi Ossis Pollicis*, is a large disgregated Flethy Muscle, arising from the *Ligamentum Transversale Carpi*, Bones of the *Carpus*, at the Basis of the *Mons Lunae*, and *Os Metacarpi* of the Middle Finger, whence it passes to its Insertion partly to the *Ossa Sesamoidea* of the second Internode, and partly to the first Bone of the Thumb: This (as *Vesalius* writes) may be divided into Three. Its Actions are various, according to the Diversity of its Series of Fibres; so it bends the first or second Bones of the Thumb, either directly or obliquely towards the *Carpus* and *Vola Manus*.

FLIE, that Part of the Mariner's Compass on which the 32 Winds are drawn, and to which the Needle is fastened underneath, they call the *Flie*.

FLOATING-BRIDGE, is a Bridge made in form of a Redoubt, consisting of two Boats covered with Planks, which ought to be so solidly Framed, as to bear both Horse and Cannon.

FLOND, or *Figurative Descant*, a Term in Music. See *Descant*.

FLOOR,

FLOOR, in a Ship, strictly taken, is so much only of her Bottom as she doth rest upon when she lieth on Ground; and therefore those Ships that have long, and withal broad Floors, lie on the Ground with most Security, and are not apt to *Seel* (that is, to fall on the one Side;) whereas the other which are *Cranck by the Ground*, (as the Sea Phrase is) that is narrow in the Floor, cannot be grounded without Peril either of being overthrown, or, at least, of wronging her Sides. And note, the Word *Overthrown* is used when a Ship is brought to be *trimmed a-ground*, and so by some Mischance doth fall over on her Side; but when a Ship at Sea is turned over on the one Side, she is said to be *Over-set*.

FLORY, a Term in Heraldry, when the Out-lines of any Ordinary are drawn, as if trimm'd with, or in the Form of Flowers.

Thus this Cross they call a *Cross-Flory*.

FLOTSON, or *Flotzam*, is a Word proper to the Sea, signifying any Goods lost by Shipwreck, and floating and swimming upon the Top of the Water; which, with *Jetson*, and *Lagon*, and others, are given to the Lord Admiral by his Letters Patent.

Jetson, is a thing cast out of the Ship, being in danger of Wreck, and beaten to the Shore by the Waters, or cast on the Shore by the Mariners.

Lagon, or *Lagan*, or *Ligan*, is that which lieth in the Bottom of the Sea.

Shares, are Goods due to more by Proportion.

FLOWER of a Plant: According to Dr. Grew, the *Flowers of Plants* have commonly these three Parts;

The *Empalement*, the *Foliation*, and the *Attire*; which Words see.

And Mr. Ray reckons, that every perfect Flower must have the *Petala*, the *Stamina*, the *Apices*, and the *Stylus*: Wherefore whatever Flower wants any of these, is to be lock'd upon as in that respect imperfect.

In most Plants there is a *Perianthium*, *Calix*, or Flower-Cup, of a stronger Consistence than the Flower it self, and design'd to strengthen and preserve it; it compasses the Flower about at the Bottom.

Mr. Ray divides also the perfect Flowers of Plants (now reckoning them perfect if they have the *Petala* without the *Stamina*) into Simple Flowers, which are not composed of other smaller ones, and which usually have but one single Style.

2. *Compounded, Aggregated, or Composite Flowers*, which are so compounded of many little *Flosculi*, as that they all make but one Flower.

Simple Flowers are *Monopetalous*, which have the Body of the Flower all of one entire Leaf, tho' sometimes cut or divided a little way into many seeming *Petala* or Leaves, as in *Borage*, *Bugloss*, &c. Or,

Polypetalous, which have distinct *Petala*, and those falling off singly, and not altogether, as the seeming *Petala* of the *Monopetalous Flowers* always do.

And both these he divides into

Uniform }
and } *Flowers*.
Difform }

The former have the right and left Hand Parts, and the forward and backward Parts of the Flower all alike.

But those he accounts to have a *Difform Flower*, which have no such Regularity; as in the *Flowers of Sage, Dead-nettle, &c.*

A *Monopetalous Difform Flower* also, he divides into,

1. *Semisiflular*; i. e. such whose upper Part resembles a Pipe cut off Obliquely, as in the *Aristolochia*.

2. *Labiata*, and this either with one Lip only, as in the *Acanthum* and *Scordium*: Or with two Lips, as in the far greatest Part of the *Labiata Flowers*. And here the upper Lip of the Flower sometimes is turned upwards, and so turns the Convex Part downwards, as in the *Chameacissus, &c.* But most usually the upper Lip is Convex above, and turns the hollow Part down to its Fellow below, and so represents a kind of *Helmet* or *Monk's Head*. And from hence these are frequently called *Galleate, Cucullate, and Galericate Flowers*, as you will find in Books of Botany: And in this Form are the *Flowers of the Lamium*, and most *Verticillate Plants*. Sometimes also the *Labium* is entire, and sometimes jagged or divided.

5. *Corniculate*; i. e. such hollow Flowers as have on their upper Part a kind of *Spury* or *Little Horn*; as in the *Linaria, Delphinium, &c.* And the *Corniculum* or *Calcar* is always impervious at the Tip or Point.

Compounded Flowers are either,

1. *Discous, or Discoidal*, that is, whose little *Flosculi* are set together so close, thick, and even, as to make the Surface of the Flower plain and flat; which therefore, because of its round Form, will be like a *Discus*: Which Disk is sometimes *Radiated*, when there are a Row of *Petala* standing round in the Disk like the Points of a Star, as in the *Metricaria, Chamaemelum, &c.*

Sometimes *Naked*; i. e. having no such radiating Leaves round the Limb of its Disk; as in the *Tanacetum*.

2. *Planifolious*, which is composed of plain Flowers set together in Circular Rows round the Center, and whose Face is usually indented, notched, uneven, and jagged; as the *Hieracia, Sonchi, &c.*

3. *Fistular*, which is compounded of many long, hollow, little Flowers like Pipes, all divided into large Jaggs at the Ends.

Imperfect Flowers, because they want the *Petala*, are called *Staminessous, Apetalous*, and *Capilla-ceous*.

And those which hang pendulous by fine Threads like the *Juli*, are by *Tournefort* called *Amentaceous*, we call them Cat's-Tails.

The same Writer uses also the Term *Campaniformis* for such Flowers as are in the Shape of a Bell; and *Infundibuliformis* for such as are in the Form of a Tunnel.

He distinguishes also some *Difform Monopetalous Flowers* by the Name of *Personati*; by which he means such as express the gaping Mouths of some *Animals*; and distinguishes these from what he calls *Labiati*, in that the *Stylus* or *Pistillum* of these doth not end in a *Capula Seminalis*, as it doth in those.

FLOWER-DE-LIS, the Mark of Difference in *Heraldry* for the Sixth Brother of any Family: 'Tis also often born as Coat Armour.

FLOWER of Sulphur or Brimstone, is made by putting the Sulphur grossly powdered into a Glass Body placed in a small open Fire, and having put over, or into its Neck, another Vessel of Earth of the same Form, but unglazed, the Fire will sublimine the Flowers, and make them adhere to the upper Vessel, which must be changed every half Hour.

FLOWERS: That fine mealy Matter which in Sublimations in Chymistry is carried up into the Head and *Aludels*, and adheres to them in the Form of a fine Powder, the Chymists call *Flores* or Flowers: See *Aludels*.

FLOWN-SHEETS: The Seamen say a Ship fails with *Flown-Sheets*, when her Sheets are not *haled home*, or close to the Blocks: They say also, *Let fly the Sheet!* When in a great Gust of Wind, for fear the Ship should over-set, or *spend* her Topmasts, they would have the Sheet *go a-main*, or as far as it will run, because then the Sail will hold no Wind; and when the Sheets are thus let go, they say, *Her Sheets are Flown*.

FLUID Body: The Excellent Sir *Is. Newton* defines a *Fluid Body* to be that whose Parts easily give Place, and move out of the way on any Force impelled upon them, and by that means do so very easily move over one another; which is a much better Definition than that of *Des Cartes*, That a Fluid is a Body whose Parts are in continual Motion; because 'tis neither apparent that the Parts of all Fluids are so; nor that the Parts of some Solid Bodies are not so.

FLUIDITY seems to consist in this, That Parts of any Bodies being very fine and small, are so disposed by Motion and Figure, as that they can easily slide over one another's Surfaces all manner of ways: It seems requisite also, as Mr. *Boyle* observes, That they should be variously and separately agitated to and fro, and that they should touch one another but in some Parts only of their Surfaces: And that Excellent Gentleman, in his History of Fluidity, intimates, That the Conditions requisite to constitute a Fluid Body are chiefly these Three:

1. The *Littleness of its Parts*: Thus we see the Fire, by dividing Metal into Parts very fine and small, will melt them, and make them Fluid. And Acid Menstruums after the same manner dissolve them and suspend them in Liquor; and Fire will turn the hard Body of common Salt almost all of it into a

Liquor, by Distillation; though 'tis not improbable, that the Shape and Figure of these small Parts may conduce much towards producing this Quality of Fluidity: For we find in the Distillation of Oil Olive (which is a Fluid made only by Pressure) that most of the Oil will be the Action of the Parts of the Fire, (note, it must be done in a Retort) be turned into a kind of consistent Substance like Butter.

2. It seems requisite to Fluidity, that there be store of vacant Places interspersed between the Corpuscles of the Fluid Body; for else there will not be room for each Particle to continue its Motion and Agitation on the Surfaces of the neighbouring ones. For,

3. The chief Condition requisite to constitute a Fluid Body, is, That its Particles be agitated variously, and apart, either by their own proper Motion, or by something of Substance which tumbles them up and down by its Passage through them. That this Qualification chiefly is requisite to Fluidity, you may gather from that common Experiment of putting Powder of Alabaster, or of common Plaster of *Paris*, finely sifted in a flat-bottom'd Vessel over the Fire; for in a little time the dry Powder will boil like Water, and imitate all the Motions of a boiling Liquor; it will tumble variously over in great Waves like that, it will bear stirring with a stick or Ladle like that, without resisting, as it will do when cold; nay, if you stir it strongly near the Side of the Vessel, its Waves will apparently dash up against the Sides; but yet if you take any of it out, and lay it speedily on a Piece of White Paper, you will see 'tis nothing but a dry Powder.

So that from hence 'tis plain, there is a real Difference between a *Fluid Body* and a *Wetting Liquor*; for not only this boiling Powder, and melted Metals, but the Air, *Aether*, and even Flame it self, are properly Fluid Bodies, though not moist Liquors.

This noble Gentleman found also, That by blowing the Smoak of Rosemary into a Glass Pipe, and then holding the Pipe (when filled) upright, the Surface of the Smoak would accommodate it self to a level Situation; and which way soever you inclined the Tube, the Superficies of the Smoak would lie parallel to the Horizon; and when the Glass was much inclined, would run along it like Water.

Whence he infers, That in order to the rendering a Body Fluid, there is no need that its Parts should be so closely condensed as those of Water are.

Dr. *Hooke*, in his *Micrograph*. P. 12. hath a pretty Experiment or Two to prove this Account of Fluidity, viz. that of a Dish of Sand set on a Drum-head briskly beaten by the Sticks, or on the upper Stone of a Mill, turning swiftly round on the (empty) lower one; it will in almost all Respects emulate the Properties of a Fluid Body. For a heavy Body will immediately sink in it to the Bottom, and a light one emerge to the Top; each Grain of Sand hath a constant vibrating and dancing Motion; and if a Hole be made in the Side of the Dish, the Sand will spin out like Water: See Vol. II.

FLUOR *Albus*, or *Fluor Uterinus*, is a continual Evacuation of corrupt Humours from the Womb, or the Pores in the *Vagina*. *Blanchard*.

FLUORES, a Word used by the Modern Mineral Writers for such soft transparent sparry kinds of Mineral Concretions, as are frequently found

found among Oars and Stones in Mines and Quarries.

FLUSH; when the Deck of a Ship is even from Stern to Stern, without any Falls or Rifings, they say her Deck lies *Flush* Fore and Aft.

FLUX and Reflux of the Sea: See *Tide*.

FLUX-POWDERS, or as the French call them, *Fondants*, are Powders prepared to facilitate the Fusion of the harder Metals, and to melt Oars in order to discover what Proportion of Metal they hold or contain.

Powder of Antimony alone is a very good Flux in many Cases, and by it you may readily melt Iron or Steel in a Crucible, with an ordinary Charcoal Fire.

Mr. Boyle gives an Account of a *Flux-Powder* he used which was composed of *Tartar*, *Sulphur*, and *Arsenick*.

FLUXION, the same with *Catarrh*.

FLUXIONS. Sir Isaac Newton, in his *Admirable Princip. Phil. Math. P. 250.* lays down this Lemma.

That the Moment of any generated Quantity, is equal to the Moments of all the several generating Terms, multiplied into the Indices of their Powers, and into their Coefficients continually.

Let a, b, c , &c. represent the Moments of any Quantities A, B, C , &c. increasing or decreasing by a perpetual Fluxion; then will the Moment or Mutation of the Rectangle AB be $Ab + aB$; and of the Content of ABC , the Moment will be $ABc + AbC + aBC$: and of the Powers A^2, A^3, A^4 , the Moments will be $2aA, 3aA^2, 4aA^3$; and the Moments of $A^{\frac{1}{2}}, A^{\frac{2}{3}}, A^{\frac{3}{4}}, A^{\frac{4}{5}}$, $\frac{1}{2}aA^{-\frac{1}{2}}, \frac{2}{3}aA^{-\frac{2}{3}}, \frac{3}{4}aA^{-\frac{3}{4}}, \frac{4}{5}aA^{-\frac{4}{5}}$, will be $\frac{1}{2}aA^{-\frac{1}{2}}, \frac{2}{3}aA^{-\frac{2}{3}}, \frac{3}{4}aA^{-\frac{3}{4}}, \frac{4}{5}aA^{-\frac{4}{5}}$, and $-\frac{1}{2}aA^{-\frac{1}{2}}, -\frac{2}{3}aA^{-\frac{2}{3}}, -\frac{3}{4}aA^{-\frac{3}{4}}, -\frac{4}{5}aA^{-\frac{4}{5}}$ respectively.

And generally, the Moment of any Power, suppose $A^{\frac{n}{m}}$, will be $\frac{n}{m}aA^{\frac{n}{m}-1}$, &c.

The Demonstration of which Lemma is this.

CASE I.

Suppose any Rectangle, as AB , made or increased by a perpetual Motion; and from the Sides AB , let there be subtracted the $\frac{1}{2}$ Moments, as $\frac{1}{2}a$ and $\frac{1}{2}b$: Then it will stand $A - \frac{1}{2}a$, and $B - \frac{1}{2}b$. Multiply them into each other, and there will arise $AB - \frac{1}{2}aB - \frac{1}{2}bA + \frac{1}{4}ab$.

Suppose also A and B increased by the half Moments, as $A + \frac{1}{2}a$, and $B + \frac{1}{2}b$; and that those thus augmented Quantities were multiplied by one another; then there will arise $AB + \frac{1}{2}aB + \frac{1}{2}bA + \frac{1}{4}ab$ for the Product: From which subtracting the former Rectangle $AB - \frac{1}{2}aB - \frac{1}{2}bA + \frac{1}{4}ab$, the Difference will be $aB + Ab$. Q.E.D. Which is the first Instance.

CASE II.

Let AB be $=$ to G : This multiplied by C , gives GC , or ABC ; and its Moment, by the last Case, will be $gC + Gc$; that is, (if instead of

G and g , you had put AB and $AB + Ab$) $aBC + AbC + ABc$. And thus it will ever be in the Quantities produced by continual Multiplication of unequal Factors.

CASE III.

Let A, B , and C , be all equal; and then the Moment of A^2 , or of the Rectangle AB , will be $2aA = aB + Ab$; and the Moment of ABC or A^3 , will be $3aA^2 = aBC + AbC + ABc$. And in the like manner if n represent the Index of any Power of A , the Moment of A^n will be naA^{n-1} . Q.E.D.

CASE IV.

Wherefore, since $\frac{1}{A}$ multiplied by $A = 1$, the Moment of $\frac{1}{A}$ multiplied by A , together with $\frac{1}{A}$ multiplied by a , will be the Moment of 1 , that is, nothing.

Further, the Moment of $\frac{1}{A^2}$ or A^{-2} , is $-\frac{2a}{A^3}$. And generally, since $\frac{1}{A^n}$ multiplied by $A^n = 1$, the Moments of $\frac{1}{A^n}$ multiplied by A^n , together with $\frac{1}{A^n}$ multiplied by naA^{n-1} , will be nothing. And consequently the Moment of $\frac{1}{A^n}$ or A^{-n} , will be $-\frac{na}{A^{n+1}}$. Q.E.D.

CASE V.

And since $A^{\frac{1}{2}}$ into $A^{\frac{1}{2}}$ produces A , the Moment of $A^{\frac{1}{2}}$ into $2A^{\frac{1}{2}}$, will be a (by Case 3.) and therefore the Moment of $A^{\frac{1}{2}}$ will be $2A^{\frac{1}{2}}$, or $2aA^{-\frac{1}{2}}$.

And generally, if $\frac{m}{A^n}$ be put equal to B , A^n shall be equal to $B^{\frac{m}{n}}$; and consequently $maA^{m-n-1} =$ to $nbB^{\frac{m}{n}-1}$, and maA^{m-n-1} equal to $nbB^{\frac{m}{n}-1}$, or $\frac{nb}{A^n}$: And therefore $\frac{m}{n}aA^{\frac{m}{n}-n-1}$ is equal to b ; $i. e.$ is equal to the Moment of $A^{\frac{m}{n}}$. Q.E.D.

CASE VI.

Wherefore the Moment of any generated Quantity $A^m B^n$, is the Moment of A^m multiplied by B^n , together with the Moment of B^n multiplied into A^m ; that is, $maA^{m-1} + nbB^{n-1}$. And this whether the Indices of the Powers be Integers or Fractions, Affirmative or Negative.

And the same Reason holds in the Products of any Numbers multiplied by themselves continually as long as you please, or to as high Powers as you will. Q.E.D.

On which Foundations the Algorithm of Fluxions, according to our way of Notation, may be thus

thus established: as I have before shewed in a good measure at the End of my *Algebra*, Pag. 115.

Where I shew, That by the Doctrine of Fluxions, we are to understand the Arithmetick of the infinitely small Increments or Decrements of indeterminate or variable Quantities; or as some call them, the Moments or infinitely small Differences of such variable Quantities. These infinitely small Increments or Decrements our incomparable Sir Isaac Newton calls very properly by this Name of Fluxions: For, as indeterminate and variable Quantities, viz. such as in the Generation of Curvilinear and other Figures, by Local Motion, are continually increasing or diminishing, he rightly denominates *Flowing Quantities*, as being such as are perpetually augmented or lessened, by the Flux or Motion of a Line, Surface, &c. So he calls the Celerity or Velocity of the Augmentation or Diminution of these *Flowing Quantities* by the Name of *Fluxions*. And because all Figures may be conceived to be generated by Local Motion, as is now very commonly supposed among Geometers, therefore 'tis much more natural to conceive the infinitely small Increments or Decrements of the variable and *flowing Quantities* under the Notion of *Fluxions*, than under that of *Moments*, or infinitely small Differences, as Leibnitz, Nieuwentijt, and the Noble Author of *Analyse des Infiniment Petits* chuse rather to take them; though even that Way also is not without its Use in many Cases.

The Excellent Sir Isaac Newton supposes the Abscissa of a Curve, or any other flowing or variable Quantity to be uniformly augmented; and therefore for its Fluxion he puts 1. or Unity; and the other flowing Quantities he denotes usually by the Letters x, y, z , and expresses their Fluxions by only repeating the same Letters with Points or

Pricks over their Heads; thus, $\dot{x}, \dot{y}, \dot{z}$, which are the Fluxions of the former flowing Quantities. And this Method is much more natural and shorter than Nieuwentijt's, or the French one with the Differential d multiplied into the flowing Quantity, to denote the Fluxion.

And because these Fluxions themselves are also Indeterminate and Variable Quantities, and do continually increase or decrease, or grow greater or lesser; therefore he considers the Velocities with which they do so increase or diminish, as the Fluxions of the former Fluxions: And those may be called *Second Fluxions*, and are noted with

Two Points over them; thus, $\ddot{y}, \ddot{x}, \ddot{z}$. And if you go on again, and consider the perpetual Augmentation or Diminution of these, as their Fluxions also, you may make third, fourth, or fifth Fluxions, &c.

which will be noted thus, $\ddot{\ddot{y}}, \ddot{\ddot{x}}, \ddot{\ddot{z}}$; $\ddot{\ddot{\ddot{y}}}, \ddot{\ddot{\ddot{x}}}, \ddot{\ddot{\ddot{z}}}$; &c. &c.

y, x, z ; and so on *ad Infinitum*. If the flowing Quantity be a Surd or a Fraction, he thus expresses its Fluxion; let the Surd be $\sqrt{a-b}$, its Fluxion

is $\frac{1}{2}\sqrt{a-b}$; and the Fluxion of the Fraction $\frac{a}{b}$ is $\frac{a\dot{b} - b\dot{a}}{b^2}$: See Dr. Wallis's *Algebra*, Lat. Edit. Pag. 392.

The main Business of the Algorithm or Arithmetick of Fluxions consists in these two Things:

I. From the Flowing Quantity given, to find the Fluxion.

II. From the Fluxion, to find the Flowing Quantity.

As to the former of these, the Learned Dr. Wallis, in the Place above-mention'd (from Sir Isaac Newton's Papers) gives this general Rule.

Let each Term of the Equation be multiplied separately by the several Indexes of the Powers of all the Flowing Quantities contain'd in that Term: And in every such Multiplication let one Root or Letter of the Power be changed into its proper Fluxion: So shall the Aggregate of all the Products connect'd together by their proper Signs, be the Fluxion of the Equation desired.

And all the Cases of it are demonstrat'd by Sir Isaac Newton in the Lemma above delivered, which I shall exemplify by particular Instances.

I. In the General; To express the Fluxions of simple variable Quantities, as was said before, you need only use the Letter or Letters which express them, with a small Point over their Heads:

Thus, the Fluxion of x is \dot{x} , and the Fluxion of y is \dot{y} , and the Fluxion of $x + y + v + z$, is $\dot{x} + \dot{y} + \dot{v} + \dot{z}$, &c.

And (inversely) the Flowing Quantities in this Case, will be easily had from the Fluxions, by only writing the Letters without the Points over them.

N. B. For the Fluxion of Permanent Quantities, when any such are in the Equation, you must imagine o or a Cypher; for such Quantities can have no Fluxions, properly speaking, because they are without Motion, or Invariable.

II. To find the Fluxions of the Products of two or more variable or flowing Quantities: Multiply the Fluxion of each Simple Quantity by the Factors of the Products, or the Product of all the rest, and connect the last Products by their proper Signs; the Sum or Aggregate is the Fluxion sought.

Thus, the Fluxion of xy is $\dot{x}y + x\dot{y}$; and the Fluxion of xyz , is $\dot{x}yz + x\dot{y}z + xy\dot{z}$; and the Fluxion of $xyyz$, is $\dot{x}yyz + x\dot{y}yz + xy\dot{y}z + xy\dot{z}$; and the Fluxion of $a + x$ by $b - y$ (the common Product being $ab - xy$) will be $b\dot{x} - y\dot{a} - x\dot{y} - y\dot{x}$.

Demonstration of Rule 2.

Suppose xy to be any Rectangle made or increased by a perpetual Motion or Fluxions of either of the Sides x or y along the other; and let the Mo-

ments or Fluxions of the Sides be \dot{x} and \dot{y} : By which we understand the Velocity with which either Side moves to form the Rectangle.

From

(for the Square of x^m is as well x^{2m} as x^{m^2}) or according to Sir *J. Newton's* Way, which is yet shorter, $\frac{m}{x^{m+1}}$: See *Case 4. P. 252.* of his *Principia*.

If the Power be Imperfect, *i. e.* if its Exponent be a Fraction, as suppose $\sqrt[n]{x^m}$; or in the other

Notation $x^{\frac{m}{n}}$, let us suppose $x^{\frac{m}{n}} = z$: Then if you raise up each Member to the Power of n , it will stand thus, $x^m = z^n$; the Fluxion of which will be, by this general Rule, $m x^{m-1} \dot{x} = n z^{n-1} \dot{z}$.

Wherefore \dot{z} will be $= \frac{m x^{m-1}}{n z^{n-1}}$ (by

dividing both Parties by $n z^{n-1}$;) and

$\frac{m}{n} x^{\frac{m}{n}-1} \dot{x}$, or $\frac{m}{n} x^{\frac{m}{n}-1} x^{\frac{m}{n}-n} \dot{x}$, by putting

instead of $n z^{n-1}$, its Value $n x^{\frac{m}{n}-n}$: So that to find the Fluxion of any kind of Power, you must proceed thus:

Multiply the Power given by its Index or Exponent, and then that Product by the Fluxion of the Root of the Power given; and after that, subtract One or Unity from the Index of the Power.

As for the Fluxions of *Surd Quantities*, Mr. *Hayes* gives the following Examples in his Treatise of Fluxions lately printed, which will make the thing plain to any one that will render himself ready at the Practice of this Art.

RULE V.

To find the Fluxions of *Surd Quantities*.

Let it be requir'd to find the Fluxion of $\sqrt[3]{2rx - xx^2}$; or $2rx - xx^2$. Suppose $2rx - xx^2 = z$; then is $2rx - xx^2 = z$; and consequently $r - x = \frac{z}{2}$; and by Division, $r - x = \frac{z}{2}$ (by Substitution)

$\frac{r - x}{2} = \frac{z}{2}$ to the Fluxion of $\sqrt[3]{2rx - xx^2}$

Let it be required to find the Fluxion of $ay - xx^3$; for $ay - xx^3$ put z , and then

$ay - xx^3 = z$, and $ay - 2xx^2 = \frac{3}{2}z - \frac{2}{3}z$:

And multiplying by 3, $3ay - 6xx^2 = \frac{3}{2}z - \frac{2}{3}z$; and consequently, $3az^{\frac{2}{3}} - 6x^2 \dot{x} = \frac{3}{2}\dot{z} - \frac{2}{3}\dot{z}$ equal (substituting $ay - xx^2 = z$) $3a^{\frac{2}{3}}y^{\frac{2}{3}} - 6a^{\frac{2}{3}}x^2y^{\frac{2}{3}} = 12ayx^2$

The Fluxions of imperfect Powers may be also investigated by (*Art. 20.*) the General Rule, and express'd otherwise, and more briefly thus:

The Fluxion of $2rx - xx^2$ is equal $\frac{1}{2} \times \frac{2r - 2x}{2} = \frac{r - x}{2}$

The Fluxion of $ay - xx^3$, is $= 3ay - xx^3$ which being reduced, will be found equal to the Fluxion thereof formerly found.

The Fluxion of $\sqrt{xy + yy}$, is $= \frac{1}{2} \times$

$xy + yy$ The Fluxion of $\sqrt{a^2 + axyy}$ is $= \frac{1}{2} \times a^2 + axyy - \frac{1}{2} \times ay^2 + 2axyy$

The Fluxion of $\sqrt{ax + xx} + \sqrt{a^2 + axyy}$ is (by the *Art. 20.* Rule, and the preceding Example)

$= \frac{1}{2} \times ax + xx + \sqrt{a^2 + axyy} + a^2 + 2ax + \frac{ay^2 + 2axyy}{2\sqrt{a^2 + axyy}}$

$2\sqrt{ax + xx} + \sqrt{a^2 + axyy} + ay^2 + 2axyy$

The Fluxion of $\sqrt{ax + xx}$, is (*Art. 14. 20.*)

(finding the Fluxions of the Numerator and Denominator) $\frac{ax - 2xx}{3\sqrt{ax + xx}} \times \sqrt{xy + yy}$

$\frac{yx + xy + 2yy}{2\sqrt{xy + yy}} \times \sqrt{ax + xx}$

To find the Fluxions of Quantities compounded of Rational and *Surd Quantities*: Let it be requir'd to find the Fluxion of $bx^2 + cax + ea^2$

$x\sqrt{xx + aa} = z$. Put $bx^2 + cax + ea^2 = p$, and $\sqrt{xx + aa} = q$. Then the given Quantity is $pq = z$, and the Fluxion thereof is $p\dot{q} + q\dot{p} = \dot{z}$. But \dot{q} is $= \frac{\dot{x}}{\sqrt{xx + aa}}$

and \dot{p} is $= 2bx + ca$; therefore in the Equation $p\dot{q} + q\dot{p} = \dot{z}$, if in place of p, q , we restore the Quantities they represent, we shall have

$\frac{bx^2 + cax^2 + ea^2xxx}{\sqrt{xx + aa}} + 2bx \times \sqrt{xx + aa} = \dot{z}$.

Which being reduc'd to one Denomination, gives $3bx^3 + 2acx^2 + ea^2x + 2ba^2x + xa^3 = \dot{z}\sqrt{xx + aa}$

$= \dot{z}$ to the Fluxion of the given Quantity.

RULE VI.

To find the Fluxions of Powers, where the Exponents of those Powers are themselves Fluent Quantities.
By Mr. Humphry Ditton, Master of the New Mathematical School in Christ's Hospital.

Let z, y, x , and v be flowing Quantities; the Varieties that may happen here, are reducible to these following Cases:

It is either $zy, zy+x, zy^x, z^y, zy^x$; in which last Case x is the Exponent of y , as y it self is also of z .

CASE I.

Let z^y be proposed, and suppose $z^y = v$, then

$z + z|y + y = v + v$, but $z + z|y + y = zy + y + yz|y + y - 1z$ (rejecting all the consequent Terms of the Series in which any Powers or Products of Fluxions would be found) ergo $v + v = zy + y + yz|y + y - 1z$, and $zy + y + yz|y + y - 1z - v = v$, but $v = z^y$; from whence $zy + y + yz|y + y - 1z - z^y = v$, is for that reason the Value of the Fluxion required.

CASE II.

2. Let $z^{y+x} = v$, then $z + z|y + y + x + x = v + v$, but $z + z|y + y + x + x = zy + y + x + x + yz|y + y + x + x - 1z$; ergo $zy + y + x + x + yz|y + y + x + x - 1z - z^{y+x} = v$.

CASE III.

3. Let $zy^x = v$, then $v + v + z + z|yx + y + x + y = zyx + y + x + y + x + yz|yx + y + x + y - 1z$, from whence arises $zyx + y + x + yz|yx + y + x + y - 1z + xyx - zyx = v$.

CASE IV.

4. Let $z^x = v$, then $v + v = z + z|x + \frac{y + yx - xy}{xx}$
 $= z + z|x + \frac{yx}{xx} = z + \frac{yx + xy - yx}{xx} + \frac{y}{x}$
 $z, \text{ thence } z + \frac{yx + xy - yx}{xx} + \frac{y}{x} - z^x = v.$

CASE V.

Lastly, Let $z^y = v$, the Fluxion of $y^x = z^{y+x} + xz^y = y - y$; ergo we have $v + v = z + z|y + y + x + x + yz|y + y + x + x - 1z$
 $= z + z|y + y + x + x + yz|y + y + x + x - 1z$
 $= z + z|y + y + x + x + yz|y + y + x + x - 1z$
 $+ yz|y + y + x + x - 1z$; and thence it is

plain; that $v = z^{y+x} + xz^y = y - y$

Next for the Rule *Inversely*, to find the Flowing Quantity belonging to the Fluxion of any Power, whether Perfect or Imperfect, proceed thus:

I. Take the Fluxionary Letter or Letters out of the Equation.

II. Augment the Index of the Fluxion by 1 or Unity.

III. Divide the Fluxion by the Index of its Power so increased by Unity.

Examples.

If $3xxx$ were proposed; by taking away x , it will be $3xx$; and by increasing its Index by Unity, it will be $3xxx$: Then dividing it by 3, its now (augmented) Index, the Quotient will be xxx , the Flowing Quantity required.

Again:

Suppose $\frac{n}{m} x^{\frac{n}{m}-1}$ a Fluxion proposed: By taking away the Fluxionary x , it will be

$\frac{n}{m} x^{\frac{n}{m}-1}$: By augmenting the Index by Unity

(i. e. taking away -1) it will be $\frac{n}{m} x^{\frac{n}{m}}$: And lastly, by dividing the remaining Part of the Fluxion by $\frac{n}{m}$, prefixed to, or multiplied into x , the

Quotient will be $x^{\frac{n}{m}}$: Which is the Flowing Quantity sought.

You will find Examples enough of this *Inverse Method*, the *Calculus Integrælis*, or *Summatory Arithmetick*, in Mr. Hayes's Book of Fluxions. Sect. 4.

Some Instances of the Proportions of Fluxions in various Curves, by Mr. H. Ditton.

Let x and v express Abscisses, y and z the Correspondent Ordinates universally: Then in the

Circle we have $y : z :: \frac{rx - xx}{y} : \frac{rv - vv}{z}$:

And supposing the Abscisse to flow uniformly, and consequently $x = v$, we have $y : z :: rz = xx :: ry - vy :: r - x :: \frac{ry - vy}{x}$; viz. the Fluxions Ce, Hi , are to one another, as BO to GO ;

the Point g being ever determined by the Perpendicular bg , let fall from b the Intersection of the Radius OG , with the Line Dh .

'Tis certain that $gO = \frac{ry - vy}{z}$, from the Similar Triangles GFO, bGO ; for $bg = DB = y$, and $z : r - v :: y : \frac{ry - vy}{z}$.

$AC = r$

Then the Rule is,

As the Sum of the Radij of both Convexities :
To the Radius of either Convexity alone ::
So is the double Radius of the other Convexity :
To the Distance of the Focus.

N. B. The Rays which fall nearer the Axis of any Glass, are not united with it so soon as those which are farther off: Nor will the Focal Distance be so great in a Plano-Convex Glass, when the Convex Side is towards the Object, as on the contrary. Wherefore that Learned Gentleman concludes truly, That in viewing any Object by a Plano-Convex Glass, the Convex Side should be turned outward: As also in burning by such a Glass, P. 25.

FOCUS Virtual: See *Virtual Focus*.

1. In Concave Glasses, when a Ray falls from Air parallel to the Axis, the *Virtual Focus*, by its first Refraction, is at the Distance of a Diameter and a Half of the Concavity.

2. In Plano-Concave Glasses, when the Rays fall parallel to the Axis, the *Virtual Focus* is distant from the Glass the Diameter of the Concavity.

3. In Plano-Concave Glasses, As 107: 193::

So the Radius of the Concavity:

To the Distance of the *Virtual Focus*.

4. In Double Concaves of the same Sphere, Parallel Rays have their *Virtual Focus* at the Distance of the Radius of the Concavity.

But whether the Concavities be equal or unequal, the *Virtual Focus*, or *Point of Divergency* of the parallel Rays is determined by this Rule:

As the Sum of the Radii of both Concavities :
Is to the Radius of either Concavity ::
So is the Double Radius of t^other Concavity :
To the Distance of the *Virtual Focus*.

5. In Concave Glasses, if the Point to which the incident Ray Converges, be distant from the Glass farther than the *Virtual Focus* of parallel Rays; The Rule for finding the *Virtual Focus* of this Ray is this;

As the Difference between the Distance of this Point from the Glass, and the Distance of the *Virtual Focus* from the Glass:

Is to the Distance of the *Virtual Focus* ::

So the Distance of this Point of Convergence from the Glass:

To the Distance of the *Virtual Focus* of this Converging Ray.

6. In Concave Glasses, if the Point to which the Incident Ray Converges, be nigher to the Glass than the *Virtual Focus* of parallel Rays; the Rule to find where it crosses the Axis is this:

As the Excess of the *Virtual Focus* more than this Point of Convergence: Is to the *Virtual Focus* ::
So the Distance of this Point of Convergence from the Glass:

To the Distance of the Point where this Ray crosses the Axis.

7. To find the Focus of a Meniscus Glass; see under the Word *Meniscus*.

Practical Rules for finding the Foci of Glasses.

For Convex Spherick Glasses.

1. For Glasses of small Spheres, (that is, of deep Convexities) apply them to the End of a Scale of Inches and Decimal Parts, and expose them before the Sun; and upon the Scale we shall find the bright Interfection of the Rays exactly measured out; or expose them in the Hole of a dark Chamber, and where a White Paper receives the distinct Representation of distant Objects, there is the Focus of this Glass. This is an universal and certain way for all Convexes.

For a Glass of a pretty long Focus, observe some distant Objects through it, and recede from the Glass till the Eye perceives all in *Confusion*, or till the Objects begin to appear *Inverted*; here the Eye is in the Focus.

If it be a *Plano-Convex Glass*, make it reflect the Sun against a Wall; we shall on the Wall perceive two Sorts of Light; one more *bright*, within another more *obscure*; withdraw the Glasses from the Wall till the *bright* Image is at its smallest, the Glass is then distant from the Wall about the fourth Part of its Focal Length.

If it be a *Double Convex*, expose each Side to the Sun in like manner, and observe both the Distances of the Glass from the Wall. The first Distance is about half the Radius of the Convexity turned from the Sun; and the second Distance is about half the Radius of t^other Convexity likewise: Thus we have the Radii of the two Convexities; whence the Focus is found by this Rule;

As the Sum of the Radii of both Convexity :
To the Radius of either Convexity ::
So is the Double Radius of the other Convexity
To the Distance of the Focus.

The *Foci* of Concaves are obtain'd by Reflection; for as a *Concave Mirror*, or *Speculum*, burns at the Distance of about half the Radius of the Concavity; so a *Concave Glass*, being supposed a *Reflecting Speculum*, shall unite the Rays of the Sun at the Distance of about half the Radius of the Concavity.

Mr. Halley's Doctrine of the Foci of Spherical Glasses of all Sorts, exposed either to Diverging, Converging, or Parallel Rays, is as follows: See Appendix to *Molyneux's* Dioptricks.

PROPOSITION.

To find the Focus of any Parcel of Rays Diverging from, or Converging to a given Point in the Axis of a Spherical Lens, and inclined thereto under the same Angle, the Ratio of the Sines in Refraction being known.

Let *G L* be the Lens.

P any Point in its Surface.

V the Pole thereof.

C the Center of the Sphere whereof it is a Segment.

O the Object or Point in the Axis, to or from which the Rays do proceed.

O P a given Ray.

Let the Ratio of Refraction be as *r* to *s*: Make *C R* to *CO*, as *s* to *r*, for the *Immerision* of a Ray;
or

or as r to s for the *Emission*; (that is, as the Sines of the Angles in the Medium which the Ray enters, to their corresponding Sines in the Medium out of which it comes.)

And laying CR from C towards O , the Point R shall be the same for all the Rays of the Point O .

Then draw the Radius PC , if need be, continued; and with the Center R , and Distance OP , sweep a touch of an Arch intersecting PC in Q : The Line QR being drawn, shall be parallel to the Refracted Ray; and PF being made parallel thereto, shall intersect the Axis in the Point F , which is the Focus sought.

Or make it, As $CQ : CP :: CR : CF$, and CF shall be the Distance of the Focus from the Center of the Sphere.

Demonstration.

Let fall the Perpendiculars Px on the Axis, Cy on the given Ray, and Cz on the refracted Ray.

Then PF and QR are parallel by Construction, whence the Triangles QRC and PFC are similar.

$$\text{And } CR : QR :: CF : PF;$$

$$\text{That is, } CR : OP :: CF : PF.$$

$$\text{Now } CF : PF :: Cz : Px \text{ ob sim. Tri.}]$$

$$\text{Whence } CR : OP :: Cz : Px$$

$$\text{And } CR : Cz :: OP : Px$$

Again, $CR : CO ::$ As the Sines of Refraction, by Construction; that is, as s to r , or r to s ; and

$$\text{as } CR : Cz :: CO = \frac{r}{s}, \text{ or } -CR : - \text{ or } -Cz,$$

$$:: PO : Px.$$

$$\text{But } PO : Px :: CO : Cy,$$

$$\text{Therefore } Cy = \frac{r}{s} \text{ or } -Cz;$$

That is, $Cy : Cz ::$ As the Sines of Refraction.

But $\{Cy\}$ is the Sine of the $\{$ Angle of Incidence.

$Q. E. D.$

The several Cases of Rays Diverging or Converging, as they enter the Curve Surface of a *Convex* or *Concave Lens*, are for the Reader's Ease delineated in Fig. 1, 2, 3, 4: And the like Cases of *Emerging Rays* in Fig. 5, 6, 7, 8:

Fig. 1

Fig. 2.

Fig.

Fig. 3.

Fig. 5.

Fig. 4.

Fig. 6.

Fig. 7.

Fig. 8.

All which are drawn with the same Letters to their respective Points, only in some the Point F falling far distant, is to be understood in the Intersection of the Line PF with the Axis.

This thus demonstrated, in the most difficult Cases will give all the Rules for the Foci of Rays parallel to the Axis, as likewise for the principal Focus, where the Rays nearest the Axis do unite: All which Rules are collected in these following Corollaries.

COROLLARY I.

If OP be equal to CR , then the Points Q and C are coincident, and the Rays OP , after Refraction, run on parallel to the Axis.

COROLLARY II.

If the Point Q fall on the same Side of the Axis, as is the Point P , then the Beams after Refraction do tend on, either Diverging or Converging, as before: But if Q fall on the other Side the Axis, as in Fig. 1. the Diverging Rays are made to Converge by a *Convex*, or the Converging to Diverge by a *Concave* Glasse.

COROLLARY III.

If OP do exceed CR , the Focus is in all Cases on the same Side of the Glasse as is the Center of the Sphere C .

But contrariwise, if OP be less than CR , the Focus falls on the other Side of the Glasse beyond the Vertex V .

COROLLARY IV.

An Object may be so placed, that the Rays next the Axis of a *Convex* Glasse shall have an Imaginary Focus transmitting Diverging Rays, when the more remote Parts thereof shall make them Converge to a real Focus.

COROLLARY V.

If OV the Distance of the Object from the Pole or Vertex of the Glasse, be taken instead of OP , then will CQ be the Difference of OV and CR ; and as that Difference is to CR , so is the Radius CV , to CF , the Distance of the principal Focus from the Center of the Sphere, whereof the Glasse is a Segment.

Or else, As CQ : To OP or RQ :: So PC : To VF , the Focal Distance from the Pole of the Glasse.

Whence follows a General Rule for the Foci of all Glasses, only according to Cor. 3. if OV do exceed CR , the Focus is on the same Side of the Glasse, as the Center of the Sphere: But if CR be greater, then the Focus is on the opposite Side of the Glasse; whence it will be determined, whether the Focus be real or Imaginary.

COROL-

COROLLARY VI.

What has been said of one Surface of a *Len*, is easily applicable to the other; taking *F*, the Focus of the first Surface, as an Object, and using it as *O* in the Figures for Emerging Rays; whereby the Focus of both Surfaces will be determined, as in Fig. 9.

Fig. 1.

COROLLARY VII.

Hitherto we have considered only *Oblique Rays*, either Diverging or Converging: It now remains to add something concerning *Rays parallel* to the *Axis*.

In this Case the Point *O* must be considered as infinitely distant; and consequently *OP*, *OC*, and *CR*, are all infinite; and *OP*, *OC* are in this Case to be accounted always equal, (since they differ but by a part of the Radius of the Sphere *GPVL*, which is no part of either of them;) wherefore the *Ratio* of *CR* to *OP* will be always the same, viz. as *s* to *r* for Immerging Rays, and as *r* to *s* for those that Emerge; and by this Proposition, *CF* is to *PF* in the same *Ratio*.

This Problem has been very fully considered by the celebrated *Dr. Wallis*, in his *Treatise of Algebra*, Pag. 258, but the Construction thereof must be repeated here: See Fig. 1. preceding, and this following one.

Fig. 2.

Fig. 2.

Let $GPVL$ be a *Lenz*, VC or PC the Radius of its Sphere; and let it be required to find all the Points f, f, f so as Cf , may be to Pf , in the given Ratio as s to r for Immersing Rays, or as r to s for the Emerging.

Divide CV in K , and continue CV to F , that CK may be to VK , as CF to VF in the proposed Ratio: Then divide KF equally in the Point a ; and with that Center sweep the Circle FKF ; this Circle being drawn, gives readily all the Foci of the parallel Rays OP, OP : For having continued CP till it intersect the Circle in F , PF shall be always equal to Vf , the Distance of the Focus of each respective Parcel of Rays OP , from the Vertex or Pole of the *Lenz*.

Demonstration.

Draw the prick'd Line VF , and by what is delivered by Dr. Wallis in the afore-cited Place, VF and CF will be always in the same proposed Ratio.

Again, Vf being made equal to PF , CF and Cf will be likewise equal, as are CP and VC ; and the Angles PCf , VCf being *ad verticem*, are also equal: Wherefore Pf will be equal to VF , and consequently Cf to Pf in the same Ratio as CF to VF ; whence, and by what foregoes, the Points f, f, f are the several respective Foci of the several Parcel of Rays OP, OP, Q, E, D .

That CF is to PF in the Ratio of the Refraction in the Case of parallel Rays, will yet be more evident, if it be considered, that the Angle at C is equal to the Angle of Incidence, and the Angle at P to the Refracted Angle; wherefore PF the Side opposite to the Angle at C , is as the Sine of the Angle of Incidence; and CF opposite to the Angle at P , is as the Sine of the respective refracted An-

gle. Whence in all Cases of parallel Rays, CF is to PF in the same constant Ratio of Refraction.

If it shall be desired to effect in Numbers what we have here done by Lines, it will be most easy to adapt a Calculus to the foregoing Geometrical Construction.

For if in the Triangle POC , there be given the Radius CP equal to Unity, CO the Distance of the Object from the Center of the Sphere, and the Perpendicular Px , equal to the Sine of the Angle PCO , the Side $PO = QR$ will be equal to

$$\sqrt{CO^2 + CP^2} + 2CO \sin \sqrt{CP^2 - Px^2}.$$

Then, As QR or PO : To Px :: So CR : To the Sine of the Angle CQR , and the Complement to 180 Degrees of the Sum of the Angles CPO and CQR , is the Angle CRQ equal to CFP ; and as Px : To PO :: So is the Sine of the Angle CRQ : To CQ ; and as CQ : To CP :: So CR : To CF , which is the Distance of the respective Focus of all the Rays PO , from the Center of the Sphere C .

But the Foci of Rays parallel to the Axis may be computed more readily, following the Footsteps of the Construction; for thereby it will appear, that the Radius of the Circle FKF , viz. aF , is equal to $\frac{rs}{rr - ss} CP$, and $Ca = \frac{rr}{rr - ss} CP$, for Emerging Rays, as in Fig. 1. but for Immersing Rays, as Fig. 2 a will be found to be $\frac{ss}{rr - ss} CP$: And supposing the Distance of the Rays from the Axis = Px in the Case of parallel Rays Emerging, the Distance of the Focus will be found,

$$PF = \frac{rr}{rr - ss} \sqrt{CP^2 - Px^2} + \sqrt{\frac{rs}{rr - ss} CP^2 - \frac{rr}{rr - ss} Px^2} - CP:$$

That is, r to s being as 3 to 2.

$$PF = \frac{2}{3} \sqrt{CP^2 - Px^2} + \sqrt{\frac{2}{3} CP^2 - \frac{2}{3} Px^2} - CP.$$

And for Immersing Rays, the Focal Distance is found by a like Rule:

$$PF = \frac{ss}{rr - ss} \sqrt{CP^2 - Px^2} + \sqrt{\frac{rs}{rr - ss} CP^2 - \frac{ss}{rr - ss} Px^2} + CP.$$

That is, r and s being as 3 to 2, as before.

$$PF = \frac{2}{3} \sqrt{CP^2 - Px^2} + \sqrt{\frac{2}{3} CP^2 - \frac{2}{3} Px^2} + CP.$$

These Canons are so easily deduced from the Constructions, that there is no need to trouble the Reader with their Demonstrations, only you have here added two Tables computed from them, with little more Work than a continual Addition; which may, by way of Example, serve to instruct and exercise the young Student in this Part of the Mathematicks.

Suppose CP the Radius of the Sphere of Glass 2 Inches, and the Ratio of Refraction as 3 to 2; at each Tenth of an Inch distance from the Axis the Foci are as follows.

55
For

For Emerging Rays.

Px	P F
0	$\sqrt{12.9600} + \sqrt{5.7600} + 2$
1	$\sqrt{12.9276} + \sqrt{5.7276} - 2$
2	$\sqrt{12.8304} + \sqrt{5.6304} - 2$
3	$\sqrt{12.6684} + \sqrt{5.4684} - 2$
4	$\sqrt{12.4416} + \sqrt{5.2416} - 2$
5	$\sqrt{12.1500} + \sqrt{4.9500} - 2$
6	$\sqrt{11.7936} + \sqrt{4.5936} - 2$
7	$\sqrt{11.3724} + \sqrt{4.1724} - 2$
8	$\sqrt{10.8864} + \sqrt{3.6864} - 2$
9	$\sqrt{10.3356} + \sqrt{3.1356} - 2$
10	$\sqrt{9.7200} + \sqrt{2.5200} - 2$

For Immerging Rays.

Px	P F
0	$\sqrt{2.5600} + \sqrt{5.7600} + 2$
1	$\sqrt{2.5536} + \sqrt{5.7536} + 2$
2	$\sqrt{2.5344} + \sqrt{5.7344} + 2$
3	$\sqrt{2.5024} + \sqrt{5.7024} + 2$
4	$\sqrt{2.4576} + \sqrt{5.6576} + 2$
5	$\sqrt{2.4000} + \sqrt{5.6000} + 2$
6	$\sqrt{2.3296} + \sqrt{5.5296} + 2$
7	$\sqrt{2.2464} + \sqrt{5.4464} + 2$
8	$\sqrt{2.1504} + \sqrt{5.3504} + 2$
9	$\sqrt{2.0416} + \sqrt{5.2416} + 2$
10	$\sqrt{1.9200} + \sqrt{5.1100} + 2$

But it is to be noted, That these *Foci* for Immerging Rays must not be taken for the *Foci* of a Plano-Convex, when the Convex-side is towards the Object; for the Plane-side, by its Refraction, does contract the Focal Length by about a Semidiameter of the Sphere; these suppose the Body of Glass continued.

The same Ingenious Author, as an Instance of the Excellence of the *Modern Algebra*, gives also in *Philos. Trans.* N. 205. a Way to find the *Foci* of all Optick Glasses universally; and shews of what great Use his and such Theorems are: But having enlarged so much already, I can only refer the *Algebraical Reader* thither, where he will find sufficient Satisfaction.

FODINA, is the Labyrinth in the Bone of the Ears.

FÆCULA, signifies a Powder which subsides to the Bottom in certain Strainings of Vegetables; for it is prepared of some green, washed, and pared Roots beat together with a little Water, then strained, that there may subside a white sort of Powder, which is to be dried lightly.

FOETUS, is the Young of all kind of Creatures, more especially Human; immediately after the Conception it is called an *Embryo*; but when its Formation in the Womb is perfectly finished, it is properly termed the *Fetus*.

Dr. Drake, in *Phil. Trans.* N. 281, ingeniously tells us, That the Nourishment of the *Fetus* in the Womb (which he makes to have a little more than Vegetative Life, and to be a Graft, as it were, upon

the Stock of the Mother) is by Transfusion of the Blood from the Hysterick Arteries, immediately to the Umbilical Vein, together with such Nutritious Juices and Aerial Particles as the Blood is supposed to carry along with it: By which Means so much of the Impulse of the Mother's Blood is preserved, as is sufficient to maintain that Languid Circulation which the *Fœtus* enjoys; for the Blood being driven through the Arteries of the Uterus into the Umbilical Vein, is conveyed directly to the *Sinus* of the *Porta*, and thence; by a short and direct Passage, thro' the *Cava* to the Heart; where passing thro' the *Foramen Ovale* to the *Left Ventricle*, and thro' the *Canalis Arteriosus* from the *Right* and *Pulmonary Artery*, it is all delivered, without coming at the Lungs, to the *Aorta*; and from thence again, by the Umbilical Arteries to the Veins of the Uterus, making a sort of *Epicycle* to the main Circulation in the Mother.

And this is confirmed by the Experiments of the Accurate Mr. Cowper, who, by pouring Mercury into a Branch of the Uterine Artery of a Cow, that went into one of the *Cotyledones* of the Uterus, filled with that Metal those Branches of the Umbilical Veins, which went from the *Cotyledon* to the Navel of the *Fœtus*.

FOLIAGE, the branched Work in Tapestry or Painting; also a kind of Ornament used in Cornices, Frizes, Capitals of Pillars, and other Members of Architecture; some of which represent the Leaves of the Herb *Brank-Ursine* or *Bear's-Foot*; and others those of divers sorts of Trees, as the *Oak*, *Laurel*, *Olives*, *Vine*, &c.

FOLIATE; to *foliate* Looking Glasses, is to spread a Composition of something which will firmly adhere to the Back of the Glass, and there reflect the Image. This is called the *Foile*, and is usually made with Quicksilver mix'd with some other Ingredients.

FOLIATION, according to Dr. Crew, is one of the Parts of a Flower of a Plant, being the Collection of those Fogacious Coloured Leaves (in *Latin Petala*) which constitute the Compass of the Flower; and also, sometimes to secure and guard the Fruit which succeeds the *Foliation*, as in Apples, Pears, &c. and sometimes stands within it, as in Cherries, Apricots, &c. for these being of a very tender and pulposus Body, and coming forth in the colder Part of the Spring, would be often injured by the Extremities of Weather, if they were not thus protected and lodged up within their Flowers.

The *Foliation* also is serviceable to the Growth of the Fruit in its Infancy or Embryo-State, being always proportionable to the Nature of the Fruit, and to the Plenty of the Sap by which the Fruit is fed or supplied. *Anat. of Plants*, P. 37.

The Doctor observes, That the Flowers of all Plants are perfectly formed or finished in all their Parts long before they appear in Sight, usually 2 or 3 Months, and sometimes Half a Year or more: And though usually the Flower appear before the Seed, yet is the Seed first formed, and then the Flower.

FOLLICULUS, a Term in Botany, signifying the Seed-Vessel, *Cassula Seminaria*, the Cale, Husk, Coat, or Cover, which some Fruits and Seeds have over them; as that of the *Alkchango*, the *Pedicularis*, &c.

FOLLICULUS Vellis, or *Vesica Biliaris*, is a little Bladder fastned to the Concave Part of the Liver, and receives the Bile, which in Proccels of Time empties

empties it self into the Gut *Duodenum*, by a Ductus or Passage called *Choledochus ductus*.

FOMAHANT, a Star of the first Magnitude in *Aquarius*, whose Longitude is 329 Degrees 17 Minutes, Latitude 21 Degrees 3 Minutes.

FOMENTATION, is the bathing of any Part of the Body with a convenient Liquor; which is usually a Decoction of Herbs in Water, Wine, or Milk: Also applying of Bags stuffed with Herbs and other Ingredients, which is commonly called a *Dry Fomentation*.

FONTANELLE, or *Issues*, are little Ulcers which Surgeons make in found Parts of the Body, to evacuate Humours, cure Diseases, or prevent them. *Issues* are made either with an actual or a potential Sealing-Iron, with a Lancet, and a Pair of Scissors, &c. You must always observe to make *Issues* betwixt two Muscles. *Blanchard*.

FORAMEN Lacrymale: See *Lacrymale Punctum*.

FORCE, in Common Law, signifies an Offence, by which Violence is used to Persons or Things; and is either *Simple* or *Compound*.

Simple Force, is that which is so committed, that it hath no other Crime adjoined to it: As if one by force do enter into another Man's Possession without doing any other unlawful Act.

Mist or Compound Force, is that Violence which is committed with such a Fact, as of it self only is Criminal; as if any by force enter into another Man's Possession, and to kill a Man, or ravish a Woman there, &c.

Force is also divided into true *Force*, and *Force* after a sort, with several other Branches; as *forcible* Entries, *forcible* Detaining, unlawful Assembly, Riots, Riots, Rebellions, &c.

FORCEPS, is an Instrument wherewith dead and corrupt Parts (also things besides or against Nature) are seized, cut off, or pulled out; they are of several Shapes, as long, crooked with Teeth, with Beaks, in fashion of an Half-Moon, such as will open the Mouth or the Womb, and by which you may see into either of them; which, according to the Difference of their Shape, are of different use. *Blanchard*.

FORCIBLE detaining or holding of Possession, is a violent Act of Resistance by strong Hand of Men weapon'd with Harnes, or other Action of Fear in the same Place, or elsewhere, whereby the lawful Entry of Justices or others is barr'd or hinder'd.

FORCIBLE Entry, is a violent actual Entry into a House or Land, &c. or taking a Distress of any Person weapon'd, whether he offer Violence, or Hurt to any there, or furiously drive any out of the Possession thereof.

FORE CASTLE of a Ship, is that Part where the Fore-Mast stands, and 'tis divided from the rest of the Floor by a Bulk Head; that Part of the *Fore-Castle* which is aloft, and not in the Hold, is called the *Prov*.

FOREFOOT, a Sea Term for one Ship's lying or sailing cross anothers way; as if two Ships being under Sail, and in ken of one another, one of them lies in a Course, with her Stem so much a Weather the other, that if they both hold on their Course, the Windward Ship will run or go out a-head of the other; and then they say such a Ship lies with the others *Fore-foot*, tho' as soon as she has passed her, or gone out before her a-head, they do not say, she passed by her *Forefoot*, but that she is *gone out a-head*.

FOREJUDGED the Court, is when an Officer of any Court is expelled the same for some Offence, or for not appearing to an Action by Bill filed a-

gainst him; and in the latter he is not to be re-admitted till he shall appear, but shall lose his Office, and be *Forejudged the Court*.

FOREJUDGER, in Law, signifies a Judgment, whereby a Man is deprived, or put by the thing in question.

FORELAND, a Term in Fortification, the same with *Berne*.

FORELOCKS, in a Ship, are little flat Wedges like pieces of Iron, used at the ends of Bolts, to keep the Bolts from flying out of the Holes: They are used also to keep fast down the Cap-squares of the Carriages for the Guns; these are also called *Fore-lolocks*.

FORE-MAST of a Ship, is a round large piece of Timber, seated in her fore-part or Fore-castle, on which is born the Fore-sail and Foretop-sail-Yards. Its Length is usually $\frac{2}{3}$ of the *Main-mast*; the Foretop-mast is half the Length of the Fore-mast, and the Foretop-gallant-Mast is half the Length of the Foretop-mast.

FORE-REACH; the Seamen say one Ship *fore-reaches* upon another, when both Sailing together, she sails better or out-goeth the other.

FORE-STAFF: See *Cross-staff*, being an Instrument used at Sea, for taking the Altitude of the Sun, Moon, or Stars, with ones Face towards the Object.

FOREIGN, is in Law used adjectively, being joyned with divers Substantives in several Senses: As,

FOREIGN Answer, is such an Answer as is not triable in the County where it is made.

FOREIGN Attachment, is an Attachment of Foreigners Goods found within a Liberty or City, in the Hands of a third Person, for the Satisfaction of some Citizen, to whom the said Foreigner oweth Money.

FOREIGN Matter; that is, Matter triable in another County.

FOREIGN Opposer, or *Apposer*, is an Officer in the *Exchequer*, to whom all Sheriffs and Bayliffs do repair to be apposed by him of their Green Wax, after they are apposed of their Sums out of the Pipe-Office; and from thence draws down a Charge upon one of them to the Clerk of the Pipe: His Business is to examine the Sheriffs Estreats with the Record, and to ask the Sheriff, what he says to every particular Sum therein.

FOREIGN Plea, is a Refusal of the Judge as Incompetent, because the Matter in Hand was not within his Precinct.

FOREIGN Service, is such Service whereby a mean Lord holdeth over of another, without the Compass of his own Fee; or else that which a Tenant performeth either to his own Lord, or to the Lord Paramount out of his own Fee.

FOREST, is a large Wood privileged to hold the King's Game of all kind.

The Properties of a Forest are these;

First, A Forest, as it is truly and strictly taken, cannot be in the Hands of any but the King, for none hath Power to grant Commission to be a Justice in *Eyre*, or the Forest, but the King.

The second Property consists in the Courts, as the *Justice-Seat* every three Years, the *Swain-mote* thrice every Year, and the *Attachment* once every forty Days.

The Third Property, are the Officers belonging to it, for the Preservation of the Vert and Venison; as the Justices of the Forest, the Warden or Keeper, Verderers, Foresters, Agistors, Regarders, Bayliffs, Beadles, and such like.

FORESTER, is a Sworn Officer of the Forest, appointed by the King's Letters-Patent to walk the Forest both early and late, watching both the Vert and Venison, attaching and presenting all Trespassers against them within their own Balywick or Walk: And tho' these Letters-Patents be ordinarily granted but *quam diu se bene gesserint*; yet some have it to them and their Heirs, and thereby are called *Foresters in Fee*.

FORFEITURE, in our Language, signifies rather the Effect of transgressing a Penal Law, than the Transgression it self, as Forfeiture of Escheats.

FORFEITURE of Marriage, is a Writ lying against him, who holding by Knights Service, and being under Age, and Unmarried, refuses her whom the Lord offers him with his Disparagement, and Marrieth another.

FORFEX, is an Instrument to pull out Teeth with.

FORGERY: See the next following, *viz.*

FORGER of False Deeds, in Law, signifies either him that fraudulently maketh and publisheth *False Writings*, to the Prejudice of any Man's Right; or else the Writ that lieth against him that committeth this Offence, which by some is called, *The Writ of Deceit*.

FORELORN-HOPE, or the *Enfans Perdue* in an Army.

FORM of any Natural Body, is the Essential, Specific, or distinguishing Modification of the Matter of which it is composed, so as thereby to give it such a peculiar manner of Existence: And this is an Aggregate or Convention of as many particular Qualities, as serve to denominate the Body of such a Nature, and to give it such a Name, and which distinguishes it from other Bodies. Thus the Qualities of greatest Specific Gravity, Fixity in the Fire, Ductility under the Hammer, Paucity and yet Largeness of Pores, Dissolubility in *Aqua Regia* and not in *Aqua fortis*, and Yellowness of Colour, make up the Form of that Metal which we call Gold. So that 'tis not any kind of substantial Soul or Substance distinct from Matter, but only such a proper and agreeable Convention of Accidents, as by common consent are reputed sufficient to make a Portion of Universal Matter, belong to this or that Determinate Genus or Species of Natural Bodies. But yet some are of Opinion, That the Human Soul may properly enough be called, a *Substantial Form*.

FORMED Stones, are with the Writers of Natural History, such Bodies as being either pure Stone, Flint, or Sparr, are found in the Earth so formed, as that they bear a near Resemblance to the external Figure and Shape of Muscles, Cockles, Periwinkles, and other Shells. There hath been a great Dispute amongst the Naturalists, how these Bodies came thus formed, and a great many have been very fond of (what appears to me as a very absurd Opinion) *viz.* That these are only a *Lusus Naturæ*, only the Sports and Diversions of Nature, to make her self Merry in the dark Regions of the Earth. But Dr. Woodward, in his Natural History of the Earth, advances a very fair Solution of this Difficulty, and proves, that these formed Stones, by the Dissolution of the Earth at the Deluge, were then made by being cast into the Cavities of those Shells which they represent, the Shells serving as Moulds to give them their proper form.

FORMEDON, is a Writ that lies for him that hath Right to any Lands or Tenements, by Vertue of an *Entail*: It lieth in three sorts;

1. *Formedon in the Descender*, which lieth for the Recovery of Lands, &c. given to one and the Heirs

of his Body, or to a Man and his Wife, and the Heirs of their Bodies, or to a Man and his Wife being Cousin to the Donor in *Frank-Marriage*, and afterwards alienated by the Donee; for after his Decease, his Heirs shall have this Writ against the Tenant or Alliance.

2. *Formedon in the Reverter*, lieth for the Donor or his Heirs, where Land entail'd to certain and their Issue, with condition for want of such Issue, to revert to the Donor and his Heirs, against him to whom the Donee alienateth, after the Issue extinct to which it was entail'd.

3. *Formedon in the Remainder*, lieth where a Man giveth Lands in Tail, the Remainder to another in Tail; and afterwards the former Tenant in Tail dieth without Issue of his Body, and a Stranger abateth, then he in the Remainder shall have this Writ.

FORMEE, the Term sometimes used for the *Crofs Patee* in Heraldry: See *Patee*.

FORMER, is the Name of a piece of Wood turn'd round and fitted to the Bore of a Piece of Ordnance, on which are founded the Cartridges which hold the due Charge of Powder for the Gun.

FORMULÆ, is the Word used for the Physician's Prescriptions. *Blanchard*.

FORNIX, is the Callous Substance of the Brain, so called, because it seems to sustain the Cavities of the Ventricles, and the Bulk of the impending Brain, like an Arch or Vault.

FORESTAL, is to be quit of Amerciaments and Cattle arrested within your Land, and the Amerciaments thereof coming.

FORESTALLING, signifies the Buying or Bargaining for any Victuals or Wares coming to be sold towards any Fair or Market, or from beyond the Seas towards any City, Port, Haven, Creek, or Road of this Realm, and before the same be there, to the intent to sell the same again at a higher and dearer price.

FORT, is a Castle, or a place of small extent, fortified either by Art or Nature.

FORT-ROYAL, is that which hath 26 Fathoms for the Line of Defence.

FORT-STAR, is a Redoubt, constituted by Re-entring and Salient Angles, which commonly have from 5 to 8 Points: See more under the Word *Sconces*.

FORTIFICATION, or *Military Architecture*, is an Art shewing how to fortifie a place with *Ramparts*, *Parapets*, *Moats*, and other *Bulwarks*, to the end, that a small number of Men within may be able to defend themselves for a considerable time against the Assaults of a numerous Army without; so that the Enemy in attacking them must of necessity suffer great loss.

Fortification is either *Regular* or *Irregular*, and with respect to Time, may be distinguish'd into *Durable* and *Temporary*.

Regular Fortification, is that which is built on a *Regular Polygon*, the Sides and Angles whereof are all equal; being commonly about a Musket-shot one from another.

Irregular Fortification, is that where the Sides and Angles are not at all uniform, equi-distant, nor equal one to another.

Durable Fortification, is that which is raised to continue a long while.

Temporary Fortification, is that which is erected upon an emergent occasion for a little time; such are all sorts of Works cast up for the seizing or maintaining

taining of a Post or Passage, as also *Circumvallations*, *Contravallations*, *Redoubts*, *Trenches*, *Batteries*, &c.

The principal Maxims of Fortification, are these:

1. Every Place within the *Fortification* ought to be flank'd; that is, seen sidewise, or defensible from the other Parts, so that there may be no Place in which an Enemy can lodge himself undiscovered by those that are within, and that both from the Front, the Sides, even from Behind if possible.

2. The Forts ought to command all Places round about; and therefore all the Out-works must be lower than the Body of the Place.

3. The Works that are most remote from the Center of the Place, ought always to be open to those that are more near.

4. The *Angle Flanquant*, or the Point of the *Bastion*, ought to be at least of 70 Degrees, or as some say (Mr. *Vauban*) not more than 100, or less than 60.

5. The *Angle of the Courtine* ought never to be less than 90, or greater than 100 Degrees, because if it be larger, 'tis too much subject to the View of the Enemy.

6. The greater the *Flank* and *Demigorge* is in Proportion to other Things, the better; because there is both more Room to retrench in, and also because there may be made retiring Flanks, which add very much to the Strength of a Place.

7. The *Line of Defence* ought never to exceed Point-blank Mullet-shot, which is about 120 or 125 Fathoms.

8. The *Bastions* that are not too little, nor yet too excessively big, are to be preferred before others; and the Angle of a *Bastion* should not exceed 100, nor be less than 60 Degrees.

9. The greater the *Angle* that is made by the outward *Polygon* and the Face shall be, the greater is the Defence of the Face.

10. Whatsoever incloses a durable *Fortification*, must be either *Flank*, *Face*, or *Curtain*; and built so well, that the first Discharge of the Cannon may not be able to pierce through it.

11. 'Tis impossible to fortify a Triangle after the common Way, because the Angle of the Gorge is always less than 90 Degrees.

12. The Acuter the Angle at the Center is, the Place is by so much the stronger, because it will have the more Sides.

13. In a *Regular Fortification* the Face must never be less than half the *Curtain*; and the Faces of the *Bastion* ought to be defended by the Small Shot of the opposite Flanks.

14. *Dry Trenches* are preferable to those filled with Water, especially in great Places, where *Salies*, *Retreats*, and *Succours* are frequently necessary; but in small Fortresses, *Water Trenches* that cannot be drained are best, because there is no need of *Salies*, *Succours*, &c.

FORTINS, or *Field-Forts*, are Sconces or little Fortresses, whose *Flank'd Angles* are generally distant one from another 120 Fathom, but their Extent and Figure are different, according to the Situation or Nature of the Ground; some of them having whole *Bastions*, and others only *Demi-Bastions*. They are made use of only for a Time, either to defend the Lines of *Circumvallation*, or to guard some Passage or dangerous Post.

FOSSILS; all Bodies whatever that are dug out of the Earth, are by Naturalists commonly treated of under this general Title of *Fossils*: But these may be distinguished into two Classes.

First, Such as are Natives of the Earth: Or, *Secondly*, Such as are *Adventitious*, and repositied in the Earth by the *Universal Deluge*, or by some other means.

Of which latter Sort are the *Exuvia* of Sea and Land Animals; the *Fossil-Shells*, *Bones*, *Teeth*, &c. which are plentifully found in the Earth, and by some Writers have been erroneously thought a sort of Stones that are peculiar, and as they speak, *sui Generis*.

The following Table of such *Fossils* are as *Natives* of the Earth, consists only of the *Heads* and *Titles* extracted out of a *Natural History* of these Bodies, composed by Dr. Woodward, and founded wholly upon Experiments and Observations made upon them.

In this Table they are rank'd and distributed according to their *Natural Properties*, and their *Relations* to each other.

Chap. 1. E A R T H S.

The *English*, *Bohemian*, and the *Armenian* Boles. Umbre. Ochre, yellow and red.

Tripela. Terra Militensis.

Chalk. Steinomarga, or Lac Lunæ.

The common black Vegetable Earth.

Loam. Marle. Clay.

Terra Lemnia. Tobacco-pipe Clay.

Argilla, or Potter's Earth. Porcellana.

Steatites, or Soap-Earth. Fuller's-Earth.

Chap. 2. S T O N E S.

SECT. 1. Those that are found in larger Masses.

Lapis Molaris, or Millstone. Grind-stone.

Sand-stone, or Saxum arenarium. Free-stone.

Saxum calcarium, or Lime-stone. Whetstone.

Ragstone.

Lapis fissilis, or Slate.

Hone. Oilstone. Touchstone.

Alabastr. Marble.

Ophites. Porphyrites.

SECT. 2. Stones found in lesser Masses.

Art. 1. Those that do not exceed Marble in Hardness.

§. 1. Those that are of an indeterminate Figure and Texture.

The coarser or gritty Pebbles.

Lapis Violaceo Odore.

§. 2. Those that are of an indeterminate Figure, but of a regular Texture.

Gypsum Striatum, English Talck.

Amianthus sive Asbestos. Alumen plumosum.

Talck.

§. 3. Those that are commonly of determinate Figures.

Selenites. Lapis Spicularis, or Muscovy Glafs.

Ludus Helmontij, or the Waxen Vein.

Lapides Tubulis referti, or the Piped Waxen Vein.

Belemnites, or the Thunder-stone.

The Fossil Coralloid Bodies, simple and branched, and the Stones related to them, e. gr.

Stelechites. Mycetites. Porpites.

Astroites. The Honey-comb-stone.

Fluor or Spar, Stalactites, Stalagmites.
Osteocolla.

Art. 2. *Stones found in lesser Masses, that do exceed Marble in Hardness.*

Those comprehended under this Second Article, are usually called *Gemms* or *Precious Stones*. The whole Tribe of these are exhibited here; and indeed none but them, excepting Pebbles and Flints, which are rank'd of course along with the Agate-kind, to which they really belong.

§. 1. *Those that are Opaque.*

Subdivision 1. *Of one Colour.*

The Turcois. The Nephritick Stone. The Malachite. The two last are sometimes a little variegated.

Subdivision 2. *Of different Colours mix'd in the same Body.*

Lapis Lazuli. Heliotropium, or Blood-stone.
The Jasper.

§. 2. *Semi-pellucid Stones.*

Subdivision 1. *With Colours changeable, according to the different Position of the Stone to the Light.*

Oculus Cati. The Opal.

Subdivision 2. *With Colours permanent.*

The finer Pebbles and Flints, Agates. The Chalcodony.

Mocho-stones. The Oculus Beli. Onyx, and Sardonyx.

The white Cornelion. The red Cornelion, and the Beryl.

§. 3. *Stones Diaphanous, with Colours.*

§§. 1. *Yellow, or partaking of it.*
The Topaz. The Jacinth.

§§. 2. *Red, or partaking of it.*
The Granate. The several Sorts of Rubies.
The Amethyst.

§§. 3. *Blue, or partaking of it.*
The Sapphire. The Water Sapphire.
The Aquemarine.

§§. 4. *Green, or partaking of it.*
The Emerald. The Chrysolite.

§. 5. *Stones Diaphanous, and without Colours.*

Crystal. The Pseudo adamantes.
The white Sapphire. The Diamond.

Chap. 3. S A L T S.

Fossil or Rock Salt. Sal Gemmeum.
The Tincal of Persia. The Natron of Egypt.
Nitre, or Salt Petre.
Alum. Vitriol.

Chap. 4. B I T U M I N A.

§. 1. *Liquid.*

Naptha. Petroleum. Oleum terræ Barbadosis.

§. 2. *Solid.*

Succinum, or Amber. Bitumen. Pissasphaltum.
Gagates, or Jet. Kanal. Coal.

Chap. 5. M E T A L L I C K M I N E R A L S.

Mercury. Cinnabar, the Mineral out of which 'tis drawn. Arsenick.

Sulphur. Pyrites, Marcasita. Cobalt.

Lapis Calaminaris. Antimony.

Bismuth, or Tin-Glass. Speltre, or Zink.

Nigrica fabrilis Merreti, or Black Lead.

Chap. 6. M E T A L S.

Tin. Lead. Silver. Gold.

Copper. The Lapis Armenius is a Copper-Ore.

Iron. The Hematites is an Iron-Ore. There is also a little Iron in the Loadstone. Manganese, Emery, the *Ætes ferruginosa*, the Mineral Bezoar, the Geodes, and the Enhydros.

FOTUS, the same with *Fomentum*.

FOVEA *Cordis*, the same with *Anticardium*.

FOUGATE, or *Fongasi*, is a small Mine dug in form of a Well, in a Place ready to be gained by the Enemy, so that when they have made themselves Masters thereof, it is sprung like a Mine by the Means of a Saucidge.

They are also prepar'd under a Work which is to be blown up, and are charged with Barrels or Sacks of Powder cover'd with Earth.

FOULE, a Word us'd at Sea in two Senses, when a Ship has been long untrimm'd, so that Grabs, Weeds, Barnacles, or Periwinkles, stick or grow to her Sides under Water, she is then said to be foule. They say also a Rope is foule, when it is either tangled in it self, or hindred by another, so that it cannot run or be haled.

FOULE-WATER: A Ship is said to make *foule Water*, when being under Sail, she comes into such Shole or shallow Water, that though her Keel do not touch the Ground, yet she comes so near it, that the Motion of the Water under her raiseth the Mud from the Bottom, and so polluteth or fouleth the Water.

FOUNDER: A Ship is said to founder at Sea, when by any extraordinary Leak, or by a great Sea breaking in upon her, she is so filled with Water, that she cannot be freed of it, nor is she able to swim under it, but sinks with the Weight thereof.

FOURCH, in Law, signifies a Delay, putting off or prolonging of an Action.

FOURTH, a Term in Musick; the same with *Diatessaron*: Which see.

FRACTION, is a broken Number, signifying one or more Parts proportionally of any thing divided. It consists of two Parts, which are two Numbers set one over another, as $\frac{1}{2}$: Of which two Numbers, that below the Line is called the *Denominator*, because it denominates or shews the Nature or Kind of the Parts any Whole is divided into; and the Number above the Line is called the *Numerator*, because it numbers or tells us how many of those Parts the *Fraction* doth consist of. Thus $\frac{1}{2}$ supposes some Whole to be divided into 2 equal Parts, and then that you take 1 of them, or 1 such Parts.

In all *Fractions*, As the *Numerator*: Is to the *Denominator*: :: So is the *Fraction* it self: To that Whole of which it is a *Fraction*. Thus, suppose $\frac{1}{2}$ of

of a Pound be equal to 15 s. then 'tis plain, 3 : 4 :: 15 s : 20 s.

From which general Axiom will follow these Corollaries.

1. That there may be infinite Fractions of the same Value one with another; for there may be infinite Numbers found, which shall have the Proportion one to another as 3 has to 4.

2. When the Numerator is less than the Denominator, the Fraction is less than the Whole, and consequently is what they call a *Proper Fraction*.

3. But when the Numerator is either equal to, or greater than the Denominator, the Fraction is called *Improper*, because 'tis equal to, or greater than the whole. Thus $\frac{4}{3}$ is equal to 1, and $\frac{5}{3}$ is equal to 1 and $\frac{2}{3}$.

Fractions are either *Single* or *Compound*.

Single Fractions are such as have but one Numerator and one Denominator, as $\frac{1}{2}$, $\frac{3}{4}$, $\frac{5}{6}$.

Compound Fractions, or Fractions of Fractions, are such as consist of more than one Numerator and one Denominator, as $\frac{1}{2}$ of $\frac{3}{4}$ of $\frac{5}{6}$, and are always connected by the Word *Of*.

Reduction of Fractions.

I. To reduce Fractions to their least Terms.

Rule 1. If both Numerators and Denominators are even Numbers, divide each by 2 as long as you can, till an odd Quotient ariseth, and then have recourse to the 4th Rule, which is General.

Thus, this Fraction $\frac{884}{1268}$ will by Bifsection be reduced to $\frac{221}{317}$, and $\frac{2}{4}$ will be reduced to $\frac{1}{2}$.

Rule 2. If both end in Cyphers, cut off an equal Number of them from both, and then proceed by the other Rules.

Thus, $\frac{3450}{4560}$ will become $\frac{345}{456}$.

3. If both Numerator and Denominator end in 5, or one in 5, and the other in 0, they may be always reduced into lesser Terms, by dividing each by 5.

Thus, $\frac{425}{575}$ ($= \frac{17}{23}$), and $\frac{345}{456}$ ($= \frac{345}{456}$).

4. When by none of the former Rules you can reduce them wholly, try this Method, which is General; that is, find the greatest Number that will divide both Numerator and Denominator without any Remainder; and then dividing both Parts of the Fraction by that Number, take the Quotients for a new Fraction, which shall be of the same Value and in its least Terms.

The *Greatest Common Divisor* to any two Numbers is thus found;

Divide the Greater by the Lesser, and then divide the last Divisor by the Remainder, and so continually till nothing remain; and then take the last Divisor for the *Greatest Common Measure* sought.

If after all Trials still there remains Unity, then the Fraction cannot be reduced farther.

Thus, in reducing $\frac{21}{117}$ into its least Terms, 'twill be found to be $\frac{2}{13}$, the *Greatest Common Divisor* being 13,

$$\begin{array}{r} 91 \overline{) 117} \quad (1 \\ \underline{91} \\ 26 \quad (3 \\ \underline{78} \\ 13 \quad (2 \\ \underline{26} \\ 00 \end{array}$$

But this Rule may also be very much abridg'd by this Method, viz. When you find any Remainder to be more than half the last Divisor, subtract it from the Divisor, and divide that Divisor by the new Remainder found by such Subtraction: As suppose you were to find the *Greatest Common Divisor* in this Fraction $\frac{244}{353}$.

$$\begin{array}{r} 744 \overline{) 899} \quad (1 \\ \underline{744} \\ 155 \quad (4 \\ \underline{620} \\ 124 \\ 155 \\ \underline{124} \\ 31 \quad (5 \\ \underline{155} \\ 0 \end{array}$$

Which last Remainder 124 being more than half 155, I subtract it from it, and there remains 31; which dividing 155 without Remainder, I find to be the *Greatest Common Divisor* to those two Numbers.

II. To find the Value of any Fraction in the known Parts of its Integer.

As suppose it was requir'd to know what is $\frac{2}{7}$ of a Pound.

Multiply (9) the Numerator by (20) the Number of known Parts of the next inferior Denomination, and divide the Product by (16) the Denominator of the given Fraction; the Quotient will be 11 s. and the Remainder (4) being multiplied by (12) the Number of known Parts in the next inferior Denomination; and dividing the Product (48) by (16) as before, the Quotient will be 3 d. So that you find that $\frac{2}{7}$ of a Pound is 11 s. and 3 d.

$$\begin{array}{r} 20 \\ \underline{9} \\ 16 \overline{) 180} \quad (11 \text{ s.} \\ \underline{160} \\ 20 \\ \underline{12} \\ 16 \overline{) 48} \quad (3 \text{ d.} \\ \underline{48} \\ 00 \end{array}$$

III. To reduce a mix'd Number (as $4\frac{1}{2}$) into an Improper Fraction of the same Value.

Multiply (4) the Integer Part, by (12) the Denominator of the Fraction; to the Product (48) add the Numerator; the Sum (59) set over the former Denominator (12). Thus $\frac{59}{12}$ will be an Improper Fraction of the same Value with the mix'd Number given; for 12 now divides that Product which before it help'd to produce, and therefore the Value must be the same as before.

IV. To reduce a whole Number into an Improper Fraction.

1. If no Denominator be assign'd, draw a Line under it, and set Unity beneath that Line, and 'tis done. Thus, if 8 were given to be reduc'd, write it in this Manner, $\frac{8}{1}$.

2. But if there be a Denominator (as suppose 3) given, multiply (8) the given Number by (3) the assign'd Denominator, and set the Product over (3) and 'tis done, and stands thus, $\frac{24}{3}$; for the Number 8 is multiplied by 3, and then that Product divided by 3, which makes it of the same Value now as before.

V. To reduce an Improper Fraction into its equivalent mix'd Number, as suppose $\frac{59}{12}$.

Divide (59) the Numerator by (12) the Denominator; the Quotient ($4\frac{1}{2}$) will be the mix'd Number sought.

VI. To reduce a Compound Fraction into a Single one.

Multiply all the Numerators continually for a new Numerator, and all the Denominators for a new Denominator.

Thus, $\frac{1}{2}$ of $\frac{1}{3}$ of $\frac{1}{4}$ reduced, will be $\frac{1}{24}$.

VII. To reduce Fractions of different Denominations to others of the same Value, having the same common Denominator.

1. Reduce them always to their least Terms.

2. Then multiply all the Denominators for a common Denominator; and multiply continually the Numerator of each Fraction into all the Denominators except its own, and that will give new Numerators to be set over the common Denominator.

Thus, if it was requir'd to reduce $\frac{2}{3}$, and $\frac{3}{4}$, and $\frac{5}{6}$ into one common Denominator:

I say, 3 into 7, into 6, produces 126 for a common Denominator.

Then $2 \times 7 \times 6 = 84$, therefore $\frac{2}{3} = \frac{84}{126}$.

And $3 \times 4 \times 6 = 72$, therefore $\frac{3}{4} = \frac{72}{126}$.

Also $5 \times 7 \times 3 = 105$, therefore $\frac{5}{6} = \frac{105}{126}$.

Addition in Vulgar Fractions.

1. If the Fractions proposed have equal Denominators, only add the Numerators, and set the Sum over the common Denominator.

Thus, $\frac{1}{2} + \frac{1}{2} = \frac{2}{2}$.

2. But if they have not a common Denominator, they must be reduced to others of the same Value, that have a common Denominator; then add as in the first Rule.

3. If Compound Fractions are given to be added, they must first be reduced to single ones of the same Value, and then they will fall under these two Rules foregoing.

4. When Fractions of different Denominations are given to be added, they must be reduced into Fractions of the same Denomination, (or which have the same common Integer) by the Rule for reducing Compound Fractions.

Thus, if $\frac{2}{3}$ of a Pound, $\frac{1}{4}$ of a Shilling, and $\frac{1}{2}$ of a Penny, were proposed to be added together, they must all be brought into the Denomination of Pounds.

Thus, $\frac{2}{3}$ of a Shilling is $\frac{2}{3}$ of $\frac{1}{20}$ of a Pound, (which reduced, is $\frac{1}{15}$ of a Pound;) So $\frac{1}{4}$ of a Penny is $\frac{1}{4}$ of $\frac{1}{240}$ of a Pound (which being reduced, is $\frac{1}{960}$) then those two Fractions $\frac{1}{15}$ and $\frac{1}{960}$ may be added by the second Rule.

5. To add mix'd Numbers.

1. Add the Integers in both Numbers together, then add the Fractional Parts, and if their Sum be a proper Fraction, only annex it to the Sum of the Integers.

2. But if it be an Improper Fraction, reduce it to its equivalent mix'd Number; and adding the Integral Part to the first Sum of the Integers, set the remaining Fractional Part after the Integers, and 'tis done.

Thus, $5\frac{1}{2} + 4\frac{1}{2} = 10\frac{1}{2}$.

Subtraction of Vulgar Fractions.

1. If they have a common Denominator, subtract the lesser Numerator from the greater, and set the Remainder over the common Denominator.

Thus, from $\frac{5}{8}$ take $\frac{2}{8}$, and there remains $\frac{3}{8}$.

2. If they have not a common Denominator, they must be reduced to Fractions of the same Value, having a common Denominator; and then as in the 1st Rule.

Thus, $\frac{5}{8} - \frac{1}{4} = \frac{5}{8} - \frac{2}{8} = \frac{3}{8}$.

3. To subtract a whole Number from a mix'd Number, or one mix'd Number from another.

Reduce the whole or mix'd Numbers to Improper Fractions, then proceed as in the 1st or 2d Rule.

N. B. This Rule is General; yet there are particular Rules, which in some Cases are more Expeditious; as follows.

Particular Rules.

1. To subtract a whole Number from a mix'd.

Subtract the whole Number from the Integral Part of the mix'd Number; then to the Remainder annex the Fractional Part of the mix'd Number.

Thus, 3 from $5\frac{1}{2}$, leaves $2\frac{1}{2}$.

2. To subtract a Fraction from 1 or Unity.

Subtract the Numerator from the Denominator, and 'tis done.

Thus, $\frac{1}{2}$ from 1, leaves $\frac{1}{2}$.

3. To subtract a Fraction from any whole Number greater than Unity.

First subtract the Fraction from Unity (by 2d) then from the whole Number given subtract that Unity, and place the remaining Integer before; and the Fractional Part (first found) after it; so shall that mix'd Number be the Remainder sought.

Thus, $\frac{2}{3}$ from 7, leaves $6\frac{1}{3}$.

4. To subtract a mix'd Number from a whole Number.

First subtract the Fractional Part from Unity, borrowed from the whole Number given, and set down the Remainder; then adding the Integer borrowed, to the Integers of the mix'd Number, subtract the said Sum from the whole Number, and to the Remainder annex the Fractional Part first found, and 'tis done.

Thus, $3\frac{1}{2}$ from 9, leaves $5\frac{1}{2}$.

5. To subtract a Fraction from a mix'd Number.

1. If the Fraction given, be less than the Fractional Part of the mix'd Number, only subtract the Fraction from the Fractional Part, and annex the Remainders to the integer Part of the mix'd, and 'tis done.

Thus, $\frac{1}{4}$ from $6\frac{2}{4}$, leaves $6\frac{1}{4}$.

2. But when the Fraction given is greater than the Fractional Part of the mix'd Number;

Subtract the Fraction from Unity, and add the Remainder to the Fractional Part of the mix'd Number; then lessening the Integral Part of the mix'd Number by Unity, annex the Fractional Part (last found) to it:

Thus, $\frac{2}{3}$ from $6\frac{1}{3}$, leaves $5\frac{1}{3}$.

C A S E I.

6. To subtract one mix'd Number from another.

When the Integral Part, and Fractional Part, of the mix'd Number to be subtracted, are both lesser than the Integers and Fractional Parts of the other mix'd Numbers; only subtract the lesser Integer from the greater, and the lesser Fraction from the greater, and to the Remainder of the Integers annex the Remainder of the Fraction, and 'tis done.

Thus, $2\frac{1}{2}$ from $5\frac{2}{2}$ leaves $3\frac{1}{2}$, or $3\frac{1}{2}$.

C A S E II.

When the Fractional Part of the mix'd Number (to be subtracted) is greater than the Fractional Part of the other mix'd Number:

First, Subtract the greater Fraction from Unity, and add the Remainder to the Fractional Part of the other mix'd Number; which Sum, as the Fractional Part of the Remainder sought, is to be kept.

Then add Unity to the lesser Integral Part, and subtract the Sum from the greater Integral Part, and to the Remainders annex the Fractional Part before reserved, and 'tis done.

Thus, $2\frac{2}{3}$ from $7\frac{1}{3}$, rests $4\frac{1}{3}$.

Multiplication of Vulgar Fractions.

1. When the Fractions proposed are both single Fractions, only multiply the Numerators one by

another for a new Numerator, and the Denominators for a new Denominator.

Thus, $\frac{2}{3}$ into $\frac{4}{5}$, produces $\frac{8}{15}$.

2. If one be a mix'd or Whole Number, it must be reduced to an Improper Fraction, and then proceed as in the last Rule.

Thus, $\frac{2}{3}$ into $5\frac{1}{3}$, gives $8\frac{1}{3}$; and $\frac{2}{3}$ into $4\frac{2}{3} = 4\frac{4}{3}$.

N. B. In Multiplication of Fractions the Product is less in Value than either Multiplicand or Multiplier; because in all Multiplications; As Unity: Is to the Multiplier :: So is the Multiplicand: To the Product; or; As Unity: Is to either Factor :: So is the other Factor: To the Product. But Unity is bigger than either Factor (if the Fractions are proper) and therefore either of them must be greater than the Product.

Thus in Whole Numbers; if 5 be multiplied by 8, 'twill be, As 1 : 5 :: 8 : 40; or, 1 : 8 :: 5 : 40. Wherefore in Fractions also, As 1 : $\frac{1}{2}$:: $\frac{1}{4}$: $\frac{1}{8}$; or, As 1 : $\frac{1}{4}$:: $\frac{1}{2}$: $\frac{1}{8}$.

But 1 is greater than either $\frac{1}{2}$ or $\frac{1}{4}$: Wherefore either of them must be bigger than $\frac{1}{8}$.

Division in Fractions.

1. When the Fractions proposed are both single; multiply the Denominator of the Divisor by the Numerator of the Dividend; the Product is the Numerator of the Quote.

Then multiply the Numerator of the Divisor, by the Denominator of the Dividend; the Product is the Denominator of the Quotient.

Thus, $\frac{4}{5}$ \div $\frac{2}{3}$ = $\frac{12}{10}$.

2. If either Dividend, Divisor, or both, be Whole or Mix'd Numbers, reduce them to improper Fractions; and if they be Compound Fractions, reduce them to Simple ones, and proceed as in the first Rule.

N. B. That in Division of Fractions, the Quotient is always greater than the Dividend; because in all Division, As the Divisor: Is to Unity :: So is the Dividend: To the Quotient; as if 3 divide 12, 'twill be, As 3 : 1 :: 12 : 4. Now 3 is greater than 1, wherefore 12 must be bigger than 4: But in Fractions, As $\frac{1}{2}$: 1 :: $\frac{2}{3}$: $\frac{4}{3}$; where $\frac{1}{2}$ is less than 1; wherefore $\frac{4}{3}$ must also be less than $\frac{2}{3}$.

FRACTURA Ossis, the breaking of a Bone, is a Solution of the Continuum in the hard or bony Parts of the Body.

FRÆNULUM, is a membranous Ligament under the Tongue, which being extended too far towards the Tip of the Tongue, hinders Children in sucking, whence they are said to be Tongue-ty'd.

FRÆNUM, is that Ligament whereby the Prepuce is tied to the lower Part of the Glans of the Penis.

FRAISES, in Fortification, are pointed Stakes fixed in Bulwarks made of Earth; on the one side of the Rampart a little below the Parapet. These Stakes being from 7 to 8 Foot long, are driven in almost half way into the Earth, and present their Points somewhat sloping toward the Field. They serve to prevent Scalades and Defection.

FRAME, is the Out-work of a Clock or Watch, consisting of the Plates and Pillars, and which contains in it the Wheels and the rest of the Work.

T. FRANKLIN.

FRANCHISE, in Law, is taken to be a Privilege or Exemption from ordinary Jurisdiction, and sometimes an Immunity from Tribute: It is either Personal or Real; that is, belonging to a Person immediately, or else by means of this or that Place, or Court of Immunity, whereof he is either Chief, or a Member.

FRANCHISE Royal, is where the King granteth to one and his Heirs, that they shall be quit of Toll.

FRANK-ALMOIN, in Law, signifies a Tenure or Title of Lands or Tenements bestow'd upon God; that is, given to such People as bestow themselves to the Service of God, for pure and perpetual Alms.

FRANK-BANK: See *Free-bench*.

FRANK-CHASE, is a Liberty of Free-Chase, whereby all Men (having Ground within that compass) are prohibited to cut down Wood, &c. without the View of the Forester, tho' it be in his own Demefine.

FRANK-FEE, in Law, is that which is in the Hands of the King or Lord of the Mannor, being ancient Demefine of the Crown; whereas that which is in the Hands of the Tenant, is ancient Demefine only.

FRANK-FORM, is a Land or Tenement, wherein the Nature of the Fee is charged by Feoffment out of Knight's-Service for several Yearly Services; and whence neither Homage, Worship, Marriage, nor Relief may be demanded, nor any other Service not contain'd in the Feoffment.

FRANK-FOLD, is where a Lord hath Benefit of Folding his Sheep within his Mannor for the Manuring of his Land.

FRANK-LAW, is taken for the free Enjoyment of all those Privileges which the Law permits to a Man not found guilty of any heinous Offence. And he that loseth his *Frank-Law*, is said to fall into these Inconveniencies:

First, That he may never be impannelled upon any Jury or Assize, or otherwise used in testifying any Truth.

Secondly, If he have any thing to do in the King's Court, he must not approach thither in Person, but appoint his Attorney.

Thirdly, His Lands, and Goods, and Chattels must be seized into the King's Hands; and his Lands must be distrained, his Trees rooted up, and his Body committed to Prison.

FRANK-MARRIAGE, is a Tenure in Land Special, whereby a Man hath Land with a Woman to him and the Heirs of his Body, without doing any Service, but Fealty to the Donor.

FRANK-PLEDGE, in Law, a certain Pledge or Surety for Freeman.

FRANK-TENEMENT: See *Free-hold*.

FREE; the Seamen say, The Pump *free*s the Ship, when it throws out more Water than leaks into her; but on the contrary, when it cannot throw out the Water as fast as it leaks in, they say, The Pump cannot *free* her: Also bailing or lading out Water out of a Boat, is called, *Freeing the Boat*.

FREE-BENCH, *Frank-Bank*, in Law, signifies that Estate in Copy-hold Lands that the Wife, being espoused a Virgin, hath after the Decease of her Husband, for her Dower.

FREEHOLD, or *Frank-Tenement*, is that Land or Tenement which a Man holdeth in Fee, Fee-tail, or at the least for Term of Life; and 'tis either *Freehold in Deed*, or *Freehold in Law*.

Freehold in Deed, is the Real Possession of Lands or Tenements in Fee, Fee-tail, or for Life.

Freehold in Law, is the Right that a Man hath to such Lands or Tenements before his Entry or Seifure.

FREESE, a Term in Architecture: See *Frize*.

FREESEING: The *Cartesians* explicate Freezing by the Refecs, or going out of the Etherial Matter from the Pores of the Water or other Liquor; which being once done, the finer Parts are too small and flexible to keep the long, slender, and Eel-like Particles of Water fluent, or in the form of a Liquor.

But the *Corpuscularians* ascribe the freezing of Water more probably, to the Ingrefs of Multitudes of cold or frigorifick Particles, as they call them, which entering the Liquor in Swarms, and dispersing themselves every way thro' it, do crowd into the Pores of the Water, and hinder the wonted agitation of its Parts, and wedge it up as it were into the hard or consistent Body of Ice.

Freezing Mixture, is what is mix'd together in order to freeze other Bodies. Mr. Boyle in his History of Cold shews, That not only all Sorts of Salts, whether *Alkalizats* or *Acid*, but even *Ardent Spirits*, such as that of Wine; also Sugar and *Saccharum Saturni*, mix'd with Snow, are capable of freezing other Bodies; and the same Effect was also very eminently produced by the Mixture of Oil of *Vitriol*, or Spirit of *Nitre* with Snow, &c.

That Ice is specifically lighter than the Water out of which it is by freezing made, is certain by its swimming in it; and that this Levity of Ice proceeds from these numerous Bubbles, which are produced in it by its Congelation, is equally plain; but how those Bubbles come to be generated in freezing, and what Substance they contain in them (if they are not quite empty) is an Enquiry of great Importance, and perhaps if discovered, may help us much to understand the Nature of Cold.

Mr. *Hobbs* asserts, That they are occasioned by the common Air, which intrudes into Water in its Coagulation, and so expands it.

But First, No such Ingrefs of Air into Water appears in its Coagulation; and that it doth not get into frozen Oil is plain, because that Body is condensed by being frozen.

Secondly, Mr. Boyle shews by undoubted Experiments, That Water frozen in Glasses sealed hermetically, and in Bras Bodies or Vessels closely stoppt, hath yet been turn'd into Ice abounding with these Bubbles.

Thirdly, He proves also by Experiment, That Water kept a while in the exhausted Receiver, till all its Bubbles were emerged and gone, being afterwards turn'd into Ice by a freezing Mixture, that Ice had scarce any Bubbles at all in it. Whence 'tis plain these Bubbles are filled with some Matter which is within the Water, if they are filled with any thing: But he proves also by plain Experiments, that they have none, or at least exceeding little true Elastick Air contain'd in them. See Vol. II.

FREEZLAND-HORSE, the same with *Chevauze de Freeze*.

FRESCO, in Architecture, to *Paint in Fresco*, is a sort of Painting which is made upon the Plastering of an Edifice before it be dry.

FRESH-DISEISEIN, in Law, signifies such a *Disseisin*, as a Man may seek to defeat of himself, and by his own Power, without the help of the King or Judges.

FRESH-FINE, is that which is levied within a Year past.

FRESH-FORCE, is a Force done within forty Days: For if a Man be disseised of any Lands or Tenements within any City or Boroughs, or *desorced* from them after the Death of his Ancestor, to whom he is Heir, or after the Death of his Tenant for Life, or in Tail, he may within forty Days after

this

his Title accrued, have a Bill out of the Chancery to the Mayor, &c.

FRESH-SHOT, in the Sea Phrase, signifies the falling down of any great River into the Sea, so that the Sea has fresh Water a good Way from the Mouth of that River, which sometimes by Accident is by the Descent of Land-Waters on a sudden; and as this is more or less, they call it a great or small *Fresh-Shot*.

FRESH-SUIT, in common-Law, is such a present and earnest Pursuit of an Offender, as never ceaseth from the Time of the Offence committed or discovered, until he be apprehended: And the Effect of this in the Pursuit of a Felon is, that the Party pursuing shall have his Goods again; whereas otherwise they are the King's.

FRETT, a Bearing in Heraldry of this Figure.

Diamond, a *Frett Topaz*: The Coat Armour formerly of *Henry Lord Maltrevers*, and now quartered by the Duke of *Norfolk*.

Here is but one *Frett*, but sometimes the *Frett* is of eight Pieces, and then 'tis specified to be so; but if it consist of more, 'tis called *Frette*.

FRIABLE, a Word used in reference to such Bodies as will easily on rubbing break, crumble, or divide into small Parts.

FRIGID Zones, See *Zones*.

FRIGORIFICK Particles, are small Particles of Matter, actually and essentially Cold, which entering and penetrating other Bodies, do (according to the Opinion of *Gassendus* and others) produce in them that Quality which we call Cold: See *Cold*.

FRISE, or *Fresse*, in Architecture, is that round Part of the Entablature which is between the *Architrave* and *Cornice*. This the *French* call the *Gorgé-rin* or *Collier*.

FRODMORTEL, or rather *Freemortoll*, in Law, is an Immunity or Freedom granted for Murder or Man-slaughter. *Cowel*.

FROENULUM, or *Frænum Penis*, is a Membrane which ties the *Præputium* to the Glands of the *Penis*.

FRONT, in Perspective, is the Orthographical Projection of an Object upon a Parallel Plane.

FRONT, in Fortification, is what the *French* call *Tenaille de Place*, and the Face of a Place. It is that which is comprehended between the Points of any two neighbouring Bastions, *viz.* the Courtine, the two Flanks which are raised upon the Courtine, and the two Faces of the Bastions which look towards one another.

FRONT-LINE, in Perspective: See *Line of the Front*.

FRONTALE, or *Frontlet*, is an external Medicine, frequently applied to the Forehead for a Pain or Heat in the Head: It is made for the most Part of Herbs, Flowers, Seeds, Meal moistned with Vinegar of *Roses*. *Blanchard*.

FRONTALIS, is a Muscle which arises thin, broad, and fleshy from the upper Part of the *Os Frontis*, near the *Sutura Coronalis*, and descending by the Posterior and Forepart of the *Temporals*, meets with its Partner near their Insertions to the Skin of the Eye-brows; these draw up and wrinkle the Skin of the Forehead.

FRONTATUM, is a Term used by Mr. *Ray*, and other Botanists, to express that the Leaf of a Flower (*Petalum*) grows broader and broader, and at last perhaps is terminated by a Right Line; and 'tis used in opposition to *Cuspidatum*, which expresses that the Leaves of a Flower end in a Point.

Thus *Marygold*; *Petala habent Frontata*,
But *Flos Solis*, *cuspidata*.

FRONTIS Os, or *Coronale*, is a Bone of the *Cranium*, in form almost round; it joins the Bones of the *Sinciput* and Temples, by the Coronal Suture, and the Bones of the upper Jaw by the *Sutura Transversalis*, and the *Os Sphenoides* by the *Sutura Sphenoidalis*. It forms the upper Part of the Orbit, and it has four *Apophyses*, which are at the four Angles of the two Orbits. It has two Holes above the Orbits, through which pass the Veins, Artery, and some Twigs of the first Branch of the fifth pair of Nerves. It has also one in each Orbit, a little above the *Os Platum*, through which a Twig of the Ophthalmick Branch of the fifth pair of Nerves passes to the Nose, it is the Orbiter *Internus*. It has two *Sinus*'s above the Eye-brows, between its two Tables; they are lined with a thin Membrane, in which there are several Blood-Vessels and Glands, which separate a Mucous Serosity, which falls into the Nostrils. The Inside of this Bone has several Inequalities, made by the Vessels of the *Dura Mater*. It has two large Dimples, made by the anterior Lobes of the Brain. Above the *Crista Galli* it has a small blind Hole, into which the End of the *Sinus Longitudinalis* is inserted. From this Hole it has a pretty large Spine which runs up along its Middle; instead of this Spine there is sometimes a *Sinus*, in which lies the *Sinus Longitudinalis*, which ought to be observed carefully by Surgeons in Wounds of this Place. This Bone is thicker than the *Sinciput* Bones, but thinner than the *Os Occipitis*: In Children it is always divided into its Middle by a true Suture.

FRONTON, is a Part or Member in Architecture, which serves to compose an Ornament raised over Doors, Cross-works, Niches, &c. sometimes making a Triangle, and sometimes Part of a Circle. It is also called *Faggium* by *Vitruvius*, and *Pediment* by the *French*.

FROZEN Zones: See *Zones*.

FRUCTIFEROUS, is that which produces Fruit; and is a Word used by my Lord *Bacon* and others, for such Experiments in Natural Philosophy, which are advantageous to the Experimenter in Point of Gain or Profit.

FRUMENTA and *Fru mentaceous Plants*, are by the Botanists reckon'd all such as have their Culm (or Stalk) pointed, and their Leaves like Reeds; and which bear their Seed (which is fit to make Bread, or be ground into Flower) in *Ears*, like common Corn; for they reckon two Kinds of *Fruges*, *Frumenta* and *Legumina*: See *Gramineous* and *Culmiferous Herbs*.

FRUSTUM, in Mathematicks, signifies a Piece cut off, or separated from any Body; as the *Frustum* of a Pyramid or Cone, is a Part or Piece thereof cut off (usually) by a Plane parallel to the Base.

All Round and Square Timber that is tapering may be conceiv'd as the *Frustum* of a Cone or a *Pyramid*. To find which, take the following Theorem, which in the main is Mr. *Oughtred*'s, who at *Pag. 99.* of his admirable *Clavis*, gives this and two others for the same Purpose.

Given

B, the Side of the greater Base,
b, the lesser Base's Side,
A, the Height of the *Frustum*,

Tho' below I suppose B and b to represent the Areas of the two Bases.

T t 2

Whole

Whole Height $a + A = H$.

First, To find a , say, As $B - b :: A : \frac{bA}{B-b}$
 or $\frac{bA}{x}$. Now $BH = 3$ times the whole Pyramid,
 because any Prism is 3 times a Pyramid of the same
 Base and Height with it, by 7. *Euclid*, and
 $bA = 3$ times the upper Pyramid. Wherefore
 $\frac{bA}{B-b}$ equal to the *Frustum* of the Pyramid
 required; Which Theorem in Words is this:

Multiply the lower Base by the whole Height, and
 from the Product subtract the upper Base multi-
 ply'd by the Height of the Top-piece wanting;
 and then one third of the Remainder shall give the
 Frustum.

And the same way you may proceed for the *Fru-*
stum of a Cone; only 'twill be more difficult to
 find the Circular Bases.

FUGA Vacui; it is a Notion of the Peripateticks,
 and some other Ancient Philosophers, that there is
 an *Abhorrence in Nature of a Vacuum*; and this in
 Latin they call *Fuga Vacui*, or Nature's endeavour
 to avoid a *Vacuum*.

FUGILE, an Imposthume in the Ears. *Blan-*
chard.

FUGITIVES Goods, are the proper Goods of him
 that flieth upon Felony, which after the Flight law-
 fully found, do belong to the King or Lord of the
 Mannor.

FUGUE, in Musick, is some Point consisting of
 4, 5, 6, or any other Number of Notes begun by
 some one single Part, and then seconded by a third,
 fourth, fifth and sixth Part (if the Composition con-
 sists of so many) repeating the same or such like
 Notes, so that the several Parts follow, or come in
 one after another in the same manner, the leading
 Parts still flying before those that follow.

FUGUE-DOUBLE, is when two or more differ-
 ent Points move together in a *Fugue*, and are al-
 ternately interchanged by several Parts.

FULIGINOUS Vapours, according to some, are
 thick, impure, and sooty Vapours.

FULMINATING Powder: See *Aurum Fulmi-*
nans, and *Pulvis Fulminans*.

FULMINATION, the same with *Detonation*;
 which see.

FUMIGATIO Chymica, is an Erosion of Metal
 by Smoak or Vapour.

FUMIGATION, is making one Body receive the
 Smoak of another, in order to impregnate it with
 the more Volatile Parts of the Body burnt.

FUNCTION, the same that *Action*. is, in re-

ference to any Operation of the Organical Parts of
 an Animal Body, an effective Motion produced in
 the Part by the proper Aptitude, or Fitness of such
 Part for the Uses the Author of Nature designed it.

FUNDUS Plantæ, the Botanists call that the Bot-
 tom of a Plant, where the Stalk and Root just meet
 and join.

FUNGUS, is a soft spongy Flesh which grows up
 on Wounds.

FUNICULAR Hypothesis, was advanced by
Franciscus Linus, against the Notion of the Spring
 and Weight of the Air; and he supposes, That the
 Suspension of the Mercury in the Torricellian Experi-
 ment, is not caused by the Weight of the Atmo-
 sphere pressing on the Mercury in the Basin, but by
 a kind of *Funiculus* of some very fine and thin Sub-
 stance; which being exceedingly rarified by a forcible
 Distension, is continually contracting it self up,
 or becoming more distended according to the differ-
 ent Temperament of the external Air, and by this
 Means occasions the rising and falling of the Quick-
 silver in the Barometer.

But 'tis strange that this little Rope or String at
 the Top would be able to sustain all the Mercury re-
 quisite to form a Column of 30 Inches in length;
 and that as Part will run out of the Tube when there
 is more Mercury in it, so none at all should run out
 after it is come to its due length: Since Mercury is a
 Fluid Body, how comes the *Funiculus* to turn it into
 a solid one? And by its little Strings hold it so to-
 gether, that none can run out?

FUNICULUS, Intestinum, Laqueus, or Ductus
Umbilicalis, the Navel-string, is a Membranous
 Channel or Conduit in the *Fetus*, which reaches
 from the Navel to the *Placenta* in the Womb; it
 contains two Arteries, one Vein, and the Urinary
 Passage in the *Fetus*, saith *Blanchard*. Indeed the
Umbilical Vessels between the Navel and the *Pla-*
centa are wrapt up in a Production of the *Chorion*
 and the *Amnion*, which is generally about a Foot and
 an half long, that the Motion of the *Fetus* may not
 pull the *Placenta* from the Womb: The Use of this
 Navel-string is to carry the Mother's Blood by the
 Veins to the *Fetus*, for its Nourishment; and that
 which is unfit for this Purpose, is carried back by the
 Arteries to the *Placenta*, while the *Fetus* is still sup-
 plied with more from the Vein; so that there is a
 continual Circulation of Blood between the Mother
 and the *Fetus*.

FURCALE Os, the same with *Furcula*.

FURCELLA, the same with *Furcula*.

FURCHE, so the Heralds call
 the Form of this kind of *Crofs* in a
 Coat of Arms.

FURCULA Superior, is the upper Bone of the
Sternum or Breast-bone; others call it *Fugulum*.
Blanchard.

FURFURATION, or *Furfures*, is when Dan-
 drifts fall from the Head in Combings; it comes for
 the most part from that Skin which is under the
 Hair; also from the Beard and Eye-brows. *Blan-*
chard.

FURFURES, the Scales that fall from the Head,
 and sometimes from Skin of the other Parts of the
 Body, occasion'd by the Separation of the *Cuticula*
 or Scarf-skin from the *Cutis*, or true Skin. *Blan-*
chard.

FURLE,

FURLE, the Sea Word for wrapping up and binding any Sail close to the Yard, which is done first by haling up the Braces, and then wrapping the Sail close together, and so binding it fast to the Yard with the Caskets, and Furling-lines. This was formerly written *Farthel*, because the Sail is thus made up in a Bundle or Farthel; but 'tis now every where corrupted into the Word *Furle*.

FURLING-LINES, are small Lines made fast to the Top-sails, Top-gallant-sails, and to the Misen-yard-Arms, to furl up those Sails. Indeed the Misen hath but one Furling-Line, but all the rest have two, one at each end.

FURNACE, the Chymists have several sorts of Furnaces, as the *Reverberatory*; which see under that Word: A *Wind Furnace*, or *Furnace for Fusions*, which is so called, because the Wind comes forcibly to blow the Coals, in order to *Melt* or *Fuse* the Matter in the *Crucible* or *Coppel*. This Furnace for *Fusions*, is in form just like the *Reverberatory*, only less, and there is no need of laying the two Cross Bars there mention'd. They frequently also use *Moveable Furnaces*, whose make is like that of the *Reverberatory*, and they are made of a Paste consisting of three parts of Powders of broken Pots, and two parts of Clay well temper'd together with Water.

Lemery gives the following Figure of a small moveable Furnace for *Fusions*.

c The Chimney.

d The Dome, consisting of two pieces.

r Three Registers, or Holes, to let in the Air to come to the Fire.

FURNITURE of a Dial, are such Lines as are drawn thereon for Ornament; as the *Parallels of Declination*, *Length of the Day*, *Azimuths*, *Points of the Compass*, *Babylonish* and *Jewish Hours*, &c.

FURRING of a Ship, is laying on double Planks on her Sides; this is done after the Ship is built, and is by the Sailors called *Plank upon Plank*: But there is another way of *Furring* which is more properly so called; and that is, when a Ship's Planks are ripped, and new Timbers are put on the former Timbers, and on them other Planks; which is done sometimes to make a Ship bear her Sails the better.

FURRS, in Heraldry, are used in the Doublings of the Mantles pertaining to a Coat of Arms, and sometimes to the Coat it self: They are usually of two Colours; as *Ermins* and *Ermines*, which are black and white; *Erminois* and *Peau*, which are black and yellow; *Vair*, which is white and blue; *Verry*, which is yellow and red, or the like colours.

FURUNCULUS, a Boil, is an acute Swelling as big as a Pigeon's Egg, attended with an Inflammation and Pain, especially when it begins to corrupt and putrify; when it is open'd, and the Matter let out, part of the Flesh underneath is turned into a Corruption of a whitish and reddish colour, which some

call the Ventricle of the *Furunculus*; there is no danger in it, tho' you apply no Remedy to it; for it ripens of it self, and bursts; but the Pain makes it more eligible to apply a Remedy, because that frees the Patient sooner from his Trouble. *Blanchard*.

FUSAROLE, is a small round Member in Architecture, cut in form of a Collar, with somewhat long Beads under the *Echinus*, or Quarter Round of Pillars of the *Dorick*, *Ionick*, and *Composite Orders*.

FUSE or *Fusel* of a Bomb, or Granado-shell, is that which makes the whole Powder, or Composition in the Shell take Fire, to do the designed Execution; 'tis usually a Wooden Pipe or Tap filled with Wild-fire, or some such Composition, and is design'd to burn so long, and no longer, as is the Time of the Motion of the Bomb from the Mouth of the Mortar to the Place where it is to fall; which Time Mr. *Anderson* makes to be about 27 Seconds; so that the Fuse must be contrived either from the Nature of the Wild-fire, or the length of the Pipe which contains it, to burn just that Time.

FUSIL, in Heraldry is a Rhomboidal Figure; more slender than a Lozenge. Thus,

And sometimes thus;

The latter of which seems to be the true Figure, for the Fusil was anciently a kind of Spindle used in Spinning.

The Word *Fusil* also signifies a Fire-lock; whence comes our Word *Fusileers*, i. e. Soldiers carrying only Fire-Arms, and without Pikes.

FUSILIERS, are (in an Army) the same with Musqueteers, and are so called from the Word *Fusil*, which signifies sometimes a Musket.

FUSILLY, in Blazon, is when the Field of an Escutcheon is divided throughout into *Fusils*, as thus:

He beareth *Fusil Sable* and *Ermin*.

The like is to be understood of *Lozenge*, or *Fretty*, respect being had to the Figure.

FUSION, in Chymistry, is the same as *Melting*; so that their Furnace for melting of Metals is called the Furnace for *Fusions*. The Cause of *Fusion*, or the Reason of melting Metals, &c. is this, That by the Force of the Heat or Fire, the Cohesion of the Parts is dissolved, and the Metalline Particles being disjoined, and having a Figure proper to slide over one another's Surfaces, are moved with a most rapid Motion, and so put on the Form or Appearance of a Fluid.

FUSY, is that Part of a Watch about which the Chain or String is wrapped, and is that which the Spring draweth, being in Form commonly taper. In larger Works going with Weights it is *Cylindrical*, and is called the Barrel.

To find what Number of Turns the *Fusy* will have, use this Proportion:

As the Beats of the Balance in one Turn of the Great-Wheel or *Fusy*, (suppose 26928) : Is to the Beats of the Balance in one Hour (20196) :: So the Continuance of the Watches going in Hours

(suppose 16) : To the Number of the Turns of the *Fusy* (12).

That is, 26928 : 20196 :: 16 : 12.

FUTTOCKS, are the Compassing Timbers in a Ship; which make her Breadth; those below next the Keel are called her *Ground Futtocks*; the other the *Upper Futtocks*.

GAL

GABEL, according to some of our Ancient Records, Statutes, Charters, &c. signifies a Rent, Custom, or Duty yielded or done to the King, or any other Lord, not by Contract or Bargain, but imposed by the Will of the Lord. Both the Word and Thing it self is grown quite out of Fashion in *England*, where no Duty can be imposed upon the Subject but by Act of Parliament; but in *France* it is still practised, where it signifies an Excise upon Salt, and is a very heavy one.

GABIONS, a Term in Fortification, signifying Baskets made of Osier-Twigs, equally wide at the Top and Bottom, about four Foot in Diameter, and from five to six high; which being filled with Earth, are sometimes used as Merlons for the Batteries, and sometimes as a Parapet for the Lines of Approach, when it is requisite to carry on the Attacks through a Stony or Rocky Ground, and to advance them with extraordinary Vigour. They serve also to make Lodgments in some Posts, and to secure other Places from the Shot of the Enemies, who nevertheless endeavour to set the Gabions on Fire with Pitch'd Faggots, to render them useless.

GAGE, when one Ship is to Windward of another, she is said to have the *Weather-gage* of her: The Seamen call also trying how much Water a Ship draws, *Gaging*, or rather *Gauging* of her; and it is thus done; They drive a Nail into a Pike near the End, and then put down this Pike by the Rudder till the Nail ketch hold under it, for then as many Feet as the Pike is under Water, is the *Ship's Gage*, or the Depth of Water she draws.

GAGE, in Common Law, signifies a Pawn or Surety: See more in *Wage*.

GAGE-POINT: See *Gauge-Point*.

GALAXY, or *Via Lactea*: See *Milky-Way*.

GALE, the Sea Word for the blowing of the Wind at Sea: When the Wind blows not so hard but that a Ship can carry her Top-sails a Trip, (that is, hoisted up to the highest) then they say it is a *Loom Gale*; when it blows very strong, they say it is a *stiff*, or *strong*, or at least, a *fresh Gale*; but when it blows so hard and violently that a Ship cannot bear any Sail, they say it blows a *Storm*. When two Ships are near one another at Sea, and there being but little Wind blowing, one of them finds more of it than the other, they say that the Ship *Gales* away from the other.

GALEA, is a Pain in the whole Head, so called from the Likeness of the Place, because it takes in, or encompasses the whole Head like an Helmet; in Latin *Galea*. *Blanchard*.

GALEA is likewise used when the Head of the *Fetus* is clothed with Part of the Membrane called *Amnion*, as it comes into the World; they say then it hath a *Galea*. *Blanchard*.

GAN

GALENICK-MEDICINE, is that Physick which is built upon the Principles of *Galen*, and therefore they are *Galenists* who embrace the Foundations of that Art, which are fetched from *Galen* and his Principles; though 'tis now frequently opposed to the Chymical Method of Practice, which, they say, is much shorter. *Blanchard*.

GALL: See *Bile*.

GALL-BLADDER, the same with *Folliculus Fellis*.

GALLACTOPHORI, are *Ductus*'s which carry Milk, and convey the Chyle (as some Modern Authors have fancied) a strait way from the Guts to the Glandules of the Breasts; yet the Arteries are more properly so called, because they carry the Chyle along with the Blood to the Breasts, wherein the Milk is separated and reserved for the Use of the *Fetus*.

GALLERY, in a Ship, is that Beautiful Frame which is made upon the Stern without-board, into which there is a Passage out of the Captain's Cabin, which is called the Great Cabin; and these Galleries are indeed rather for Stately Shew, and the Captain's Pleasure, than any other Benefit; for in Ships of War all open Galleries of this kind are to be avoided, in regard of the Facility of an Enemy's Entrance, and boarding of the Ship that way.

GALLERY, in Fortification, is a covered Walk, the Sides whereof are Musket-proof, consisting of a Double Row of Planks lined with Plates of Iron; the Top being sometimes covered with Earth or Turf, to hinder the Effect of the Artificial Fire of the Besieged. These Galleries are frequently made use of in the Moat already filled with Faggots and Bivins, to the end that the Miner may approach safe to the Face of the Bastion, when the Artillery of the opposite Flank is dismounted.

GALREDA, a thick viscous Juice that is extracted by boiling from the Gristly Parts of Animals, and is usually called a *Gelly*.

GANG: To Man the Boat, in the Sea Phrase, is to put a Gang of Men (which is a Company) into her: They are commonly called the *Coxswain's Gang* who hath the Charge of her.

GANGWAY, signifies all the several Entrances, Ways, or Passages from one Part of the Ship to the other; and whatsoever is put in any one of these Passages, are said to be laid or put in the *Gangway*.

GANGLION, is an Humour in the Tendinous and Nervous Parts, proceeding from a Fall, Stroke, or otherwise: It resists if stirred; if pressed upon the Side, is not diverted, nor can be turned round. *Blanchard*.

GANGRENE, is a Cadaverous Corruption of a Part, attended with a beginning of Stink, Blackness, and Mortification. *Blanchard*.

GARB,

GARB, the Term in Heraldry for a Wheat-Sheaf.
GARBOARD-PLANK, the first Plank of a Ship fastened on her Keel; as

GARBOARD-STRAKE, is the first Seam in a Ship next to the Keel.

GARD DU-CORD, or *Gard-du-Gut*: See *Gard-decut*.

GARDECAUT, or *Gard-du-cord*, is that which stops the Fusy of a Watch when wound up, and for that end is driven up by the String; some call it *Guard-Cock*, others *Gard-du-Gut*.

GARDEYNE DEL EGLISE, or *Church-Warden*, are Officers chosen in every Parish to have the Care and Custody of the Church Goods; and they may have an Action for the Goods of the Church, and divers other things they may do for the Benefit of the Church: They are to join with the Overseers for the making of Rates, and other Provision for the Poor of the Parish.

GARDIAN, or *Guardian*, signifies generally him that hath the Custody or Charge of any Person or thing; but most commonly him that hath the Education or Protection of such People as are not of sufficient Discretion to guide themselves and their Affairs, being indeed as largely extended as *Tutor* and *Curator* among the *Civilians*; for whereas *Tutor* is he that hath the Government of a Youth until he come to fourteen Years of Age; and *Curator*, he that hath the imposition and ordering his Estate afterwards, until he attain to the Age of five and twenty Years; or that hath the Charge of a Frantick Person during his Lunacy; both these with us are called *Guardians*.

A *Tutor* is either *Testamentarius*, or à *Prætoribus ex Lege Atilia*; or lastly, *Legitimus*: So we have three sorts of *Guardians* in England, one ordained by the Father in his last Will, another appointed by the Judge, the third cast upon the Minor by the Law and Custom of the Land.

As to the first of these, a Man having Goods or Chattels, may appoint a *Guardian* to the Body or Person of his Child, by his Last Will and Testament, until he come to the Age of fourteen Years, and to the disposing and ordering of his Estate so long as he thinks meet, which is commonly to one and twenty Years of Age. The same he may do of Lands not holden in *Capite*, or by Knight's-Service; but the ancient Law in this Case is very much altered, and in all Cases gives the Father Power to appoint a *Guardian* for his Child; but if the Father order no *Guardian* to his Child, the Ordinary may appoint one to manage his Goods and Chattels till the Age of fourteen Years; at which time he may chuse him another *Guardian*, as by the Civil Law he may his *Curator*; for this Rule holds, that is, *Invito Curator non datur*. And for his Lands the next a-kin on that Side, by which the Land cometh not, shall be *Guardian*, who was formerly called *Guardian in Socage*.

GARDIAN, or *Guardian of the Spiritualities*, is he to whom the *Spiritual Jurisdiction* of any Diocese is committed during the Vacancy of the See. And the *Guardians* of the *Spiritualities* may either be *Guardian* in Law, or *Jure Magistratus*, as the Archbishop of any Diocese within his Province; or *Guardians* by Delegation, as he to whom the Archbishop or Vicar-General doth for the time depute.

GARDIAN, or rather *Warden of the Cinque Ports*, is a principal Magistrate that hath the Jurisdiction of those Havens in the South-East part of England, which are commonly called, *The Cinque Ports*; that is, the five *Ports* or *Havens*; who there hath all

that Jurisdiction that the Lord High Admiral of England hath in Places not exempt.

GARGAREON, the same with the *Epiglottis*, or Cover of the Wind-pipe; which see.

GARGARISM, is a Liquid Medicine which is used to cleanse the Mouth and the adjacent Parts, by gargling or moving it up and down in the Throat without swallowing; and it is either a Decoction, wherein convenient Syrups are dissolved, or distilled Waters mixed with Syrups, and sometimes with Mineral Spirits. *Blanchard*.

GARLAND, in a Ship, is that Collar of Rope which is wound about the Head of the Main-mast, to keep the Shrouds from galling.

GARNET, is a Tackle in a Ship, having a Pendant coming from the Head of the Main-mast, with a Block strongly seized to the Main-stay just over the Hatch-way; in which Block is reeved the Runner, which hath an Hook at one End, in which is hitched the Slings; and at the other End is a Double Block, in which the Fall of the Runner is reeved, that so by it any Goods or Casks that are not over-heavy, may be haled and hoisted into, or out of the Ship; when this *Garnet* is not used, it's fastened along by the Stay at the Bottom of it.

GARNISHEE, is taken for the Party in whose Hands Money is attached within the Liberties of the City of London, so used in the Sheriff of London's Court, because he has had *Garnishment* or Warning, not to pay the Money, but to appear and answer to the Plaintiff's Creditor's Suit.

GARNISHMENT, in Law, is a Warning given to one for his Appearance, for the better furnishing of the Cause and Court; as if one is sued for the Detinue of certain Evidences and Charters, and saith, That the Evidences were delivered to him, not only by the Plaintiff, but another also; therefore prayeth that that other may be warned to plead with the Plaintiff, Whether the said Conditions be performed or no? And in this Petition he is said to pray *Garnishment*: *New Book of Entries*, Fol. 211. Col. 3.

GARRISON, is a certain number of Officers and Soldiers that defend a Place.

GARTER, a Term in Heraldry, signifying the Moiety or half of a *Bend*: See *Bend*.

GAS, a Word used by *Van Helmont*, and seems designed to signify in general a Spirit not capable of being coagulated: But he uses it loosely in many Senses; as he calls the Vital Principle in Man, *Gas Vitale*; that Sulphureous or Arsenical, or any other way noxious Damp which is found in some Mines, he calls *Gas Pingue Sulphureum*: Nay, sometimes he calls the Air its *Gas Ventosum*, as he doth Water *Gas Salium*; and in short, speaks very unintelligibly and inconsistently about it, as the Chymist's Manner is in other things.

GASTEROCNEMIUM, is the Calf of the Leg, whence its Muscles are called *Gasterocnemii*, from their swelling like a Belly: Therefore two of these Muscles are called *Gasterocnemii*.

GASTEROCNEMIUS *Externus*, also *Gemellus*, is a Muscle of the *Tarsus*, so called, (because with the *Soleus* or *Internus* of that Name) it composes the Calf of the Leg: It is also called *Gemellus*, from its being as it were double. It has two distinct Fleishy Originations, from the superior and hindmost Parts of each Tubercle of the lower Appendage of the Thigh Bone, which in their Descent are each dilated into two large Fleishy Bellies, the innermost of which is thickest and largest, having each a differing Series of Fleishy Fibres, and join to each other near where they make a broad strong Tendon,

tion, which narrowing it self, joins with the great Tendon of the *Gastrocnemius Internus*, four Fingers breadth above its Insertion to the *Os Calcis*. When this Muscle acts, the Foot is said to be extended or pulled backwards, which Motion of it is very necessary in Walking, Running, Leaping, and Standing on Tiptoe, &c. Hence it is, those that walk much, that carry heavy Burthens, Chairs, &c. and who wear low-heel'd Shoes, have these Muscles larger than others.

GASTROCNEMIUS Internus, is a Muscle of the Foot, which is placed under the *Gastrocnemius Externus* and *Plantaris*. It is also called *Soleus* from its Figure, resembling a Sole-Fish. It's externally fleshy Part is covered with a Transparent Tendinous Expansion, which makes it appear of a livid Colour. Its Beginning is partly Tendinous, but chiefly Fleshy from the hindermost Part of the upper Appendix of the *Fibula*, and Back-part of the *Tibia*, that is below the Insertion of the *Subpopliteus*, and increasing to a large Fleshy Belly composed of various Orders of Fleshy Fibres, some of them underneath aptly expressing the Figure of the Top of a Feather, whose *Stamina* here being Tendinous, join with the great Tendon, which is about a Finger's Breadth in Length, and inserted to the superior and hindmost Part of the *Os Calcis*. The Foot, together with the Toes, being as it were a Lever to the whole Body, ought therefore to be attended with Muscles of great Strength to extend it; wherefore we find these Muscles so much to exceed the *Antagonist*, the *Tibialis Anticus*, as well in the advantageous Construction of their differing Series of Fleshy Fibres, as their Magnitude and Insertion at the Extremity of the *Os Calcis*, whereby they are not only rendred serviceable in Walking, Running, Leaping, &c. but do also support the *Tibia* in Standing, lest the superincumbent Pressure of the Weight of the Body should make them incline forwards at their Articulations with the *Talus*.

GASTROEPIPIOICA, is the Vein and Artery which goes to the Ventricle and Cawl.

GASTRORHAPHIA, is a Connexion or a Suture in the Wounds of the Abdomen.

GASTROTOMY, the cutting of the Abdomen: See *Cæsarean Section*.

GATE of the Sea, or a *Sea-Gate*, is when two Ships lie aboard one another in a Wave or Billow, and by that Means sometimes become Rib-broken.

GAVEL, in Law, signifies Tribute, Toll, Custom, Yearly Rent, Payment, or Revenue, of which there are several Kinds, as *Gavel-Corn*, *Gavel-Malt*, *Out-Gavel*, *Gavel-Fodder*, &c.

GAVELET, is a special and ancient kind of *Cessavit* used in *Kent*, where the Custom of *Gavel-kind* continueth, whereby the Tenant shall forfeit his Lands and Tenements to the Lord of whom he holdeth, if he withdraw from him his due Rents and Services. Mr. S. in his *History of Gavel-kind* says, That this *Gavelet* was not a Rent or Service, but signified a Rent or Service withheld, denied, or detained, causing the Forfeiture of the Tenement to the Lord; with which the Lord Coke agrees, where he says, That *Gaveletum* is as much as to say, to cease, or to let to pay the Rent. And it seems this Writ lay in *London* as well as *Kent*.

GAVEL-KIND, signifies, in Law, a Custom, whereby the Land of the Father is equally divided at his Death among all his Sons, or the Land of the Brother at his Death equally divided among all his Brethren, if he have no Issue of his own. This Custom is still in force in divers Places of *England*, e-

specially in *Kent*, *Urchensfield* in *Herefordshire*, and elsewhere, though with some Difference: And all *Gavel-kind* Land in *Wales* are made defendable to the Heirs, according to the Course of the Common Law. In *Gavel-kind*, tho' the Father be hang'd, the Son shall inherit; for their Custom is,

The Father to the Bough, the Son to the Plough.

GAUGE-POINT, of a Solid Measure, is the Diameter of a Circle, whose Superficial Content is equal to the Solid Content of the same Measure: Thus, the Solid Content of a Wine Gallon being 231 Cubick Inches, if you conceive a Circle to contain so many Inches, you may easily find the Diameter of it; which shall be the *Gauge-Point* for Wine Measure: After the like Manner the *Gauge-Point* for Ale Measure, &c. is found. Vid. *Windgate's Rule of Proportion*, Ch. 10.

GAUGING, is the finding the Capacities or Contents of all sorts of Vessels which hold Liquids, Powders, Meal, Corn, &c.

If these are of a Square form like hollow Cubes or Parallelopipids, &c. such as many sorts of *Bucks*, *Coolers*, *Fats*, &c. their Content is easily found, by multiplying the Area of the Base by the perpendicular Altitude, as you find the Solidity of Parallelopipids and Prisms.

If they are of a Cylindrical Figure, as *Bushels*, *Gallons*, &c. you must, as near as you can, find the Area of the Circular Base, and multiply that by the perpendicular Altitude as before.

If they are *Casks* of the usual Form of our *Hogheads*, *Barrels*, &c. Mr. *Oughtred* considers them as Segments of a *Spheroid*, cut off by two Planes perpendicular to the Axis.

And then Mr. *Caswell* thus easily deduces his Theorem for measuring Wine and Ale Casks:

Suppose *CEB* a Quadrant of an Ellipsis, whose Semi-Axes are *CB* and *CE*; and let the Ratio of the Semi-Parameter to *CB*, be as *l* to *t*: And let *EC*, *ED*, *mm*, *HG*, be considered as the Radii of Circles, which when turned round the Axis, *BC* shall form a *Spheroid*: Therefore the Elemental Circle

$$\begin{aligned} DF &= l \\ \odot nM &= \frac{1}{t} \times \odot CB - \odot CD \\ \odot GH &= t \times \odot CB - \odot CG \end{aligned}$$

Wherefore, the Frustum of the Spheroid is

$$\frac{1}{2} p \times CB - \frac{1}{2} \odot CG : = \frac{1}{2} p \times \frac{1}{t} \odot CB - \frac{1}{2} \odot CG = \frac{1}{2} p \times 2 \odot CE + \odot HG$$

Which

Which last is Mr. Oughtred's Theorem; in Words thus:

Add twice the Area of the Circle at the Bung, to the Area of the Circle of the Head; and then multiply that Sum by one Third of the Length of the Cask, (which p stands for here, as being a Perpendicular to the Planes of these Circles) the Product is the Content of the Vessel in Cubick Inches.

But perhaps, saith Mr. Caswell, most of our Casks had better be considered as *Frusta* of a *Parabolick Spindle*; and then the Ground of their Mensuration he thus deduces.

Suppose A the Axis of a Parabola, and P an Ordinate to that Axis, divided into innumerable Parts by $B, C, \&c.$ drawn parallel to the Axis, whose Differences from A , suppose $n, m, \&c.$

$$\text{That is, } \begin{cases} B = A - n \\ C = A - m \\ E = A - x \end{cases}$$

$$\text{Therefore } \begin{cases} B^2 = A^2 - 2An + nn \\ C^2 = A^2 - 2Am + mm \\ E^2 = A^2 - 2Ax + xx \end{cases}$$

But $A^2, A^2, \&c.$ is a Series of Equals, therefore $= p A^2$, and $2An, 2Am, \&c.$ (by the Nature of the Parabola) is a Series of *Secundans*, therefore $= p \times \frac{2}{3} Ax$. And nn, mm, xx , is a Series of *Quartans*, therefore $= \frac{1}{4} p xx$.

Therefore the Frustum of a *Pyramidoid*, made of $A^2, B^2, C^2, \&c.$ is $= P \times A^2 - \frac{2}{3} Ax + \frac{1}{4} xx = \frac{1}{3} P x : \frac{2}{3} xx + 2A^2 + (A^2 - 2Ax) = E^2 - xx = \frac{1}{3} P x : 2A^2 + E^2 - \frac{2}{3} xx$.

Therefore if a Segment of a *Parabola*, cut off by a Line parallel to the Axis, be turn'd about its ordinate Applycate P , the Frustum of the Acute *Parabolick Conoid*, so generated, or as some call it, a *Parabolick Spindle*, is $= \frac{1}{3} P x : 2A^2 + E^2 - \frac{2}{3} xx$.

So that the Frustum of a *Parabolick Spindle*, is less than the Frustum of the *Spheroid* of the same Base and Height by $\frac{2}{3} \times \frac{1}{3} P$; and for the most Part gives the Capacity of Casks nearer the Truth than the Theorem of *Oughtred*, who supposes Casks to be *Frusta* of *Spheroids*; or than that of others, by multiplying the Circles at the Bung and Head into half the Length of the Cask, which supposes it to be a *Parabolick Conoid*: Or lastly, than with others,

to suppose them for *Frusta* of *Cones*, which is farthest of all from the Truth.

The Common Rule for all Ale or Wine Casks, is to take the Diameters at the Bung and at the Head; by which you must find the Areas of the Circle there; then you must take $\frac{2}{3}$ of the Area of the Circle at the Bung, and $\frac{1}{3}$ of the Area of the Circle at the Head, and add them together into one Sum, which Sum multiplied by the internal Length of the Cask, gives the Content, in Solid Inches: Which you may turn into Gallons, by dividing by 282 for Ale, and 231 for Wine Gallons.

But certainly, 'tis easier and shorter to use the Theorem, as Mr. Oughtred expresses it, as above-said, viz, $\frac{1}{3} p \times 2 \odot CE + HG$, than to make Fractions of the Areas of those Circles, as in the common way.

GAYNAGE, in our Law, signifies most properly the Profit that comes by the Tillage of the Land held by the baser kind of Soke-men.

GAZONS, in Fortification, are Pieces of fresh Earth covered with Grass cut in Form of a Wedge, about a Foot long, and half a Foot thick, to line Parapets and the Transverses of Galleries.

GEMELLES, the Term in Heraldry for the bearing of Bars by Pairs or Couples in a Coat of Arms: As,

He beareth Gules on a Chevron Argent, three Bars Gemelles Sable, by the Name of *Throgmorton*.

GEMELLUS, is a Muscle of the Cubit, so called from its double Origine; it ariseth first Tendinous from the superior Part of the inferior *Costa* of the *Scapula* internally, and as it passeth between the two round Muscles, it grows Flethy, and in its Descent joineth with its other Beginning, which arises broad and Flethy from the upper and back-part of the *Os Humeri*, under the Deltoid Muscle; and being Tendinous on the outside, and Flethy within, is so inserted to the superior and external Part of the *Ulna*, called *Olecranon* and *Ancon*, or the Elbow. Its Use is to extend the Cubit: If we examine the two Beginnings of this Muscle, we shall find them interwoven with various Orders of Fibres, whereby it is rendred capable of performing the Extension of the Cubit with a greater Strength; which appears in Tumblers when they are walking on their Hands, who by an immediate Extension of their Cubits, can return to their Feet.

GEMINI, a Muscle serving to move the Thigh outwards.

GEMINI, one of the 12 Signs of the Zodiack, being the Third in Order; also a Constellation of that Name.

GEMINOUS Arteries, so some call the two small Arteries which defend to the Joint of the Knee, between the Processes of the Thigh-bones.

GEMMA, among the Botanists, is the Turgid Bud of any Tree when it is beginning to bear: 'Tis called also *Oculus*.

GENA Mala, is the Part of the Face from the Nose to the Ears: Also the Chin and the Jaw-bone is sometimes so called, which is either upper, or lower. *Blanchard*.

GENERATING Line or Figure, in Geometry, is that which by its Motion or Revolution produces any other Figure Plane or Solid. Thus a Right Line moved any way parallel to itself, generates a Parallelogram; if round a Point in the same Plane, with one End fastened in that Point, it generates a Circle.

One entire Revolution of a Circle in the same Plane, generates the Cycloid; the Revolution of a Semi-circle round its Diameter, generates a Sphere, &c. Sir Isaac Newton uses the Word

GENERATED, or *Genited Quantity*, in a very large Sense, for whatever is produced either in Arithmetick by the Multiplication, Division, or Extraction of Roots; or in Geometry by the Invention of the Contents, Areas, and Sides; or of Extream and Mean Proportionals, without Addition and Subtraction.

GENERATION, is the Production of any thing in a Natural Way, which before was not in Being: For when in any Parcel of Matter there is produced such a Concurrence of all those Accidents which ('tis agreed) are necessary and sufficient to constitute a *determinate Species* of things Corporeal; we then say a Body belonging to that Species is generated. So that here, properly speaking, no *New Substance*, but only a new *Essential Denomination, Modification, or Manner of Existence* is produced or generated: And when that Union of Accidents which denominates a Body generated, is destroyed and dissolved, that Body losing its Essential Modification is said to be Corrupted.

GENEROUSA, a Law Term for a Gentlewoman; if she be really so, and named *Spinster* in any Original Writ, Appeal, or Indictment, she may abate and quash the same; for she hath as good Right to that Addition, as a Barones or Dutches have to theirs: The same may be said of *Generosus*, a Gentleman. 2 Inst. 668.

GENESIS, in Geometry, is the Formation of any Plane or Solid Figure by the Motion of some Line or Surface, which Line or Surface is always called the *Describent*; and that Line according to which the Motion is made, is called the *Dirigent*.

GENICULUM, in Botany, is the Knot or Joint in the Stalk of any Plant.

GENIOGLOSSUM, is a Pair of Muscles proceeding inwardly from the Fore-part of the Lower Jaw, under another Pair called *Geniohyoides*, and enlarging themselves, are fastened into the Basis of the Tongue: These serve to pull the Tongue forward, and to thrust it out of the Mouth.

GENIOHYOIDEUS, is a Muscle of the *Os Hyoides*, which, with its Partner, is short, thick, and fleshy, arising from the internal Parts of the Lower Jaw-bone called the Chin, and dilating themselves, are soon lessened again, and inserted to the superior Part of the Fore-bone of the *Os Hyoides*. These acting, pull the *Os Hyoides*, &c. both upwards and forwards, and assist the *Genioglossa* in thrusting the Tongue out of the Mouth.

GENUS, in Logick, is an Idea so common and universal, that it extends its self also to other *Universal Ideas*. Thus a Right-lined Figure of four Sides, is a *Genus*, in respect of a *Parallelogram* or a *Trapezium*. And in like manner Substance is the same in respect of *Substance extended*, which is a Body; and *Thinking Substance*, which is a Spirit. The Logicians divide *Genus* into *Summum* or the highest *Genus*, which hath nothing above it to be a *Species* of: And *Subalternate*, which is sometimes, or in some respects, a *Genus*, and in others a *Species*.

GEOCENTRICK, signifies any Planet or Orb that has the Earth for its Center, or the same Center with the Earth.

GEOCENTRICK Latitude of a Planet, is its Latitude seen from the Earth; or the Inclination of a Line connecting the Planet and the Earth, to the Plane of the Earth's (or true) Ecliptick: Otherwise

'tis the Angle which the aforesaid Line (connecting the Planet and the Earth) makes with the Line, which is drawn perpendicular to the Plane of the Ecliptick.

Thus in the Figure annexed, the Angle $\angle T e$ is the Measure of the Planet φ , her Geocentrick Latitude when the Earth is in T , and the Angle $\angle e \varphi$, the Measure of it when the Earth is in t .

GEOCENTRICK Place of a Planet, is such as it would appear to us from the Earth, if our Eye were there fixed.

GEODÆSIA, Surveying, or the Art of measuring Land: See Surveying.

GEODÆTICAL Numbers, are such as are considered according to those Vulgar Names or Denominations, by which Money, Weights, Measures, &c. are generally known, or particularly divided by the Laws and Customs of several Nations.

GEOGRAPHICAL Mile, is the *Sea Mile*, or *Minutes*, being one 60th Part of a Degree of a great Circle on the Earth's Surface.

GEOGRAPHY, is a Description of the whole Globe of the Earth, or known Habitable World; together with all its Parts, Limits, Situations, and other remarkable things relating thereto.

GEOMETRICAL, or *Algebraical Curves*, are such, as that when their Nature or Property comes to be expressed by an Equation, the two variable Quantities in that Equation (as x and y , the *Abscissa* and *Ordinate*, are called in the Doctrine of Fluxions) are both, or do both denote straight Lines, then that is truly a Geometrical or Algebraical Curve.

But when one of the Variable or Flowing Quantities in such an Equation denotes a *Curve-Line*, then that Curve is called a *Transcendent Curve*.

GEOMETRICAL-PLANE: See Plane.

GEOMETRICAL Progression or *Proportion*: See Progression.

GEOMETRICAL Solution of a Problem, is when the Thing is solved according to the Rules of Geometry, and by such Lines as are truly Geometrical and agreeable to the Nature of the Problem.

Thus *Des Cartes's* Way of finding two Mean Proportionals is a *Geometrical Solution*, because done according to the Nature of the Problem, which is a Solid one; and also because performed by the *Periphery* of a Circle and the *Parabola*, which are truly Geometrical Curves, and agreeable to the Nature of the proposed Problem: But then the Solution of it by *Diocles* is not *Geometrical*, because both the *Cissoid* (by which he performs it) is no true Geometrical Curve, and also being a Line of the *Second Gender* (as they call it) it is proper only to a *Surfsolid Problem*.

GEOMETRICK Places: See *Places Geometrical*.

GEOMETRY, originally signifies the Art of measuring the Earth, or any Distances or Dimensions on or within it; but 'tis now used for the *Science of Quantity, Extension, or Magnitude, abstractedly considered, without any regard to Matter*.

Geometry, very probably, had its first Rise in *Egypt*, where the Nile annually overflowing the Country, and covering it with Mud, obliged Men to distinguish their Lands one from another, by the Consideration of their Figure; and to be able also to measure the Quantity of it, and to know how to plot it and lay it out again in its just Dimensions, Figure, and Proportion: After which 'tis likely a farther Contemplation of those Draughts and Figures, help'd them to discover many excellent and wonderful Properties belonging to them, which Speculation continually was improving, and is still to this very Day.

GEOMETRY is usually divided into *Speculative* and *Practical*: The former of which contemplates and treats of the Properties of continued Quantity abstractedly: And the latter applies these Speculations and Theorems to Use and Practice, and to the Benefit and Advantage of Mankind. See Vol. II.

GERMINATION, is the growing or sprouting out of Vegetables, or of any Parts of them.

GIBBOUS, is a Term used in reference to the enlightened Parts of the Moon, while she is moving from Full to the First Quarter, and from the last Quarter to Full again; for all that Time the dark Part appears horned and *falcated*, and the light one bunched out, Convex, or *Gibbous*.

GIFT-ROPE, is the Boat-Rope, which is fastened to the Boat when she is *swifted*, in order to her being towed at the Stern of a Ship.

GILD, or *Guild*, in Law, signifies a Tribute, or sometimes an Amerciament; and sometimes also a Fraternity or Company combined together, with Orders and Laws made among themselves by the Prince's License.

GILLA Vitrioli, is only a Purification of White Vitriol, by dissolving it in the Phlegm of Vitriol, and then filtrating the Solution, and either crystallizing it, or evaporating *ad siccitatem*, to gain the Salt or *Gilla*, which accordingly will be in the Form either of Crystals, or a dry Salt at the Bottom.

GINGLIMUS, is an Articulation of a Bone when it both receives and is received: Of this Articulation there are three sorts.

The First is when the End of a Bone has two Protuberances and one Cavity, and the End of the Bone which is articulated with it has two Cavities and one Protuberance, as the *Humerus* and the *Ulna*; or when a Bone at one Extremity receives another Bone, and at its other Extremity it is received by the same Bone, as the *Radius* and *Ulna*.

The Second Sort is when a Bone at one End receives another Bone, and at the other End is received by a third Bone, as the *Vertebrae* do.

The Third is when a Bone has a Cavity which receives the long Process of another Bone, which Process turns in the Cavity like the Axle-tree in a Wheel, as the second *Vertebra* of the Neck is articulated with the first; but this is no true *Ginglimus*.

GIRDING-GIRT: The Seamen say a Ship is *Girt*, or hath a *Girding-Girt*, when her Cable is so tight, or strained, that upon the running of the Tide, she cannot go over it with her *Stern part*, but will lie a-cross the Tides.

GIVEN, is a Word often used in Mathematicks, and signifies something which is supposed to be

known: Thus, if a Magnitude be known, or that we can find another equal to it, they say, 'Tis a *given Magnitude*, or that such a thing is *given in Magnitude*. If the Position of any thing be supposed as known, they say, *Given in Position*: Thus, if a Circle be actually described upon any Plane, they say, its Center is *given in Position*; its Circumference is *given in Magnitude*; and the Circle both in *Position* and *Magnitude*. But a Circle may be *given in Magnitude only*; as when only its Diameter is given, but the Circle not actually described. If the Kind or Species of any Figure be given, they say, *Given in Specie*. If the Ratio between any two Quantities is known, they are said to be *given in Proportion*. See *Barrow's* Definitions and Propositions of *Euclid's Data*, at the End of the Elements put forth by that Great Geometrician, Anno 1678.

GLACIALIS Humor: See *Humores Oculi*.

GLACIATION, the turning of Water, or any other Liquor, into Ice: See *Freezing*.

GLACIS, a sloping Bank in Fortification: It signifies a very gentle Steepness, but is more especially taken for that which rangeth from the Parapet of the *Cover'd-way* to the Level on the Side of the Field.

GLAND: See *Glandula*.

GLANDULA: A *Glandule* is a Substance of a peculiar Nature, Flethy, White, or Gray; and it is two-fold: *Adventitious*, as those Kernels which are sometimes under the Arm-holes, and in the Neck, as the *King's-Evil*; a Swelling in the *Larynx* and middle of the Wind-pipe, &c. Or *Perpetual and Natural*, as the *Thymus*, *Pancreas*, *Glandula Pinealis*, &c. The *Perpetual* is again two-fold, either *Conglobated* in one entire Piece, which sends the separated Humour into the Veins, as the *Pituitary Glandule*, the *Pinealis*, the Glandules of the Mesentery, of the Groins, &c. Or *Conglomerated* in a Cluster, which convey the Juice by their own Channels into some notable Cavities of the Body; as the *Pancreas*, the Glandules of the *Breast*, the *Salivary Glandules*, &c.

There are also discovered by Dr. *Haver's* a sort of Glands, which he calls *Mucilaginous Glands*; which see under *Mucilaginous*.

GLANDULA Guidonis, is a Tumor like a *Glandula*, soft, single, moveable, without Roots, and separated from the adjacent Parts.

GLANDULA Pinealis: See *Conarium*.

GLANDULA Pituitaria, is a little Body in the *Sella Equina*, a Place in the Brain so called, cover'd over with the *Rete Mirabile* in many Brutes, but not in Men: It receives the Serous Humour from the *Infundibulum* and the *Rete Mirabile*, which it sends into the Jugular Veins and the Lymphatick Vessels.

GLANDULÆ Lumbares, are three Glands described by *Bartholin*, and by him so named, by reason of their lying upon the Loins: He thus describes them, *Pag. 191. of his Anat. Edit. 1674*.

The two largest lie one upon another betwixt the descending *Cava* and *Aorta*, in that Angle which the Emulgents make with the *Cava*: The third being smaller stands over these, under the Appendices of the Diaphragm. They have Communication, or are knit to one another by small Lacteal Branches, especially the two larger.

He once thought them to supply the Place of the common Receptacle in Man; that not being so plain in him as in several Brutes: But since a Receptacle is acknowledg'd as well in Men as Brutes, Dr. *Wharton's* Opinion concerning their Use seems more probable, *viz.*

That they supply the Place of those larger Glands that are found in the Mesenteries of Brutes, but are not Natural to Men: And for this Reason he presumes, That all such Animals as want those greater Glands in the Mesentery, have these *Lumbares* as well as Men.

GLANDULÆ Otoriferae are certain small Glandules discovered by that Accurate Anatomist Dr. Tyson, in that Part of the *Penis* where the *Preputium* is contiguous to the *Balamus*; and he gives them this Name from the great Scent which their separated Liquor emits: In such Persons as have the Prepuce longer than ordinary, these Glands are not only more, but larger, and separate a greater Quantity of their Juice, which lodging there, often grows Acid, and corrodes the Glands: These are very conspicuous in most Quadrupeds, especially in Dogs and Boars.

GLANDULÆ Renales, seu Capsula Atrabiles, are Glands which lie between the *Aorta* and the Kidneys, a little above the Emulgent Vessels: They are two in Number, one on each Side, wrap'd up in Fat: They sometimes change their Situation, and their Figure is also various; for in some they are Round, in others Oval, Square, Triangular, of a Trapezial or Irregular Figure; the Right is ordinarily bigger than the Left, and each about the Bigness of a *Nux Vomica*. Their Use is not certainly known; they seem to separate a Liquor from the Arterial Blood before it goes to the Kidneys, for the liquifying the Blood which is thick after it comes from them.

GLANS, in Botany, is that which being contained within a smooth but hard Bark, and containing but one Seed, hath its Hinder-Part (which adheres to the Tree) covered with a kind of Cup, while the Fore-part is bare; as Acorns, &c. but properly *Glans* is the Fruit without the Cup.

GLANS, the same with *Balamus* and *Suppositorium*.

GLANDULUM Corpus, the same with *Prostata*.
GLANDULOSA Tunica Intestinorum: See *Papilla Intestinorum*.

GLASS of Antimony: See *Regulus of Antimony*.

GLASSY Humour of the Eye: See *Vitreous Humour*.

GLASSY Tunicle: See *Vitreous Tunicle*.

GLAUCOMA, is a Fault in the Eye, or a Transmutation of the Crystalline Humour into a Gray or Sky Colour.

GLAUCOSIS, the same with *Glaucoma*.

GLEBE-LAND, Church-Land, is most commonly taken for Land belonging to a Parish-Church beside the Tythe.

GLENE, the same with *Pupilla*; also the Cavity of a Bone which receives another within it.

GLENOIDES, are two Cavities in the lower Part of the first Vertebre of the Neck.

GLOBE or *Sphere*, is a round solid Body, every Part of whose Surface is equally distant from a Point within it, called its Center: and it may be conceived to be formed by the Revolution of a Semicircle round its Diameter.

When such a Body as this hath all the Parts of the Earth and Sea drawn or delineated on its Surface, like as in a Map, and placed in their Natural Order and Situation, it is called the *Terrestrial Globe*.

But if on its Surface it hath the fixed Stars and the Images of the Constellations drawn, together with the Circles of the Sphere below described, 'tis then called the *Celestial Globe*.

And when the following Circles are supposed to be described on the Convex Surface of a Sphere,

which is hollow within, and after this you imagine all Parts of the Sphere's Surface to be cut away, except those Parts on which such Circles are described, then that Sphere is called an *Armillary Sphere*, because it appears in the Form of several Circular Rings or Bracelets put together in a due Position.

There are Ten Eminent Circles upon the Globe or of the Sphere; Six of which are called *Greater*, and the Four other *Lesser Circles*.

A *Great Circle* of the Sphere is that whose Plane passeth through the Center of the Sphere, and divides it into two equal Parts or Hemispheres.

A *Lesser Circle* is that which is parallel to a *Greater*, as the *Tropicks* and the *Polar Circles* are to the *Equator*, and as the *Circles of Altitude* are to the *Horizon*.

Or *Lesser Circles* are such as do not divide the Globe into two equal Parts.

The *Greater Circles* are,

I. The *Horizon*, which is a broad wooden Circle encompassing the Globe round about, having two Notches, the one in the North, the other in the South Part of it, for the Brazen *Meridian* to stand in.

There are usually accounted two *Horizons*:

First, The *Visible*, or *Sensible*, which you may conceive to be made by some great Plain, or the Surface of the Sea; and which divides the Heavens into two *Hemispheres*, the one above, the other (apparently) below the Level of the Earth.

This Circle determines the Rising and Setting of the Sun, Moon, or Stars, in any particular Latitude; for when any one of them comes just to the Eastern Edge of the *Horizon*, then we say it Riseth; and when it doth so at the Western Edge, we say it Setteth. And from hence also the Altitude of the Sun and Stars is accounted, which is their Height in Degrees above the *Horizon*.

II. The other *Horizon* is called the *Real* or *Rational*, and is a Circle which encompasses the Earth exactly in the Middle, and whose Poles are the *Zenith* and *Nadir*; that is, two Points in its Axis, each 90 Degrees distant from its Plain (as the Poles of all Circles are) and the one exactly over our Heads, and the other directly under our Feet. This is the Circle which the Wooden *Horizon* on the Globe represents.

On which *Broad Horizon* several Circles are drawn, the innermost of which is the Number of Degrees of the *Twelve Signs* of the *Zodiack*, viz. 30 to each Sign: For the Ancient Astronomers observed the Sun in his (apparent) Annual Motion, to describe always one and the same Line in Heaven, and never to deviate from this Track or Path to the North or South, as all the other Planets did more or less; and because they found the Sun also to shift, as it were backward, through all the parts of this Circle or Path, so that in his whole Year's Course he would *Rise*, *Culminate*, and *Set* with every Point of it; they distinguished the fixed Stars that appeared in or near this Circle into *Twelve Constellations* or Divisions, which they called *Signs*; and because they were most of them usually drawn in the Form of Animals, they called this Circle by the Name of the *Zodiack*, and the very middle Line of it the *Ecliptick*: And since every Circle was divided into 360 Parts or Degrees, a twelfth

twelfth Part of that Number must be 30, the Degrees in each Sign.

Next to this you have the Names of those Signs ; next to this the Days of the Month, according to the *Julian Account*, or *Old Stile*, with the *Calendar* ; and then another *Calendar* according to the *Foreign Account*, called the *New Stile*.

And without there is a Circle divided into Thirty two equal Parts, which make the Thirty two Rhombs or Points of the Mariner's Compass, with the first Letters of the Names annexed ; and since a Thirty second Part of 360 Degrees is 11 Degrees 15 Minutes, they account that each single Point of the Compass is 11 Degrees 15 Minutes.

The Uses of this Circle in the Globe are,

1. To determine the Rising and Setting of the Sun, Moon, or Stars, and to shew the Time of it by the help of the Hour-Circle and Index ; as shall be shewed hereafter.

2. To limit the Increase and Decrease of the Day and Night : For when the Sun rises due East, and sets West, the Days are equal.

But when he Riseth and Setteth to the North of the East and West, the Days are longer than the Nights ; as on the contrary, the Nights are longer than the Days, when the Sun Riseth and Setteth to the Southward of the East and West Points of the Horizon.

3. To shew the Amplitude of the Sun, or of any Star ; and also, on what Point of the Compass it Riseth and Setteth.

II. The next *Great Circle* is the *Meridian*, which is represented by the Brazen Frame or Circle in which the Globe hangs and turns : This is divided into four Nineties, or 360 Degrees, beginning at the *Equinoctial*. 'Tis called the *Meridian*, because when the Sun comes to the South Part of this Circle, 'tis then *Meridies*, *Mid-Day*, or *High-noon*, and then the Sun hath its greatest Altitude for that Day, which therefore is called the *Meridian Altitude*. The Plane of this Circle is perpendicular to the *Horizon*, and passeth through the South and North Points thereof through the *Zenith* and *Nadir*, and through the Poles of the World. In it, each way from the *Equinoctial* on the *Celestial Globe*, is accounted the North or South Declination of the Sun or Stars ; and on the *Terrestrial*, the Latitude of a Place North or South ; which is all one Quantity with the Elevation or the Height of the Pole above the Horizon : Because the Distance from the *Zenith* to the *Horizon*, being the same as that between the *Equinoctial* and the *Poles*, if from each you imagine the Distance from the *Pole* to the *Zenith* to be taken away, the Latitude must remain equal to the *Pole's Height*.

There are Two Points of this Circle, each 90 Degrees from the *Equinoctial*, which are thence the *Poles of the World* ; and a Diameter from thence continued through the Center of either Globe, is called the *Axis of the Earth or Heavens*, on which they are supposed to turn round.

These *Meridians* are various, and change according to the Longitude of Places ; for as soon as ever a Man moves but one Degree, or but a Point to the East or West, he is under a new Meridian : But there is (or should be) one fix'd, which is called the *First Meridian*.

And this on some Globes passes through *Gratiosa*, one of the *Azores* Islands ; but the French place the first Meridian at *Fero*, one of the *Canary* Islands.

The Poles of the Meridian are the East and West Points of the Horizon.

On the *Terrestrial Globe* there are usually drawn Twenty four Meridians, one through every 15 Degrees of the Equator, or through every 15 Degrees of Longitude.

The Uses of this Circle are,

First, To set the Globe to any particular Latitude, by a proper Elevation of the Pole above the Horizon of that Place : And,

Secondly, To shew the Sun or Stars Declination, right Ascension, and greatest Altitude ; of which more below.

III. The next *Great Circle* is the *Equinoctial*, as it is called on the Celestial, and *Equator* on the Terrestrial Globe. This is a great Circle, whose Poles are the Poles of the World : It divides the Globe into two equal Parts or Hemispheres, as to North and South ; and it passes through the East and West Points of the Horizon, and at the Meridian is always as much raised above the Horizon, as is the Complement of the Latitude of any particular Place. Whenever the Sun cometh to this Circle, it makes equal Days and Nights all round the Globe, because it always Riseth then due East, and Sets due West, which it doth at no other Time of the Year. All Stars also which are under this Circle, or which have no Declination, do always Rise due East, and Set full West.

All People living under this Circle (which in Geography, or rather by Navigators, is called the *Line*) have the Days and Nights constantly equal ; and when the Sun is in the Equinoctial, he will be at Noon in their Zenith, or directly over their Heads, and so their erect Bodies can cast no Shadow.

From this Circle, both ways, the Sun or Star's Declination on the Celestial, or Latitude of all Places on the *Terrestrial Globe*, is accounted on the Meridian : And such lesser Circles as run through each Degree of Latitude or Declination parallel to the Equinoctial, are called *Parallels of Latitude*, or *Parallels of Declination*.

Through every 15 Degrees of this Equinoctial the Hour-Circles are drawn at Right Angles to it on the *Celestial Globe*, and all pass through the Poles of the World, dividing the Equinoctial into 24 equal Parts.

And the *Equator* on the *Terrestrial Globe* is divided by the Meridian into 36 equal Parts ; which Meridians are equivalent to the Hour-Circles on the other Globe.

IV. The *Zodiack* is another *Great Circle* of the *Sphere*, dividing the Globe into two equal Parts : When the Points of *Aries* and *Libra* are brought to the Horizon, it will cut that and the Equinoctial obliquely, making with the former an Angle equal to the Sun's greatest Meridian Altitude in any Latitude ; and with the Equinoctial, an Angle equal to 23 Degrees and 30 Minutes, which is the Sun's greatest Declination. This Circle by Astronomers is accounted as a kind of broad one, and is like a Belt or Girdle round the Globe : Through the Middle of it is drawn a Line called the *Ecliptick*, or *Via Solis*, the *Way of the Sun* ; because the Sun never deviates from it in its Annual Motion, as the Planets do all more or less, where it hath its Breadth.

This Circle is mark'd with the Characters of the *Twelve Signs*, and on it is found out the Sun's Place, which

which is under what Star or Degree of any of the *Twelve Zodiacal Constellations* he appears to be at Noon. By this are determined the Four Quarters of the Year, according as the Ecliptick is divided into four equal Parts; and according as the Sun goes on here, he hath more or less Declination.

Also from this Circle the Latitude of the Planets and fixed Stars are accounted from the Ecliptick towards its Poles.

The Poles of this Circle are 23 Degrees 30 Minutes distant from the Poles of the World, or of the Equinoctial, and by their Motion round the Poles of the World, are the Polar Circles described.

In these Poles of the Ecliptick all the Circles of Longitude which are drawn through the Zodiac do determinate, as the *Meridians* and *Hour-Circles* do in the Poles of the World, and as the *Azimuth* or *Vertical Circles* do in the *Zenith* and *Nadir*.

V. If you imagine two *Great Circles* passing both through the Poles of the World, and also one of them through the *Equinoctial Points*, *Aries* and *Libra*, and the other through the *Solstitial Points*, *Cancer* and *Capricorn*:

These are called the two *Colures*, the one the *Equinoctial*, the other the *Solstitial Colure*. These will divide the Ecliptick into four equal Parts or Quarters, which are denominated according to the Points where these pass through, called the four Cardinal Points, and are the first Points of *Aries*, *Libra*, *Cancer*, and *Capricorn*.

These are all the Great Circles.

VI. If you suppose Two Circles drawn parallel to the Equinoctial, at 23 Degrees 30 Minutes distant from it, one towards the North, the other towards the South, these are called the *Tropicks*, because the Sun appears, when in them, to turn backward from his former Course; the one the *Tropick of Cancer*, and the other, the *Tropick of Capricorn*, because they are under these Signs.

VII. If two other Circles are supposed to be drawn through 23 Degrees 30 Minutes, reckoned on the Meridian from the Polar Points, these are called the *Polar Circles*: The Northern is the *Arctic*, and the Southern the *Antarctic* Circles, because opposite to the former:

These are the Four Lesser Circles.

And these on the *Terrestrial Globe* the Ancients supposed to divide the Earth into five *Zones*, viz. two *Frigid*, two *Temperate*, and the *Torrid Zone*.

Besides these Ten Circles lately described, which are always drawn on the Globe it self, there are some other necessary Circles to be known, which are barely imaginary, and supposed only to be drawn upon the Globe.

1. *Meridians*, or *Hour-Circles*, which are great Circles meeting all in the Poles of the World, and crossing the Equinoctial at Right Angles; these are supplied by the Meridian, Hour-Circle, and Index.

2. *Azimuths*, or *Vertical Circles*, which likewise are *Great Circles of the Sphere*, and meet in the *Zenith* and *Nadir*, as the *Meridians* and *Hour-Circles* do in the Poles: These cut the Horizon at Right Angles, and on these is reckoned the Sun's Altitude when he is not in the Meridian. They are represented by the Quadrant of Altitude, which being fixed at the Zenith, is moveable about round the Globe through all the Points of the Compass.

3. There are also *Circles of Longitude* of the Stars and Planets, which are Great Circles passing through

the Pole of the Ecliptick, and in that Line determining the Stars or Planets Place or Longitude reckoned from the first Point of *Aries*.

4. *Almacanters*, or *Parallels of Altitude*, are Circles having their Poles in the Zenith, and are always drawn parallel to the Horizon. These are *Lesser Circles of the Sphere*, diminishing gradually as they go farther and farther from the Horizon.

In respect of the Stars there are also supposed to be *Parallels of Latitude*, which are parallel to the Ecliptick, and have their Poles the same with those of that Circle.

5. *Parallels of Declination* of the Sun or Stars, which are lesser Circles, whose Poles are the Poles of the World, and are all drawn parallel to the Equinoctial, either North or South; and these (when drawn on the *Terrestrial Globe*) are called *Parallels of Latitude*.

DEFINITIONS.

1. *Latitude of any Place*, is an Arch of the Meridian of that Place, intercepted between its Zenith and the Equator; and this is the same with an Arch of the Meridian, intercepted between the Pole and the Horizon; and therefore it is often expressed by the Poles Height, or Elevation of the Pole: The Reason of which is, That from the Equator to the Pole, there always being the Distance of 90 Degrees, and from the Zenith to the Horizon the same Number, and each of these 90 Degrees containing within it the Distance between the Zenith and the Pole; that Distance therefore being taken away from both, must leave the Distance from the Zenith to the Equator, equal to the Distance between the Pole and the Horizon, or to the Elevation of the Pole above the Horizon.

2. *Latitude of a Star or Planet*, is an Arch of a Great Circle reckoned on the Quadrant of Altitude, laid through the Star and Pole of the Ecliptick, from the Ecliptick towards its Pole.

3. *Longitude of a Place*, is an Arch of the Equator intercepted between the Meridian of the Place and the first Meridian: Or it is more properly the Difference, either East or West, between the Meridians of any two Places, accounted on the Equator.

4. *Longitude of a Star*, is an Arch of the Ecliptick, accounted from the beginning of *Aries* to the Place where the Stars Circle of Longitude crosseth the Ecliptick; so that it is much the same as the Stars Place in the Ecliptick, accounted from the beginning of *Aries*.

5. *Amplitude of the Sun*, or of a *Star*, is an Arch of the Horizon intercepted between the true East or West Points of it, and that Point upon which the Sun or Star rises or sets.

6. *Right Ascension of the Sun*, or of a *Star*, is that part of the Equinoctial reckoned from the beginning of *Aries*, which riseth or setteth with the Sun or Star in a Right Sphere: But in an Oblique Sphere it is that Part or Degree of the Equinoctial which comes to the *Meridian* with it, (as before) reckoned from the beginning of *Aries*.

1. *A Right or Direct Sphere*, is when the Poles are in the Horizon, and the Equator in the Zenith. The Consequence of being under such a Position of the Heavens as this (which is the Case of those who live directly under the Line) is, That the Inhabitants have no Latitude nor Elevation of the Pole: They can nearly see both the Poles of the World: All the

Stars

Stars in the Heavens do once in 24 Hours Rise, Culminate, and Set with them; the Sun always Rises and Descends at Right Angles with the Horizon, which is the Reason they have always equal Day and Night, because the Horizon doth exactly bisect the Circle of the Sun's Diurnal Revolution.

2. *A Parallel Sphere*, is where the Poles are in the Zenith and Nadir, and the *Equinoctial* in the Horizon; which is the Case of such Persons, if any such there be, who live directly under the North or South Poles.

And the Consequences of such a Position are, That the Parallels of the Sun's Declination will also be Parallels of his Altitude, or Almucanters to them. The Inhabitants can see only such Stars as are on their Side the Equinoctial; and they must have 6 Months Day, and 6 Months continual Night every Year; and the Sun can never be higher with them than 23 Degrees 30 Minutes (which is not so high as it is with us on *February 10th*.)

3. *An Oblique Sphere*, is where the Pole is elevated to any Number of Degrees less than 90: And consequently the Axis of the Globe can never be at Right Angles to, nor in the Horizon; and the Equator, and Parallels of Declination, will all cut the Horizon Obliquely, from whence it takes its Name.

Oblique Ascension of the Sun, or Stars, is that Part or Degree of the Equinoctial reckoned from the beginning of *Aries*, which Rises and Sets with them in an Oblique Sphere.

Ascensional Difference, is the Difference between the Right and Oblique Ascension, when the Lesser is subtracted from the Greater.

On the Terrestrial Globe.

1. A Space upon the Surface of the Earth, reckoned between two Parallels to the Equator, wherein the Increase of the longest Day is a Quarter of an Hour, is by some Writers called a *Parallel*.

2. And the Space contained between two such Parallels, is called a *Climate*: These *Climates* begin at the Equator; and when we go thence North or South, till the Day become half an Hour longer than it was before, they say, we are come into the *First Climate*; when the Days are an Hour longer, than they are under the Equator, we are come to the *Second Climate*, &c. These *Climates* are accounted in Number 24, reckoned each way towards the Poles.

The Inhabitants of the Earth are divided into three Sorts, as to the falling of their Shadows.

1. *Amphiscii*, who are those which inhabit the *Torrid Zone*, or live between the Equator and Tropicks, and consequently have the Sun twice a Year in their Zenith; at which time they are *Ascii*, i. e. have no Shadows, the Sun being Vertical to them. These have their Shadows cast to the Southward, when the Sun is in the Northern Signs; and to the Northward, when the Sun is in the Southern Signs, reckoned in respect of them.

2. *Heteroscii*, who are those whose Shadows fall but one way; as is the Case of all such as live between the Tropick and Polar Circles: For their Shadows at Noon are always to the Northward in North Latitude, and to the Southward in South Latitude.

3. *Periscii*, are such Persons that inhabit those Places of the Earth that lie between the Polar Circles and the Poles, and therefore have their Shadows falling all manner of ways, because the Sun at some times of the Year goes clear round about them.

The Inhabitants of the Earth, in respect of one another, are also divided into three Sorts.

1. *Periaci*, who are such as inhabiting the same Parallel (not a *Great Circle*) are yet directly opposite to one another, the one being East or West from the other exactly 180 Degrees, which is their Difference of Longitude: Now these have the same Latitude and Length of Days and Nights, but exactly at contrary Times; for when the Sun Riseteth to one, it Sets to the other.

2. *Anteci*, who are Inhabitants of such Places, as being under a Semicircle of the same Meridian, do lie at equal Distances from the Equator, one towards the North, and the other towards the South.

Now these have the same Degree of Latitude, but towards contrary Parts, the one North, and the other South; and therefore must have the Seasons of the Year directly at contrary Times one to the other.

3. *Antipodes*, who are such as dwell under the same Meridian, but in two opposite and equidistant Parallels, and in the two opposite Points of those two Parallels; so that they go Feet against Feet, and are distant from each other an entire Diameter of the Earth, or 180 Degrees of a Great Circle.

These have the same Degree of Latitude, but the one South, the other North, and accounted from the Equator a quite contrary way; and therefore these will have all Things, as Day and Night, Summer and Winter, directly contrary to one another.

PROBLEMS.

I. To find the Latitude of any Place.

Bring the Place to the Brafs Meridian, and the Degrees of that Circle, intercepted between the Place and the Equinoctial, are the Latitude of that Place either North or South.

Then to fit the Globe so that the *Wooden Horizon* shall represent the Horizon of that Place, elevate the Pole as many Degrees above the *Wooden Horizon*, as are the Latitude of that Place, and it is done; for then will that Place be in the Zenith.

If after this you rectify the Globe to any particular Time, you may by the Index know the Time of Sun-rising and Setting with the Inhabitants of that Place, and consequently the present Length of their Day and Night, &c.

PROBLEM II.

To find the Longitude of Places.

Bring the Places severally to the Brafs Meridian and then the Number of Degrees of the *Equinoctial*, which are between the Meridians of each Place, are their Difference of Longitude either East or West.

But if you reckon it from any Place where a *First Meridian* is supposed to be placed, you must bring that *First Meridian* to the Brazen one on the Globe; and then turning the Globe about, till the other Place come thither also, reckon the Number of Degrees of the *Equinoctial*, intercepted between that *First Meridian*, and the proper one of the Place, and that is the Longitude of that Place, either East or West.

PROBLEM III.

For the Distances of Places on the Terrestrial Globe.

See the *Problem* on the Celestial Globe; *For finding the Distance between two Stars.*

PROBLEM IV.

To find what Places of the Earth the Sun is Vertical to at any time assigned.

Bring the Sun's Place, found in the Ecliptick on the Terrestrial Globe, to the Brazen Meridian, and note what Degree of the Meridian it cuts; then by turning the Globe round about, you will see what Places of the Earth are in that Parallel of Declination, (for they will all come successively to that Degree of the Brazen Meridian) and those are the Places or Parts of the Earth to which the Sun will be Vertical that Day; whose Inhabitants will then be *Asii*; that is, their erect Bodies at Noon will cast no Shadow.

Problems on the Celestial Globe.

Suppose *May* the 10th, 1701, the Sun's Place to be just at the Entrance into the first Degree of *Gemini*.

PROBLEM I.

To rectify the Globe: Or, To render it in the General fit to resolve any Problem; which Rectification therefore is always supposed to be the first thing done: To do which,

Bring the Sun's Place, found in the Ecliptick on the Globe, to the *Meridian*, and the Hour-Index to 12 at Noon.

PROBLEM II.

For the Sun's Declination.

Bring the Sun's Place for that Day, (which here and below is supposed to be given) to the *Meridian* as before, and then the Degrees of the *Meridian*, reckoned from the Equinoctial either North or South, are the Sun's Declination at Noon; either North or South, according to the Time of the Year, *viz.* from *March* the 10th to *September* the 12th, North; and thence to *March* again South: And the Declination for *May* the 10th will be 20 Degrees and about 12 Minutes North.

PROBLEM III.

For his Amplitude either Rising or Setting.

Bring the Sun's Place to the *Horizon*, either on the East or West Side, and the Degrees of the *Horizon*, accounted from the East Point, either North or South, are the Amplitude required; *viz.* *May* the 10th, the Sun's Amplitude will be 34 Degrees to the North of the East.

And at the same Time you have in the outer Circle of Rhombs the Point which the Sun Rises or Sets upon, N.E. by E. or N.W. by W.

PROBLEM IV.

For his Right Ascension.

Bring the Sun's Place to the *Meridian*, and the Number of Degrees intercepted between the beginning of *Aries*, and that Degree of the Equinoctial, which comes to the *Meridian* with the Sun, is the *Right Ascension*.

If you would have it in Time, account every 15 Degrees to be an Hour, and every Degree to be 4 Minutes.

N.B. The Reason of bringing the Sun's Place to the *Meridian* in this Problem, is to save the Trouble of putting the Globe into the Position of a *Right Sphere*: For properly *Right Ascension* is that Degree of the Equinoctial which Rises with the Sun, in a *Right Sphere*. But since the Equator is always at Right Angles to the *Meridian*, if you bring the Sun's Place thither, it must in the Equinoctial cut his *Right Ascension*: Thus in the Instance of *May* the 10th, the Sun's *Right Ascension* will be 59 Degrees, or 4 Hours wanting 4 Minutes.

PROBLEM V.

For the Oblique Ascension.

Bring the Sun's Place to the *Horizon* on the East-side, and the Number of Degrees intercepted between that Degree of the Equinoctial which is now come to the *Horizon*, and the beginning or first Point of *Aries* is the *Oblique Ascension*. Thus, *May* the 10th, the Sun's *Oblique Ascension* is 30 Degrees 15 Minutes.

Of those two *Ascensions* take the Lesser from the Greater, the Remainder will be,

PROBLEM VI.

The Ascensional Difference.

Which therefore is the Difference in Degrees between the *Right* or *Oblique Ascension*, or the Space between the Sun's Rising and Setting, and the Hour of Six: Wherefore his *Ascensional Difference* turned into Time, will give the Time of the Sun's Rising or Setting before or after Six. Thus, from 59 Degrees take 30 Degrees 15 Minutes, there will remain 28 Degrees 45 Minutes, the *Ascensional Difference* in Degrees, and in Time 1 Hour 55 Minutes; and so much doth the Sun Rise before Six, and Set after it.

PROBLEM VII.

For the Sun's Rising or Setting.

Bring his Place to the *Horizon*, either East or West, and the Hour-Index shall shew the Time either of his Rising or Setting accordingly; which, *May* 10th, is 5 Minutes after 4 in the Morning, and and 5 Minutes before 8 at Night.

The Time of the Sun's Setting doubled, gives the Length of the Day, which then will be 15 Hours 50 Minutes; and the Time of this Rising doubled, gives the Length of the Night; which, *May* 10th, is 8 Hours 10 Minutes.

PROBLEM VIII.

For the Sun's Meridian Altitude, or Depression at Midnight.

Bring his Place to the *Meridian*, above the *Horizon*, for his Noon Altitude, which will shew the Degrees of it accounted there from the *Horizon*; which, *May* the 10th, will be 58 Degrees 42 Minutes. For his Midnight Depression, below the North Point of the *Horizon*, you must bring the Point in the Ecliptick, opposite to the Sun's present Place, to the South Part of the *Meridian* above the *Horizon*; and the Degrees there intercepted between that Point and the *Horizon*, are his Midnight Depression;

Depression; which, *May* the 10th, will be 18 Degrees 42 Minutes.

PROBLEM IX.

For the Sun's Altitude at any Time of the Day given.

Rectify the Globe, and fit the Quadrant of Altitude; that is, screw the Brass Quadrant of Altitude to the Zenith; or in our Latitude, screw it so that the graduated Edge cut 51 Degrees 30 Minutes on the Meridian, reckoned from the Equinoctial.

Then turn about the Globe till the Index shew the Time proposed, and stay the Globe there; after which bring the Quadrant of Altitude to cut the Sun's Place in the Ecliptick, and then that Place or Degree of the Ecliptick shall shew the Sun's Altitude on the Quadrant.

Thus, *May* the 10th, the Sun's Altitude at Nine a Clock in the Morning will be 43 Degrees 30 Minutes.

PROBLEM X.

To find the Sun's Hour or Altitude when he is due East or West above the Horizon.

Rectify the Globe, and fit the Quadrant of the Altitude; then bring the Quadrant to cut the true East Point, and next turn the Globe about till the Sun's Place in the Ecliptick cut the graduated Edge of the Quadrant; for then that Place will shew the Altitude and the Index of the Hour.

Thus, *May* the 10th, the Sun will be East at 5 Minutes past Seven in the Morning, and his Altitude then is 26 Degrees.

PROBLEM XI.

To find the Sun's Altitude or Time of the Day on any Azimuth given: Or, When the Sun is on any given Point of the Compass.

Set the Quadrant of Altitude to the Azimuth given, then turn the Globe till his Place in the Ecliptick touch the graduated Edge of the Quadrant; so shall that Place give the Altitude on the Quadrant, and the Hour-Index the Time of the Day.

Example.

May the 10th, the Azimuth being 60 Degrees from the South toward the East, or the Point of the Compass which the Sun is then on, being S. E. by E. and near half a Point more Easterly; his Altitude will be (nearly) 46 Degrees, and the Hour of the Day a little more than a Quarter past Nine in the Morning.

PROBLEM XII.

To find the Declination and Right Ascension of any Star.

Bring the Star to the Meridian, and then the Degrees intercepted between the Equinoctial and the Point of the Meridian cut by the Star, are its Declination; and the Meridian curs and shews its Right Ascension on the Equinoctial, accounting it from the beginning of *Aries*.

PROBLEM XIII.

To find the Longitude and Latitude of any Star.

Bring the Solstitial Colure to the Brass Meridian, and there fix the Globe; then will the Pole of the Ecliptick be juſt under 23 Degrees 30 Minutes, accounted from the Pole above the North Point of the Horizon, and upon the ſame Meridian; there ſcrew the Quadrant of Altitude, and then bring its graduated Edge to the Star assigned, and there ſtay it; ſo will the Star cut its proper Latitude on the Quadrant, reckoned from the Ecliptick; and the Quadrant will cut the Ecliptick in the Star's Longitude, or its Diſtance from the firſt Point of *Aries*.

PROBLEM XIV.

To find the Time of any Star's Riſing, Setting, or Culminating, i. e. being on the Meridian.

Rectify the Globe and Hour Index, and bring the Star to the Eaſt or Weſt Part of the Horizon, or to the Brazen Meridian, and the Index will ſhew accordingly the Time of the Star's Riſing, Setting, or Culminating, or of its being on the Meridian.

Thus, *May* the 10th, *Arcturus* will be on the Meridian at about $\frac{1}{2}$ of an Hour after 10 at Night; *Cor Leonis* will be Setting about one in the Morning; and the firſt Star in the Head of *Aries* will be Riſing about an Hour after.

PROBLEM XV.

To know, at any Time assigned, what Stars are Riſing or Setting; what are on the Meridian, and how high they are above the Horizon; and on what Azimuth or Point of the Compaſs they are; by which means the real Stars in the Heaven may eaſily be known by their proper Names, and rightly diſtinguiſhed one from another.

Rectify the Globe, and fit the Quadrant of Altitude, and ſet the Globe, by the Means of the Compaſs, due North and South; then turn the Globe and Hour-Index to the Hour of the Night assigned; ſo will the Globe, thus fix'd, repreſent the Face or Appearance of the Heavens for that Time.

Whereby you may readily ſee what Stars are in or near the Horizon; what are on or near the Meridian; which are to the North, or which to the South, &c. And the Quadrant of Altitude being laid over any particular Star, will ſhew its Altitude and Azimuth, and on what Point of the Compaſs it is; whereby any Star may eaſily be known, eſpecially if you have a Quadrant, or any ſuch Inſtrument, to take the Altitude of any real Star ſuppoſed to be known by the Globe, to ſee whether it agree with that Star which is its Representative on the Globe or not.

PROBLEM XVI.

Given the Sun's Place, and any Star's Altitude, to find the Hour of the Night.

Rectify the Globe and fit the Quadrant, then move the Globe to and fro till the Quadrant cut the Star in its given Altitude, for then the Hour-Index will ſhew the Hour of the Night: And thus may

the Hour of the Night be known by a Star's Azimuth, or its Azimuth from its Altitude.

Example.

May the 10th, the Sun being in the first Degree of *Gemini*, I take the Altitude of *Lucida Lyra*; which I find to be 51 Degrees, or I find its Azimuth to be two Degrees to the Northward of the East; then bringing the Quadrant of the Altitude to cut that Star in 51 Degrees of Altitude, I find the Hour-Index points at Eleven a Clock at Night; as it would also have done had the Star been brought to the Azimuth on the Globe.

PROBLEM XVII.

To find the Distance between any Two Stars.

If the Stars lie both under the same Meridian, bring them to the Brazen Meridian, and the Degrees between them there reckoned are their true Distance.

Thus *Capella*, or the Star in the Left Shoulder of *Auriga*, and *Rigel*, which is in *Orion's* Left Thigh, are nearly under the same Meridian; and being both brought to the Brazen Meridian of the Globe, their Distance there will be found to be 54 Degrees.

If they are both in the Equinoctial, or have both the same Declination, *i. e.* are both in the same Parallel, then bring them one after another to the Brazen Meridian, and the Degrees of the Equinoctial intercepted between them, when thus brought to the Meridian severally, are their Distance.

If the Stars are neither under the same Meridian, nor parallel, then either lay the Quadrant of Altitude from one to the other, (if it will reach) and that will shew the Distance between them in Degrees; or else take the Distance with Compasses, and apply that to the Equinoctial, or to the Meridian.

Which Method of Proceeding also will shew the Distance of any Two Places on the Terrestrial Globe in Degrees; and by Multiplication by 70, you will have it in Miles. Wherefore to find how far any Place on the Globe is from another, you need only take the Distance between them on the Globe with a pair of Compasses; and applying the Compasses to the Equator at the beginning of *Aries*, or at the first Meridian, you will there find the Degrees; which multiply by 70, and that will turn it into Miles.

Thus the Distance between *London* and *Jamaica* being on the Globe 69 Degrees, I multiply that by 70, and it gives me 4830 Miles; and so far is *Jamaica* distant directly from *London*, or in an Arch of a Great Circle.

GLOBULUS Nafi, is the lower cartilaginous moveable Part of the Nose.

GLOSSOCOMIUM, is a Chyrurgeon's Instrument for broken Limbs; so called from the Shape of a Merchant's little Casket, which was formerly carried upon the Back. *Blanchard*.

GLOTTIS, is the Chink of the *Larynx*, which is covered by the *Epiglottis*.

GLUTÆI, are Six Muscles which move the Buttocks, on each Side three.

GLUTÆUS Major, a Muscle of the Thigh, so called from its being the largest Muscle of those which compose the Buttocks: It has a large Semi-circular Beginning, forwards merely Tendinous from near two Thirds of the External Parts of the

Spine of the *Os Ilium*; backwards its Origination is thick and fleshy from the posterior Part of the Spine, and hindmost part of the *Sacrum* laterally, and the whole *Os Coccygis*; as also from a broad Ligament that's extended between the two last named Bones and the Tubercle of the *Os Ischium*; its Fleishy Fibres descending digregately, in an almost Semi-circular manner, become Tendinous as they approach the great *Trochanter*, where it's united with its first described Tendinous Beginning, descending over the External Part of the great *Trochanter*, and after being joined with the Tendon of the *Membranosus*, proceeds to cover and strictly embrace all the External Muscles of the *Tibia*, like as the External Tendon doth of the *Biceps* of those of the *Cubiti*: But the other part of it proceeding from the Fleishy Body of this Muscle, is largely inferted to the *Linea Aspera*, on the back Part of the *Os Femoris*, near four Finger's Breadth below the great *Trochanter*.

The first described Tendinous Beginning of this Muscle doth not only serve to support its Fleishy Body, but its Fibres intersecting those of the *Membranosus*, as they cover all the Muscles of the *Tibia*, do more adequately include them, whereby they are corroborated in their Action: When this Muscle acts, it pulls the Thigh directly backwards.

GLUTÆUS Medius, a Muscle of the Thigh, which lies chiefly under the Tendinous Beginning of the *Glutæus Major*, and arising Fleishy from almost the whole External Part of the *Os Ilium*, in its descent becomes thicker and fleshy, and is inferted by a short strong Tendon to the Superior and External Part of the great *Trochanter* in a Semi-circular Manner. Mr. *Cowper* thinks this Muscle is employed to turn the Thigh inwards, though others say it serves to extend it.

GLUTÆUS Minor, is a Muscle of the Thigh, which lies totally under the *Glutæus Medius*, it being so much less than that, as that is than the *Glutæus Major*. It ariseth Semi-circular, Broad, and Fleishy from the *Dorsus Ilij*; from hence its Fleishy Eibres descend to their partly Tendinous and partly Fleishy Infertion, like the *Medius*, at the Superior Part of the Root of the great *Trochanter*.

The Fibres of this running Parallel with those of the *Medius*, assist it in all its Actions: They also assist in rendering the Articulation of the Thigh-bone, with the *Coxa*, more stable in standing erect.

GLUTIA, are Two Prominences of the Brain, called *Nates*.

GLUTOS is the greater *Rotator* (an *Apophysis*) in the upper Part of the Thigh-bone, named *Trochanter*. *Blanchard*.

GNOMON, in a Parallelogram, is a Figure made of the two Complements, together with either of the Parallelograms about the Diagonal.

Thus here, in the Parallelogram *AB*, the *Gnomon* is $M + z + x + N$, or $M + r + s + N$.

GNOMON, in *Dialling*, signifies the *Style*, *Pin*, or *Cock* of a Dial, the Shadow whereof pointeth out the Hours.

The *Gnomon* of every *Dial* is supposed to represent the *Axis of the World*; and therefore the two Ends or Extremities thereof must directly answer to the North and South Pole.

GNOMONICKS, the same with *Dialling*.

GOARING; the Seamen say a Sail is cut *Goaring*, when 'tis cut sloping by degrees, and is broader at the *Clew* than at the *Earing*, as all *Top-sails* and *Top-gallant Sails* are.

GOBONATED, a Term in Heraldry for a Bordure of this Form; which is neither *Checky*, nor *Counter-compounded*, but of a different Division from both.

GOLDEN-NUMBER: See *Cycle of the Moon*.

To find the Golden-Number.

To the Year add 1, and divide the Sum by 19, the Remainder is the *Golden-Number*.

Example.

To 1701 add 1, the Sum 1702 divide by 19, the Remainder 11 is the *Golden-Number* for that Year.

GOLDEN-RULE: See *Rule of Three*.

GOLDEN Sulphur of Antimony, is made by boiling the Dross, arising in the making of *Regulus of Antimony*, in a little more than its Weight of common Water, in an Earthen Pot for about half an Hour, and then straining the Liquor, there is Vinegar poured upon it, on which a Reddish or Gold-colour Powder will precipitate: It must be gathered by Filtration and dried; 'tis an Emetick; the Dose from 2 to 6 Grains.

GOMPHOS, is when the Pupil of the Eye, going beyond a little Skin of the *Tunica Uvea*, is like that Swelling of hard Flesh in the Corner of the Eye called *Clavus*. *Blanchard*.

GOMPHOSIS, or *Conclavatio*, is when one Bone is fastened into another like a Nail, as may be seen in the Teeth. *Blanchard*.

GO NARGA, the Gout in the Knee.

GOOD-A-BEARING, or *Good-behaviour*, in Common Law, signifies an exact Carriage or Behaviour of a Subject to the King and his Liege-people, whereunto Men upon their evil Course of Life, or loose Demeanor, are sometimes bound: He that is bound to this, is more strictly bound than to the Peace; for the Peace is not broken without an Affray, but this Surety, *de bono gestu*, may be forfeited by the Number of a Man's Company, or by his or their Weapons or Harnes.

GOOSE-WING: When a Ship fails before a Wind, or with a Quarter Wind, and in a fresh Gale, the Seamen sometimes, to make the more haste, do *unparal* the Mizen-yard, and then they launch out both Sail and Yard over the Quarter on the Lee-side, fitting Guyes at the further End, to keep the Yards steady with a *Boom*, and this booms out the Mizen-sheet, and all this they do to give the Ship the more way, which otherwise, with these Winds, the Mizen-fail could not do, and this Sail so fitted is called a *Goose-wing*, and sometimes a *studding Sail*.

GORGE, *Gulla*, or *Neck*, in Architecture, is the narrowest part of the *Tuscan* or *Doric* Cap-

itals, lying between the *Astragal* above the Shaft of the Pillar and the *Annulets*. It is also a kind of Concave Moulding, larger, but not so deep as a *Scotia*, which serves for Compartments, Chambers, &c.

GORGE, in Fortification, is the Entrance of the Platform of any Work.

GORGE, in all other Out-Works, is the Interval betwixt their Wings on the Side of the great Ditch: But it ought to be observed, that all the *Gorges* are destitute of *Parapets*, because if there were any, the Besiegers having taken Possession of a Work, might make use thereof, to defend themselves from the Shot of the Place; so that they are only fortified with *Palisados* to prevent a Surprise.

GORGE of a Bastion, is nothing else but the prolonging of the *Curtains* from their Angle with *Flank* to the Center of the *Bastion* where they meet: But when the Bastion is flat, its *Gorge* is a right Line which terminates the Distance comprehended between two Flanks.

GORGE of the Ravelin, or of a *Half-Moon*, is the Space contained between the Extremities of the two Faces on the Side of the Place.

GORGED, the Herald's Term for the Bearing of Crown, Coronet, or such like thing about the Neck of a Lion or a Swan, &c. for then they say the Lion or Cygnet is *Gorged* with a Ducal Coronet, &c.

GOTHICK, in Architecture, is an Order so far different from the Ancient Proportions and Ornaments, that its Columns are either too massy in a Form of vast Pillars, or as slender as Poles, having Capitals without any certain Dimensions, carved with the Leaves of *Brank-Ursin*, *Thistles*, *Coleworts*, &c.

GRACILIS, is one of the Muscles of the Legs, so called from being the most slender of them: It ariseth somewhat broad, partly Tendinous and partly Flethy from the *Os Pubis* internally, between the first and second described Heads of the *Triceps*, and in its streight Descent in the Inside of the Thigh grows narrow, and becomes Tendinous a little above the *Sartorius*, and is so inserted (immediately beneath it) to the *Tibia*. It assisteth in bending the Thigh and Leg inwards.

GRAMINEOUS Herbs, amongst the Botanists, are such as have a long narrow Leaf, and no Foot-stalk.

These Bishop *Wilkins* (in his *Real Character*) ranges into such as are either,

1. *Fruentaceous*, i.e. whose Seed is used by Men for Food, either Bread, Drink, or Broth; such as Wheat, Rye, Barley, &c. Or,

2. Not *Fruentaceous*, more properly called Grasses, which have an hollow-jointed Stalk not branched, and a Stameneous Flower: See *Gramina* and *Grasses*. The *Fruentaceous Herbs* are sometimes called *Cercoles*.

GRAMMAR, is the Art of Speaking and Writing any Language truly. It takes its Name from the Greek Word *Gramma*, which signifies a Letter, because it treateth primarily of the Formation of Articulate Sounds, which are represented by Letters.

GRANADO, is a little hollow Globe or Ball of Iron, or other Metal, about two Inches and a half in Diameter, which being filled with fine Powder, is set on fire by the means of a small Fusee fastened to the Touch-hole; as soon as it is kindled, the Case flies into many Shatters, much to the Damage of all that

that stand near. These *Granadoes* serve to fire close and narrow Passages, and are often thrown with the Hand among the Soldiers to disorder their Ranks, more especially in those Posts where they stand thickest; as in *Trenches, Redoubts, Lodgments, &c.*

GRAND-ASSIZE: See *Assize*.

GRAND-CAPE: See *Cape* and *Attachment*.

GRAND-CLIMACTERICKS: See *Climacterical Year*.

GRAND-DISTRESS, is so called, because of the Quality and Extent thereof; for thereby the Sheriff is commanded, *Quod distringat tenentem, ita quod nec ipse nec aliquis per ipsum ad eam animum ap- paret, donec habuerit aliud preceptum, & quod de exitibus eorundem nobis respondeat, & quod habeat corpus ejus, &c.*

This Writ lies in two Cases, either when the Tenant or Defendant is Attached, and so return'd, and appears not, but makes Default; then a *Grand-Distress* is to be awarded: Or else when the Tenant or Defendant hath once appeared, and after makes Default, then this Writ lies by the Common Law in lieu of a *Petit-Cape*.

GRANIVOROUS, are those Animals that feed upon Corn and other Seed.

GRANT, in Law, signifies a Gift in Writing of such a thing as cannot aptly be passed or conveyed by Word only, as Rents, Reversions, Services, Advowsons in Gross, Common in Gross, Tythes, &c. Or made by such Persons as cannot give but by Deed, as the King and all Bodies Politick: Which Difference is often in Speech neglected, and then it is taken generally for every Gift whatsoever, made of any thing by any Person; and he that *granteth* is named *Grantor*, and he to whom it is made, the *Grantee*. A thing is said to lie in *Grant*, which cannot be assigned without Deed, 3 *Rep.* 63.

GRANULATION, in Chymistry, signifies pouring a melted Metal Drop by Drop into cold Water, that so it may *granulate* or congeal into small Grains. The best way is to pour the Metal through an Iron-Cullender, or through a new Birchen Broom.

GRAPHOIDES, a long, sharp, and slender Appendix of the Temple-Bones, somewhat bow'd like a Cock's-Spur: Also the Muscle called *Digastricus*.

GRAPHOIDES, is a Process like the Pen for a Table-book; about the Basis of the Brain it inclines backward.

GRAPNEL, is a kind of Anchor for Boats or Gallies to ride by: They differ from other Anchors, in that they have four Flukes and no Shack, though there are some with three Flukes, with which they use to sweep for Hawkers or small Cables: In Men of War also these Grapnels, or at least a lighter kind of them, are used to be thrown into an Enemy's Ship, in order to catch hold of some of her Gratings, Rails, Gunwales, &c. this is done in order to boarding of her.

GRATINGS, in a Ship, are small Ledges of sawed Plank framed one into another like a Lattice or Prison-grate, lying on the Upper-Deck between the Main-mast and Fore-mast, serving for a Defence in a close Fight; and also for the Coolness, Light and Contrivance of the Ship's Company.

There is also another Grating in the Head of a Ship, where the Necessary-House stands.

GRAVE-ACCENT, in Grammar, shews when the Voice is to be depress'd, and is express'd thus, ()

GRAVEDO, the same with *Corryza*.

GRAVELLED-ASHES, are the Lees of Wine dried and burn'd to Ashes: So that they are a kind of Calcined Tartar.

GRAVING of a Ship, is bringing her first a-ground, and then burning off (with Reeds, Broom, &c.) all the Filth and Foulness that sticks to her Sides without-board, in order to pay her anew.

GRAVITAS *Acceleratrix*: See *Vis Centripeta*.

GRAVITY, or as it may be called, the *Vis Centripeta*, is that Quality by which all Heavy Bodies tend towards the Center of the Earth, accelerating the Motion as they come nearer towards it. And this Admirable and Universal Law of Nature is that which (generally speaking) keeps all Bodies in those Places and Stations which they are designed for.

About the Cause of this great and Catholick Affection of Matter, there have been various Sentiments.

1. *Aristotle* will have all Earthy Bodies, by a Natural Inclination, to tend towards the Center of the Earth, as to their proper Place, *Sub Concava Luna*: But it hath been proved over and over, that there is no such thing as *Positive* or *Absolute Gravity* or *Levity*.

2. *Copernicus* asserts Gravity to be an Innate Principle in all the Parts of Matter, when they are by any Means separated from their Wholes, to reduce themselves thither again the nearest way, or in Right Lines. But this is not to assign any Physical Cause of this great Effect, but only to say Bodies descend, because they are heavy, or because they descend.

They also that explain Gravity by *Universal Attraction*, do only give us another Word, but no Idea of the Cause of Gravity.

3. *Gassendus* and *Kepler*, and many others, define Gravity to be a Motion impressed on all Bodies by a certain Magnetic Attraction of the Earth or Globe, to which any Body descends.

These will have the Earth to be one great Magnet or Loadstone, continually sending out Magnetical Effluvia, which lay hold on all Bodies, and draw them towards the Earth: See *Gilbert* and *Kircher de Magnete*.

4. *Des Cartes* supposes the Particles of his Celestial Matter, by being reflected from the Surface of the Earth, and consequently ascending up again, from thence to drive down into their Places the Terrestrial Bodies which they find above them, *See* 20, 21, 22, 23. of his *Principia Philosoph.*

But 'tis very difficult to conceive, and, I think, implies a kind of Contradiction, that Bodies should be forced downwards by a continual Impulse of other Matter tending upwards, and acting upon all Parts uniformly and equally.

The Ingenious Mathematician Mr. *Keil* of *Batol-College, Oxon*, hath also sufficiently overthrowed this Hypothesis in the Preface to his *Introductio ad Veram Physicam*.

5. *Vossius*, and some others, will needs have the Diurnal Motion of the Earth round its Axis to be the Cause of the Descent of heavy Bodies: Whereas 'tis demonstrable, from Experiment and the Doctrine of the Laws of Motion, That the Reverse of Gravity would thence ensue: For all Bodies moving circularly, do always endeavour to recede *ab Axe Motus*; and all loose Bodies would then be cast off from the Earth in a Tangent to the Parallel Latitude of any Place.

6. Others mistaking the Effect for the Cause, will have the Pressure of the Atmosphere to occasion Gravity, or the Descent of heavy Bodies: But 'tis plain by Experiments made in *Vacuo*, That the Atmosphere, like all other Fluids, doth hinder the Descent of heavy Bodies, rather than further them or cause them; for a Feather in *Vacuo* will descend as fast as a Bullet or Stone in the open Air.

7. The Learned Dr. Hook, in his *Micrographia*, P. 22. seems to think, that by supposing our Globe of Earth, Air, and Water, environ'd round with a Fluid very subtle and heterogeneous to them all, and which can freely pervade the Pores, not only of Glasses, but even of the closest Metals; the Endeavour of this Fluid to intrude all Earthly Bodies from it, may, by that and some other Properties, make all Bodies move towards the Center of the Earth: And he saith he can prove, by many Experiments, that there is such a Fluid. But this Opinion appears to be Defective on the same Account that the *Cartesian* is; which see.

8. The Learned Mathematician Capt. Edmund Halley, owns Gravity to be an Effect unsolvable by any Philosophical Hypothesis; and Modestly and Religiously resolves it into the immediate Will of our All-wise Creator, who by appointing this Law throughout all the Material World, keeps all Bodies in their proper Places and Stations, which, without it, would soon fall to Pieces and be utterly destroyed. *Philosoph. Transact. N. 197.*

Sir Isaac Newton, Book 2. Prop. 19. Corol. 5. observes very well, That of all Bodies confidered within the Confines of any Fluid, there is a twofold Gravity, the one *True* and *Absolute*, the other *Apparent*, and *Vulgar*, and *Comparative*.

Absolute Gravity, is the whole Force by which any Body tends downwards; but the *Relative* or *Vulgar* is the Excess of Gravity in any Body above the Specific Gravity of the Fluid, whereby it tends downwards more than the Ambient Fluid doth.

In reference to *Absolute Gravity*, the Parts of all Fluids and all Bodies do really gravitate in their proper Places, and therefore by their joint Weights do make the Weight of the Whole: For every heavy Whole is an Heavy Body, as we find by Experience in Vessels filled with all Kinds of Liquors; and the Weight of any Whole is equal to, because compounded of, the Weight of all its Parts.

The latter Kind of Gravity is such, that in reference to it, Bodies do not gravitate in their Places, or rather do not, when compared one with another, *pre-gravitate*; but by hindring one another in their mutual Endeavour to descend, do remain in their proper Places all one as if they were not heavy at all. Those Things which do not *pre-gravitate* in the Air, Water, &c. the Vulgar take to have no Gravity; and only judge those to be heavy Bodies which they see *pre-gravitate* or descend, because they cannot be supported by the ordinary Gravitation of the Fluid, or by its Pressure all manner of ways.

So that the Notion of Weight among the Vulgar, is only the Excess of any Bodies Weight above that of Air: And consequently they account those things to be *Light*, which being less heavy than Air, are supported by it, or buoyed up in it.

Whereas these *Comparatively* light Bodies are not so *really*, since in *Vacuo* it hath been found by Experiment, that they descend as fast as other heavy Bodies do in the Air, (Vid. Mr. Boyle's Experiments of his Air Pump.)

The Properties of Gravity are very well enumerated by Capt. Halley, in Numb. 179. of Philosophical Transactions.

1. That by it all Bodies descend towards a Point, which either is, or is very near to the Center of Magnitude of the Earth and Sea; about which the Sea forms it self into a Spherical Surface, and the Prominences of the Land, considering the Bulk of the Whole, differ but insensibly therefrom.

2. That this Point or Center is fixed within the Earth, or at least hath been so ever since we have any Authentick History: For a Consequence of its Shifting, though never so little, would be the overflowing of the Low-Lands on that Side the Globe towards which it approached.

And this he thinks would well account for the Universal Deluge, To have the Center of Gravitation to be removed for a Time towards the Middle of the then inhabited World.

And he saith, That a Change of its Place but the 2000th Part of the Radius of our Earth, would be sufficient to lay the Tops of the highest Hills under Water.

3. That in all Places equi-distant from the Center of the Earth, the Force of Gravity is nearly equal.

But indeed all Places on the Earth's Surface are not at equal Distances from the Center; because, as Sir Isaac Newton hath proved, the Equatorial Parts are something higher than the Polar Parts; the Difference between the Earth's Diameter and Axis being about 34 English Miles, which hath been confirmed by the Necessity of making a Pendulum shorter (in those Places) before they will swing Seconds.

4. Gravity equally affects all Bodies, without regard either to their Bulk, Figure, or Matter: So that abstracting from the Resistance of the Medium, the most Compact and Loose, the Greatest and Smallest Bodies would descend equal Spaces in equal Times, as appears from the quick Descent of very light Bodies in the exhausted Receiver. Whence a very great Difference may be observed betwixt Gravity and Magnetism; the latter affecting only Iron, and that towards its Poles; the former all Bodies alike in every Part.

Hence also may be concluded there is no such Thing as positive Levity, those Things which appear light being only comparatively so. And whereas several Things rise and swim in Fluids, 'tis only because they are not, bulk for bulk, so heavy as those Fluids: Nor is there any Reason why Cork for Instance, should be said to be light, because it swims on Water, any more than Iron, because it will swim on Mercury.

5. That this Power increases as you descend, and decreases as you ascend from the Center of the Earth; and that in Proportion of the Squares of the Distances therefrom reciprocally: So, as for Instance, at a double Distance to have but a Quarter of the Force, &c. which is highly agreeable to Reason,

son, because the gravitating or attracting Power must needs be exerted more vigorously in a small Sphere, and more feebly in a greater, in Proportion, as it is contracted or expanded. Wherefore seeing the Surfaces of Spheres are to one another, as the Squares of their Radij, their Power at several Distances will be as the Squares of those Distances reciprocally; and then its whole Action upon each Spherical Surface, be it great or small, will be always equal.

Mr. *Hugens*, in the last Proposition of his Fourth Part of his Book *De Horologio Oscillatorio*, shews by Experiments most accurately made, That Gravity is that Force by which a Body, placed any where near the Surface of the Earth, is impelled towards the Center after the Rate of $15\frac{1}{12}$ of Paris Feet in a Second of Time.

The very Learned and Ingenious Capt. *Halley*, in his Discourse about the Cause of Springs in *Philos. Transact. N. 192.* seems to think, That there may be some Matter which may have a *Conatus* directly contrary to that of Gravity; as is, saith he, the Case in Vegetation, where the Sprouts tend directly upwards, or against the Perpendicular.

GRAVITY of Bodies, is either *Specifick* or *Absolute*: See *Specifick Gravity*.

GREAT-HEAR: See *Urfa Major*.

GREAT CIRCLES of the Globe or Sphere, are those whose Plane passing thro' the Center of the Sphere, divides it into two equal Parts or Hemispheres; of which there are Six drawn on the Globe, viz. the *Meridian*, *Horizon*, *Equator*, *Ecliptick*, and the two *Colures*; which see.

GREEN-CLOTH, or *Counting-House* of the King's Household, is so called, because the Table stands always covered with a *Green-Cloth*: Here sit the Lord-Steward, Treasurer of the King's House, Comptroller, Master of the Household, Cofferer, two Clerks of the *Green-Cloth*, and two Clerks Comptrollers, for Daily taking the Accounts of all Expences of the Household, making Provisions and ordering Payment for the same, for the good Government of the King's Servants, and paying the Wages of those below Stairs.

GREEN-WAX, in Law, signifies the Estreats of Fines, Issues, and Amerciaments in the Exchequer, under the Seal of that Court made in *Green-Wax*, to be levied in the County: See *Foreign Apposer*.

GREGORIAN-YEAR, *The New Account*, or, *New Stile*, instituted upon the Reformation of the Calendar by Pope Gregory XIII. (from whom it takes the Name) in the Year 1582; whereby Ten Days being taken out of the Month of *October*, the Days of their Months go always Ten Days before ours: As for Instance, their Eleventh is our First Day: Which *New Stile*, or *Account* is used in most Parts beyond the Seas; and is called from Pope Gregory, the *Gregorian Account*.

GRENADO: See *Grenado-Shell*.

GRIPE of a Ship, is the *Compass* or Sharpness of her Stem under Water, and chiefly towards the Bottom of the Stem: And the Design of shaping her so, is to make her Gripe the more, or keep a good Wind; for which end sometimes a False Stem is put on upon the true one.

GRIPE also is the Sea Phrase for a Ship's being apt to run her Head or Nose too much into the Wind, for then they say *She Gripes*. And there are two Causes of this Effect; either over-loading a

Ship a-head, the Weight of which presses her Head so down, that it is not apt to fall off from the Wind; or else the *Staying* or *Setting* her Masts too much aft, which will always be Fault in a short Ship that draws much Water, and will cause her to be continually running into the Wind: But in *Floaty Ships*, if the Masts be not stayed very far aft, they will never keep a good Wind.

GROMETS, in a Ship, are small Rings fastened to the upper Side of the Yard of a Ship, by Staples, to tie unto it, or to fasten the *Laskets*.

GROUND-TACKLE, is the Sea Term for a Ship's Anchor, Cables, &c. in general; or whatever is necessary to make her ride safe at Anchor in proper Ground.

GROUND-TIMBERS, in a Ship, are those Timbers which lie on her Keel, and are fastened to it with Bolts through the Keelson. They are so called, because the Ship lies at rest upon them when she is a-Ground.

GROUNDING of a Ship, is bringing of her on Ground to be trimmed, made clean, scrubbed, or have some Leak stopp'd in her.

GRY, according to Mr. *Lock*, is a Measure containing $\frac{1}{10}$ of a Line: A Line is $\frac{1}{10}$ of an Inch, an Inch $\frac{1}{10}$ of a Philosophical Foot, and a Philosophical Foot is $\frac{1}{2}$ of a Pendulum, whose *Diadromes* or *Vibrations*, in the Latitude of 45 Degrees, are each equal to one Second of Time, or $\frac{2}{3}$ of a Minute.

GRYPHUS, a sort of crooked Pincers used by Surgeons.

GUARDANT, the Term in Heraldry for a Lion born in a Coat of Arms, when his Face is turned towards the Spectator, and he appears in a Posture of Guard or Defence (as it were) of himself.

GUARD-COCK: See *Gardecout*.

GUDGIONS, in a Ship, are the Eyes drove into the Stern Post, into which the Pintles of the Rudder go, to hang her on.

GUEST-ROPE, is that Rope by which the Boat is kept from *Steering*, or going too much in and out, as she lies in the Tow of a Ship.

GULA or Gullet: See *Oesophagus*.

GULBE, in Architecture, the same with *Gorge*.

GULES, so the Heralds call the Red Colour in the Arms of Gentlemen; but in those of the Nobility they call it *Ruby*; and in Sovereign Princes Coats *Mars*. 'Tis expressed in Engraving by perpendicular Strokes or Hatches, thus,

GULF, in Geography, is a Part of the Ocean or Great Sea, which runs up into the Land thro' narrow Passages, which are called *Streights*; as the *Gulf of Florida* in America, the *Arabian Gulf* or *Red-Sea* in Africa, the *Persian Gulf* in Asia, and the *Gulf of Venice*, or the *Adriatick Sea* in Europe.

GUMMA Gallicum, is by some the Term for the eating out of a Bone in the *French Pox*.

GUNTER'S-LINE, is the common Line of Numbers, invented first by Mr. *Gunter*, and so commonly known that there is no need of a Description of it here; it being not only done by the Inventor in his Book of the Sector, but also by *Everard*, *Brown*, *Partridge*, in their Sliding Rules, and almost every one that hath written of Practical Mathematics. See Vol. II.

GUNTER'S-QUADRANT, is an Instrument made in Wood or Brass, curiously contrived to find the Hour of the Day and Azimuth, with most Propositions of the Globe; as also Heights and Distances.

You have a full Description of it in Mr. *Gunter's* Book of the Sector; but 'tis by no means so good to find the Hour of the Day as Mr. *Collins's* Quadrant: See *Quadrant*.

GUNTER'S-SCALE, called by the Common Seamen usually, *The Gunter*, is a large plain Scale, with the Lines of Artificial Sines and Tangents fitted so to a Line of Numbers, that they can by the Compasses work all Questions in plain Dialling, &c. with tolerable Exactness, if the Scale be large and good. It hath its Name for being the Invention of the above-named Mr. *Gunter*, and is now commonly put on all our Scales, and on our Sectors, where they are usually called, *The Artificial Lines*.

GUNWALE, or *Gunnel* of a Ship, is that Piece of Timber which reaches on either side of the Ship from the Half-Deck to the Fore-castle, being the uppermost *Bend* which finisheth the upper Works of the Hull in that Part, and wherein they put the Stanchions which support the Waite-Trees; and this is called the *Gunwale*, whether there be Guns in the Ship or no: And the lower Part of any *Port*, where any Ordnance are, is also termed the *Gunwal*.

GURGULIO, the same with *Gion*, or the *Epi-glottis*; which see.

GUTTA Rosacea, is a Redness with Pimples, wherewith the Cheeks, Nose, and whole Face is deformed, as if it were sprinkled with red Drops: These Pimples or Wheals often increase to that degree, that they render the Face rough and horrid, and the Nose monstrously big.

GUTTA-SERENA, or *Amaurosis*, is a Dimness, or even total Loss of the Sight, caused by a Watery Humour flowing down from the Brain upon the Optick Nerves.

GUTTÆ, or *Drops*, in Architecture are certain Parts in Form of little Bells, which, to the Number of Six, are put below every *Triglyph* in the *Architrave* of the *Dorick* Order. They are so called by Architects from their Shape, representing the Drops of Water, which having run along the *Triglyphs*, still hang under the Closure between the Pillars.

GUTTAL-CARTILAGE, in Anatomy, is that which includes the third and fourth Gristle of the *Larynx*, which seem to be but one, by reason of the common Membrane with which they are covered.

GUTTE de l'Eau, Drops of Water; these in Heraldry they paint Argent or White.

GUTTE de Larmes, when they are Drops of Tears, and these in Heraldry are painted Blue or Azure.

GUTTE de Or, Drops of melted Gold; all which kinds are sometimes born in Escutcheons,

GUTTE de Sang, the Term in Heraldry for Drops of Blood born any how in a Coat of Arms; if the Drops are of any other Substance, they are called accordingly.

GUTTORIŌ Or, the same that is called *Hyoides Or*.

GUVE de Ronde, a Term in Fortification, signifying the same as a simple or a *single Tenaille*: See *Tenaille*.

GUY; a *Guy* in a Ship, is any Rope used to keep off things from bearing or falling against the Ship Side when they are to be hoisted in: Thus, if any thing is to be haled in over the Gunwale, it is gently eased in by a *Guy-Rope* fastened usually to the Stanchions of the Waite-Trees.

That Rope also which is made fast to the Fore-mast at one End, and is reeved thro' a single Block seized to the Pendant of the Winding-Tackle, and then again reeved through another seized to the Fore-mast, and whose Use is to hale forward the Pendant of the Winding-Tackle, is also called a *Guy*.

GYMNASTICKS, that Part of Physick which treats of the Rules that are to be observed in all sorts of Exercises, in order to the Preservation of Health. This is said to be invented by one *Herodicus*, born at *Selymbra* a City of *Thrace*, or, as some say, at *Leutimi* in *Sicily*; He was Brother to *Georgius* the Famous Rhetorician and Philosopher.

This *Herodicus* was at first Master of an Academy, where young Gentlemen came to learn Warlike and Manly Exercises; and whom he observing to be very Healthful on that Account, he made *Exercise* become an Art, in reference to the Recovery of Men out of Diseases, as well as, preserving them from them, and called it *Gymnastick*, which he made a great Part of his Practice of Physick: But *Hippocrates*, who was his Scholar, blames him sometimes for his *Excesses* in this kind of Physick, and his want of Judgment in prescribing this Method of Cure in Fevers, &c. And *Plato*, in his *Phædr.* exclaims against him with great warmth on this Account, and saith, he used to enjoin his Patients to walk from *Athens* to *Megara*, (which is about 25 Miles) and to come home again on Foot as they went, as soon as ever they had once but touch'd the Walls of the City.

GYNÆCIA, in general, are the Accidents incident to Women; but *Hippocrates* takes them more strictly for the Courses. *Blanchard*.

GYNÆCOMASTUM, is the growing of the Breasts. *Blanchard*.

GYRON, an Ordinary in Heraldry, consisting of two straight Lines issuing from divers Parts of the Escutcheon, and meeting in the Fesse Point; thus,

He beareth *Sanguine* a Gyron issuing from the Dexter Point Or.

HABEAS *Corpora*, is a Writ that lies for the bringing in a Jury, or so many of them as refuse to come upon the *Venire facias*, for the Trial of a Cause brought to issue.

HABEAS Corpus, is a Writ which a Man Indicted for a Trespass before Justices of Peace, or in a Court of any Franchise, and being apprehended and imprisoned for the same, may have out of the King's Bench, to remove himself thither at his own Costs, and to answer the Cause there.

And the Order of this Case is, first to procure a *Certiorari* out of the Chancery, directed to the said Justices for the removing of the Indictment into the King's Bench; and upon that, to procure this Writ to the Sheriff, for the causing of his Body to be brought at a Day.

HABENDUM, is a Word of Form in a Deed or Conveyance, every of which must have two Parts, *viz.* the *Premises*, and the *Habendum*.

The Office of the *Premises* is to express the Names of the Grantor, Grantee, and the Thing granted.

The Office of the *Habendum* is to limit the Estate so, that the general Implication of the Estate, which (by Construction of Law) passeth into the *Premises*, is by the *Habendum* controlled and qualified.

HABERE facias Seisinam, is a Writ Judicial, which lieth where a Man hath recovered Lands in the King's Court, directed to the Sheriff, and commanding him to give *Seisin* of the Land recovered. This Writ is sometimes issuing out of the Records of a Fine, executory, directed to the Sheriff of the County where the Land lieth, and commanding him to give the Cognisee, or his Heirs, *Seisin* of the Land whereof the Fine is levied, which Writ lieth within the Year after the Fine or Judgment, upon a *Scire facias*, and may be made in divers Forms.

There is also a Writ called *Habere facias Seisinam, ubi Rex habuit annum, diem, & vasum*; which lies for the Delivery of Land to the Lord of the Fee, after the King has taken his Due of Lands of him that was convicted of Felony.

HABERE facias visum, is a Writ that lies in divers Cases, where view is to be taken of the Lands or Tenements in question.

HABITUDE, is a Disposition of the Mind or Body, acquir'd by reiterated or repeated Acts; as Skill and Knowledge in the Sciences, Virtue, Vice, Excellence in Painting, Writing, Dancing, &c.

HAEMOLYSIS, according to some, is a reflected Inversion of the Eye-lid.

HEMALOPS, the Extravasation of Blood about the Eye, occasion'd by a Blow or Contusion, commonly called a *Blue Eye*: Also the Redness of the Eyes proceeding from an Inflammation, or the Distention of the Blood-Vessels in the Eye, or that which we call a *Blood-shotten Eye*.

HEMATOSIS, the same with *Sanguification*; it is performed in all the Parts of the Body, and not in any peculiar Part, as the Heart, Liver, Spleen, as some formerly imagined: See *Blood*.

HEMODIA, a painful Numness of the Teeth, proceeding from the Irritation of the Membranes

that surround their Roots, or of the Nerves that are dispersed through their Substance. 'Tis usually occasioned by the eating of Acid Fruits, or the Vomiting of Acid Humours: We commonly say in *English*, that the Teeth are set on Edge.

HEMOPTYSIS, is the spitting of Blood from the Lungs, which proceeds either from a sweating out at the Glandules of the *Larynx*, with which its *Tunick* is clothed within; to wit, when the Openings of the Arteries are too much relaxed; or from some great Vessels that are broke, or out of the little Bladders of the Lungs themselves. *Blanchard*.

HEMORHAGIA, is a Flux of Blood at the Nostrils, Mouth, or Eyes, &c.

HEMORRHOIDES, are Swelling Inflammations in the *Rectum*, or about the Fundament, red and painful, which sometimes send forth Blood or Matter. *Blanchard*.

HEMORRHOIDICAL-VEINS, are either *Internal* or *External*.

The *Internal* are Branches of the third and last Division of the *Vena Mesenterica*, which is it self the right Branch of the *Porta*: This is spread thro' the Middle of the *Mesenterium*, and goes to that Part of the *Colon* which lies on the Left Side to the *Rectum*, and thence down to the *Anus*.

The *External Hemorrhoidal-Veins* arise from the *Vena Hypogastrica*, and sometimes from a double Branch of it spreading about the *Sphincter* of the *Anus*; and this Hypogastrick-Vein is, in it self, Part of the Internal Branch of the *Vena Iliaca*.

HÆREDE Abducto, is a Writ that lieth for a Lord, who having the Wardship of his Tenant under Age, by Right cannot come by his Body, for that he is conveyed away by another.

HÆREDE deliberando alii qui habet custodiam terre, is a Writ directed to the Sheriff, willing him to command one, having the Body of him that is Ward to another, to deliver him to him, whole Ward he was by reason of his Lord.

HÆRETARE, in Law, signifies to give a Right of Inheritance, or make the Donation Hereditary to the Grantee and his Heirs.

HÆRETICO Comburendo, is a Writ that lies against him that is a Heretick; *viz.* that having once been convicted of *Heresy* by his Bishop, and having abjured it, afterwards falling into it again, or into some other, is thereupon committed to the Secular Power. Sir *Edward Coke*, in his 12th Report, Fol. 93. is of Opinion, that this Writ lies not at this Day.

HAILE; to *haile* a Ship, is either to call to her to know from whence she is, and whither she is bound; or else to salute her, and wish her Health.

HALE; to *hale* a Ship, is the same thing as what we call *pulling a-shore*.

HALF-MOON, in Fortification, is an Out-work that hath only two Faces, forming together a Salient-Angle, which is flanked by some Part of the Place, and of the other Bastions.

These *Half Moons* are sometimes raised before the Curtain, when the Ditch is a little wider than it ought to be; in which Sense 'tis much the same with a Ravelin, only the Gorge of an *Half-Moon* is

is made bending in like a Bow or Crescent; and is most times used to cover the Point of a Bastion; whereas Ravelins are placed before the Curtain; but they are Defective, as being ill Flanked.

HALLIARDS, in a Ship, are those Ropes by which they hoist up all her Yards. The Cross-jack and the Sprit-sail Yard indeed have no *Halliards*, because they are always flung; tho' in small Craft, or Vessels, they have *Halliards* to the Sprit-sail Yard.

HALO, or *Halos*, is a certain Meteor in Form of a bright Circle or Ring that surrounds the Sun, Moon, or Star, but more especially the Moon.

These *Halos* or Crowns do sometimes appear colour'd like the Rainbow: And our Incomparable Sir Isaac Newton gives a Hint of the Solution of this Phenomenon in his Opticks, *Pag. III.* shewing that it arises from the Sun or Moon's shining thro' a thin Cloud, consisting of Globules of Hail or Water all of the same Size. And he gives you two Observations of his own, of the actual Appearance of colour'd *Halos*'s; one about the Sun, *June 1692*; the other round the Moon, *Febr. 19. 1694*, at Night.

HALO, is a reddish Spot or Circle of Flesh which surrounds each Nipple in the Breasts of Women.

HANDSPIKE, is a Wooden Leaver, with which, at Sea, they *Traverse* the Ordnance, or heave withal in a *Windlass* to weigh up the Anchor.

HARIOT, or *Heriot*, in Law, is taken for the best Cattle that a Tenant hath at the Hour of his Death, due to the Lord by Custom. And there is *Harriot Service* and *Harriot Custom*. *Harriot Service* is after the Death of a Tenant in Fee-simple; and *Harriot Custom* is after the Death of a Tenant for Life. Also *Harriot Service* is often express'd in the Grant of a Man, that he holds by such Service to pay *Harriot* at the Time of his Death, that holdeth in Fee-simple. *Harriot Custom* is when *Harriots* have been paid Time out of Mind by Custom, and this may be after the Death of a Tenant for Life: And for this the Lord may distrain and seize; but of right, neither the Lord nor Officer should take *Harriot*, before it be presented at the next Court holden after the Tenant is dead, that such a Beast is due for a *Harriot*. If the Lord purchase Part of the Tenancy, *Harriot Service* is extinguish'd; but it is not so in *Harriot Custom*. And if the Lord ought to have a *Harriot* when his Tenant dieth, and the Tenant deviseth away all the Goods, yet the Lord shall have the *Harriot*, for the Law preferreth the Custom before the Devise.

HARMONIE, is, in some Authors, an Anatomical Term, and signifies the same with *Mendosa Sutura*, viz. a jointing together the Bones of the Head, particularly those of the Nose and Palate, by a freight Line.

HARMONICAL Proportion, or *Musical*, is when, of four Numbers, As the First: Is to the Fourth :: So is the Difference of the First and Second: To the Difference of the Third and Fourth.

As 5 : 8 : 12 : 30, are *Musical Proportionals*, because 5 : 30 :: 8 - 5 : 30 - 12 :: 3 : 18.

Suppose in *Species* the four Terms *A, M, N, E*, let it be, *A : E :: M - A : E - N*.

Wherefore *AE - AN = ME - AE*. These Terms being rightly ordered, 'twill be $\frac{AN}{2A - M}$

$= E$; and $\frac{EM}{2E - N} = A$.

In Words thus:

If the Rectangle, contained under the first and third Terms, be divided by the Excess of twice the first above the second; the Quotient will be the fourth Term in *Harmonical* or *Musical Proportion*: Wherefore it is necessary the Terms should be so given, that the double of the first may exceed the second.

A Right Line, as *AD*, is said to be divided *Harmonically*, if being cut into 3 Parts, *AB, BC*, and *CD*, the Case be so, that as the Whole *AD* (or *ZD*) is to either Extream *a* or *c* :: so shall the other Extream be : to the indeterminate Part *m*. That is,

$$\begin{array}{l} Z : a :: c : m \\ Z : c :: a : m \end{array} \quad \text{Wherefore } Zm = ac.$$

And to divide any given Right Line thus *harmonically*, as suppose *AD*;

From either End of it draw a Right Line, as *DG*, making an Angle with it, and of any Length: Connect the End of this Line with the other End *A*, by drawing *AG*; and then taking any Point, as *B*, at pleasure, in the given Line there draw *EF* parallel to *DG*, and in it take *BE* equal to *BF*; then draw *EG*, and that shall find the Point *C* required; and then calling, as above, the whole Line *Z : AB = a : BC = m*, and *CD = c*: I say *Z : a :: c : m*.

For the Triangles *ADG, ABF*, and *BEC* are all similar; and consequently *AD : AB :: DG : BF*; or as *DG : to BF = BE*; but as *DG : BE :: CD : BC*; (by working about the equal Angles *D* and *BEC*.) Wherefore, by Equality, *AD : AB :: CD : CB*; that is, *Z : a :: c : m. Q.E.D.*

And from hence 'tis plain, That the Ratio of the whole Line *AD* to the Segment *B*, may be taken at pleasure: But that the intermediate Part *BC*, must be less than either *AB* or *CD*.

HARMONY, is an agreeable or pleasing Union between two or more Sounds, continuing together at the same time.

Harmony is naturally produced by *Consonances*, but Art has discover'd the way to make it yet more agreeable, by the Mixture of *Dissonances*.

HARPINGS, in a Ship, is properly her Breadth at the Bow; tho' some call the Ends of the *Bentis*, which are fastened into the Stem, by the same Name.

HATCHES of a Ship, are the Doors in the Midship, or between the Main-mast and Fore-mast, by which any Goods of Bulk are let down into the Hold. Hence the

HATCH-WAY, is that Place which is directly over the Hatches; so that to lay a thing into the *Hatch-way*, is to put it so that the Hatches cannot be come at, or opened.

The Heat of the Sun for any small Portion of Time, is always as a Rectangle, contain'd under the Sine of the Angle of Incidence of the Ray producing Heat at that Time.

The Excellent Sir *Isaac Newton*, at the End of his Opticks, just now publish'd, renders it probable, tho' he proposes it but as a Query; That Flame is a Fume, Vapour, or Exhalation heated red hot; that is, so hot as to shine: Because Bodies don't flame without emitting a copious Fume, and this Fume burns in the Flame.

The *Ignis Fatuus*, is a Vapour shining without Heat, and there seems to be the same difference between the Vapour and Flame, as between rotten Wood shining without Heat, and burning Coals of Fire. In distilling hot or ardent Spirits, if the Head of the Still be taken off, the ascending Vapour will take Fire at the Flame of a Candle, and be turn'd into Flame; and the Flame will run along the Vapour from the Candle to the Still.

Some Bodies heated by Motion or Fermentation, if the Heat grow intense, fume copiously; and if the Heat be great enough, the Fumes will shine and become Flame: Metals in Fusion usually don't Flame for want of a copious Sulphur; except Spelter, which Fumes copiously, and thereby flames.

All Flaming Bodies, as Old Tallow, Wax, Wood, Fossil-Coals, Pitch, Sulphur, &c. by Flaming waste and vanish into burning Smoke; which Smoke, if the Flame be put out, is very thick and visible, and sometimes smells strongly, but in the Flame loses its Smell by Burning; and according to the Nature of the Smoke, the Flame is of several Colours, as that of Sulphur is Blue, that of Copper open'd with Sublimate, Green, that of Tallow, Yellow, &c. Smoke passing through Flame cannot but grow red hot, and red hot Smoke can have no other appearance but that of Flame.

As great Bodies probably conserve their Heat the longest, so the Reason of it seems to be, That their Parts heat one another: Whence *great dense*, and *fix'd Bodies*, when heated beyond such a Degree, may emit Light so copiously, as by the Emission and Reaction of its Light, and the Reflections and Reactions of its Rays within its Pores to grow still hotter, till it come to such a Period of Heat, as is that of the Sun: Wherefore we may suppose the Sun and fix'd Stars to be great Earths vehemently hot, whose Heat is conserved by the Greatness of the Bodies, and the mutual Action and Reaction between them and the Light which they emit; and whose Parts are kept from fuming away, not only by their Fixity, but also by the vast Weight and Density of the Atmospheres incumbent upon them, and very strongly pressing them, and condensing the Vapours which arise from them. See Vol. II.

HEAVE, at Sea, signifies to throw away, or to fling any thing over-board, this they call, *Heaving it over-board*; also, turning about the Captain, is called, *Heaving at the Captain*; likewise when a Ship being at Anchor, riseth and falleth by the force of the Waves, she is said, *To Heave and Set*.

HEAULME, (or as they write it, *Heawme*) is the Herald's Term for an Helmet, or Head-piece.

HEAVY Bodies Descent: See *Descent of heavy Bodies*.

HEBRAISM, is the proper Idiom of the Hebrew Tongue.

HECTICA, is a Continued Fever, arising from the very Habit of the Body, and introduced in a long Time, and has so rooted it self into the very Constitution, that it is very difficult ever to cure

it: For the most part it is accompanied with an Ulcer of the Lungs, Leanness, and a Cough. *Blanchard*.

HEEL; that part of the Foot of any Mast which is pared away flanting on the aftward side of the Foot, in order that the Mast may be *stayed after-ward on*, the Seamen call the *Heel of the Mast*; but the *Heels of the Top-masts* are Squares, and in that they put the Fid of the Top-mast.

Also if a Ship lie on one side, whether she be *a-ground* or *a-float*, they say *She Heels offward*, or to the Shore, *a-starboard*, or *a-port*.

HEGEMONICA, are the Principal Actions in a Humane Body, as the Actions Animal and Vital. *Blanchard*.

HEGIRA, a Term in Chronology, signifying the *Epocha*, or Account of Time used by the *Arabians* and *Turks*, who begin their Computation from the Day that *Mahomet* was forced to make his Escape from the City of *Mecca*, which happen'd on *Friday, July 16. A.D. 622.* under the Reign of the Emperor *Heracleus*.

HEIGHT of a Figure, is the Perpendicular Line drawn from the Top to the Base (sometimes produced) either within the Figure or without it.

HEIGHT of the Pole: See *Altitude of the Pole*.

HEIR, a Word having not altogether the same Signification with *Civilians*; who call *Heredem*, *qui ex testamento succedit in universum jus Testatoris*; as in Common Law, which calls him *Heir* that succeeds by Right of Blood in any Man's Lands or Tenements in Fee; for by the Common Law nothing passeth *Jure Hereditatis*, but only Fee: Moveables, or Chattels immovable, are given by Testament to whom the Testator listeth, or else are at the Disposition of the Ordinary, to be distributed as he in Conscience thinketh meet. Every *Heir*, having Lands by Descent, is bound by the binding Acts of his Ancestors, if he be named, *Qui sentit commodum, sentire debet et onus*.

HELICYDRA, are certain little Ulcers, thick and red; and in the Skin of the Head, like the Nipples of the Breasts, which send forth Matter. *Blanchard*.

HELIACAL-RISING, is when a Star, having been under the Sun's Beams, gets from the same so as to be seen again.

HELIACAL-SETTING, is when a Star, by the near Approach of the Sun, first becomes inconspicuous; this is reckon'd in the Moon but at 17 Degrees distance, or thereabouts; but in other Stars, 'tis as soon as they get distant, or come near the Sun by the Space of a whole Sign.

HELICE Major and Minor, the same with *Ursa Major and Minor*.

HELICOSOPHY, is the Art of Delineating all sorts of *Spiral Lines in Plano*.

HELIOCENTRICK Place of a Planet, is said to be such, as it would appear to us from the Sun, if our Eye were fix'd in its Center.

Heliocentrick Latitude of a Planet.

If the outer Circle represent the Orbit of the Earth round the Sun, and then the inner one be placed so as to be inclined to the Plane of the other (for which reason it appears in the form of an Ellipsis) when the Planet is in *N* or *n* (which Points are call'd its *Nodes*) it will appear in the Ecliptick, and so have no *Latitude*; but if it move to *P*, then being seen by the Sun, it will appear to decline from the Ecliptick, or to have *Latitude*, and the Inclination of the Line $\odot P$ to the Plane of the Ecliptick, is called the Planet's *Heliocentrick Latitude*, and the Measure of it is the Angle $P \odot q$, supposing the Line Pq to be perpendicular to the Plane of the Ecliptick: And this Heliocentrick Latitude will be continually increasing till it come to the Point *A*, which they call the *Limit* or utmost Extent of it, and then it will decrease again till it come to nothing in *N*; after which it will increase again till it come to *B*; and lastly, be decreasing again till the Planet come to be in *n*, &c.

HELIOSCOPES, are a sort of Telescopes fitted so as to look on the Body of the Sun without Offence to the Eyes.

Of these Dr. Hook hath written a little Tract, and proposes, that by inserting 4. Reflecting Glasses into a Telescope, the Sun's Rays shall come to the Eye, but with $\frac{1}{257}$ part of their usual Strength. And this Way the Doctor prefers to all others.

But without any such long Apparatus, Mr. Hagen's Way, of only using a Plane-Glass black'd at the Flame of a Lamp or Candle on one Side and placed between the Eye-Glass and the Eye, will answer the Design of an Helioscope very well: The Truth of which I have often found my self by Experience.

HELIX, is the Exterior Brim of the Ear, so called from its winding. The Interior is called *Scapha*.

HELIX, in Geometry, is the same with *Spiral*; which see.

HELLENISM, is the Imitation in *Latin*, or any other Language, of the proper Idiom of the Greek Tongue.

HELM, or Tiller of a Ship, is that Beam or Piece of Timber that is fastened into the Rudder, and so comes forward into the Steerage, where he that stands at Helm steers the Ship, by holding the Whip-staff in his Hand, a piece of Wood for that purpose, fastened into the *Helm*.

The Terms of Art belonging to the Helm, are,

1. Port the Helm: That is, Put the Helm over to the Left Side of the Ship.

2. Starboard the Helm; That is, Put it to the Right side of the Ship.

3. Right the Helm, or Helm a Mid-ship; that is, Keep it even with the Middle of the Ship.

Bear up the Helm; That is, Let the Ship go more large before the Wind.

5. Bear up round; That is, Let the Ship go directly before the Wind, in the Middle between her two Sheets.

HELM also, with the Chymists, is the Head of any Still or Alembick, because 'tis in Figure something like an Helmet, or Steel Cap, used by the Cavalry in War: So that to bring a thing over the Helm, is the same as to force it by Fire up to the Top of the Vessel, that it may distil down into the Receiver by the Nose or Beak of the Head; and when they say, That such a Thing cannot be brought over the Helm, they mean, 'tis of too fix'd a Nature to be raised into Vapour, or Salt, by the Force of Fire.

HELMINTHAGOGUES, or *Helminthicks*, are Medicines that expel Worms, or bring 'em away by Stool. *Blanchard*.

HELOS, or *Clavus*, is a round, white, callous Swelling of the Foot like the Head of a Nail, and fixed in the Roots of the hard Skin of the Foot. *Blanchard*.

HEMERALOPIA, or *Acies nocturna*, is when one sees better in the Night than in the Day. *Blanchard*.

HEMICRANIA, is a Head-ach in either Part of the Brain.

HEMPAGIA, the same that *Hemicrania*.

HEMIPLEGIA, is a Palsie on one Side below the Head, proceeding from an Obstruction in one part or other of the Spinal Marrow; or from a Blow; whence it comes to pass, that the Animal Spirits are obstructed in their Passage. *Blanchard*.

HEMIPLEXIA, the same with *Hemiplegia*.

HEMISPHERE, is the Half of a Globe or Sphere when 'tis supposed to be cut thro' the Center in the Plane of one of its greatest Circles. Thus the Equator divides the Terrestrial Globe into the Northern and Southern Hemisphere; and the Equinoctial, the Heavens after the same manner.

The Horizon also divides the Earth into 2 Hemispheres, the one Light, and the other Dark, according as the Sun is above or below that Circle.

Also Maps or Prints of the Heavens, Constellations, &c. pasted on Boards, are sometimes called *Hemispheres*, but usually *Planispheres*.

The Writers of *Opticks* prove, that a Glass Hemisphere unites the Parallel Rays at the Distance of a Diameter and one third of a Diameter from the Pole of a Glass. *Molyneux Dioptr. Nov. p. 94.*

HEMITRITEUS, an Irregular Intermitting Fever that returns every Day, but with this Difference from a Quotidian, that the Fit comes twice every other Day.

HENDECAGON, in Geometry, is a Figure that hath 11 Sides, and as many Angles.

Hendecagon, in Fortification, is taken for a Place defended by 11 Bastions.

HENIOCHUS, one of the Northern Constellations of fix'd Stars: See *Auriga*.

HEPAR, the Liver, is a Flethy large Viscus, placed in the Right Hypochondrium; its Convex and Upper-side reaches a little beyond the *Cartilago Xiphoides*, and touches the *Diaphragm*; its Concave and Under-side covers the *Pylorus*, and part of the Stomach, as also part of the *Colon*, all the *Duodenum*:

with a part of the *Jejunum*, and of the *Omentum*; and when we are standing, its lowest Extremity reaches near to the Navel.

Its Figure is almost round and pretty thick; its upper Convex-side being smooth and equal, but the lower Concave one by no means so. In its Middle and Fore-part it is divided into two, by a Fissure where the Umbilical Vessels enter. The Gall-Bladder is fastened to its Under-side, where are three Eminences that the Ancients called *Porta*, of which one passes for a little Lobe.

When it is full of Blood, it is of a dark red Colour; but when the Blood is wash'd out of it, it looks pale and feels soft.

It is fasten'd to the Body by two Ligaments:

The first, which is large and strong, comes from the *Peritonæum*, that covers the *Diaphragm*, and penetrating the Substance of the Liver, joins the *Capsule* of the *Porta*.

The second is the Umbilical Vein, it comes from the Navel, and enters by the great Fissure of the Liver to join the *Porta*: After the Birth it degenerates into a Ligament, but is of little Use for the fastening the Liver: 'Tis covered with a common Membrane from the *Peritonæum*, besides that every Lobe and Gland has its proper Membrane: The common Membrane of the Liver being raised, its Substance appears, which is composed of several Lobes of Glands, of a Conick Figure, not easily to be distinguish'd in the Liver of Men: These Lobes are dispos'd all along the Sides of each Branch of the Vessels in the Liver, they are every one cover'd with a proper Membrane, and ty'd to one another by other Membranes in such a manner, as that they leave also little Intervals betwixt them, which are more visible in Fish, and other imperfect Animals; every Lobe receives small Vessels, which are continu'd to the little Glands of which each Lobe is composed.

The Vessels of the Liver, are the *Vena Cava* and the *Porta*; they are accompanied with many small Branches of the Arteries, which come from the *Celiacæ* and *Mesentericæ Superior*, which two bring the Blood for the Nourishment of the Liver: The *Porta* brings the Blood full of Bile for Secretion, and the *Cava* carries back the Blood that remains from both: The *Vena Porta* and the *Cava* enter the Liver by its Concave-side, and are equally distributed through all its Substance: Where ever there is a Branch of the one, there is a Branch of the other; so that each Lobe, and each Gland in the Lobe, whether on the Convex, or on the Concave-side, receive the same Vessels.

The *Vena Porta* discharges by the Extremity of its Branches, the Blood, as yet full of Bile, into the little Glands which form the Lobes, of which the *Parenchyma* of the Liver is composed, where being separated from the Bile, which is taken up by the Biliary Vessels (which accompany the Branches of the *Porta*) and carried to the Gall-Bladder or *Duodenum*, it is carried back by the Branches of the *Cava*; it receives its Nerves from the *Plexus Hepaticus* of the Intercostal Nerve.

Besides these Vessels, the Liver has Lymphatick Vessels, most of which open into the conglobated Glands, near the *Porta*, on the Concave-side of the Liver, from thence the *Lympha* is carried, by other Lymphaticks, to the *Receptaculum Chyli*.

We come now to the Excretory Vessels of the Liver; which are, the *Vesicula Fellea*, and *Porus Biliaris*: The *Vesicula Fellea*, or Gall-Bladder, is fix'd to the Concave-side of the Liver; its Figure is like that of a Pear; 'tis of a different Bigness almost in

every Subject; the biggest is about the Bigness of a little Hen's Egg; when the Liver is in its natural Situation, the bottom or largest Part of the Bladder is downwards; and the Neck or narrowest Part upwards, and the Point touches the Stomach, as well as the *Colon*, where it frequently dyes them Yellow. This Bladder is compos'd of three Coats, the outermost is common to it with the Liver; the next which is proper to it, is thick and solid, compos'd of Transverse, Oblique, and Streight Fibres: The third is thin and nervous: This last Coat is cover'd within by a kind of Crust or Mucus, which preserves it against the Acrimony of the Bile: *Malthighius* has remarked some little Glands between its Coats, where the Cystick Arteries end; which gave him Ground to think that it was the same in the *Porus Biliaris*. The Bile is brought into the Gall-Bladder by some small Vessels which arise from the neighbouring Glands, and uniting, form one or two Pipes which open at the Neck of the Bladder: These Ducts I could never discover in any Liver, but an Ox's, though I have reason to think they are likewise in a Human. From the Neck of the Gall-Bladder there goes a Pipe, not in a streight Line with the Bladder, but as it were more depress'd in the Liver; it is called *Ductus Chylificus*; some small Biliary Ducts open likewise into it, and its inner Membrane has several *Ruga*, which retard the Motion of the Bile. To this Pipe (which is about the bigness of a Goose-Quill) is join'd another, called, *Ductus Hepaticus*, or *Porus Biliaris*; these two together make the *Ductus Communis Choledochus*, which goes obliquely to the lower end of the *Duodenum*, or the beginning of *Jejunum*: After it has pierc'd between the Coats, before it opens the Cavity of the Intestine; which oblique Insertion serves instead of a Valve, to hinder the Bile to return into *Ductus Communis*, having once enter'd the Intestine. The Gall-Bladder has two Veins from the *Porta*, which are called *Cystica Gemellæ*; it has some small Arteries from the *Celiacæ Dextra*, and some Lymphaticks.

The *Porus Biliaris* is another Excretory Vessel of the Liver; it has as many Branches as the *Vena Porta*, which it accompanies through every Lobe and Gland in the Liver; where ever there is a Branch of the one, there is a Branch of the other, and these two are enclosed in one common Capsule, as in a Sheath: The Use of this Capsule is to facilitate the Blood and Bile, by the Contraction of its Fibres. All these Branches unite, and make one Pipe of the Bigness of a small Quill, which joins, as we have said, at the end of the *Ductus Chylificus*, for the carrying the Bile from the Liver to the Intestines, by the *Ductus Communis Choledochus*.

The Insertion of the *Porus Biliaris* into the *Ductus Chylificus*, is Oblique, with its Mouth looking towards the *Ductus Communis*; by which means it is impossible that the Bile which comes from the *Cystica*, can enter the *Porus*.

The Bile which is found in the Gall-Bladder, is thinner, and different from that which is in the *Porus Biliaris*. This *Malthighius* proves by an Experiment; which is this, That having tied the *Ductus Chylificus*, he remarked, that the Bile which came by the *Porus Biliaris* was of a different Taste, Smell, Colour, and Consistency from that in the Gall-Bladder.

The Use of the Bile is to sheath or blunt the Acids of the Chyle; because they being entangled with its Sulphurs, thicken it so, as that it cannot be sufficiently diluted by the *Succus Pancreaticus* to enter the *Lactæal Vessels*; this appears not only from the

the Analysis of the Bile, which yields more of a Lixivious than of a Volatile Alkaline Salt; but likewise from what *Lubenboeck* has observed, That of the great quantity of Acid Salts he has seen amongst the Aliments of the Stomach, he never could find any in the Chyle, after it had passed the *Duodenum*.

Because some Chyle is almost always passing through the *Duodenum*, therefore it was necessary that the Bile likewise should be continually poured into it from the *Ductus Hepaticus*. In a Dog, whose *Ductus Communis Cholidochus*, was near as big as in a Man, I have gather'd it at the rate of 2 Drachms in an Hour; but because a great Quantity of Aliments requires a greater Quantity of Bile, therefore according as the Stomach is more or less defended with Food, it presses out of the Gall-Bladder a proportionable Quantity of Gall, to be mix'd with the Chyle in the Guts. *Dr. Keil.*

HEPATICK Medicines are, for the most part, such as are both *Diaphoretical* and *Diuretical*.

HEPATICA *Vena*, the same with *Basilica*.

HEPATICK *Aloes*, is the finest sort of Aloes, brought commonly from an Island in *Persia*, called *Succotra*, whence the Name *Aloes Succotrina*: 'Tis called *Hepatick*, because 'tis near the Colour of the Liver.

HEPATICUS *Morbus*, or *Hepatick Flux*, is a Dejection, of a watery sharp Blood, like the washing of Flesh, when the nervous Juice, or watery Blood, being not rightly concocted, but sharp, is discharged into the Guts: Also when black shining dried Blood is driven into the Guts. The Disease is so called, because they attributed Sanguification to the Liver. *Blanchard.*

HEPIALA: See *Epiala*.

HEPTAGON, in Geometry, is a Figure of several Sides and Angles; and is call'd a *Regular Heptagon*, if those Sides and Angles be equal.

HEPTAGON, in Fortification, is taken for a Place that hath 7 Bastions for its Defence.

HEPTANGULAR Figure, in Geometry, is that which consisteth of 7 Angles.

HEPTHEMIMERIS, is a *Cesura* in a *Latin Verse*, where after the third Foot there is an odd Syllable, which serves to help make a Foot with the next Word; as in this:

Ille latus niveum molli fultus hyacinto.

HERCULIUS *Morbus*, the same with *Epilepsia*.

HEREDITAMENTS, in Law, signifies all such Things immovable, be they corporeal, or incorporeal, as a Man may have to himself and his Heirs, by way of Inheritance; or not being otherwise bequeathed, do naturally and of course descend to him and his next Heir of Blood, and fall not within the Compaſs of an Executor or Administrator, as Chattels do. It is a Word of large extent, and much used in Conveyances; for by the Grant of *Hereditaments*, Houses, Seigniories, Mannors, Houſes and Lands of all Sorts, Charters, Rents, Services, Advowſons, Commissions, and whatever may be inherited, will paſs.

HERETICO *Comburendo*: See *Heretico Comburendo*.

HERISSON, in Fortification, is a Beam arm'd with a great Quantity of small Iron Spikes or Nails, having their Points outward, and is supported by a Pivot, upon which it turns, and ſerves inſtead of a Barrier to block up any Paſſage. They are frequently placed before the Gates, and more eſpecially the Wicket-Doors of a Town or Fortreſs, to ſecure thoſe Paſſages which muſt of Neceſſity be often open'd and ſhut.

HERMETICAL *Philosophy*, is that which pretends to ſolve and explain all the Phenomena of Nature, by the three Chymical Principles, Salt, Sulphur, and Mercury.

HERMETICAL *Physick*, is that Hypotheſis in the Medicinal Art, which refers the Cauſe of all Diſeaſes to Salt, Sulphur, and Mercury.

HERMETICAL *Seal*, or *Hermes's Seal*, or to Seal or Stop up any Glaſs *Hermetically*, is to heat the Neck of the Glaſs till 'tis juſt ready to melt; and then with a pair of hot Pincers to pinch or cloſe it together. This way are all *Thermometers* ſealed up, and the Chymiſts ſeal up thus a Liquor in a Matraſs, or Bolt-head, when they deſign it ſhould be long circulated in a gentle Heat.

HERMETICK *Art*, is the ſame with Chymiſtry: 'Tis ſo called from *Hermes*, or *Mercury*; whom the Chymiſts will needs aſſert to have been the firſt and moſt famous Chymiſt.

HERNIA, or *Ramex*, is properly the Falling of the Inteſtines, Cawl, &c. by the Proceſſes of the *Peritoneum* dilated into the Groin: Alſo a Protuberance of the Navel: The Falling down of the Womb is improperly ſo called; as alſo ſwelling in the *Larynx*; winding Tumours of the Spermatick Veſſels; Diſtenſions from Flatulent Matter; watery Humours, or Swellings: *Blanchard.*

HERPES, a ſpreading and winding Inflammation, is two-fold; either *Miliaris*, or *Pustularis*, like Millet-ſeed, which ſeizes the Skin only, and itches; or *Exedens*, conſuming; which not only ſeizes the Skin, but the Muſcles underneath: The Cauſe of it is, That the Glandules of the Skin are too much ſtuffed with Salt Particles, which are kept there by others that are viſcous, whence proceed the little Ulcers like Millet-ſeed, that occasion an itching in the Skin, which if the Peccant Humour abound, they grow into a Cruſt, and eat the Parts they lie upon. *Blanchard.*

HERSE, in Fortification, is a *Lattice*, or *Port-cullice*, made in the Form of a Harrow, and beſet with many Iron Spikes. It is uſually hung by a Cord faſten'd to a Moulinet, which is cut in caſe of Surprize, or when the firſt Gate is broken with a *Petard*, to the End that the *Herſe* may fall, and ſtop up the Paſſage of the Gate, or other Entrance of a Fortreſs. Theſe *Herſes* are alſo often laid in the Roads to incommode the March as well of the Horſe, as of the Infantry.

HERSILLON, in Fortification, is a Plank ſtuck with Iron Spikes, for the ſame Uſe as the *Herſe*.

HETEROCLITES, in Grammar, are ſuch Nouns as are of different Declenſions in one Number, from what they are in the other.

HETEROCRANIA, is a Pain in one Part or other of the Head.

HETEROGENEAL Nouns, in Grammar, are ſuch as have one Gender in the Singular Number, and another in the Plural, as *Tartarus*, *Tartara*; *Locus*, *Loca*, &c.

HETEROGENEAL Numbers, are mix'd Numbers conſiſting of Whole ones (or Integers) and of Fractions.

HETEROGENEAL Surds, are ſuch as have different Radical Signs; as

$$\sqrt[3]{aa} \text{ and } \sqrt[5]{bb} : \sqrt[5]{7} \text{, and } \sqrt[3]{19}.$$

How to reduce Surds to Homogeneal ones, ſee under *Surds*.

HETEROGENEAL Light, is by our admirable Sir *Iſaac Newton* ſaid to be that which conſiſts of Rays of differing Degrees of Refrangibility: This, the

the common Light of the Sun or Clouds is *Heterogeneous*, being a Mixture of all Sorts of Rays. See *Colours*.

HETEROGENEOUS Particles, are such as are of different Kinds, Natures, and Qualities, of which, generally, all Bodies are composed: And therefore, when in Chymistry a Body is analysed or dissolved by the Fire, or any *Menstruum*; if Parts or Principles of different Natures (such as Salt, Oil, Spirit, Water, and Earth) can be separated from it; those are called *Heterogeneities* (by *Helmont*) because they are all of very different Kinds or Natures from one another.

HETEROSCH, in Cosmography, are such Inhabitants of the Earth as have their Shadows falling but one way; as those who live between the Tropicks and Polar Circles, whose Shadows at Noon in North Latitude, are always to the Northward, and in South Latitude to the Southward.

HEXACHORD, a certain Interval of Musick or Concord, commonly called a *Sixth*; and is twofold, viz. the *Greater* and *Lesser*.

The *Greater Hexachord* is composed of two greater Tones, two lesser Tones, and one greater Semi-Tone, which are five Intervals: But the *Lesser Hexachord*, consists only of two Greater Tones, one Lesser Tone, and two Greater Semi-Tones.

The Proportion of the former, in Numbers, is as 3 to 5; and that of the other, as 5 to 8.

HEXAGON, in Geometry, is a Figure of six Sides and Angles; and if those Sides and Angles be equal, 'tis called a *Regular Hexagon*.

HEXAHEDRON, is the same with the Cube, being a Regular Solid of six equal Sides or Faces. See *Regular Bodies*.

The following Figure, being cut in Paste-board and folded up, will represent the *Hexahedron* or *Cube*.

HEXASTYLE, an Ancient Building which had six Columns in the Face before, and six also behind, and is the same with the *Pseudodipteron*.

HIDROA, are Pimples about the Secret Parts, proceeding from a sharp Humour. *Blanchard*.

HIDRONOSUS, is a Fever, wherein the Patient sweats extremely: The *English* call it the *Sweating-Sickness*. *Blanchard*.

HIDROTICK Medicines, are those that procure and promote Sweating: See *Sudorificks*.

HIPPEUS, or *Equinus*, a Comet that some Writers will needs have to resemble a Horse: But the Shape of this kind of Comet is not always alike, as being sometimes *Oval*, and sometimes imitating a *Rhomboides*.

Its Train, in like manner, is sometimes spread from the Front or Fore Part; and at other times from the Hinder Part: Therefore they are distinguished into *Equinus Barbatus*, *Equinus Quadrangularis*, and *Equinus Ellipticus*.

HIPPUS, is an Affection of the Eyes, wherein they continually shake and tremble, and now and then twinkle, as it happens in riding. *Blanchard*.

HIRCUS, *Hirci*, or *Hirqui*, the Corners of the Eyes: See *Cantibus*. *Blanchard*.

HIRCUS, a fixed Star; the same with *Capella*.

HIRCUS, a Name given by some Writers to a sort of a Comet encompassed by a kind of Main, seeming to be rough and hairy, by reason of its Rays appearing like Hairs: It is also sometimes without any Train or Bush.

HIRQUUS, the same with *Cantibus*.

HITCH, is a Sea Word, to catch hold of any Thing with a Hook or a Rope; and to hold it fast. Thus say they, when the Boat is to be hoisted in, *Hitch the Tackles into the Rings of the Boat*; so *Hitch the Fish-hook to the Fluke of the Anchor*, when they are about to weigh the Anchor.

HOISE: See *Hoyse*.

HOLD, of a Ship, is all that Part of it which lies between the Keelson and the Lower-Deck; wherein, divided by Bulk-heads, are the Steward's Room, the Powder-Room, the Bread-Room, and the Boat-swain's-Room; and in a Merchant-Man, the Goods or Lading in general.

HOLD-OFF, is a Term at Sea, used about heaving in the Cable at the Capstan: For if it be very stiff and great, or have lain long in a Slimy or Oazy Ground, unless that Part which is heaved in by, be haled away hard from the Capstan, the Cable will surge or slip back; therefore it must be haled away as fast as it comes in, that the Cable may keep close about the Whelps: And this Work is called *Holding-off*, and may be done by Hand with a small Cable; but in all great Ships they either *hold-off* with Nippers, or else bring the Cable also to the Jeer-Capitan.

HOLLOW-TOWER, in Fortification, is a Rounding made of the Remainder of two Bristures, to join the Curtain to the Orillon, where the Small-Shot are plaid, that they may not be so much exposed to the View of the Enemy. And the

HOLLOW-SQUARE, is a Body of Foot drawn up, with an empty Space in the Middle for the Colours, Drums, and Baggage, facing and covered by the Pikes every way to oppose the Horse.

HOMAGE, is the Submission, Promise, and Oath of Service and Loyalty which a Tenant makes to his Lord, when he is first admitted to his Land, which he holds of the Lord in Fee (tis probably derived from the Word *Homo*;) because the Form, as appointed by Stat. 17. Edw. 2. in these Words; When a Free-man shall do *Homage* to his Lord, of whom he holdeth in Chief, he shall hold his Hands together between the Hands of his Lord, and shall say thus;

I become your Man from this Day forth for my Life, for Member, and for Worldly Honour; and shall owe you my Faith for the Land I hold of you, saving the Faith that I owe unto our Sovereign Lord the King, and to mine other Lords.

And in this manner the Lord of the Fee, for which *Homage* is due, taketh *Homage* of every Tenant as he cometh to the Land or Fee.

HOMAGE is sometimes used for the Jury in a Court-Baron, where it consisteth most commonly of such as owe *Homage* unto the Lord of the Fee.

HOMAGE Ancestral, is where a Man and his Ancestors, time out of Mind, held their Land of their Lords and his Ancestors by *Homage*: And if such Lord have received *Homage*, he is bound to acquit the Tenant against all other Lords above him; of every manner of Service. And if the Te-

nant hath done *Homage* to his Lord, and is impleaded, and vouches the Lord to Warranty, the Lord is bound to warrant him; and if the Tenant lose, he shall recover in Value against the Lord so much of the Lands as he had at that time of the Voucher, or any time after.

HOMAGIO Respektuando, is a Writ directed to the Escheator, commanding him to deliver Seisin of Lands to the Heir that is full Age, notwithstanding his *Homage* not done, which ought to be performed before the Heir have Livery, or his Lands, except there fall out some reasonable Cause to hinder it.

HOMICIDE, in Common Law, signifies the Killing of a Man, and it is divided into *Voluntary* and *Casual*.

Homicide Voluntary, is that which is deliberate, and committed of a set Mind and Purpose to kill, and is either with a precedent Malice, or without: The former is Murder, and is a Felonious Killing, through Malice premeditated, of any Person living in this Realm under the King's Protection: See *Murder*, *Man-slaughter*, *Chance-medley*.

Homicide Casual, is either merely *Casual* or *mixt*.

Merely Casual, is when the Slayer kills a Man by pure Mischance, being about his lawful Occasions; as in the Case of an Axe slipping out of a Man's Hand, or falling off while he is felling a Tree.

But 'tis accounted *Mixt*, when there is Negligence, or some other unwarrantable Circumstance, seized with the Action.

HOMINE capto in Withernamium, is a Writ to take him that hath taken any Bond-man or Woman, and let him or her out of the Country, so that he or she cannot be replevied according to Law.

HOMINE eligendo ad custodiendam peciam sigilli pro mercatoribus editi, is a Writ directed to a Corporation, for the Choice of a new Man to keep the one Part of the Seal, appointed for *Statutes-Merchants*, when the other is Dead.

HOMINE replegiendo, is a Writ to bail a Man out of Prison: In what Case it lies, see the *New Book of Entries*.

HOMOCENTRICK, the same with *Concentrick*.

HOMOGENEAL, signifies of the same Kind or Sort, or that which differs not in Nature, &c. The same with *Homogeneous*.

HOMOGENEAL Numbers, are those of the same Nature and Kind: And

HOMOGENEAL Surds, are such as have one commo Radical Sign; As

$$\sqrt[3]{27}, \text{ and } \sqrt[3]{3}.$$

HOMOGENEOUS Particles, are such as are all of the same Kind, Nature, and Properties: As the Parts of pure Water, of mere Earth without Salt in it; or the Parts of the finer Metals, such as Gold, Silver, &c. 'Tis used in Opposition to *Heterogeneous*; which see.

HOMOGENEAL Light, is that whose Rays are all of one Colour and Degree of Refrangibility, without any Mixture of others: See *Colours*.

HOMOGENEUM Comparationis, so *Vieta* calls the *Absolute Number* in a Quadratick or Cubick, &c. Equation; and this Number always possesseth one Side of the Equation, and is the Product of the Roots multiplied one into another; therefore *Oughtred* expresses it by this Character *E*, because 'tis a Rectangle between the two Roots *A* and *E*. The Reason of the Name is, that all the Roots, which

being multiplied into one another, do produce the *Absolute Number*, must be Homogeneous one to another: See *Absolute Number*.

HOMOIOMERICAL Principles of Anaxagoras: This Ancient Philosopher supposed, that there were in all mixt Bodies, (such as Fleth, Fruits, &c.) determinate Numbers of such *Similar Principles*, as when they came to become Parts (*ex. gr.*) of an Animal Body, would there make such Masses and Combinations as their Nature required, *viz.* the *Sanguinary Particles* would then meet all together, and make *Blood*; the *Urinous Particles* would constitute *Urine*; the *Osseous* ones *Bones*; the *Carneous* ones *Flesh*, &c.

HOMOLOGOUS, in Geometry, signifies those Quantities which are alike to one another in *Reason*; as when we say, there is the same Reason of *A* to *B*, as of *C* to *D*: Here *A* is Homologous to *C*, as *B* to *D*, because of the Similitude between Antecedents and Consequents: So that the two Antecedents, and the two Consequents, are called the Homologous Terms in any Proportion; and when Triangles are Similar, the Sides which are the two Antecedents or the two Consequents, are called the Homologous Sides: And such Triangles are always to one another as the Squares of such Homologous Sides, as you will find proved under *Triangles*.

HOMOLOGOUS Things, in Logic, are such as agree only in Name, but are of very different Natures; and therefore are the same with what they otherwise call Equivocal Terms.

HOMOPLATA, *Scapule Spatula*, *Scapula Aperta*, the Shoulder-Blades, are two large, broad, and triangular Bones, which constitute the Breadth of the Shoulder; thin, especially in the Middle, but thick in its Processes, and are situated on each Side of the Upper and Back-part of the *Thorax*; the upper Edge of them is called *Costa Superior*; their lower *Costa Inferior*. Each has three Processes; of which, the First runs all along the Middle of their Outside, and is called their *Spine*; whose End, which receives the *Clavicula*, is called the *Acromion*, or the Shoulder-point. *Caracoides*, or *Anchoralis*, is the Name of the Second Process; as the Third is called *Cervix*: These two latter are tied together by a strong Ligament, which serves to keep the Head of the *Humerus* in the Cavity of the *Cervix*. The Use of the *Homoplata*, or *Scapula*, is to receive the Extremities of the *Clavicula* and *Humeri* for the easier Motion of the Arm, and to give Ease to the Muscles which move it.

HOMOTONA, is a continued Fever that acts always alike. *Blanchard*.

HONOUR-POINT, in an Escutcheon: See *Escutcheon*.

HONEY-COMBS, are certain Holes or Cavities within the Body of a great Gun, wherein there is Danger of some Sparks of Fire being lodged; or Pieces of Cartridges, where they lie Paper Cartridges.

HOOKS, of a Ship, are all those forked Timbers which are placed directly upon the Keel, as well in her *Run*, as in her *Rake*.

HOOP-WHEEL: See *Detent-Wheel*.

HOPLO Chrysmata, the *Armarij* or *Weapon Salve*: See *Armarij*.

HORDEATUM, is a liquid Medicine taken inwardly, prepared of Barley beat and boild, with the Addition of suitable and well-strained Liquors; to which are frequently added Almonds, and the Seeds of White Poppies, &c. *Blanchard*.

HORDEOLUM, the same with *Gritha*.

HORIZON, is that Great Circle which divides the Heavens and the Earth into two Parts or Hemispheres, distinguishing the upper from the lower: It's either *Sensible* or *Apparent*, or the *Rational* or *True Horizon*,

The *Sensible* or *Visible Horizon*, is that Circle which limits our Sight, and may be conceived to be made by some great Plain, or the Surface of the Sea.

It divides the Heavens and Earth into two Parts, the one Light, and the other Dark, which are sometimes greater or lesser, according to the Condition of the Place, &c.

It determines the Rising and Setting of the Sun, Moon, or Stars, in any particular Latitude; for when any of these appears just at the Eastern Part of the *Horizon*, we say it *Rises*; and when it doth so at the Western Part, we say it *Sets*: And from hence also the Altitude of the Sun or Stars is accounted, which is their Height above the *Horizon*.

The *Rational*, *Real*, or *True Horizon*, is a Circle which encompasses the Earth exactly in the Middle, and whose Poles are the *Zenith* and *Nadir*; that is, the two Points, one exactly over our Heads, and the other under Feet.

Horizon on the *Globe* or *Sphere*, is a broad wooden Circle encompassing it round, and representing the *Rational Horizon*, having two Notches in the North and South Parts of it for the Brazen Meridian to stand in:

On this broad wooden *Horizon* several Circles are drawn, the innermost of which is the Number of Degrees of the 12 Signs of the Zodiac, viz. 30 Degrees to each Sign.

Next to this you have the Names of those Signs; then the Days of the Month, according to the *Julian Account*, or Old Style, with the Calendar; and then a Calendar according to the Foreign Account, called New Style: And without these is a Circle divided into 32 equal Parts, which make 32 Rhumbs, or Points of the Mariner's Compass, with the first Letters of their Names annexed.

The Uses of this Circle on the Globe are,

1. To determine the Rising and Setting of the Sun, Moon, or Stars; and to shew the Time of it by the Hour-Circle and the Index.

2. To limit the Increase and Decrease of Day and Night: For when the Sun rises due East, and sets West, the Days and Nights are equal: When he rises and sets to the North of the East and West, the Days are longer than the Nights: But the Nights are longer than the Days, when the Sun rises and sets to the Southward of the East and West Points of the *Horizon*.

3. To shew the Amplitude and Point of the Compass the Sun rises and sets upon.

HORIZONTAL, or *Base-Line of a Hill*, how to find: See *Surveying*.

HORIZONTAL Dials, are those whose Planes lie parallel to the Horizon of any Place.

For the drawing of these *Dials*, you must have always given the *Latitude of the Place*, or Height of the Pole above the Horizon, (which is equal to the *Height of the Style*) by the Help of which you may find the *Hours Distance from the Meridian* by the following Proportion:

As the Radius is to the Sine of the *Styles Height*: So is the Tangent of the Hour (or Angle at the Pole): To the Tangent of the *Hours Distance from 12*, (or the *Hour-Arch*)

Example.

Suppose an *Horizontal Dial* was to be drawn for the Latitude of 51 Degrees 32 Minutes.

First, Find the Distance of the Hours 1 and 11 from the Meridian, according to the preceding Canon:

Thus,

To the S. of the *Styles Height* --- 51° 32' --- 9893745
Add the Tangent of the Hour --- 15 00 --- 9428052

Sum --- Rad. = T. of the *H. Arc.* 11° 50' --- 19321797

Which is the Distance of 1 and 11 from the *Meridian Line*.

In like manner find the rest of the *Hours Distances*, and place them in a Table:

Thus,

Latitude 32 Degrees 51 Minutes North.

Hours.	Angle at Pole.		Hour Arches.	
	G.	M.	G.	M.
12	00	00	00	00
11 1	15	00	11	50
10 2	30	00	24	20
9 3	45	00	38	03
8 4	60	00	53	35
7 5	75	00	71	06
6	90	00	90	00

For the Style, make the Angle *BCA* = to the Latitude of the Place.

So shall *BCA* be the Style or Cock, which must stand perpendicularly on *C: 12*, and Point due North.

If you would Calculate for every half Quarter, you must say,

As *R: S* Latitude :: *T*, 1 Degree 52 Minutes : To the Tangent of the first half Quarter's Distance from the Meridian ::
So *T*, 3 Degrees 45 Minutes : To *T*, of the first Quarter of an Hour's Distance ::
So *T*, 5 Degrees 37 Minutes : To a Quarter and half Quarter's Distance ::
So *T*, 7 Degrees 30 Minutes : To the half Hour's Distance, &c.

To describe the Dial, Respect must be had to the Bigness of the Plane, and the Place for the Center *C* determined; and then through *C* draw *C* 12 for the Meridian (which will also be the Subtilar-Line and Hour-Line of 12) and at Right Angles to it *C* 6 for the Hour-Line of Six. Then on *C*, with a Line of Chords, whose Radius is proper for the Largeness of the Dial, draw a Circle, and from *E*, both ways, set the several Distances of the Hour-Arks, found by Calculation, in the Circumference of that Circle: Then lay a Ruler to *C*, and draw Lines from thence through all those Divisions, they will be the true Hour-Lines on the Plane of the Dial.

N.B. This Practice serves to draw an *Erect Vertical Dial*; only in Calculation you must use the Complement of the Latitude instead of the Latitude, and the Hours must be numbered differently.

To draw an Horizontal Dial Geometrically.

Let two Lines be drawn Square-wise, viz. bd for the Hour of 12, and bc for the Hour of 6 draw the *Style* be fo, that the Angle ebd may be equal to the Elevation of the Pole; take (where you please) any Point in the Meridian Line, suppose d , from which, unto the *Style*, let fall a Perpendicular as de , and transfer it into the Meridian in df : Then draw id perpendicular to the Meridian in d , for a *Line of Contingence*.

From f_1 as a Center, describe a Circle representing the Equinoctial at any considerable Distance (the bigger the better) and divide it into 24 Parts for Hours, and 48 Parts for Half-Hours: But it is enough for an *Horizontal Dial*, if one Quadrant betwixt the Hours of 12 and 6 be divided into 6 Parts or 12.

Make Points in the *Contingent*, where it shall be cut by a Ruler applied to the Center and every Division in the Equinoctial.

Draw the Hour-Lines from the Center *b*, and every correspondent Point in the *Contingent*; erecting the *Style* over the *Meridian*, according to the Angle *i b d*.

HORIZONTAL Line, any Line drawn parallel to the Horizon upon a Plane: See *Line*.

HORIZONTAL *Parallax*: See *Parallax*.

HORIZONTAL *Projection*: See *Projection*.

HORIZONTAL Range, or *Level Range*, of a Piece of Ordnance, is the Line it describes parallel to the Horizon or Horizontal Line.

Capt. Huley, in *Philos. Trans.* N. 216. gives two very ready Theorems, the one to find the greatest Horizontal Range at 45 Degrees Elevation, by any Shot made upon any inclined Plane, with any Elevation of the Piece whatsoever; and the other to find Elevations proper to strike a given Object with any Force greater than what suffices to reach it with the middle Elevation.

PROP. 1.

A Shot being made on an inclined Plane, having the Horizontal Distance of the Object it strikes, with the Elevation of the Piece, and the Angle at the Gun between the Object and the Perpendicular; To find the greatest Horizontal Range of that Piece, laden with the same Charge; that is, half the Latus Rectum of all the Parabola made with the same Impetus.

R U L E.

Take half the Distance of the Object from the *Nadr*, and take the Difference of the given Elevation from that half; the Versed Sine of that Difference substract from the Versed Sine of the Distance of the Object from the *Zenith*: Then shall the Difference of those Versed Sines: Be to the Sine of the Distance of the Object from the *Zenith*: As the Horizontal Distance of the Object struck: To the greatest Range at 45 Degrees.

PROP. II.

Having the greatest Horizontal Range of a Gun, the Horizontal Distance and Angle of Inclination of an Object to the Perpendicular; To find the two Elevations necessary to strike that Object.

R U L E.

Halve the Distance of the Object from the *Nadir*; this half is always equal to the half Sum of the two Elevations sought: Then say, As the greatest
 $Z \propto 2$ Horizontal

Horizontal Range: Is to the Horizontal Distance of the Object: So is the Sine of the Angle of Inclination, or Distance of the Object from the Perpendicular: To a Fourth Proportional; which Fourth being subtracted from the Versed Sine of the Distance of the Object from the Zenith, leaves the Versed Sine of half the Difference of the Elevations sought; which Elevations are therefore had, by adding and subtracting that half the Difference to and from the aforesaid half Sum.

HORN-WORK, in Fortification, is an Out-work which advanceth toward the Field, carrying in the Fore-part, or its Head, two Demi-Bastions in Form of *Horns*. These Horns, Epaulments, or Shouldrings, being joined by a Curtain, shut up on the Side by two Wings parallel one to another, are terminated at the Gorge of the Work, and so present themselves to the Enemy.

HOROLOGIOGRAPHY, the Art of making *Dials*, *Clocks*, or other Instruments, to shew the Time of the Day.

HOROMETRY, the Art of measuring or dividing the Hours, and keeping Account of Time.

HOROPTER, in Opticks, is a Right Line drawn through the Point of Concourse, parallel to that which joins the Center of the Eye.

HOROSCOPE, a Word in great Request with the Canting Astrologers; and sometimes they put either for a Figure of the Twelve Houses (as they call the Signs of the Zodiac) erected to tell other Men's Fortunes, and to shew their own Folly; or else for the Degree of the Ascendants, or the Star ascending above the Horizon, at the Time the Question is put, any thing enquired for, or a Native born: But most properly *Horoscope* signifies the first House or Ascendant, and is that Part of the Zodiac which is rising at the Time of the Scheme.

HORRIFICA Febris, is that Fever in which the Patient is often seized with shaking Fits and horrible Agonies; 'tis otherwise called *Phricodes*; which see. *Blanchard*.

HORS de son fee, is an Exception to avoid an Action brought for Rent, issuing out of certain Land by him that pretendeth to be the Lord, or for some Custom and Services; for if he can justify that the Land is without the Compass of his Fee, the Action falls.

HORSE, is a Rope in a Ship, made fast to one of the Fore-mast Shrouds, having a Dead Man's Eye at its End, through which the Pendant of the Sprit-sail Sheets is reeved. Its Use is only to keep the Sprit-sail Sheets clear of the Flukes of the Anchors: Also he that heaves the Lead out of the Shrouds, has a Rope which is there fastened to preserve him from falling into the Sea, which also is called a *Horse*, and so also is the *Wap* called, which is that whereby the Shrouds are set Taught, also those little short *Waps* seized to the Middle of the Top-mast and Top-gallant-mast Stay, wherein are reeved the Top-fail and Top-gallant-fail Bowlings, are also called *Horses*.

HORSE-SHOE, in Fortification, is a Work sometimes of a round, and sometimes of an oval Figure, raised in the Ditch of a Marshy Place, or in low Grounds, and bordered with a Parapet. It is made to secure a Gate, or to serve as Lodgment for Soldiers to prevent Surprizes, or to relieve an over-tedious Defence.

HOTCHPOT, in Law, signifies a Commixture, or putting together of Lands of several Tenures, for the equal Division of them: As if a Man, seized of thirty Acres of Land in Fee, hath

Issue two Daughters, and gives with one of his Daughters, to a Man that marries her, ten Acres of the same Land in *Frank-marriage*, and dies seized of the other twenty Acres: Now if she that is thus married will have any Part of the twenty Acres whereof her Father died seized, she must put her Lands, given in *Frank-marriage*, in *Hotchpot*; that is, she must refuse to take the sole Profits of the Lands given in *Frank-marriage*, and suffer the Land to be commixt and mingled with the other Land whereof her Father died seized; so that an equal Division may be made of the whole between her and her Sister, and thus for her ten Acres shall have fifteen, else her Sister will have the whole twenty of which her Father died seized.

HOUNDS, in a Ship, are Holes in the Cheeks at the Top of the Masts, through which the Ties run to hoist the Yards: A Top-mast hath but one *Hound*.

HOURL, is the 24th Part of a Natural Day, containing 60 Minutes, and each Minute 60 Seconds, &c. These are *Astronomical Hours*, which always begin at the Meridian, and are reckoned from Noon to Noon.

But some *Hours* are begun to be accounted from the Horizon, which, when the Account begins at the Sun's Rising, are called *Babylonish Hours*; who begin with the Sun's Rising, and reckoned on 24 *Hours* to his Rising again the next Day.

Others are reckoned after the same manner, only begin at the Sun's Setting instead of his Rising; and these are called the *Italian Hours*, because the *Italians* account their Time after this Fashion.

There is yet another Kind of *Hours*, which are called the *Jewish Hours*, because of old the *Jews* accounted their Time this way: These are one 12th Part of the Day or Night, reckoned from the Sun Rising to Sun Setting (be the Days or Nights long or short;) and these were called, as we find in Holy Scripture, the First, Second, or Third, &c. *Hour* of the Day or Night.

HOUR-CIRCLES, the same with *Meridians*, are Great Circles meeting in the Poles of the World, and crossing the *Equinoctial* at Right Angles: They are supposed to be drawn thro' every 15th Degree of the *Equinoctial* and *Equator*, and on both Globes are supplied by the *Meridian*, *Hour-Circle*, and *Index*.

The Planes of the *Hour-Circles* are perpendicular to the Plane of the *Equinoctial*, which they divide into 24 equal Parts.

HOURLINES, on a Dial, arise from the Intersection of the Plane of the Dial, with the several Planes of the *Hour-Circles* in the Sphere, and therefore must be all Right Lines.

To find the Hour of the Day Trigonometrically, having the Latitude of the Place, the Sun's Altitude at Six, and present Altitude given.

In Summer.

Say, As the Co-sine of the Latitude is to the Difference of the Sines of the Altitude at Six, and present Altitude: So is the Radius to the Sine of the Hour from Six.

In Winter.

Say, As the Co-sine of the Latitude: Is to the Sum of the Sines of the Altitude at Six, and present Altitude: :

So is the Radius: To the Sine of the Hour from Six.

To find the Hour of the Day, having the Co-Latitude of the Place = 38 Degrees 30 Minutes.

The Sun's Co-Altitude = 60 Degrees, and his Co-Declination = 76 Degrees 53 Minutes;

Proceed and set all things thus;

Co-Latitude 38° 30'	{ whose Compl. } = 0.205853
Co-Declinat. 76° 53'	{ whose Compl. } = 0.011481

Difference 38° 23'
Co-Altitude 60 00

Sum 98 23
Difference 21 37

Half Sum 49 11
Half Differ. 10 48

Sine 9.878984
Sine 9.272726

Sum of all the 4 Sines 19.379044

Their half Sum 9.689522

Which last Logarithm is the Sine of 29 Degrees 17 Minutes, and this doubled, gives 58 Degrees, 17 Minutes; and then converted into Time, gives 38 Hours 51 Minutes, and so much did it want of Noon then; that is, 'twas 8 a-Clock, and 9 Minutes before Noon.

HOUSED-IN, the Seamen say of a Ship, which, after the Breadth of her Bearing, is brought in too narrow to her upper Works, that she is *Housed-in* or *Pinched-in* too much.

HOWLE, when the Foot-hooks of a Ship are scarfed into the Ground-Timbers and bolted; and then the Plank laid on them up to the Orlop, the Carpenters say, they begin to make the Ship *Howle*.

HOY, is a small Vessel or Bark, whose Yards are not a-cross, nor the Sails square like those of Ships; but her Sails are like a Miffen, and so she can lie nearer the Wind than a Vessel with cross Sails can do. A *Ketch* is a smaller Vessel of this Kind.

HOYSE, is the Sea Word for haling up any thing into the Ship for getting up a Yard, &c. Thus they say, *Hoise up the Yard!* *Hoise the Water in!* &c.

HUE-AND-CRY: *Manwood*, in *Forest Law*, c. 19. Num. 11. saith, That *Hue* signifies the Complaint of the Party, and *Cry* is the Pursuit of the Felon upon the High-way upon that Complaint; for if the Party robbed, or any in the Company of one robbed or murdered come to the Constable of the next Town; and will him to raise the *Hue-and-Cry*, (that is, make the Complaint known, and follow the Pursuit) after the Offender, describing the Party, and shewing, as near as he can, which way he went; the Constable ought forthwith to call upon the Parish for Aid in seeking the Felon; and if he be not found there, then to give the next Constable Notice, and the next, until he be apprehended, or at least, until he be thus pursued unto the Sea-side.

HUROSCOPE: See *Hydroscope*.

HULL of a Ship, is her Main Body, without any Masts, Yards, Sails, or Rigging.

To *Hull*, or lie a *Hull*, is spoken of a Ship, when either in a dead Calm (to preserve her from beating her Sails against the Masts) or in a Storm when she can't carry 'em, all her Sails are taken in to preserve them, so that nothing but her *bare Poles*, her Masts, Yards, and Rigging are abroad; this is called *Hulling*; her Helm is tied down to the Lee-side of the Ship, and then if she be a good Sailer, she will lie easily under the Sea, and make her way one Point before the *Beam*.

HULLOCK of a Sail, is when in a great Storm some small Part of a Sail is cut and left loose: It's chiefly used in the Miffen-sail, to keep the Ship's Head to the Sea, then all the rest of the Sail is made up, except a little at the Miffen-yard Arm: Also when a Ship will not *Weather-Coil*, to lay her Head the other way, they loose a *Hulloek* of her Fore-sails; and then changing the Helm to the Weather-side, she is then made to fall off, and to lay her Head where her Stern lay before.

HUMECTATION, is the moistening of any mixt thing, in order to prepare it for some Operation, or that its best or finest Parts may the better be extracted: Thus *Agarick*, &c. are moistened while they are pounding, lest they should exhale too fast; and *Cassia* is moistened, the better to extract its Pulp.

HUMERUS, the Shoulder-bone, being the first Bone of the Arm; 'tis long and round, its Substance or Fibres are pretty solid and compact; it has a wide and long Cavity in its Middle, in which is contained its Marrow. At its upper-end it has a round Head covered with a Cartilage, which is received into the Cavity of the Neck of the *Scapula*; but because this Head is much larger than the Cavity, therefore it is surrounded with a strong Ligament, which rises from the Edge of the Cavity of the *Scapula*. At its lower End it has two Protuberances; the one External, which receives the Extremity of the *Radius*; the other Internal, which is received into the Semi-circular *Sinus* of the *Ulna*: On the Fore-side of this Protuberance there is a small *Sinus*, which receives the fore Process of the *Ulna*; and on the back-side there is another large *Sinus*, which receives the *Olecranium*. There is another small Protuberance on the Side of this, from which the Muscles that lie on the Inside of the Arm arise.

HUMID: *Bloom*, in his Heraldry, gives you a *Fesse* of this Form, which he calls *Fesse Humid*.

HUMIDITY, is the Quality which we call Moisture, or the Power of wetting others, which some Liquors and Fluids are endowed with. This differs very much, from *Fluidity*, as you may see under that Word; and seems to be merely a relative thing depending on the Congruity of the Component Particles of the Liquor, to the Pores of such particular Bodies as it is capable of adhering to, penetrating a little into, or wetting.

Thus, for Instance, Quicksilver is not a moist Liquor, as to our Hands or Cloaths; but may be called so in reference to Gold, Tin, or Lead, to whose Surfaces it will presently adhere. Now even Water it self that wets almost every thing, and is the great Standard of Moistured and *Humidity*, is

not capable, as it appears, of wetting every thing; for it stands, and runs easily off in Globular Drops on the Leaves of Cabbages and many other Plants, and will not wet the Feathers of Ducks, Swans, and other Water-Fowl, as it will other Things. And that Texture only may cause a Fluid to be *Humid*, is plain from hence, That though neither Quicksilver alone, Lead, or Bismuth will adhere to Glafs; yet being mixed together, they will form a Mass that will do so; as is plain from such a Composition being frequently used to Foliate Looking-Glasses, Vid. Mr. Boyle's *History of Fluids and Firmness*, Pag. 187.

HUMILIS: See *Deprimens*.

HUMOURS: The Ancients made four *Humours* in the Blood, the Bilious, Pituitous, (Yellow and Black Choler) Melancholick, and the Blood, properly so called, and that according to the four Peripapetick Elements: But this Opinion is cashier'd, since the Invention of the Circulation of the Blood; yet they are found when the Blood preternaturally departs from its due Temperature; but they do not constitute an integral Part of the Blood, for the Blood is only one *Humour*; if otherwise, Tartar in Wine, and Dregs in Beer, were constituent Parts of Wine and Beer. In Blood that is let, there appear only three different Species of Bodies; for in the Surface you see a Kind of a Fibrous Crust of coagulated Blood, which spreads it self over the whole Mass; then you see certain red Particles amongst the Fibres, which grow black about the Bottom by reason of their Fewness: Lastly, you see the *Serum* wherein it swims. But if any one will proceed more accurately, distil the Blood, and dissolve it Chymically, he shall find five pure Bodies in it; to wit, Spirit, Sulphur, or Oil, Water, Salt and Earth.

There are three general *Humours* which wash the whole Body, Blood, Lympha, (a sort of pure Water) and the Nervous Juice; but there are several particular *Humours*, as Chyle, Bile, Spittle, Pancreatic Juice, Seed, &c.

There are also *Humours* in the three Membranes that cloath the *Fetus* in the Womb, which are three in those Animals that have Bladders: At the Beginning, when the Egg falls down from the *Ovaria* into the Womb, the *Humours* which are to this Purpose in the Bottom of the Womb, first sink into the Membrane called *Chorion*, and then into the *Amnion*; but in Process of Time, when the *Fetus* is formed, and the Navel-Vessels are extended to the *Chorion* and the *Amnion*, we imagine that the Nutritious *Humour*, being received by the Opening of the Veins, is carried to the *Fetus*, and thence, by the Arteries, some Part of it is carried into the *Amnion*, as into the Child's Store-house; so that at the said time the Liquor of the Membrane *Amnion* may be increased upon this double Account. *Blanchard*.

At last, when the Time of Delivery draws near, that way of Sweating through seems to cease, and the others only take Place; unless, (as *Wharton* writes) the Nutritious *Humour* descend from the *Placenta* by the Navel-String, and by the little soft Protuberances, thence pass into the Cavity of the *Amnion*: The Use of these *Humours* is to nourish the *Fetus* at the Mouth.

The Third *Humour* is the Urine, which flows from the Bladder by the Urinary Passage, into the Urinary Membrane.

HUMOURS of the Eye, are Three: The Watery or Aqueous, which is contained between the *Tunica Cornea* and *Uvea*.

2. The *Crystalline* or *Icy Humour*, which is contained in the *Tunica Uvea*, and is thicker than the rest.

3. The *Vitreous* or *Glassy Humour*, bigger than any of the rest, fills the backward Cavity of the Eye.

The *Aqueous Humour* serves to moisten and levigate the two other denser *Humours*, as also the *Tunica Uvea* and *Retina*, and perhaps (saith *Diemerbroeck*) to nourish them too: When this fails, grows dreggy, or too thick, the Sight presently grows dull and imperfect. If it be so dreggy as that pretty large Particles are formed, and swim about in it, the Person fancies he see Flies and Motes always before his Eyes; and if these Particles grow altogether in a Film or Membrane, and so come to cover the Pupil, 'tis called a *Suffusion*, which is the Beginning of a *Cataract*.

The *Vitreous Humour*, some say, serves to dilate the Rays which it receives from the *Crystalline*, and to bring them to the *Retina*; or, as others think, it helps to collect the Rays refracted by the *Crystalline* into one Point, that the Vision may be the more distinct and vivid.

The *Crystalline Humour*, which some call *Glaucialis*, is the primary Instrument of Vision, in respect of its Collecting and Reception of the Rays, which coming hither, dilated by the *Aqueous Humour*, are collected and conveyed to the *Retina*.

HURDLES, or *Clays*, in Fortification, are made of thick and small Twigs of Willows or Osiers, being 5 or 6 Foot high, and from 3 to 4 Foot broad. They are interwoven very close together, and usually laden with Earth, that they may serve to render Batteries firm, or to consolidate the Passage over muddy Ditches; or to cover Traverses and Lodgements for the Defence of the Workmen, against the Artificial Fires or Stones that may be cast upon them.

HURTS, a Term in Blazony: See *Balls*.

HUSTINGS, a Court held before the Lord-Mayor and Aldermen of *London*; an Error or Attaint lies there of a Judgment or false Verdict in the Sheriff's Court.

HYALOIDES, is the Vitreous Humour of the Eye, contained betwixt the *Tunica Retina* and the *Uvea*.

HYBERNAL Occident: See *Occident*.

HYBERNAL Orient: See *Orient*.

HYBONA, is an Incurvation of all the Vertebres.

HYDATIDES, are little Watery Bladders in the Liver, Spleen, or some other Viscus, common to Hydropical Persons: But Dr. *Tyson* supposes them to be a Species of Worms, or imperfect Animals.

HYDATOIDES, is the Watery Humour of the Eye, contained betwixt the *Tunica Cornea* and *Uvea*.

HYDRA, a Southern Constellation, consisting of 26 Stars, and imagined to represent a *Water-Serpent*.

HYDRAGIA: See *Vena Lymphatica*.

HYDRAGOGUES, are Medicines which, by Fermentation and Precipitation, purge out the Watery Humours.

The Ancients thought this was done by some peculiar Texture, and that thence its Virtue arose to purge away Serofities or Watery Humours only.

HYDRAULICS, the Art of making all sorts of Engines to carry or raise Water, or which are moved by Water, and serve for other Uses: The Word

Word signifies Sound made by Water, because when Organs were first found out, they were blown by the Fall of Water instead of Bellows.

You have many Ancient Water-Engines described by *Heron*, and which are called *Machina Hydraulica*. *Arbenaus* attributes the Invention of the Water-Organ to *Ctesibius* but others say *Plato* first found out the founding *Clepsydra*, which told the Hour of the Night by the Noise of Pipes blown by the Air forced by the Fall of Water: Mr. *Ozonam* confounds this Word with *Hydrostatics*.

HYDRAULO-PNEUMATICAL Engines, are such as raise Water by means of the Spring (either Natural or Forced) of the Air.

The Honourable Mr. *Boyle* mentions a very pretty Fountain, which he calls *Hydraulto-Pneumatical*, and which was made by the Spring of the Air pressing up Water in a Pipe, when in the Exhausted Receiver the Weight of the Atmosphere was taken off: See *Continuation of Physico-Mechanical Experiments*, Exper. 4.

And you may easily try the thing, if you fill but any middle siz'd Vial about half full of Water; and then, with Sealing-Wax or Cement, fasten in its Neck a long slender Glass Pipe, (a Piece of Tobacco-pipe or Quill will do) one of whose Ends shall be below the Surface of the Water in the Glass; for then, if the Mouth of the Bottle be accurately stopp'd, the Warmth of your Hand only will so increase the Spring of the included Air, that it

will make the Water rise up, and run out at the Top of the Pipe; and if you blow strongly in at the Top, and force a good Quantity of Air into the Bottle, the Spring of the Air so forced in, will, on the Removal of your Mouth, drive the Water up the Pipe with a great Force; and if the Orifice be very slender, or the Cavity of the Pipe very small, it will make the Water imitate an Artificial Fountain, which will keep running for near half a Minute.

A Description of the Common Hydraulick Engine used to quench Fire, &c. from Philosph. Trans. Numb. 128.

The Engine is a Chest of Copper, as *A*, transportable by means of two wooden Bars, like a Sedan or Chair. This Chest is pierced with many Holes above *B B*, and holds within it the Body of a Pump *E F M*, whose Sucker *D E* is raised and abased by two Leavers *C O*: These Leavers have each of them two Arms, and each Arm being fitted to be laid hold on by both Hands of a Man. Each Leaver is pierced in the Middle by a Mortise *a a*, in which an Iron Nail, which passes through the Handle of the Sucker, turns round when that Sucker is raised or lowered.

Near the Body of the Pump there is a Copper Pot *I H K*, join'd to it by the Tube *G*; and having another Tube *K N L*, which in *N* may be turned every way.

To make this Engine play, Water is poured up on the Chest, to enter in at the Holes that are in the Cover thereof: This Water is drawn into this Body of the Pump at the Hole *F*, at the Time when the

Sucker is raised; and when the same is let down, the Valve of the same Hole *F* shuts, and forces the Water to pass thro' the Hole: For in the Tube *G* of which the Valve *H* being lifted up, the Water enters

enters into the Pot, and filling the Bottom, it enters thro' the Hole *K* into the Tube *KNL*, in such a manner, that when the Water is higher than the Tube *KNL*, and the Hole of the Tube *G* is shut by the Valve *H*, the Air inclosed in the Pot hath no Issue; and it comes to pass, that when you continue to make the Water enter into the Pot by the Tube *G*, which is much thicker than the Aperture of the End *L*, at which it must issue, it must needs be, that the Surplus of the Water that enters into the Pot, and exceeds that which at the same time issues through the small End of the Jet, compresses the Air to find Place in the Pot, which makes that, whilst the Sucker is rais'd again, to make new Water by the Force of its Spring, mean time that a new Compression of the Sucker makes new Water to enter, and causes also a new Compression of Air: And thus the Course of the Water which issues by the Jet, is always entertained in the same State, because that proportionably, as the Impulse is strong, the Water entering faster, and consequently in greater Quantity into the Pot, makes a greater Compression of the Air, which, the more strongly it is compress'd and penn'd in, returns also with the greater Force into its Native State, by means of its Spring, and therefore throws out the Water with greater Force.

HYDRENTEROCELE, is a Falling of the Intestines, together with Water, into the *Scrotum*. *Blanchard*.

HYDROA, are certain little, broad, moist, itching Pimples, like Millet-seed; sometimes without itching, which render the Skin ulcerous and rough; tho' to expel the Sweat by the Skin, is hindered sometimes by its Thickness; so that the Matter being lodged there, and the subtiler Parts being either carried back by the Lymphatick Vessels, or evaporated, the Skin swells. This Distemper is familiar and common to Boys and young Men, especially of a hot Constitution, when they use too much Exercise in Summer: It infects the Neck, Shoulder-blades, Breasts, Arms, Thighs, yet more frequently the Secret Parts and the Fundament. *Blanchard*.

HYDROBELE, is a swelling of the outermost Skin of the *Scrotum*, proceeding from a Watery Humour. *Blanchard*.

HYDROCEPHALUM, is a Swelling of the Head, by reason of a watery Humour; whence the Sutures of the Brain are forced asunder; it proceeds sometimes from a Bursting of the Lymphatick Vessels. *Blanchard*.

HYDROGRAPHICAL-CHARTS, are certain Sea Maps, delineated for the Use of Pilots and other Mariners; wherein are mark'd all the Rhumbs or Points of the Compass and Meridians parallel to one another, with the Shelves, Shallows, Rocks, Capes, &c.

HYDROGRAPHY, is an Art which teacheth how to describe and measure the Sea; giving an Account of its Tides, Counter-Tides, Soundings, Bays, Gulphs, Creeks, &c. As also the Rocks, Shelves, Sands, Shallows, Promontories, Harbours, Distance from one Port to another, and other things remarkable on the Coasts.

HYDROMANCY, a pretended Divination by Water.

HYDROMEL, Mead, is a Decoction of Water and Honey.

HYDROMPHALUM, is a Protuberance of the Navel, proceeding from Watery Humours in the *Abdomen*. *Blanchard*.

HYDROPHOBIA, is a Distemper highly Convulsive, accompanied with Fury, and shunning of all things that are Liquids and Splendid; sometimes

with a *Delirium*, a Fever, and other Symptoms, and not without great Danger of Life, proceeding from the Bite of a mad Dog, or a Contagion analogous to it.

In *Philosop. Transact. N. 147*. there is an Instance of one having this Disease, occasioned by the Bite of a mad Dog.

HYDROPICA, are Medicines that expel the Watery Humour in a Dropie.

HYDROPS, a Stagnation of the Watery Humour in the Habit of the Body, or some Cavity of it: And it is either General, as an *Anasarca*, and *Ascites*; to which some add a Tympany, but ill: Or Particular, confined to one Part, as a Dropie in the Head, Breasts, Hand, Foot, &c. *Blanchard*.

HYDROPS ad Matulam, the same with *Diabetes*.

HYDROSTATICKS, is that Part of Statics which relates to the Gravities and *Equilibria* of Liquors; and also comprehends the Art of Weighing Bodies in Water, or some other proper Liquor, thereby to estimate their Specifick Gravity, and to deduce thence many other useful Theorems.

And this is observed by the Honourable Mr. *Boyle* is a Part of Philosophy which ought to be looked upon as the most ingenious of any: The Theorems and Problems of this Art, being handsome Productions of Reason, and affording Discoveries, not only pleasing, but also surprizing and wonderful: Nay, very many of the most familiar, as well as most abstruse Phenomena of Nature, can hardly ever be thoroughly understood without Hydrostatical Principles. 'Tis an Art also not only delightfully Speculative, but practically Useful: It may be of the highest Importance to Shipping and Navigation, to those that deal in Salt-works, and to those whose Business 'tis to enquire into the Gravities and Magnitudes of some Bodies; the exact Knowledge of which would very much conduce to their Interest. But of the great Usefulness of this Art, see more under *Specifick Gravity*.

And that Admirable Gentleman, the Honourable Mr. *R. Boyle*, considering that all Persons are not acquainted with, and cannot readily digest rigid Mathematical Demonstrations, that it might be of great Advantage to prove the Truth of such useful Propositions, as those given us by Hydrostatical Writers, in a Sensible and Physical way: As also, That some things before passing for receiv'd Truths, would then be discover'd to be palpable Errors, as well as many Noble and useful Discoveries this way communicated to the World:

Considering this, I say, That Noble Author reduced the chiefest of the Hydrostatical Theorems into the following Paradoxes; which you will see he made clearly out by Experiment and sensible Proof.

Though before he comes to them, he thinks fit to premise these things as *Positata* or *Lemnata*.

1. That if a Pipe, or Tube, open'd at both Ends, and placed perpendicularly to the Horizon, have its lower Orifice under Water, there will pass an Imaginary Plane or Surface parallel, as to Sense, to the upper Surface of the Water, which shall touch that lower Orifice of the Tube.

2. That each Part of this Surface or Plane will be alike press'd (if at all) by the Weight of the perpendicularly incumbent Water, which cannot but be granted, since the Water being suppos'd an homogenous Fluid of equal Gravity every where, and equally high above the aforesaid Plane, there can

no reason be assign'd why any one Part of it should be more or less pressed than any other.

3. That though in this Case the Liquor will keep its former Position, yet if any one Part of it comes to have a greater Weight incumbent on it than another, then that Part will be displaced and depressed; as is the Case when a Stone or other Body, specifically heavier than Water, sinks down in it, and tends to the Bottom.

For in what Part soever of the Water the Stone is, that part being more pressed upon than the rest, must yield and give way to the Motion of the Stone downward, till it come to the Bottom.

And on the other Hand, if any Part of this imaginary Surface be less pressed upon than the rest, it must, by the greater Pressure of the rest, be impelled upwards, till it have an height equivalent to balance the Pressure made on the other Parts of the Water; which latter Part will appear highly reasonable and grantable by any attentive Considerer.

And its Truth in Fact he proves by this Experiment:

If a small Tube, open at both Ends, be held or placed perpendicularly a little beneath the Surface of the Water, in any Vessel; [Note, 'Tis best to use one of Glass, that the Experiment may be the more visible;] then will the Water rise in the Tube as high and a little higher (for a Reason which you will find given hereafter) than the Surface of the Water without: But if you gently pour Oil of Turpentine, or any other Liquor which will not mix with Water, upon that contained in the Vessel, you will see, that as the Oil grows higher and higher on the Surface of the Water, and presses consequently more and more upon it, so will the Water rise within the Orifice of the Tube; and descend again proportionably as you take off the Oil; which plainly proves, That the Weight of the Oil pressing more on the Surface of the Water without the Tube, than the bare Air only can do within it, forces up the Water so high in the Tube, till the Cylinder of Water within the Tube, doth as much gravitate on that Part of the Water under the Orifice of the Tube, as the Air, Oil and Water together do on all the others, without it.

PARADOX I.

That the Upper Parts of all Fluids, as Water, &c. do press upon the Lower.

Provide a Glass Jarr, near of the Shape in the Figure annexed; (though a long Drinking-glass, like that used for Mum, may do well enough.) Fill it with Water near full, as up to AB: Then take a small Glass Pipe or Tube, open at both Ends, and dipping the lower End into Oil of Turpentine, you may, by stopping the Top with your Finger, suspend as much of the Oil as you please in the Tube: This done, move the Tube into the Glass of Water; and thrust it down till the upper Surface of the Oil in the Tube, be near as low as the upper Surface of the Water: And when you take your Finger from the Top of the Tube, you will see the Oil will not run out at the lower Orifice of the Tube. Nay, if you thrust the Tube lower down into the Water, that Liquor will rise up into the Tube, and bear the Oil above it; but if you raise the Tube up, so that the upper Surface of the Oil in it be higher considerably than that of the Water, the Oil will

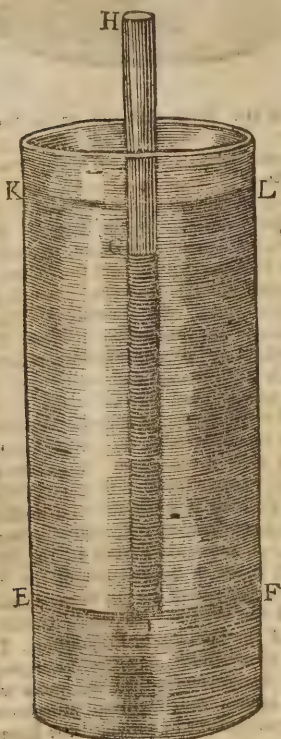

drop out of the Tube, and rise up to the Top of the Water. The Reason of which is this: When the Imaginary Surface *GH*, on which the End *Q* of the Tube *PQ* leans, is as much, and no more, pressed upon by the Oil in the Pipe, than the other Parts of that Surface are by the Parts of the Water perpendicularly incumbent on them, there is an *Equilibrium* between the Oil and the Water, and so the Oil cannot run out; and when you sink the Tube down as low as *O*, the incumbent Water doth more gravitate on the Surface or Plane *EF*, than the Oil in the Tube doth on the Part under it; and consequently the Water will be forced up into the Tube, and will bear the Oil above it; and the Water will rise so high, as that the Water and Oil together in the Tube *NO*, do gravitate as much on the Surface *EF*, as the other incumbent Parts of the external Water do: But if you raise the Tube up into the Position *RS*, the Oil in it pressing more on the Imaginary Surface *IK*, than the incumbent Water doth on any other Part of it, the Oil must run out, till so much descend out of the Tube as will bring the Gravity of the Oil to an *Equilibrium* with that of the Water. All which plainly prove the Truth of the Paradox or Proposition, *That the upper Parts of all Fluids, do gravitate or press upon the Lower.* For if you try the Experiment with any two other Liquors, which will not mingle one with another, it will succeed; provided the Bore of the Pipe be not too large.

PARADOX II.

That a lighter Fluid may gravitate or press upon a heavier.

Fill the former Jarr with Oil of Turpentine, instead of Water, and then place in it a Tube of the same Bore as the former, in which you shall have suspended a Column of Water, as before you had of Oil: And you will find that though the Water be heavier than Oil of Turpentine, yet if you do not take your Finger from the upper Orifice till such time as you have sunk the Pipe so low as that the upper Surface of the Water in it be a little below the Surface of the Oil in the Glass; I say, that then on taking off your Finger, you will find the Water in the Pipe will not run out: That if you sink the Tube lower, or pour more Oil into the Vessel, the Oil will rise up in its Lower End; and that if you raise it higher, the Water will run or drop out, and fall to the Bottom of the Vessel. Which plainly shews, That a Liquor lighter in Specie, may buoy up and keep suspended one that is heavier; and the Reasons are in effect the same as those given for the Solution of the Phenomena of the First Paradox; the only Difference being, that the Oil and the Water have changed Places, the Oil now being in the Jarr, and the Water in the Tube.

This Second Paradox our Author also very ingeniously illustrates and confirms by the following Experiment.

Into a long Glass Pipe, sealed at one End, and whose Bore was about half an Inch in Diameter, he poured a Quantity of Water, and then having a small Glass Bubble about the Bigness of a Pea, with a very small and slender Stem, as you see in the Figure annexed; which Bubble was exactly

poised, by forcing Water into it, that tho' it would not sink in a Vessel of Water, yet a very little more Weight would make it do so.

This Bubble being put into the Glass Pipe, did swim on the Top of the Water contained in it; but when he poured Oil of Turpentine (very gently, to prevent confounding the Two Liquors) on the Water in the Pipe, and that till it had attained a convenient Height above the Surface of the Water, he found that the Bubble, which before swam on the Surface of the Water, did now sink down to the Bottom, and stay there as long as the Oil was kept upon the Water; but if either the Tube was very much inclined any way, or if the Oil, by a Siphon or otherwise, were drawn off, the Bubble would then emerge to the Top.

The Reason of which Phenomenon he truly states to be this, That when the Oil was poured on, that did (though a lighter Fluid by its proper Gravity) press on the Water on which it was incumbent, and by that Means did force some of it to enter in at the little Stem of the Bubble; which, by that means being rendered in the whole more heavy, did sink to the Bottom: But when the perpendicular Pressure of

of the Oil upon the Water was taken off, by inclining the Tube, or removed by drawing off the Oil quite, the Air in the Bubble, which before was compressed, did now by its Spring force out the newly admitted Water again; and so reduce the Bubble to its former Degree of Gravity, so that it would be suspended in the Water as before.

He found also, that pouring on more Water would produce the same Phenomenon, if, by a Wire, he first thrust down to, and then kept at the Bottom of the Tube the aforesaid poised Bubble; for though it would readily emerge on the removal of the Rod or Wire, when no more Water was poured into the Tube, yet, that if the Wire kept the Bubble at the Bottom till he had poured in more Water, to about two or three Foot high, into the Pipe, the Bubble would then, on the removal of the Wire, stay there, and not rise at all till the same Quantity of Water was taken out which was before added: Which Experiment doth Nobly Illustrate and Prove his first Proposition, *That the upper Parts of the same Fluid, do press or gravitate on the lower.*

PARADOX III.

If a Body contiguous to the Water be altogether, or in Parts, lower than the upper Surface of the Water, the lower Part of the Body will be pressed upward by the Water which toucheth it beneath.

This appears from the *First Experiment*, where the Oil of Turpentine was kept in an open Tube from descending, or running out of it, by the Pressure upwards of the Water on its lower Parts.

And by the *Second Paradox* it appears, that Oil, a lighter Fluid, could press upwards, or keep Water, a Fluid in Specie heavier than it, suspended in an open Pipe.

But in order to estimate how much the Pressure of the Water against the lower Parts of any Body doth amount to, let us suppose a Parcel of Oil, heavier than Water, as suppose that of Cinnamon, Cloves, Guaiacum, &c. were taken up into a Tube, and then that Tube were, as in the former instance, immersed into a Vessel of Water, and there placed so shallow, that the Oil, on removing of the Finger from the Top of the Tube, would drop out. The Drop G, being heavier in Specie than Water, would (by *Lemma 3.*) sink to the Bottom, but not so quickly as it would in the Air; and since, if it were of a Matter equi-ponderant to Water, 'tis plain it could not sink at all, any more than emerge; it doth now sink by no greater a Degree of Gravity, than that by which it surmounts a Quantity of Water equal to it in Bulk: And therefore it will lose in the Water just as much of the Weight it would have in the Air, as so much Water as is equal to it in Bulk, if weighed in the Air also, would amount to: which is a Physical Demonstration of the *Grand Theorem of Hydrostatics*, first put in a clear Light by our Noble Author Mr. Boyle.

The Pressure of Water also against the lower Parts of any immersed Body, is confirmed by attending to the Reason why any Body lighter in Specie than Water, doth emerge out of it; which is this, That there is a greater Pressure or Weight on every other Part of the imaginary Surface of the Water (as suppose *I K* in Fig. 1.) than there is on that, on which the emerging or rising Body leans; and consequently to produce an *Equilibrium* in the Fluid, the Parts immediately under the rising Bo-

dy being pressed by the rest every way, must continually force it upwards, till it attain the upper Surface of the Water: For the emerging Body is

continually pressed upon by two Columns of Water, one bearing against its upper, and the other against the lower Parts; the Length of both which Columns being to be accounted from the Top of the Water, that which presses on the lower Part, will be the longer by the Thickness of the ascending Body, and consequently over-balance it by the Weight of as much Water as will fill the Space that Body takes up: Wherefore the greater Disparity there is between the Specific Gravities of Water and the emerging Body, and the larger the Particles are that emerge, the swifter will they ascend.

And this will help us to account for these things.

1. For the Reason of that Experiment, That if two Pieces of a Stick of the same Bigness, but of unequal Length, as *OP*, and *QR*, are permitted to rise from the Bottom of a Vessel of Water at the same time, the longest will come first to the Top, which must be because the Columns of Water which press against the lower Ends of both, being equal, but that shorter which presses on the upper End of the longer Piece, it must be less pressed downwards than the other, and so by the general Pressure upwards will rise fastest.

2. From hence we may easily conceive one Reason, (for I assert not that 'tis the only one) why very minute Corpuscles, either higher or heavier in Specie than the Liquor they are mingled with, may be kept there a good while without emerging to the Top, or precipitating to the Bottom: For their

Thickness being indefinitely made small, the Difference between the two Columns before mentioned, will be so too, and consequently either of them can very little over-balance the other.

3. We may from hence account for the Quantity of that Part of any Floating Body which is beneath the Surface of the Water, *which is always in Bulk equal to as much Water as the whole Floating Body doth weigh*: For this Floating Body doth by its lower

Part presses on the subjacent Parts of the imaginary Surface of the Water *XW*, just as much as the Columns of Water to the Altitude *AX* or *BW* do on all other Parts; that is, just as much as the Water would do if it were in the Space which the Part immersed takes up, or as much as a Quantity of Water equal in Bulk to the immersed Part would do.

And from hence 'tis clear, That the Weight of that mighty Ship, the *Royal Sovereign*, is the same with that of so much Water as is in Bulk equal to the immer'd Part of her, or to that Part of her Hull which is underneath the Surface of the Sea. Which Assertion Mr. Boyle found accurately enough to hold true by the following Experiment:

A broad shallow Vessel of Glass being near filled with Water, he placed floating in it a Glass Tumbler or short Drinking Glass; and to make it a little resemble a Ship, he fitted a Wooden Deck, with a Mast, &c. to it; and then he sunk it by ballasting it with Sand, and made it draw as much Water (as the Seamen say) as he thought fit: Then did he, by accurate Marks, distinguish how high the Water in the containing Glass did rise on the Sides of the Vessel: This done, he took the Tumbler out, wiped it dry, and weighed it, and then found a Quantity of Water exactly equal to that Weight: which Water, when put into the broad Glass, rose up to those Marks exactly which he had before observed the Tumbler had raised the Water to.

PARADOX IV.

That to account for the raising of Water in Pumps, &c. there needs only the competent Weight of an External Fluid.

Take up in a slender Glass Tube about an Inch in height of any deeply tinged Liquor (such as an Infusion of Brazil-wood and Cochineal; &c. in Water, for else the Phenomena will not be conspicuous) and then stopping the upper End with your Finger, place it in a Glass Vessel filled with the same tinged Liquor, and that so low, that the upper Surface of the Liquor in the Tube be at least an Inch below that of the Liquor of the Vessel: Then pour on Oil of Turpentine for about 3 or 4 Inches height above the Water in the Vessel, and you will see, on the removal of your Finger from the Top of the Tube, that the tinged Water will be raised or impelled upward near as high as the Surface of the Oil.

Now here no abhorrence of a Vacuum can be pretended, as the Cause of the Ascent of the Water, for the Tube is full of Air, and the External Air hath a free Ingress into it: But the plain Reason is this, That there being a greater Pressure made by the Oil and Water together on the imaginary Plane that passes by the lower Orifice of the Tube without the Tube, than within it, (for within there is a Pressure only of an Inch of Water, and of a Column of Air) the Parts of the Water at the Bottom of the Pipe must be thrust upwards into it, till it rise so high as to gain an *Equilibrium* with the rest.

And this will easily account for the Ascent of the Water in the Pumps:

Where the external Air presses every where on the Surface of the Water in the Well, but not on that within the Pump, because 'tis taken off by the Sucker; which is therefore with soft Leather, &c. made stanch on purpose.

On the raising therefore of the Sucker, the Water must follow it (if the Pump be good) because the Weight of the whole Atmosphere presses on the Surface of the Water in the Well, (but not at all within the Body of the Pump) and so raises or forces it up into the Cavity of the Pump. And that this Pressure of the Air is the Cause of the Waters rise, is more than probable, because no Pump can ever raise Water above 33 or 34 Foot; which is found to be exactly agreeable to the different Gravities of Air and Water, allowing for the great Height of the Atmosphere: Of which more elsewhere.

PARADOX V.

That the Pressure of an External Fluid, is able to keep an Heterogeneous Liquor suspended at the same Height in several Pipes, though they be of different Diameters.

Take a pretty wide-mouth'd Glass, (as in Fig. 5. following) of a convenient Depth, and put into it a sufficient Quantity of Water well tinged with Brazil, &c. then fit to it a Cover of Cork, through which bore, with a red-hot taper Iron, several round Holes, to admit Tubes of different Bignesses or Sizes. Let these Tubes stand nearly upright in the Vessel, and reach all with their lower Orifices below the Surface of the Water: Then at an Hole purpose-

purposely left for it, pour in gently, by a Glafs Funnel, a good Quantity of Oil of Turpentine, and you will plainly see the tinged Water rise equally, (*i. e.* to equal Heights) in all the Tubes, tho' of very different Bores and Sizes.

The Reason of which will thus appear.

Let *EF* represent the Surface of the Water in the Vessel; when the Oil comes to be poured upon it, not being of a Nature fit to mingle or incorpo-

rate with it, it will swim at the Top, and with an equal Gravity press upon all Parts of the Surface of the Water, and consequently will raise or press up the Water in the Tubes, till it come near to the same Height in them, as the Oil is at in the Glafs, to bring the Liquors to a Balance. But there is no Reason why the Water should be raised to a greater Height in any one Tube than in another; because the Oil presses uniformly and equally on all Parts of the Surface of the Water; and consequently can force up the Water no higher in the smallest Tube than in the greatest; for should it do so, the Water in the small Tube must be of a larger Length than the corresponding Column of Oil (whose Diameter is equal to the Orifice of that Tube, and which keeps it up by equi-ponderating with it) doth require: But then it must be heavier than it, and so would sink down, and drive the subjacent Water away to make room for its Descent: Wherefore no Cylinder of Water in any Tube, can be higher than an equal Cylinder of Oil that bears or buoys it up; and this being the Case with them all, they must be all of the same Height; that is, the Water will rise as high in one Tube as in another, be their Bores never so different; and the Reason is, because each one is born up by a corresponding Column or Cylinder of Oil, whose Diameter is the same with that of the Orifice of the Tube.

PARADOX VI.

If a Body be placed under Water, with its uppermost Surface parallel to the Horizon, the direct Pressure which it sustains, is no more than that of a Column of Water, having the Horizontal Superficies of the Body for its Base, and the Perpendicular Depth of the Water for its Height. And if the Water that leans on the Body be contained in Pipes open at both Ends, the Pressure of the Water is to be estimated by the Weight of a Pillar of Water, whose Base is equal to the lower Orifice of the Pipe, and its Height equal to a Perpendicular reaching from thence to the Top of the Water; though the Pipe be much inclined any way, or though it be never so irregularly shaped; and much broader in some other Places than at the Bottom.

Take a slender Glafs Pipe of an even Bore, turned up at one End like this in the Figure; dip this Tube (open at both Ends) into Oil of Turpentine,

till the Liquor be risen up to two or three Inches in the longer Leg, whose upper Orifice then stop with your Finger; and then remove the Tube into a Glafs of Water, and hold it so that the Surface of the Oil in the longer Leg of the Pipe be but a very little higher than that of the Water: And then, if you take away your Finger that stopp the Pipe, you will see the Oil will keep its station, and not at all, or at least but very little, rise or fall; but if you sink the Tube lower, the Oil will rise; if

if you raise the Tube higher, the Oil will run out at the lower End: From whence it appears, That of all the Water in the Glass, no more pressed on the Orifice of the Pipe, than a Cylinder equal to it in Diameter, and in Length equal to the Distance between the Orifice of the Pipe and the Top of the Water (as you may also easily find if you make a Siphon, whose shorter Leg shall be long enough to contain such a Cylinder of Water as will counterpoise the Oil in the longer.) For when, by raising up the Pipe, you shorten that Cylinder, the Oil will run out: As when by sinking it lower, and so lengthening the Cylinder of Water, the Oil will be forced up higher into the longer Leg of the Tube.

You will find also by Experiment, That this Paradox will hold, whatever be the Figure of the shorter Leg of the Tube, whether opening broad like a Tunnel by Degrees, or whether it have a Spherical, or otherwise figured Cavity of considerable Dimensions in the Middle of it.

For our Noble Author found, by providing a Syphon of the Figure annexed, and pouring in Mercury till it reached up to the Bottom of the Globular Part of the shorter Leg, and to an equal Height in the longer Leg of the Syphon; he found, I say, that if he poured Water in at the Top of the longer Leg, it would drive up the Mercury into the Ball of the shorter Leg, and more than half fill its Cavity; (which it would have filled quite, had the other Leg been long enough.) And that this Ball in the Middle of the shorter Leg, though it held a great Weight of that heavy fluid Mercury, did no more hinder the Mercury from rising to its due Height, according to the different Specifick Gravity of those two Liquors, Water and Mercury, than if the shorter Leg had been every where of the same Dimensions with its upper Orifice *D*: For the great Quantity of Mercury which was forced up into the Ball,

22

was there, in a good Measure, supported by the Bottom and Sides of it, and no more gravitated on *C*, than what lay perpendicularly over it between *B* and *C*.

And farther, to make out the latter Part of this Paradox, he took three Glass Pipes, *L*, *O*, *G*, of such irregular Shapes as the Figure adjoining shew-

eth

-eth; and these, by Holes purposely made for them in a Covert of Cork, he placed obliquely within a Glass Vessel filled with Water up to *AB*. Then by the help of the Tunnel *T*, he gently poured in

Oil of Turpentine, till its upper Surface reached to *FE*; which Oil he found did, by its Pressure on the Surface of the Water, raise it up to an equal Height in all the three Pipes.

SCHO-

IN SCHOLIUM.

is in a Cylindrical, or otherwise Figured Vessel, have, by a Hole made in its Cover or Lid, a Pipe of any length fastened there, and the Vessel by that Pipe be filled with Water, as also the Pipe it self; the Basis of that Vessel doth sustain a Pressure equal to that of a Column of Water, whose Base is the same with the Bottom of the Vessel, and its Height that of the Vessel, Pipe and all.

This Paradox *Stevinus* adds by way of Appendix to the last; but the ways he proposes to Experiment its Truth, are not such as will answer trial; and therefore Mr. *Boyle* devised the following Experiment, which (though not so accurate as some other) doth yet very well deserve to be considered.

He ordered a Tin or Laton Vessel to be made of the adjoining Shape, which had a loose Bottom,

CD, made of a flat Piece of Wood, covered with a soft Piece of Bladder, and greased on the lower Side near the Edges, that so leaning on the Rim of Wood *GH*, contiguous every where to the Inside of the Laton, it might easily be lifted off from it, and yet lie so close upon it at other times, that the Water should not get between them. To the Middle of the loose Bottom was fastened a long String, that came up through the Body of the Pipe *AB*.

The Instrument thus fitted, there was Water poured in at *A*, which pressed against the false Bottom *CD*, and kept it so tight down, that no Water ran out. When the Vessel and Pipe were both

filled with Water, the upper End of the String *KY* was fastened to the Beam of a good Pair of Scales, and then as much Weight was put into the opposite Scale, as did lift up the false Bottom, *CD*, from the Rim *GH*, and so let out the Water; and this Weight he found to be very considerably more than what would have served to lift up as much Water as that Vessel did contain, had it been in an open one of the common Shape: But he neither tells us the Measure of the Vessel, the Height of the Tube, nor the Weight which was required to raise the Bottom; which if he had done, 'twere very easy to have calculated the Quantity and Weight of a Column of Water, which should have had the Bottom for its Base, and the united Length of Tube and Vessel for its Altitude.

This Paradox, in the *Memoirs Mathematiques 69 de Physique*, A.D. 1692. P. 12. is thus stated by Mr. *Varignon*.

If there be two Tubes or Vessels, having the same Heights and Bases, both filled with Water, but one of them made so tapering upwards, that it shall contain but 20 Ounces of Water, whereas the other holds 200; the Bottoms of the two Tubes shall sustain an equal Pressure of Water, viz. each of them that of the Weight of 200 Ounces, the Quantity of the Liquid contained in the greater Tube.

This is undoubted Fact, and agreed upon by all to be true, as long as the contained Liquor continues Fluid; but if it should freeze, then it will by no means hold, the lesser Quantity of Ice (to be sure) being much lighter than the greater.

This Reason therefore of this surprising Phenomenon seems to depend much on the Nature of Fluidity; and accordingly Mr. *Varignon* espouses the Opinion of those who assert, That the 20 Ounces of Water in the tapering, or otherwise unequally form'd Tube, as long as the Water continues liquid, do press and effectively charge the Bottom of the Vessel, as much as 200 Ounces would do in a uniform Cylindrical Tube of the same Base and Altitude.

Others say the straitened Sides of the unequal Tube, by hindering the rising of the Water, do help to sustain the Weight; and that the Bottom alone is not charged with the whole Pressure, but a good Part of it taken off by the Sides.

Mr. *Varignon* thinks the Matter easily solvable in the former way, thus:

The Tube *BACFHKEDB*. (See the following Figure) having its bottom Part *DKHF* much larger than its upper Shank *BCFD*; I say, hath its Bottom *KH* charged with as great a Weight or Pressure of Water, as if it were a Cylindrical Vessel, as *QTHK*, of the same Base and Altitude with the unequally shaped Tube.

Draw the Lines, as you see in the Figure, so shall *QV* represent a Column of Water in the supposed truly Cylindrical Vessel, having the Diameter of its Base double to that of *RL*, *BM*, or *AO*.

Then will the Column of Water *BN*, bearing upon the Arm *MN* of the Libra *LN*, whose *Hypomochlion* is imagined to be at *M*, be a Counterbalance to the Column of Water *EM*, which is kept down from ascending any higher by the Side of the Vessel *EL*, just as the Weight at *Z*, at the End *X*, of the Libra *EX*, whose *Hypomochlion* is at *Y*, is balanced by the Side of the Vessel *ED*, which hinders the Arm *ET* from ascending. Now *ET* being = *YX*, the Weight sustained by the *Hypomochlion*

hypomochlion at T , is double to that at Z ; wherefore the subjacent Point M , or that part of the Bottom of the Vessel LN , must be charged with double the Weight of the Column of Water BN ; or which is all one, will be pressed with the Weight of the Column of Water RN , which may be supposed to reach quite up to the Top.

Let us then take $ANLKED$, as equivalent to such a Column; then will that Water be a Balance on the *Hypomochlion* L , to the Water leaning on the other Arm of the *Libra* KL , and kept down by the Side of the Vessel KE ; and consequently, the part of the Bottom KN , will sustain a Pressure equal to that of the Column of Water QN ; for this, by the above-mention'd way of arguing, is the same as that of the Water contained in the Space $ANKDB$.

And thus, on the other Side, it may be proved, That the remaining part of the Bottom NH , is pressed upon by the Water $ANHFC$, equivalent to the Weight of the Column of Water TN , reaching up to the Top.

From whence it follows plainly, That the Water in the Tube $BDKHFC$, presses or gravitates on the Bottom equally with the Weight of the Cylindrical Column $QTHK$, having an equal Base with it.
